cefonicid sodium /sēfon′isid/, a parenteral cephalosporin-type antibiotic.

■ INDICATIONS: It is prescribed for bacterial infections of the lower respiratory or urinary tract, skin, bones, and joints; septicemia; and surgical prophylaxis.

■ CONTRAINDICATIONS: A history of allergy to cephalosporins or acute anaphylactic or urticarial reactions to penicillin prohibit its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are pain and phlebitis at the injection site and occasionally allergic reactions and GI effects.

cefoperazone sodium /sē′fōper′əzōn/, a third-generation cephalosporin antibiotic.

■ INDICATIONS: It is prescribed in the treatment of respiratory tract, bone, joint, skin, and female genital tract infections and of bacterial septicemia.

■ CONTRAINDICATIONS: Hypersensitivity to the cephalosporins or known sensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse reactions are pruritus, urticaria, transient eosinophilia, neutropenia, and injection site reactions.

Cefotan, a trademark for a cephalosporin antibiotic **(cefotetan disodium).**

cefotaxime sodium /sēfōtak′zēm/, a third-generation cephalosporin antibiotic.

■ INDICATIONS: It is prescribed for lower respiratory tract, genitourinary, gynecological, skin, bone and joint, and central nervous system infections and for bacterial septicemia caused by strains of susceptible microorganisms.

■ CONTRAINDICATIONS: Hypersensitivity to the cephalosporins or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: The most serious adverse reactions are pruritus, colitis, fungal infections, and injection site reactions.

cefotetan disodium /sē′fōtet′ən/, a parenteral second-generation cephalosporin antibiotic with greater activity against anaerobes and gram-negative bacilli than first-generation cephalosporins.

■ INDICATIONS: It is prescribed for bacterial infections of the lower respiratory tract, urinary tract, skin, abdomen, bones or joints, or reproductive organs and for surgical prophylaxis.

■ CONTRAINDICATIONS: It is contraindicated for patients who are hypersensitive to cefotetan or to other cephalosporin antibiotics.

■ ADVERSE EFFECTS: Among adverse reactions reported are skin rash, diarrhea, eosinophilia, positive Coombs' test results, and elevated liver enzyme levels.

cefoxitin sodium /sēfok′sitin/, a parenteral second-generation cephalosporin antibiotic with greater activity against anaerobes and gram-negative bacilli than first-generation cephalosporins.

■ INDICATIONS: It is prescribed for bacterial infections of the lower respiratory tract, urinary tract, skin, abdomen, bones or joints, or reproductive organs and for surgical prophlaxis.

■ CONTRAINDICATIONS: Known hypersensitivity to cephalosporins prohibits its use. It is administered with caution to patients who are allergic to penicillin and related antibiotics or who have impaired renal function.

■ ADVERSE EFFECTS: Among the most serious adverse reactions are hypersensitivity reactions, phlebitis, superinfection, and pain on intramuscular injection.

ceftazidime /seftaz′idēm/, a parenteral third-generation cephalosporin-type antibiotic.

■ INDICATIONS: It is prescribed for treatment of documented *Pseudomonas aeruginosa* infection and other bacterial infections of the lower respiratory tract, urinary tract, skin, abdomen, blood, bones and joints, and central nervous system.

■ CONTRAINDICATIONS: It is contraindicated in patients who are hypersensitive to this product or to other cephalosporin antibiotics.

■ ADVERSE EFFECTS: Among adverse reactions reported are pruritus, fever, skin rash, diarrhea, eosinophilia, thrombocytosis, phlebitis, discomfort at the site of injection, and positive Coombs' test result.

ceftibuten, an oral third-generation cephalosporin.

■ INDICATIONS: It is prescribed in the treatment of chronic bronchitis, acute bacterial otitis media, pharyngitis, and tonsillitis.

■ CONTRAINDICATIONS: It should not be given to children with abdominal pain, vomiting, and diarrhea.

■ ADVERSE EFFECTS: The side effects most often reported include nausea, headache, diarrhea, dyspepsia, dizziness, and abdominal pain.

ceftizoxime sodium /sef′tizok′zēm/, a third-generation cephalosporin antibiotic.

■ INDICATIONS: It is prescribed in the treatment of infections caused by susceptible bacterial strains (does not include *Pseudomonas aeruginosa*), primarily in the respiratory system, genitourinary system, bone, joints, and skin.

■ CONTRAINDICATIONS: Known sensitivity to this drug prohibits its use. It is used with caution in patients who are allergic to penicillin.

■ ADVERSE EFFECTS: Among the most serious adverse reactions are hypersensitivity reactions, neutropenia, leukopenia, thrombocytopenia, and pain at the injection site.

ceftriaxone sodium /sef′trī·ak′sōn/, a parenteral third-generation cephalosporin antibiotic.

■ INDICATIONS: It is prescribed for infections of the lower respiratory tract, urinary tract, skin, abdomen, bones, and joints. It is also used to treat gonorrhea, septicemia, and meningitis and in surgical prophylaxis, particularly in coronary bypass operations. It has a comparatively long half-life and although its dosage must still be decreased with renal impairment, it is one of the few cephalosporins that is eliminated primarily by the liver.

■ CONTRAINDICATIONS: It is contraindicated in patients who are hypersensitive to this product or to other cephalosporin antibiotics.

■ ADVERSE EFFECTS: Among reported adverse reactions are skin rash, diarrhea, eosinophilia, thrombocytosis, leukopenia, increased liver enzyme and blood urea nitrogen levels, and pain and tenderness at the site of injection.

cefuroxime sodium /sef′o͞orok′zēm/, a cephalosporin antibiotic.

■ INDICATIONS: It is prescribed in the treatment of lower respiratory tract, urinary tract, skin, and gonococcal infections; bacterial septicemia; and meningitis and for the prevention of postoperative infections.

■ CONTRAINDICATIONS: Hypersensitivity to the cephalosporins or known sensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse reactions are pruritus, urticaria, transient eosinophilia, neutropenia, leukopenia, and injection site reactions.

CEJ, abbreviation for **cementoenamel junction.**

cel-, coel-, **1.** prefix meaning "a cavity of the body": *celarium*. **2.** prefix meaning "a swelling or tumor, hernia": *celosomia*. **3.** prefix meaning "belly or abdomen": *coelom*.

-cele, suffix meaning "relating to a hernia or swelling": *rectocele, cystocele*.

celecoxib /sel′ekok′sib/, a nonsteroidal antiinflammatory drug of the cox-2 inhibitors group, administered orally for symptomatic treatment of arthritis.

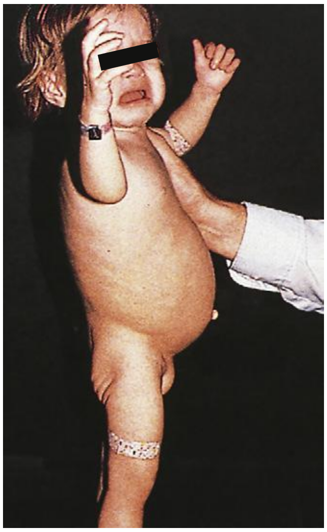
Celestone, a trademark for a glucocorticoid **(betamethasone).**

Celexa /sĕ-lek′sə/, a trademark for a preparation of citalopram hydrobromide, an antidepressant.

celiac /sē′lē·ak/ [Gk, *koilia,* belly], pertaining to the abdominal cavity.

celiac artery [Gk, *koilia,* belly, *arteria,* airpipe], a thick visceral branch of the abdominal aorta, arising caudal to the diaphragm, usually dividing into the left gastric, common hepatic, and splenic arteries.

celiac disease [Gk, *koilia* + L, *dis,* opposite of; Fr, *aise,* ease], an inborn error of metabolism characterized by the inability to hydrolyze peptides contained in gluten. Gluten is found in wheat, oats, and barley. The disease affects adults and young children, who suffer from abdominal distension, vomiting, diarrhea, muscle wasting, and extreme lethargy. A characteristic sign is a pale, foul-smelling stool that floats on water because of its high fat content. There may be a secondary lactose intolerance, and it may become necessary to eliminate all milk products from the diet. Most patients respond well to a high-protein, high-calorie, gluten-free diet. Rice and corn are good substitutes for wheat, and any vitamin or mineral deficiencies can be corrected with oral preparations. Prognosis for full recovery is excellent. Failure to respond generally indicates misdiagnosis. Also called **celiac sprue, gluten-induced enteropathy, nontropical sprue.** Compare **malabsorption syndrome.**



[redacted]

Celiac disease: abdominal distention
(Zitelli and Davis, 2007)

celiac ganglion, a group of nerve cells located on each side of the crura of the diaphragm. The cells are connected to the **celiac plexus.**

celiacoduodenal part of suspensory muscle of duodenum, a band of smooth muscle that passes from the terminal duodenum to join the phrenicoceliac part (pars phrenicocoeliaca) and end in connective tissue that attaches to the celiac trunk.

celiac plexus. See **solar plexus.**

celiac rickets [Gk, *koilia* + *rhachis,* spine, *itis,* inflammation], arrested growth and osseous deformities resulting from malabsorption of fat and calcium. See also **celiac disease, rickets.**

celiac sprue. See **celiac disease.**

celio-, prefix meaning "belly or abdomen": *celioma, celiorrhaphy.*

celiocolpotomy /sē′lē·ōkəlpot′əmē/ [Gk, *koilia* + *kolpos,* vagina, *temnein,* to cut], an incision into the abdomen through the vagina.

celioscope. See **laparoscope.**

cell [L, *cella,* storeroom], the fundamental unit of all living tissue. **Eukaryotic cells** consist of a nucleus, cytoplasm, and organelles surrounded by a plasma membrane. Within the nucleus are the nucleolus (containing ribonucleic acid) and the chromatin (containing protein and deoxyribonucleic acid), which form chromosomes, wherein are located the determinants of inherited characteristics. Organelles within the cytoplasm include the endoplasmic reticulum, ribosomes, Golgi apparatus, mitochondria, lysosomes, and centrosome. **Prokaryotic cells** are much smaller and simpler than eukaryocytic cells, even lacking a nucleus. The specialized nature of body tissue reflects the specialized structure and function of its constituent cells. See also **cell theory. —cellular,** *adj.*

cella /sel′ə/ *pl. cellae* [L, storeroom], an enclosed space.

cell bank, a storage facility for frozen tissue samples held for research purposes and for surgical reconstruction of damaged body structures.

cell biology. See **cytology.**

cell body [L, *cella* + AS, *bodig*], the part of a cell that contains the nucleus and surrounding cytoplasm exclusive of any projections or processes, such as the axon and dendrites of a neuron or the tail of a spermatozoon.

cell culture [L, *cella,* storeroom, *colere,* to cultivate], living cells that are maintained in vitro in artificial media of serum and nutrients for the study and growth of certain strains of microorganisms or for experiments in controlling diseases, such as cancer. They are routinely used to culture viruses that infect patients.

cell death, **1.** terminal failure of a cell to maintain essential life functions. See also **apoptosis, necrosis. 2.** the point in the process of dying at which vital functions have ceased at the cellular level. **3.** programmed cell death.

Cell *(Huether and McCance, 2008)*

cell determination, the process by which an undifferentiated embryonic cell becomes committed to develop into a specific type of cell. Cell determination appears to involve the selective activation of certain sets of genes and the inactivation of others.

cell division, the continuous process by which a cell alternates between a long interphase period and mitosis. Mitosis involves four stages: prophase, metaphase, anaphase, and telophase. Cell division does not occur in discrete steps: each phase is part of a continuous process that may require hours for its completion. During the interphase period new deoxyribonucleic acid, ribonucleic acid, and protein molecules are synthesized before the start of the next prophase. Compare **meiosis.** See also **mitosis.**

cell division cycle (cdc), the sequence of events that occur during the growth and division of cells.

CELLector, a trademark for a device that modifies human blood cells by circulating them through a box containing a number of polystyrene plates. Genetically engineered monoclonal antibodies are permanently attached to the polystyrene plates, which capture specifically targeted cells while the rest of the cells are transfused back into the patient's body. The device is used in bone marrow transplantation.

cell inclusion [L, *cella,* storeroom, *in* + *claudere,* to shut], any foreign matter or residual elements of the cytoplasm that are enclosed within a cell. They are metabolic products of the cell (for example, granules or crystals). Also called **metaplasm.**

cell line [L, *cella* + *linea*], a colony of animal cells derived and developed as a subculture from a primary cell culture.

cell mass [L, *cella,* storeroom, *massa*]. See **inner cell mass.**

cell-mediated cytotoxicity, cytolysis of a target cell by effector lymphocytes, such as cytotoxic T lymphocytes or natural killer cells. It may be antibody-dependent *(antibody-dependent cell-mediated cytotoxicity)* or independent, as in certain type IV hypersensitivity reactions.

cell-mediated hypersensitivity, hypersensitivity initiated by antigen-specific T lymphocytes. Unlike forms of hypersensitivity mediated by antibodies, it takes one or more days to develop and can be transferred by lymphocytes but not by serum. The term is often equated with **delayed hypersensitivity,** although the latter is sometimes restricted to hypersensitivity involving cytokine-mediated reactions (as contrasted with direct cytolysis).

cell-mediated hypersensitivity reaction. See **hypersensitivity reaction.**

cell-mediated immune response, a delayed reaction of the immune system, mediated primarily by sensitized T lymphocytes rather than antibodies. Cell-mediated immune response reactions are responsible for defense against certain bacterial, fungal, and viral pathogens; malignant cells; and other foreign proteins and tissues. Allergic dermatitis is an example of a cell-mediated immune response. Also called **cellular hypersensitivity reaction, delayed hypersensitivity reaction, type IV hypersensitivity.** Compare **anaphylactic hypersensitivity.**

cell-mediated immunity. See **cellular immunity.**

cell membrane. See **plasma membrane.**

cell of Corti. See **auditory hair.**

cell organelle [L, *cella,* storeroom; Gk, *organon,* instrument], any of a number of membrane-bound structures within a cell that have specific functions, such as reproduction or metabolism. Examples include mitochondria and Golgi bodies.

cell receptor, a protein located either on a cell's surface, in its cytoplasm, or in its nucleus that binds to a specific ligand (typically an ion or a molecule), initiating signal transduction and a change in cellular activity.

cells of Paneth /pä′nət, pan′əth/ [Josef Paneth, Austrian physiologist, 1857–1890], large granular epithelial cells found in intestinal glands. They secrete digestive enzymes and bactericidal lysozyme. Also called **Davidoff's cells.**

cell-surface marker, an antigenic determinant found on the surface of a specific type of cell.

cell theory, the proposition that cells are the basic units of all living tissues or organisms and that cellular function is the essential process of living things.

cellular /sel′yələr/ [L, *cella,* storeroom], pertaining to or consisting of cells.

cellular hypersensitivity reaction. See **cell-mediated immune response.**

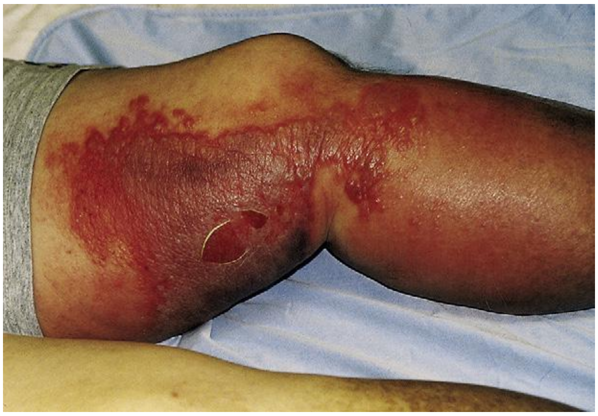
cellular immunity [L, *cellula,* little cell, *immunis,* exempt], the mechanism of acquired immunity characterized by the dominant role of T cell lymphocytes. Cellular immunity is involved in resistance to infectious diseases caused by viruses and some bacteria and in delayed hypersensitivity reactions, some aspects of resistance to cancer, certain autoimmune diseases, graft rejection, and certain allergies. It does not involve the production of humoral antibody but instead involves the activation of Mo and natural killer cells. Also called **cell-mediated immunity.** Compare **humoral immunity.**

cellular infiltration, the migration and grouping of cells, especially blood cells, within tissues throughout the body.

cellular pathology. See **pathology.**

cellulite /sel′yəlīt/, a nonmedical term for fat and fibrous tissue deposits that result in dimpling of the skin.

cellulitis /sel′yəlī′tis/ [L, *cellula,* little cell; Gk, *itis,* inflammation], a diffuse, acute bacterial infection of the skin and subcutaneous tissue characterized most commonly by local heat, redness, pain, and swelling and occasionally by fever, malaise, chills, and headache. Abscess and tissue destruction usually follow if antibiotics are not taken. The infection is more likely to develop in the presence of damaged skin, poor circulation, or diabetes mellitus. In addition to appropriate antibiotics, treatment includes warm soaks, elevation, and prevention of pressure to the affected areas.



Cellulitis *(Black and Hawks, 2009)*

cellulose /sel′yo͝olōs/ [L, *cellula,* little cell], a colorless, insoluble, indigestible, transparent, solid polysaccharide that is the primary constituent of the cell walls of plants. In the diet it provides the bulk necessary for proper digestive tract functioning. Rich sources are fruits, such as apples and bananas, and legumes, bran, and green vegetables, especially celery. See also **dietary fiber.**

cellulose sodium phosphate, an insoluble, nonabsorbable cation-exchange resin prepared from cellulose. It binds calcium and is used to prevent formation of calcium-containing kidney stones.

cell wall, the structure that covers and protects the plasma membrane in some kinds of cells, such as certain bacteria and all fungi and plant cells. The cell walls of plant cells are composed of cellulose.

celom, celomic. See **coelom.**

Celontin, a trademark for an anticonvulsant **(methsuximide).**

celosomia /sē′ləsō′mē·ə/ [Gk, *kele*, hernia, *soma*, body], a congenital malformation characterized by a fissure or absence of the sternum and ribs and protrusion of the viscera.

celosomus /sē′ləsō′məs/, a fetus with celosomia.

celothelioma. See **mesothelioma.**

Celsius (°C) /sel′sē·əs/ [Anders Celsius, Swedish scientist, 1701–1744], temperature scale in which 0° is the freezing point of water and 100° is the boiling point of water at sea level. To convert to Fahrenheit, multiply the Celsius by 1.8, then add 32. Also called **centigrade.** Compare **Fahrenheit.**

Celsius thermometer. See **Celsius.**

cement /siment′/ [L, *caementum*, rough stone], **1.** a sticky or mucilaginous substance that hardens into a firm mass and helps neighboring tissue cells stick together. **2.** any of a variety of dental materials used to fill cavities or to hold bridgework or other dental prostheses in place. **3.** a material used in the fixation of a prosthetic joint in adjacent bone, such as methyl methacrylate.

cemental fiber /simen′təl/ [L, *caementum*, rough stone, *fibra*], any one of the many fibers of the periodontal membrane that extend from the cementum to the intermediate plexus, where their terminations are mixed with those of the alveolar fibers.

cementation /sē′məntā′shən/ [L, *caementum*, rough stone], the attachment of anything with cement, such as restorative material (for example, inlay, onlay, crown) to a natural tooth or of an orthodontic band.

cement base, a layer of dental cement material, sometimes containing medication, that is applied to the bottom of a prepared tooth cavity to protect the pulp, reduce the bulk of metallic restoration, or eliminate undercuts in a tapered preparation.

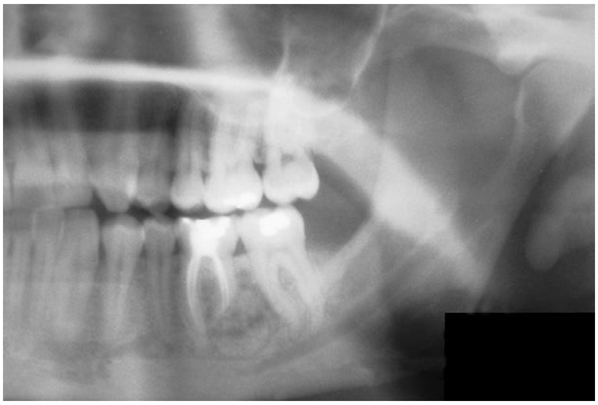
cementifying fibroma /-ifī′ing/ [L, *caementum* + *facere*, to make, *fibra*, fiber; Gk, *oma*, tumor], **1.** an intraosseous lesion composed of fibrous connective tissue enclosing foci of calcified material resembling cementum. **2.** a rare odontogenic tumor composed of varying amounts of fibrous connective tissue resembling cementum. **3.** rare benign neoplasm that usually arises from the mandible and maxilla.

cementoblast /simen′təblast/, (in dentistry) one of the large cuboidal cells that are responsible for the formation of cementum on the root dentin of developing teeth.

cementoblastoma /simen′tōblastō′mə/ *pl. cementoblastomas, cementoblastomata* [L, *caementum* + Gk, *blastos*, germ, *oma*, tumor], A rare, benign odontogenic tumor representing a true neoplasm of cementum that primarily affects mandibular permanent first molars in children and young adults under the age of 30 years. Radiographically, it appears as a well-defined radiopaque mass surrounded by a thin radiolucent halo. Treatment consists of enucleation of the tumor and removal of the involved tooth or teeth. Not to be confused with cementoma.

cementocyte /simen′təsīt/, a cell found in the cementum of teeth.

cementoenamel junction, the junction of the coronal border of the cementum and the apical border of the enamel.



[redacted]

Cementoblastoma *(Regezi, Sciubba, and Jordan, 2008)*

cementoma /sē′mentō′mə/ *pl. cementomas, cementomata* [L, *caementum* + Gk, *oma*, tumor], any benign, dysplastic cementum-producing tumor associated with the apices of teeth. It may be present as a mass of fibrous connective tissue, as fibrous connective tissue with spicules of cementum, or as a calcified mass resembling cementum. Radiographically, early cementomas appear as well-defined radiolucencies at the apex of mandibular anterior teeth that are often mistaken for periapical lesions. Older lesions may appear to calcify with time. An important diagnostic indication is that these teeth test vital to vitality testing. Examples are **cementoblastoma** and **cementifying fibroma.**

cementum /simen′təm/, the bonelike connective tissue that covers the roots of the teeth and helps to support them by providing a place of attachment for the periodontal ligament fibers and overlying dentin.

cen, abbreviation for **centromere.**

CEN, abbreviation for **certified emergency nurse.**

cen-, prefix meaning "common": *cenadelphus, cenesthesia, cenesthopathia*.

cenesthesia /sē′nesthē′zhə/ [Gk, *kenos*, empty, *aisthesis*, feeling], the general sense of existing, derived as the aggregate of all the various stimuli and reactions throughout the body at any specific moment to produce a feeling of health or of illness. Also called *cenesthesis*, **coenesthesis.**

ceno-, prefix meaning "new, empty, or having a common feature": *cenogenesis*.

cenogenesis /sē′nōjen′əsis/ [Gk, *kenos*, empty, *genein*, to produce], the development of structural characteristics that are absent in earlier forms of a species, as an adaptive response to environmental conditions. Also spelled **caenogenesis,** *coenogenesis*, **kenogenesis.** Compare **palingenesis.** —*caenogenetic, cenogenetic, coenogenetic, adj.*

cenophobia. See **kenophobia.**

censor [L, *censere*, to assess], **1.** a person who monitors or evaluates books, newspapers, plays, works of art, speech, or other means of expression in order to suppress certain kinds of information. **2.** (in psychoanalysis) a psychic suppression that allows unconscious thoughts to rise to consciousness only if they are heavily disguised.

census [L, *censere*, to assess], **1.** an enumeration of the population, usually conducted periodically as a function of an official agency. In addition to counting heads, the census often collects information about members of a household, sources of income, types of dwellings, and matters relating to the health of the community. **2.** in the hospital setting, the number of patients in the hospital.

cente-, prefix meaning "puncture": *centesis*.

center [Gk, *kentron*], **1.** the middle point of the body or geometric entity, equidistant from points on the periphery. **2.** a group of neurons with a common function, such as the accelerating center in the brain that controls the heartbeat.

center-edge angle of Wiberg, the angle formed by a line drawn perpendicular to a baseline that passes through the center of the femoral heads and a line connecting the center of the femoral head and the superior border of the acetabulum, used in radiographic evaluation of the hip joint. It is less than 20° in developmental dysplasia of the hip.

Center for American Nurses (CAN), a unit of the American Nurses Association whose activities concern the creation of a healthy work environment.

center of excellence, a tertiary or quaternary health care provider that is identified as the most expert and cost efficient and produces the best outcomes. Also called **center of quality.**

center of gravity, the midpoint or center of the weight of a body or object. In the standing adult human the center of gravity is in the midpelvic cavity, between the symphysis pubis and the umbilicus.

center of quality. See **center of excellence.**

Centers for Disease Control and Prevention (CDC), a federal agency of the U.S. government that provides facilities and services for the investigation, identification, prevention, and control of disease. It is concerned with all of the epidemiological aspects and the laboratory diagnosis of disease. Immunization programs, quarantine regulations and programs, laboratory standards, and community surveillance for disease are among the activities of the CDC, which is located in Atlanta. Many state and local health workers and scientists receive training in specific techniques there. Originally the **Communicable Disease Center,** it was concerned only with communicable diseases; today its interests include environmental health, smoking, malnutrition, poisoning, and issues in occupational health. The name was changed again in 1992 to include its prevention function.

centesis /sentē′sis/ [Gk, *kentesis,* pricking], a perforation or a puncture of a cavity, such as paracentesis or thoracocentesis.

centi- (c), prefix meaning “a hundred or a hundredth”: *centibar, centiliter, centipoise*.

centigrade. See **Celsius.**

centigram (cg), a mass equal to one hundredth of a gram, or 10 milligrams.

centigray (cGy) /sen′tigra/, a unit of absorbed radiation dose equal to one hundredth (10^{-2}) of a gray, or 1 rad.

centiliter (cL), a volume equal to one hundredth of a liter, or 10 milliliters.

centimeter (cm) /sen′timē′tər/ [L, *centum,* hundred; Gk, *metron,* measure], the metric unit of measurement equal to one hundredth of a meter, or 0.3937 inch.

centimeter-gram-second system (cgs, CGS), the internationally accepted scientific system of expressing length, mass, and time in basic units of centimeters, grams, and seconds. The CGS system is gradually being replaced by the Système International d’Unités (SI, or the International System of Units), based on the meter, kilogram, and second.

centipede bite /sen′təpēd/ [L, *centum,* hundred, *pes,* foot], a wound produced by the poison claws and the first body segment of a centipede, an elongate arthropod with many pairs of legs. The bite of a few species, including *Scolopendra morsitans* in the southern United States, may cause painful local inflammation, fever, headache, vomiting, and dizziness.

centipoise /sen′təpois/ [Jean L.M. Poiseuille, French physiologist, 1797–1869], a measure of the viscosity of a liquid, equal to one hundredth of a poise. The viscosity of glycerin is 1490 centipoise, compared with 1.005 centipoise for water.

centrad [L, *centum,* hundred], **1.** pertaining to a central direction, toward the center. **2.** a unit of measure equal to one hundredth part of a radian. **3.** a measure of the refractive strength of a prism.

central [Gk, *kentron,* center], pertaining to or situated at a center.

central amaurosis [Gk, *kentron* + *amauroein,* to darken], blindness caused by a disease of the central nervous system.

central anesthesia, a loss of feeling or sensation as a result of a lesion in the central nervous system.

central auditory processing disorder (CAPD), difficulty in processing and interpreting auditory stimuli in the absence of a peripheral hearing loss, usually resulting from a problem in the brainstem or cerebral cortex. Children with CAPD often have difficulty with written language tasks and may exhibit other learning disabilities as well.

central biasing /bī′əsing/, a theory of pain modulation in which higher centers such as the cerebral cortex influence the perception of and response to pain.

central canal of spinal cord [Gk, *kentron* + L, *canalis,* channel], the conduit that runs the entire length of the spinal cord and contains some of the 140 mL of cerebrospinal fluid (CSF) in the body of the average individual. The central canal of the spinal cord lies in the center of the cord between the ventral and the dorsal gray commissures and extends toward the cranium into the medulla oblongata, where it opens into the fourth ventricle of the brain. Lumbar puncture, often performed to obtain samples of CSF for diagnostic purposes, draws fluid from the subarachnoid space around the spinal cord and not from the central canal. See also **lumbar puncture.**

central catheter [Gk, *kentron,* central, *katheter,* a thing lowered into], a catheter inserted into either a central artery or a central vein for diagnostic or therapeutic procedures.

central chemoreceptor, any of the sensory nerve cells or chemical receptors that are located in the medulla of the brain. Also called **medullary chemoreceptor.**

central chondrosarcoma [Gk, *kentron* + *chondros,* cartilage, *sarx,* flesh, *oma,* tumor], a malignant cartilaginous tumor that forms inside a bone. Also called **enchondrosarcoma.**

central core disease, an autosomal-dominant muscle disorder characterized by dense, amorphous hyaline changes in the central portion of the myofibrils, which lack organelles. Onset is in infancy and causes delayed motor development, especially in the lower limbs. Also called **Shy-Magee syndrome.**

central deafness. See **central auditory processing disorder.**

central electrode, a key part of a radiation detection instrument, consisting of a positively charged rigid wire in the center of a gas-filled cylinder. The electrode attracts electrons liberated by the ionization effects of radiation and converts them into an electric current.

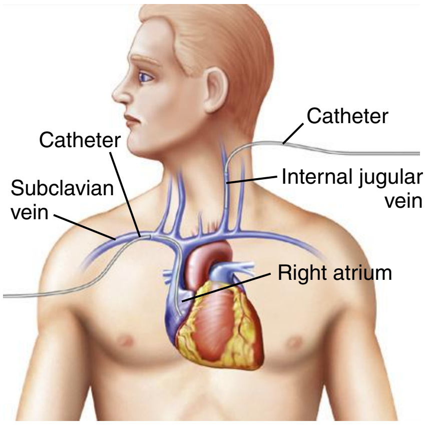
central facilitation, (in chiropractic) a model based on neurophysiological findings that explains the symptoms of subluxogenic pain and discomfort that arise from nonspinal sites.

central fissure. See **central sulcus.**

central implantation. See **superficial implantation.**

central incisor, one of the two teeth located closest to the sagittal plane in the upper and lower jaws.

central line, IV tubing inserted for continuous access to a central vein for administering fluids and medicines and for obtaining diagnostic information. Keeping the central line in place ensures accessibility to the venous system in case the peripheral veins collapse. See also **central venous catheter.**



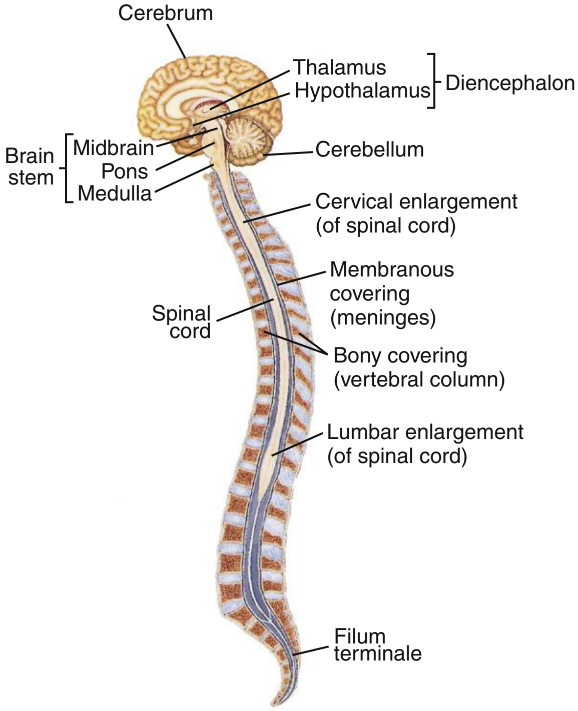
Central line *(Harkreader, Hogan, and Thobaben, 2007)*

central lobe, one of the lobes constituting each of the cerebral hemispheres, lying hidden in the depths of the lateral sulcus. The central lobe can be seen only if the lips of the sulcus are parted or cut away. Also called **island of Reil.** Compare **frontal lobe, occipital lobe, parietal lobe, temporal lobe.**

central necrosis [Gk, *kentron,* central, *nekros,* dead, *osis,* condition], death of the central part of a tissue or organ.

central nervous system (CNS) [Gk, *kentron* + L, *nervus,* nerve; Gk, *systema*], one of the two main divisions of the nervous system, consisting of the brain and the spinal cord. The central nervous system processes information to and from the peripheral nervous system and is the main network of coordination and control for the entire body. The brain controls many functions and sensations, such as sleep, sexual activity, muscular movement, hunger, thirst, memory, and emotions. The spinal cord extends various types of nerve fibers from the brain and acts as a switching and relay terminal for the peripheral nervous system. The 12 pairs of cranial nerves emerge directly from the brain. Sensory nerves and motor nerves of the peripheral system leave the spinal cord separately between the vertebrae but unite to form 31 pairs of spinal nerves containing sensory fibers and motor fibers. More than 10 billion neurons constitute but one tenth of the brain cells; the other cells consist of neuroglia that support the neurons. The neurons and the neuroglia form the soft, jellylike substance of the brain, which is supported and protected by the skull. The brain and the spinal cord are composed of gray matter and white matter. The gray matter primarily contains nerve cells and associated processes; the white matter consists predominantly of bundles of myelinated nerve fibers. Compare **peripheral nervous system.** See also **brain, spinal cord.**

central nervous system depressant, any drug that decreases the function of the central nervous system, such as alcohol, tranquilizers, barbiturates, and hypnotics. Such drugs can produce tolerance, physical dependence, and compulsive drug use. These substances depress excitable tissue throughout the central nervous system by stabilizing neuronal membranes, decreasing the amount of transmitter released by the nerve impulse, and generally depressing postsynaptic responsiveness and ion movement. Larger dosages cause anesthesia and potentially fatal respiratory and cardiovascular depression. Central nervous system depressants elevate the seizure threshold and can produce physical dependence in a relatively short period. After alcohol the most abused depressants are the short-acting barbiturates, especially pentobarbital, secobarbital, glutethimide, methyprylon, and methaqualone. These substances have popular street names on the illicit market, such as "reds" (secobarbital) and "yellows" (pentobarbital). Sudden withdrawal of general central nervous system depressants that have been used in high doses for prolonged periods can be fatal to some individuals.



Cerebrum
Thalamus
Hypothalamus
Diencephalon
Brain stem
Midbrain
Pons
Medulla
Cerebellum
Cervical enlargement (of spinal cord)
Membranous covering (meninges)
Spinal cord
Bony covering (vertebral column)
Lumbar enlargement (of spinal cord)
Filum terminale

Central nervous system *(Patton and Thibodeau, 2010)*

central nervous system stimulant, a substance that quickens the activity of the central nervous system by increasing the rate of neuronal discharge or by blocking an inhibitory neurotransmitter. Many natural and synthetic compounds stimulate the central nervous system, but only a few are used therapeutically. Caffeine, a potent central nervous system stimulant, is used to help restore mental alertness and overcome respiratory depression, but it may cause nausea, nervousness, tinnitus, tremor, tachycardia, extrasystoles, diuresis, and visual disturbances. Amphetamines, sympathomimetic amines with central nervous system stimulating activity, are used in treating narcolepsy and obesity, but these drugs have a high potential for abuse and may cause dizziness, restlessness, tachycardia, increased blood pressure, headache, mouth dryness, an unpleasant taste, GI symptoms, and urticaria. Various amphetamines, especially deanol acetamidobenzoate, a precursor of acetylcholine, are prescribed for hyperkinetic child syndrome because central nervous system stimulants may act as depressants in children. Doxapram is used to stimulate the respiratory center and restore consciousness after anesthesia and to treat acute sedative-hypnotic intoxication. Also called **analeptic.**

central nervous system (CNS) syndrome, a constellation of neurological and emotional signs and symptoms that results from a massive whole-body dosage of radiation. It includes hysteria and disorientation, which increase during the last 24 to 48 hours before death.

central nervous system tumor, a neoplasm of the brain or spinal cord that characteristically does not spread beyond the cerebrospinal axis, although it may be highly invasive locally and have widespread effects on body functions. Intracranial neoplasms are about four times more common than those arising in the spinal cord. From 20% to 40% of brain tumors are metastatic lesions from primary cancer elsewhere, such as in the breast, lung, GI tract, kidney, or a site of melanoma. See also **brain tumor, spinal cord tumor.**

central neurogenic hyperventilation (CNHV) [Gk, *kentron* + *neuron,* nerve, *genein,* to produce], a pattern of breathing during coma marked by rapid, regular ventilations at a rate of about 25 per minute. Increasing regularity rather than rate indicates an increasing depth of coma.

central neuronal plasticity, (in chiropractic) the tendency for the neuronal responses to noxious stimuli to spread to other central pathways, producing the symptoms of referred pain.

central pain [Gk, *kentron* + L, *poena,* penalty], pain caused by a lesion in the central nervous system.

central paralysis [Gk, *kentron* + *paralyein,* to be palsied], paralysis caused by a lesion in the central nervous system.

central pathway, a nerve tract in the brain or spinal cord.

central placenta previa [Gk, *kentron* + L, *placenta,* flat cake, *praevius,* preceding], placenta previa in which the placenta is implanted in the lower segment of the uterus and completely covers the internal os of the uterine cervix. In labor, as the cervix dilates, the placenta is gradually separated from the underlying blood vessels in the uterine lining, causing bleeding that usually begins slowly, is painless, and progresses to hemorrhage that is life-threatening to the mother and the baby. Cesarean section is usually performed to save the mother and the baby. The condition may be discovered by ultrasound visualization before any bleeding occurs or by digital palpation in the normal course of prenatal care. Also called **complete previa.** See also **placenta previa.**

central processing unit (cpu, CPU), the component of a computer that controls the encoding and execution of instructions, consisting mainly of an arithmetic unit, which performs arithmetic functions, and an internal memory, which controls the sequencing of operations. Also called **processor.**

central ray (CR), the portion of an x-ray beam that is directed toward the center of the film or of the object being radiographed.

central scotoma [Gk, *kentron* + *skotos,* darkness, *oma,* tumor], an area of blindness or site of depressed vision involving the macula of the retina.

central sensitization, (in chiropractic) a state in which neurons activated by noxious mechanical and chemical stimuli are sensitized by such stimuli and become hyperresponsive to all subsequent stimuli delivered to the neurons' receptive fields.

central sleep apnea, a form of sleep apnea resulting from decreased respiratory center output. It may involve primary brainstem medullary depression resulting from a tumor of the posterior fossa, poliomyelitis, or idiopathic central hypoventilation.

central slip, the part of the extensor tendon of a finger that inserts into the middle phalanx.

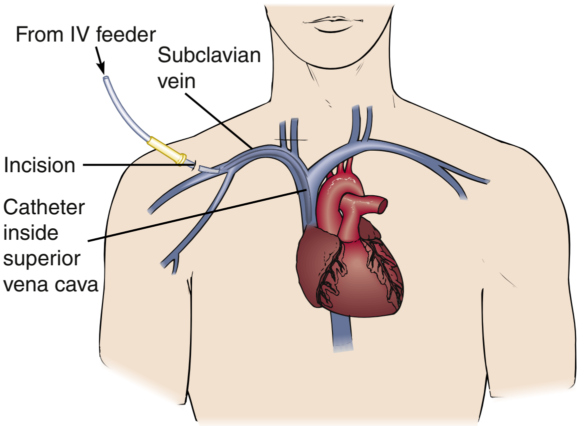
central stimulant. See **central nervous system stimulant.**

central sulcus [Gk, *kentron* + L, furrow], a cleft separating the frontal from the parietal lobes of the brain. Also called **central fissure, fissure of Rolando.**

central tendon, a broad connective tissue sheet that forms the diaphragm. It is composed of interlacing fibers that arise from the lumbar vertebrae, the costal margin, and the xiphoid process of the sternum.

central venous blood pressure, the blood pressure in the superior vena cava, measured by inserting a catheter attached to a manometer directly outside the right atrium. It is approximately equal to the right atrial pressure. On physical examination, it may be approximated by evaluation of jugular venous distension.

central venous catheter, a catheter that is threaded through the internal jugular, antecubital, or subclavian vein, usually with the tip resting in the superior vena cava or the right atrium of the heart. It is also used to administer fluids or medications for hemodynamic monitoring and to measure central venous pressure.



Central venous catheter placement through the subclavian vein *(Elkin, Perry, and Potter, 2007)*

central venous oxygen saturation ($CVSO_2$), the oxygen saturation in the vena cava. The $CVSO_2$ is measured through a central venous catheter and is useful in measuring cardiac output. A reading of less than 55% usually indicates a falling cardiac output and probable cardiac failure.

central venous pressure (CVP), the blood pressure in the large veins of the body, as distinguished from peripheral venous pressure in an extremity. It is measured with a water manometer that may be attached to the head of a patient's bed and to a central venous catheter inserted into the vena cava. The normal CVP values are 2 to 14 cm H_2O.

central venous pressure monitor (CVP monitor), a device for measuring and recording the venous blood pressure by means of an indwelling venous catheter and a pressure manometer. It is used to evaluate the right ventricular function, the right atrial filling pressure, and the circulating blood volume.

central venous return, the blood from the venous system that flows into the right atrium through the vena cava.

central vertigo [Gk, *kentron* + L, *vertigo,* dizziness], vertigo that is caused by a central nervous system disorder.

central vision, vision that results from images falling on the macula of the retina.

central zone, a cone-shaped area of the prostate composed mainly of stromal cells, found deep to the peripheral zone and extending from there to the base of the prostate.

Centrax, a trademark for a benzodiazepine antianxiety agent **(prazepam).**

centre. See **center.**

centrencephalic /sen′trensifal′ik/ [Gk, *kentron* + *enkephalos,* brain], pertaining to the center of the encephalon.

centri-. See **centro-.**

centriacinar emphysema /sentrē·əsin′ər/, one of the types of emphysema, characterized by enlargement of air spaces in the proximal part of the acinus, primarily at the level of the respiratory bronchioles. Also called **centrilobular emphysema, focal emphysema.**

centric /sen′trik/, **1.** See **central. 2.** (in dentistry) a shorthand term referring to centric relation or centric occlusion.

centriciput /sentris′ipo͝ot/, the central part of the head, between the occiput and the sinciput.

centric occlusion, the position of the mandible in relation to the maxilla where the teeth of each jaw are perfectly intermeshed and bite forces are distributed equally.

centric relation, the position of the mandible in relation to the maxilla in which the mandible is positioned midline with the mandibular condyles as posterior and superior as possible within the mandibular fossa. This position is used to determine occlusal relations and positioning for the fabrication of denture prosthetics.

centrifugal /sentrif′yəgəl/, **1.** denoting a force that is directed outward, away from a central point or axis. The force does not actually exist, but is a manifestation of **inertia.** See also **centripetal force. 2.** pertaining to a direction away from the head.

centrifugal current, an electrical current in the body with the positive pole near the nerve center and the negative pole at the periphery. Also called **descending current.**

centrifugal force, an inertial force in a rotating system, directed outward from the axis of rotation and inversely proportional to the distance from the axis of rotation. The force is the product of the mass of an object and its radial acceleration; thus in centrifugation the heavier components of a mixture are separated from the other components by being thrown to the periphery of the orbit.

centrifuge /sen′trifyo͞oj′/ [Gk, *kentron* + L, *fugere*, to flee], a device for separating components of different densities contained in liquid by spinning them at high speeds. Centrifugal force causes the heavier components to move to one part of the container, leaving the lighter substances in another. **—centrifugal,** *adj*., **centrifuge,** *v*.

centrilobular /sen′trəlob′yələr/ [Gk, *kentron* + L, *lobulus*, small lobe], pertaining to the center of a lobule.

centrilobular emphysema. See **centriacinar emphysema.**

centriole /sen′trē·ōl′/ [Gk, *kentron*], an intracellular organelle, usually a component of the centrosome. Often occurring in pairs, centrioles are associated with cell division and can be closely studied only with an electron microscope. They are tiny cylinders positioned at right angles to each other, with walls consisting of nine bundles of fine tubules, three tubules to a bundle. Numerous centrioles occur in some large cells, such as the giant cells in bone marrow. The precise function of centrioles is still a mystery, but they appear to aid in the formation of the spindle that develops during mitosis.

centripetal /sentrip′ətəl/ [Gk, *kentron* + L, *petere*, to seek], **1.** denoting an afferent direction, such as that of a sensory nerve impulse traveling toward the brain. **2.** denoting the direction of a force pulling an object toward an axis of rotation or constraining an object to a specific curved path.

centripetal current, an electrical current passing through the body from a peripheral positive electrode to a negative pole near the nerve center. Also called **ascending current.**

centripetal force, the force, directed toward the axis of rotation, required to keep an object moving in a circular path.

centro-, centri-, prefix meaning "center, central, to the center": *centrocecal, centrocinesia, centrosclerosis*.

centromere (cen) /sen′trəmir/ [Gk, *kentron* + *meros*, part], the constricted region of a chromosome that joins the two chromatids to each other and attaches to spindle fibers in mitosis and meiosis. During cell division the centromeres split longitudinally, half going to each of the new daughter chromosomes. The position of the centromere is constant for a specific chromosome and is identified as acrocentric, metacentric, submetacentric, or telocentric. Also called **kinetochore, kinomere, primary constriction.** *—centromeric, adj*.

Capped syringes in centrifuge *(top)*; centrifuge loaded *(middle)*; separation of layers by centrifugation *(bottom)* *(Tyers and Collin, 2008)*

centrosome [Gk, *kentron* + *soma*, body], a self-propagating cytoplasmic organelle present in animal cells and in those of some lower plants. The structure, which consists of the centrosphere and the centrioles, is located near the nucleus of the cell center or attraction sphere and functions as the dynamic center of the cell, especially during mitosis. Also called **cytocentrum, microcentrum, paranuclear body.**

centrosphere [Gk, *kentron* + *sphaira,* ball], the condensed area of cytoplasm surrounding the centrioles in the centrosome of a cell.

centrostaltic /sen′trōstôl′tik/, pertaining to the center of movement.

centrum *pl. centra* [Gk, *kentron*], any kind of center, especially one related to a body structure, as the centrum semiovale of a cerebral hemisphere.

CEO, C.E.O., abbreviation for **chief executive officer.**

CEP, abbreviation for **congenital erythropoietic porphyria**.

cephal-. See **cephalo-.**

cephalad /sef′əlad/ [Gk, *kephale,* head], toward the head, away from the ends or tail. Compare **caudad.**

cephalalgia /sef′əlal′jə/ [Gk, *kephale,* head, *algos,* pain], headache, often combined with another word to indicate a specific type of headache, such as histamine cephalalgia. Also called *cephalea,* **cephalgia.** See also **histamine headache.**

cephalea agitata, cephalea attonita /sef′əlē′ə/, a violent headache that is frequently an early symptom of an infection, such as influenza.

cephaledema /sef′əlidē′mə/, a swelling of the brain caused by fluid accumulation. See also **cerebral edema.**

cephalexin /sef′əlek′sin/, an oral first-generation cephalosporin antibiotic.

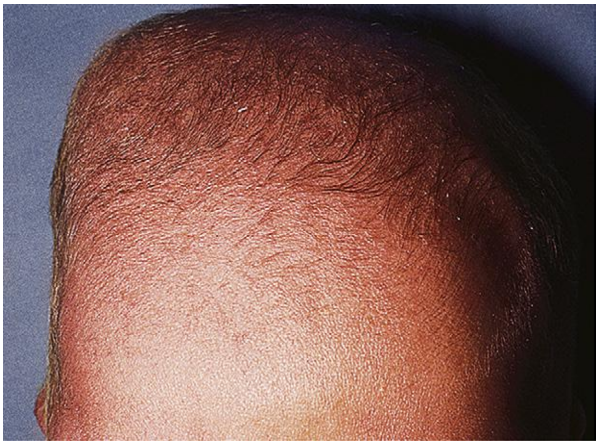
■ INDICATIONS: It is prescribed for oral treatment of selected infections caused by susceptible bacterial strains, especially lower respiratory tract, urinary tract, skin and soft tissue, and bone and joint infections. It is also used as a prophylaxis against bacterial endocarditis in high-risk patients undergoing surgical or dental procedures.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to any cephalosporin medication prohibits its use, as does severely impaired renal function. It is used with caution in patients who are allergic to penicillin or other drugs.

■ ADVERSE EFFECTS: Nausea, diarrhea, and hypersensitivity reactions may occur.

cephalgia. See **cephalalgia, headache.**

cephalhematoma /sef′əlhē′mətō′mə, -hem′ətō′mə/, swelling caused by subcutaneous bleeding and accumulation of blood. It may begin to form in the scalp of a fetus during labor and enlarge slowly in the first few days after birth. It is usually a result of trauma, often caused by forceps. Large cephalhematomas may become infected, require surgical drainage, and take several months to resolve. Also called **cephalhaematoma.** Compare **caput succedaneum, molding.**



Cephalhematoma *(Cohen, 2005)*

-cephalia, suffix meaning a specified "(condition of the) head": *hemicephalia, megacephalia, notancephalia.*

cephalic /sifal′ik/, pertaining to the head.

-cephalic, suffix meaning "relating to the head": *holocephalic, megalocephalic, postcephalic.*

cephalic index [Gk, *kephale,* head, *index,* pointer], a ratio between the breadth and length of the head. It is calculated as 100 times the maximum breadth of the head, measured at the greatest diameter of the cranial vault above the supramastoid crest, divided by the maximum length measured from the most prominent point on the glabella to the opisthocranion.

cephalic presentation, a classification of fetal position in which the head of the fetus is at the uterine cervix. Cephalic presentation is usually further qualified by an indication of the part of the head presenting, such as the occiput, brow, or chin.

cephalic vein, one of the four superficial veins of the upper limb. It receives deoxygenated blood from the dorsal and palmar surfaces of the forearm. Compare **basilic vein, dorsal digital vein, median antebrachial vein.**

cephalo-, cephal-, prefix meaning "head": *cephalocaudal, cephalocentesis, cephalogenesis.*

cephalocaudal /sef′əlōkô′dəl/ [Gk, *kephale* + L, *cauda,* tail], pertaining to the long axis of the body, or the relationship between the head and the base of the spine. Also called **cephalocercal** /sef′əlōsur′kəl/.

cephalocele /sef′əlōsēl′/, the protrusion of a part of the brain through an opening in the skull. The opening may be congenital or may result from an injury. Also called **cerebral hernia.**

cephalocentesis /-sentē′sis/, the puncture of the skull with a hollow needle, performed to allow drainage of fluid or an abscess.

cephalocercal. See **cephalocaudal.**

cephalogram. See **cephalometric radiograph projection.**

cephalomelus /sef′əlom′ələs/ [Gk, *kephale* + *melos,* limb], a deformed individual who has a structure resembling an arm or a leg protruding from the head.

cephalometric radiograph projection /sef′əlōmet′rik rā′dē·ōgraf/, a radiograph of the head, including the mandible, in full lateral view, used for making cranial measurements especially for use in orthodontic treatment planning. Also called **cephalogram.**

cephalometric tracing, a line drawing of structural outlines of craniofacial landmarks and facial bones made directly from a cephalometric radiogram.

cephalometry /-ətrē/, scientific measurement of the head, such as that performed in dentistry to determine appropriate orthodontic procedures for correcting malocclusions and other abnormal conditions. —*cephalometric, adj.*

cephalomotor /sef′əlōmō′tər/ [Gk, *kephale,* head + L, *motare,* to move about], moving the head; pertaining to motions of the head.

cephalopagus. See **craniopagus.**

cephalopelvic /-pel′vik/, pertaining to a relationship between the fetal head and the maternal pelvis.

cephalopelvic disproportion (CPD) [Gk, *kephale* + L, *pelvis,* basin, *dis,* opposite of, *proportio,* similarity], an obstetric condition in which a baby's head is too large or a mother's birth canal too small to permit normal labor or birth. In relative CPD, the size of the baby's head is within normal limits but larger than average or the size of the mother's birth canal is within normal limits but smaller than average, or both; relative CPD is often overcome by molding of the head, the forces of labor, or the use of forceps to effect delivery. In absolute CPD, the baby's head is markedly or abnormally enlarged or the mother's birth canal is markedly or abnormally contracted, making vaginal delivery impossible. See also **clinical pelvimetry, x-ray pelvimetry.**

cephalopelvimetry /-pelvim′ətrē/, radiographic measurement of the fetal head in utero.

cephalophlebitis, an inflammation of the vena cava.

cephalosporin antibiotic. See **antibiotic.**

cephalosporinase. See **beta-lactamase.**

Cephalosporium /sef′əlōspo′re·um/. See ***Acremonium.***

cephalothin sodium /sef′əlō′thin/, a parenteral first-generation cephalosporin antibiotic.

■ INDICATIONS: It is prescribed in the treatment of infections caused by susceptible bacterial strains causing respiratory, genitourinary, gastrointestinal, skin and soft tissue, and bone and joint infections, or septicemia. It is effective against many gram-positive bacilli and cocci (other than enterococcus) and some gram-negative bacilli.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to any cephalosporin medication prohibits its use. It is prescribed with caution for patients who are allergic to penicillin.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are pain at the site of injection and hypersensitivity reactions.

cephalothoracoiliopagus. See **synadelphus.**

-cephalus [Gk, *kephale,* head], suffix meaning *(a)* an abnormal condition of the head, as indicated by the stem to which the ending is attached, such as **hydrocephalus;** *(b)* an individual having an abnormal condition of the head, especially a congenital anomaly of the fetus, such as **dicephalus.**

-cephaly [Gk, *kephale,* head], suffix meaning an abnormal condition of the head.

-cephaly, -cephalia, suffix meaning a “(specified) condition of the head”: *macrencephaly, platycephaly, trochocephaly.*

cephapirin /sef′əprin/, a parenteral first-generation cephalosporin antibiotic.

■ INDICATIONS: It is prescribed in the treatment of bacterial infections caused by cephapirin-susceptible strains of a wide variety of microorganisms that cause septicemia, endocarditis, osteomyelitis, and bacterial infections of the respiratory tract, urinary tract, and skin.

■ CONTRAINDICATION: Known sensitivity to cephalosporin antibiotics prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse reactions are neutropenia, leukopenia, anemia, bone marrow depression, and allergic reactions.

cephradine /sef′rədēn/, an oral first-generation cephalosporin antibiotic.

■ INDICATIONS: It is prescribed in the treatment of certain infections caused by susceptible bacterial strains causing respiratory, genitourinary, gastrointestinal, skin and soft tissue, and bone and joint infections, or septicemia. It is effective against many gram-positive bacilli and cocci (other than enterococcus) and some gram-negative bacilli.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to any cephalosporin medication prohibits its use. It is prescribed with caution for patients who are allergic to penicillin.

■ ADVERSE EFFECTS: Nausea, diarrhea, and hypersensitivity reactions may occur.

-ceptor [shortened from *receptor;* L, *recipere,* to receive], suffix denoting a receptor, with the root preceding it specifying the type.

cer-, prefix meaning “wax”: *ceraceous, cerate, cerumen.*

cera, wax. Ordinary yellow beeswax is sometimes identified as cera flava; white beeswax, bleached by exposure to air and sunlight, is known as cera alba.

ceramics /səram′iks/, (in dentistry) the process of making dental restorations from fused porcelain and other glasses.

ceramidase /səram′idās/, an enzyme of the hydrolase class that catalyzes the cleavage of a ceramide to form sphingosine and a fatty acid anion, a step in the degradation of sphingolipids. See also **Farber’s disease.**

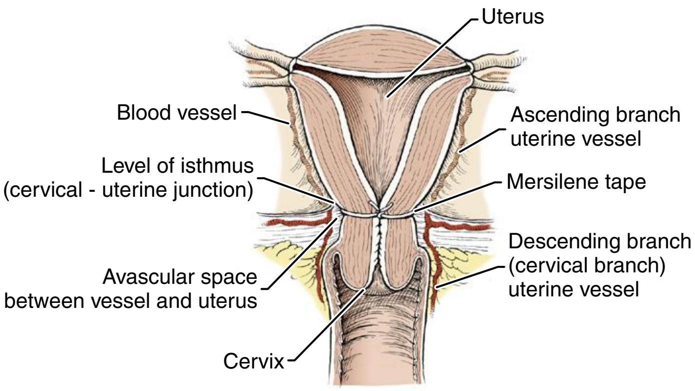
ceramidase deficiency. See **Farber’s disease.**

ceramide /ser′əmīd/, the basic unit of the sphingolipids, consisting of sphingosine or a related base attached by means of its amino group to a long-chain fatty acyl group.

cerato-, kerato-, prefix meaning “cornea or horny tissue”: *ceratocricoid, ceratohyal, ceratopharyngeus.*

cercaria /sərker′ē·ə/ *pl. cercariae* [Gk, *kerkos,* tail], a minute, wormlike early developmental form of trematode. It develops in a freshwater snail, is released into the water, and swims toward the sun, rising to the surface of the water in the warmest part of the day. Cercariae enter the body of the next host by ingestion, by direct invasion through the skin, or through a cut or other break in the skin. Some cercariae of the genera ***Schistosoma,*** *Chlonorchis, Paragonimus, Fasciolopsis,* and *Fasciola* are known to infect humans. They encyst and complete their development in various organs of the body. Each species tends to migrate to one organ, such as *Fasciola hepatica,* which grows to become a liver fluke. See also **fluke, schistosomiasis.**

cerclage /serklāzh′/ [Fr, cask hooping], **1.** an orthopedic procedure in which the ends of an oblique bone fracture or the chips of a broken patella are bound together with a wire loop or a metal band to hold them in position until healed. **2.** a procedure in which a taut silicone band is applied around the sclera to restore contact between the retina and the choroid when the retina is detached. **3.** an obstetric procedure in which a nonabsorbable suture is used for holding the cervix



Uterus
Blood vessel
Ascending branch uterine vessel
Level of isthmus (cervical - uterine junction)
Mersilene tape
Descending branch (cervical branch) uterine vessel
Avascular space between vessel and uterus
Cervix

Abdominal cerclage *(Gabbe et al, 2007)* closed to prevent spontaneous abortion in a woman who has an incompetent cervix. The band is usually released when the pregnancy is at full term to allow labor to begin. See also **incompetent cervix.**

cerea flexibilitas /sirē′ə flek′sibil′itas/ [L, waxlike flexibility], a cataleptic state, frequently observed in catatonic schizophrenia, in which the limbs maintain the positions in which they are placed for an indefinite period. Also called **flexibilitas cerea, waxy flexibility.** See also **catalepsy.**

cerebella. See **cerebellum.**

cerebellar /ser′əbel′ər/ [L, *cerebellum,* small brain], pertaining to the cerebellum.

cerebellar angioblastoma [L, *cerebellum* + Gk, *angeion,* vessel, *blastos,* germ, *oma*], a cystic tumor in the cerebellum composed of a mass of blood vessels. It is frequently associated with **von Hippel-Lindau disease.**

cerebellar artery, one of the three major arteries (superior, posterior inferior, and anterior inferior) on each side that supply the cerebellum.

cerebellar artery occlusion, an obstruction of one of the arteries supplying the cerebellum. It can result in ipsilateral ataxia, facial analgesia, contralateral hemiparesis, and loss of temperature and pain sensations.

cerebellar ataxia [L, *cerebellum,* small brain; Gk, *ataxia,* without order], a loss of muscle coordination caused by a lesion in the cerebellum.

cerebellar atrophy [L, *cerebellum* + Gk, *a* + *trophe,* without nourishment], deterioration and wasting of tissues of the cerebellum. Causes of the condition include nutritional and metabolic factors such as alcohol abuse and degenerative disease. See also **spinocerebellar disorder.**

cerebellar cortex, the superficial gray matter of the cerebellum covering the white substance in the medullary core. It consists of two layers, an external molecular layer and an internal granule cell layer. Also called **cortical substance of cerebellum.**

cerebellar cyst, a cyst that develops in the white matter of the cerebellum and can be associated with an astrocytoma.

cerebellar falx, a small sickle-shaped process of the dura mater attached to the occipital bone above and projecting into the posterior cerebellar notch between the two cerebellar hemispheres. Also called **falx cerebelli.**

cerebellar gait [L, *cerebellum,* small brain; ONorse, *geta,* a way], a staggering gait in which the person walks with a wide base and has difficulty turning. The feet can be turned outward, and the person puts his or her weight first on the heel and then on the toes. The condition is caused by a lesion in the cerebellum or cerebellar pathways. Also called **ataxic gait.**

cerebellar hemangioblastoma, hemangioblastoma of the cerebellum, often cystic. An autosomal-dominant form is associated with **von Hippel-Lindau disease.**

cerebellar inferior peduncle [L, *cerebellum,* small brain, *inferior,* lower, *pes,* foot], a band of nerve fibers that forms the lateral boundary of the bottom part of the fourth ventricle and carries afferent fibers into the cerebellum.

cerebellar middle peduncle [L, *cerebellum,* small brain, *medius* + *pes,* foot], a lateral extension of the transverse nerve fibers of the pons. It consists mainly of fibers from the pontine nuclei to the neocerebellum.

cerebellar notch, **1.** anteriorly, a broad depression that lies dorsal to the midbrain and separates the cerebellar hemispheres rostral to the vermis. **2.** posteriorly, a deep depression adjacent to the falx cerebelli.

cerebellar rigidity, a stiffness of the trunk muscles caused by a midline (vermal) lesion in the cerebellum. In some cases, the limbs may also be rigid and the neck and back arched, as in opisthotonos.

cerebellar speech [L, *cerebellum* + AS, *spaec*], abnormal speech caused by diseases of the cerebellum, characterized by slow, jerky, and slurred articulation that may be intermittent and explosive or monotonous and unvaried in pitch. See also **ataxic dysarthria.**

cerebellar superior peduncle [L, *cerebellum,* small brain, *superior* + *pes,* foot], a band of nerve fibers that passes from the cerebellum on each side of the superior medullary velum. It includes nerve tracts linking the dentate nucleus to the red nucleus of the midbrain and to the thalamus.

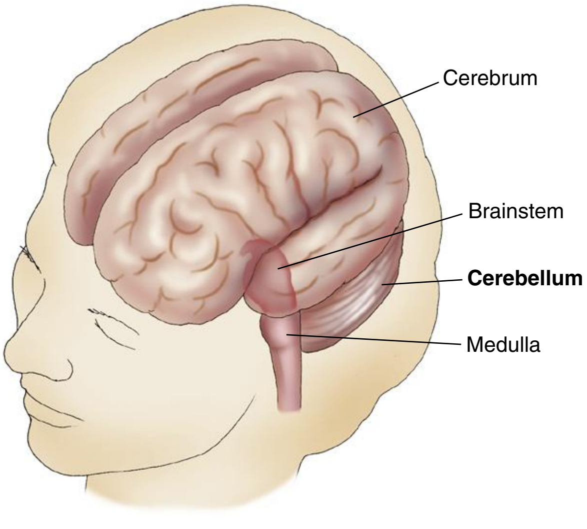
cerebellar tentorium, a horizontal projection of the meningeal dura mater that covers and separates the cerebellum in the posterior cranial fossa from the posterior parts of the cerebral hemispheres. It is attached posteriorly to the occipital bone and laterally to the superior border of the petrous part of the temporal bone. The anterior and medial borders of the tentorium cerebelli are free, forming an oval opening into the midline through which the midbrain passes. Also called **tentorium cerebelli.** Compare **cerebellar falx, cerebral falx.**

cerebellar tremor [L, *cerebellum,* small brain, *tremor,* shaking], an intention tremor or trembling during voluntary movements, caused by lesions in the cerebellum.

cerebellopontine /ser′əbel′ōpon′tīn/ [L, *cerebellum* + *pons,* bridge], leading from the cerebellum to the pons varolii.

cerebellospinal /ser′əbel′ōspī′nəl/ [L, *cerebellum* + *spina,* backbone], leading from the cerebellum to the spinal cord.

cerebellum /ser′əbel′əm/ *pl.* *cerebellums,* **cerebella** [L, small brain], the part of the brain located in the posterior cranial fossa behind the brainstem. It consists of two lateral cerebellar hemispheres, or lobes, and a middle section called the vermis. Three pairs of peduncles link it with the brainstem. Its functions are concerned primarily with coordinating voluntary muscular activity.



Cerebellum *(McSwain and Paturas, 2003)*

cerebr-, prefix meaning "cerebrum": *cerebralgia, cerebrocardiac, cerebropathy.*

cerebra. See **cerebrum.**

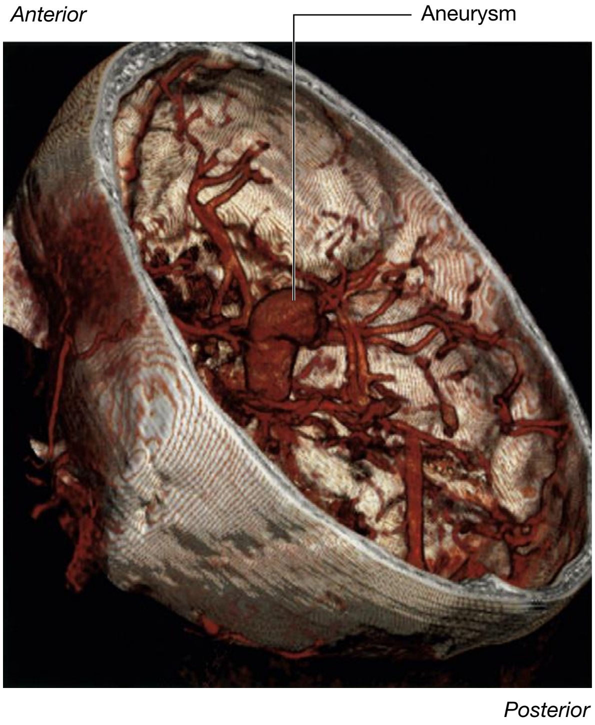
cerebral /ser′əbrəl, sərē′brəl/, pertaining to the cerebrum.

-cerebral, suffix referring to the brain: *craniocerebral, medicerebral, postcerebral.*

cerebral abscess. See **brain abscess.**

cerebral amyloid angiopathy, vascular amyloidosis affecting small- and medium-sized arteries of the leptomeninges and cerebral cortex, resulting in microinfarcts or in microhemorrhages or large hemorrhages. It may be asymptomatic or may result in hemorrhagic stroke or dementia. It usually occurs in the elderly, and most cases are sporadic. A hereditary form with autosomal-dominant inheritance also exists.

cerebral aneurysm [L, *cerebrum,* brain; Gk, *aneurysma,* a widening], an abnormal, localized dilation of a cerebral artery. It is most commonly the result of congenital weakness of the tunica media or muscle layer of the arterial wall. Cerebral aneurysms may also be caused by infection, such as occurs in subacute bacterial endocarditis or syphilis, and by neoplasms, arteriosclerosis, and trauma. The most frequent sites are the middle cerebral, internal carotid, basilar, and anterior cerebral arteries, especially at bifurcations of vessels. Cerebral aneurysms may occur in infancy or old age. They may be fusiform dilations of the entire circumference of an artery or saccular outcroppings of the side of a vessel. The outcroppings may be as small as a pinhead or as large as an orange but are usually the size of a pea. Cerebral aneurysms pose a danger of rupture and intracranial hemorrhage.



Cerebral aneurysm *(Drake, Vogl, and Mitchell, 2010)*

cerebral angiography [L, *cerebrum,* brain; Gk, *angeion,* vessel, *graphein,* to record], a radiographic procedure used to visualize the vascular system of the brain after injection of a radiopaque contrast medium.

cerebral anoxia, a condition in which oxygen is deficient in brain tissue. This state, which is caused by circulatory failure, can exist for no more than 4 to 6 minutes before the onset of irreversible brain damage.

cerebral aqueduct [L, *cerebrum* + *aqueductus,* water canal], the narrow conduit in the midbrain, between the third and the fourth ventricles, that conveys the cerebrospinal fluid. Also called **aqueduct of Sylvius.**

cerebral arteriovenous malformation. See **arteriovenous angioma of the brain.**

cerebral artery, one of the arteries that supply the brain. The middle cerebral artery is the largest of the cerebral arteries and the vessel most commonly affected by a **cerebrovascular accident.**

cerebral blood flow, **1.** the blood supply to the brain in a given period of time. **2.** the circulation of blood through the vascular system of the brain.

cerebral cavity. See **cranial cavity.**

cerebral compression [L, *cerebrum,* brain, *comprimere,* to press together], any abnormal condition resulting from hemorrhage, abscess, or tumor that increases intracranial pressure. If untreated, the compression destroys the brain tissues and causes herniation of the brain. Also called **brain compression.**

cerebral cortex [L, *cerebrum* + *cortex,* bark], a layer of neurons and synapses (gray matter) on the surface of the cerebral hemispheres, folded into gyri with about two thirds of its area buried in fissures. It integrates higher mental functions, general movement, visceral functions, perception, and behavioral reactions. It has been classified in many different ways. Research has described more than 200 areas on the basis of differences in myelinated fiber patterns and has defined 47 separate function areas with different cell designs. For example, stimulation of the precentral cortex or motor area with electrodes causes contractions of voluntary muscles. Destruction of a motor speech area in the frontal operculum causes motor aphasia or speech defects despite healthy, intact vocal organs. Stimulation of the frontal area affects circulation, respiration, pupillary reaction, and other visceral activity. Also called **pallium.** See also **cerebrum.**

cerebral deafness. See **central auditory processing disorder.**

cerebral depressant [L, *cerebrum,* brain, *deprimere,* to press down], a drug or other agent that has a sedating effect on the brain, reducing activity and alertness and, in some instances, causing a loss of consciousness. See also **central nervous system depressant**.

cerebral dominance, the specialization of each of the two cerebral hemispheres in the integration and control of different functions. In 90% of the population, the left cerebral hemisphere specializes in or dominates the ability to speak and write and the capacity to understand spoken and written words. The areas that control these activities are situated in the frontal, parietal, and temporal lobes of the left hemisphere. In the other 10% of the population, either the right hemisphere or both hemispheres dominate the speech and writing abilities. The right cerebral hemisphere dominates the integration of certain sounds other than those associated with speaking, such as sounds of coughing, laughter, crying, and melodies. The right cerebral hemisphere perceives tactile stimuli and visual spatial relationships better than the left cerebral hemisphere does. See also **Brodmann's areas.**

cerebral edema [L, *cerebrum* + Gk, *oidema,* swelling], an accumulation of fluid in the brain tissues. Causes include infection, tumor, trauma, or exposure to certain toxins. Because the skull cannot expand to accommodate the fluid pressure, brain tissues are compressed. Early symptoms are changes in level of consciousness: sluggishness, then dilation of one or both pupils, and a gradual loss of consciousness. Cerebral edema can be fatal.

cerebral edema management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as limitation of secondary cerebral injury resulting from swelling of brain tissue. See also **Nursing Interventions Classification.**

cerebral embolism [L, *cerebrum* + *embolos,* plug], a condition in which an embolus blocks blood flow through the vessels of the cerebrum, resulting in tissue ischemia distal to the occlusion. See also **cerebrovascular accident.**

cerebral falx, a sickle-shaped fold of dura mater membrane extending into and following along the longitudinal fissure and separating the two hemispheres of the cerebrum. Also called **falx cerebri.**

cerebral fossa, the stem of the lateral sulcus of the cerebrum, which forms a furrow separating the orbital surface of the frontal lobe from the temporal lobe.

cerebral gigantism [L, *cerebrum* + Gk, *gigas,* giant], an abnormal condition characterized by excessive weight and size at birth, accelerated growth during the first 4 or 5 years after birth without any increase in the level of growth hormone, and then reversion to normal growth. Some typical signs of this condition are prognathism, antimongoloid slant, dolichocephalic skull, moderate mental retardation, and impaired coordination. Also called **Sotos' syndrome.**

cerebral gyrus. See **gyrus.**

cerebral hemiplegia [L, *cerebrum* + Gk, *hemi,* half, *plege,* stroke], paralysis of one side of the body caused by a brain lesion.

cerebral hemisphere [L, *cerebrum* + Gk, *hemi,* half, *sphaira,* ball], one of the halves of the cerebrum. The two cerebral hemispheres are divided by a deep longitudinal fissure and are connected medially at the bottom of the fissure by the corpus callosum. Prominent grooves, subdividing each hemisphere into four major lobes, are the central sulcus, the lateral fissure, and the parietooccipital fissure. Each hemisphere also has a fifth major lobe deep in the brain. The hemispheres consist of an external gray layer and an internal white matter that surrounds islands of gray matter called nuclei (the basal ganglia).

cerebral hemorrhage [L, *cerebrum* + Gk, *haima,* blood, *rhegnynei,* to burst forth], a hemorrhage from a blood vessel in the brain. Three criteria used to classify cerebral hemorrhages are location (subarachnoid, extradural, subdural), kind of vessel involved (arterial, venous, capillary), and origin (traumatic, degenerative). Each kind of cerebral hemorrhage has distinctive clinical characteristics. Most cerebral hemorrhages occur in the region of the basal ganglia and are caused by the rupture of a sclerotic artery as a result of hypertension. Other causes of rupture include congenital aneurysm, cerebrovascular thrombosis, and head trauma.

■ OBSERVATIONS: Bleeding may lead to displacement or destruction of brain tissue. Extensive hemorrhage is usually fatal. Depending on the extent and the location of the damaged tissue, residual effects may include aphasia, diminished mental function, hemiplegia, or disturbance of the function of a special sense.

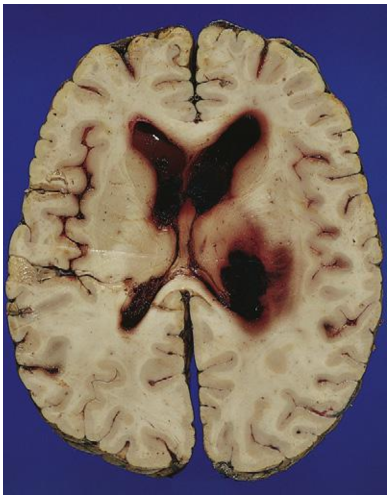
■ INTERVENTIONS: A computed tomography scan may be performed to locate the lesion and to differentiate the hemorrhage from an embolus or thrombus, or cerebral angiography may be used for these purposes. Lumbar puncture may be performed to reveal blood in the spinal fluid if subarachnoid bleeding is suspected, but computed tomography must be performed first because of the risk of brain herniation if high intracranial pressure is present. Surgery is sometimes necessary to stop the bleeding and to prevent death from greatly increased intracranial pressure, although it has not been shown to improve long-term outcome. Treatment is usually supportive.

cerebral hernia. See **cephalocele.**

cerebral infarction. See **cerebrovascular accident.**

cerebral lobes, the well defined areas of the cerebral cortex, demarcated by fissures, sulci, and arbitrary lines, which include the frontal, temporal, parietal, and occipital lobes.

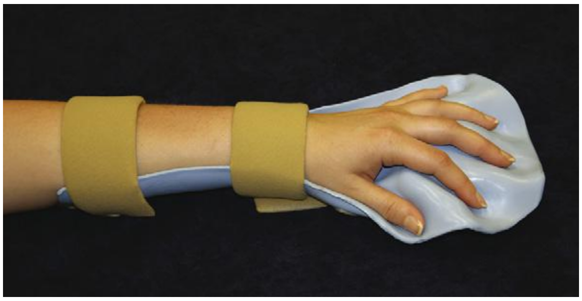
cerebral localization, **1.** the determination of various areas in the cerebral cortex associated with specific functions, such as the 47 Brodmann's areas. **2.** the diagnosis of a cerebral condition, such as a brain lesion, by analyzing the signs manifested by the patient to determine the area of the brain affected.



Cerebral hemorrhage *(Finkbeiner, Ursell, and Davis, 2009)*

cerebral nerves. See **cranial nerves.**

cerebral palsy (CP) [L, *cerebrum* + Gk, *para,* beyond, *lysis,* loosening], a motor function disorder caused by a permanent, nonprogressive brain defect or lesion present at birth or shortly thereafter. The neurological deficit may result in spastic hemiplegia, monoplegia, diplegia, or tetraplegia; athetosis or ataxia; seizures; paresthesia; varying degrees of mental retardation; and impaired speech, vision, and hearing. The disorder is usually associated with premature or abnormal birth and intrapartum asphyxia, causing damage to the nervous system. Abnormalities in breathing, sucking, swallowing, and responsiveness are usually apparent soon after birth, but the characteristic stiff, awkward movements of the infant's limbs may be overlooked for several months. Walking is usually delayed, and, when it is attempted, the child manifests a typical scissors gait. The arms may be affected only slightly, but the fingers are often spastic. Deep-tendon reflexes are exaggerated, and there may be slurred speech, delay in development of sphincter control, and athetotic movements of the face and hands. Early identification of the disorder facilitates the handling of infants with cerebral palsy and the initiation of an exercise and training program. Treatment is individualized and may include the use of braces, surgical correction of deformities, speech therapy, and various indicated drugs, such as muscle relaxants and anticonvulsants. Also called **congenital cerebral diplegia, Little's disease.**



Splint for spastic hand due to cerebral palsy
(Canale and Beaty, 2008)

cerebral peduncle [L, *cerebrum*, brain, *pes*, foot], a pair of ovoid masses of nerve fibers at the upper border of the pons that disappear into the left and right hemispheres of the cerebrum. It includes corticopontine and pyramidal-tract fibers and helps constitute the central portion of the midbrain.

cerebral perfusion pressure (CPP), a parameter that is related to the amount of blood flow to the brain. It is calculated by subtracting the intracranial pressure from the mean systemic arterial blood pressure.

cerebral perfusion promotion, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion of adequate perfusion and limitation of complications for a patient experiencing or at risk for inadequate cerebral perfusion. See also **Nursing Interventions Classification.**

cerebral sulci, the furrows on the surface of the brain between the gyri. See also **gyrus.**

cerebral thrombosis [L, *cerebrum* + Gk, *thrombos*, lump, *osis*, condition], an abnormal condition in which a blood clot forms in a cerebral blood vessel.

cerebral vertigo [L, *cerebrum*, brain, *vertigo*, dizziness], vertigo that is caused by organic brain disease. See also **central vertigo.**

cerebral vomiting, vomiting caused by a disorder of the central nervous system, especially stimulation of the vomiting center, usually without preceding nausea.

cerebriform carcinoma. See **medullary carcinoma.**

cerebroatrophic hyperammonemia. See **Rett's syndrome.**

cerebrocerebellar atrophy /ser′əbrōser′əbel′ər/ [L, *cerebrum*, brain, *cerebellum*, small brain; Gk, *a* + *trophe*, without nourishment], a deterioration of the cerebellum caused by certain abiotrophic diseases.

cerebrocostomandibular syndrome /ser′əbrōkos′tō·man dib′yo͞olər/ [L, *cerebrum*, brain + *costa*, rib + *mandibula*, mandible], an autosomal-recessive syndrome of severe micrognathia and costovertebral abnormalities, including small bell-shaped thorax, incompletely ossified aberrant rib structure, and abnormal rib attachment to vertebrae. There are also palatal defects, glossoptosis, prenatal and postnatal growth deficiencies, and mental retardation, the last perhaps because of neonatal respiratory distress.

cerebrohepatorenal syndrome /ser′əbrōhep′ətō·rē′nəl/, an autosomal-recessive disorder characterized by craniofacial abnormalities, hypotonia, hepatomegaly, polycystic kidneys, jaundice, and death in early infancy, and associated with absence of peroxisomes in the liver and kidneys. Also called **Zellweger's syndrome.**

cerebroid /ser′əbroid/ [L, *cerebrum* + Gk, *eidos*, form], resembling the substance of the brain.

cerebroma /ser′əbrō′mə/, *pl. cerebromas, cerebromata,* any unusual mass of brain tissue.

cerebromedullary tube. See **neural tube.**

cerebromeningitis /-men′injī′tis/. See **meningitis.**

cerebropathia psychia toxemia. See **Korsakoff's psychosis.**

cerebroretinal angiomatosis. See **von Hippel-Lindau disease.**

cerebroside /ser′əbrōsīd′/, any of a group of glycolipids found in the brain and other tissues of the nervous system, especially the myelin sheath.

cerebroside sulfatase [L, *cerebrum*, brain, *sulfur*, brimstone, *ase*, enzyme], an enzyme of the hydrolase class that catalyzes the reaction of cerebroside 3-sulfate + H_2O. A deficiency of the enzyme, which is transmitted through an autosomal-recessive gene, causes metachromatic leukodystrophy.

cerebrospinal /ser′əbrōspī′nəl, sərē′brō-/, pertaining to or involving the brain and the spinal cord.

cerebrospinal axis [L, *cerebrum*, brain, *spina*, spine, *axle*], a line formed by the brain and spinal cord about which the body turns.

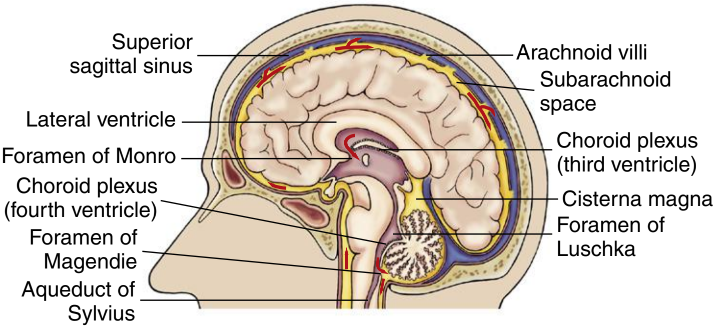
cerebrospinal fever. See **meningococcal meningitis.**

cerebrospinal fluid (CSF), the fluid that flows through and protects the four ventricles of the brain, the subarachnoid spaces, and the spinal canal. It is composed mainly of secretions of the choroid plexuses in the lateral ventricles and in the third and the fourth ventricles of the brain and is clear and colorless. Changes in the carbon dioxide content of CSF affect the respiratory center in the medulla, helping to control breathing. A brain tumor may press against the cerebral aqueduct and shut off the flow of the fluid from the third to the fourth ventricle, causing fluid accumulation in the lateral and third ventricles, called internal hydrocephalus. Other blockages of the flow of CSF, such as those caused by blood clots, result in serious complications. Certain illnesses and various diagnoses may require microscopic examination and chemical analysis of CSF. Samples of the fluid may be removed by lumbar puncture between the third and the fourth lumbar vertebrae or from the cisterna magna.

cerebrospinal ganglion, a cluster of sensory ganglia neurons on roots of cranial and spinal nerves. The neurons lack dendrites and have no synapses on their cell bodies. See also **autonomic ganglion, dorsal root ganglion, ganglion.**

cerebrospinal nerves, the 12 pairs of cranial nerves and 31 pairs of spinal nerves that originate in the brain and spinal cord.

cerebrospinal otorrhea, a discharge of cerebrospinal fluid (CSF) from the ear. Basal skull fractures can transverse the paranasal air sinuses of the middle ear within the temporal bone, resulting in a dural tear. CSF can then leak through the



Cerebrospinal fluid circulation *(Monahan et al, 1998)* dural tear and drain from the ear. Compare **cerebrospinal rhinorrhea.**

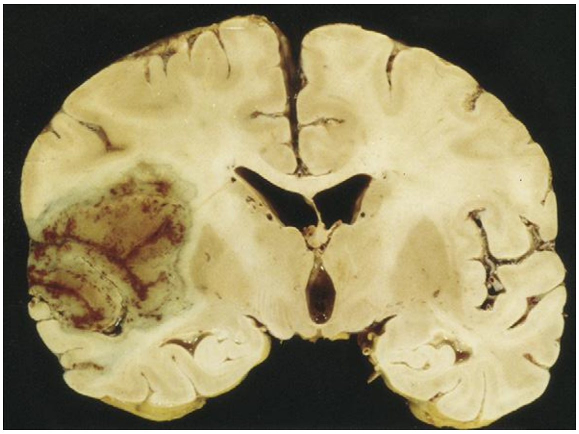
cerebrospinal pressure [L, *cerebrum* + *spina* + *premere,* to press], the pressure of cerebrospinal fluid in the central nervous system. It usually measures between 100 and 150 mm of H_2O or 10 and 15 mm Hg and is measured by a manometer attached to the end of a needle after it has been inserted into the subarachnoid space via lumbar puncture (most commonly). See also **cerebrospinal fluid.**

cerebrospinal rhinorrhea [L, *cerebrum,* brain, *spina,* spine; Gk, *rhis,* nose, *rhoia,* flow], a discharge of cerebrospinal fluid (CSF) from the nose. Basal skull fractures can transverse the paranasal air sinuses of the frontal bone, resulting in a dural tear. CSF can then leak through the dural tear and drain from the nose. Compare **cerebrospinal otorrhea.**

cerebrotendinous xanthomatosis. See **van Bogaert's disease.**

cerebrovascular /ser′əbrōvas′kyələr, sərē′brō-/ [L, *cerebrum* + *vasculum,* little vessel], pertaining to the vascular system and blood supply of the brain.

cerebrovascular accident (CVA), an abnormal condition of the brain characterized by occlusion by an embolus, thrombus, or cerebrovascular hemorrhage or vasospasm, resulting in ischemia of the brain tissues normally perfused by the damaged vessels. The sequelae of a cerebrovascular insult depend on the location and extent of ischemia. Paralysis, weakness, sensory change, speech defect, aphasia, or death may occur. Symptoms remit somewhat after the first few days as brain swelling subsides. In the United States, 80% of cerebrovascular incidents are ischemic and 20% are hemorrhagic. Also called **brain attack, cerebrovascular insult, stroke.**



Effects of a cerebrovascular accident *(Kumar et al, 2007)*

cerebrum /ser′əbrəm, sərē′brəm/*pl. cerebrums,* **cerebra** [L, brain], the largest and uppermost section of the brain, divided by a longitudinal fissure into the left and right cerebral hemispheres. At the bottom of the groove, the hemispheres are connected by the corpus callosum. The internal structures of the hemispheres merge with those of the diencephalon and further communicate with the brainstem through the cerebral peduncles. The surface of the cerebrum is called gyri. Each lobe bears the name of the bone under which it lies. The cerebrum performs sensory functions, motor functions, and less easily defined integration functions associated with various mental activities. It generates a variety of electrical waves that may be recorded as an electroencephalogram to localize areas of brain dysfunction, to identify altered states of consciousness, or to establish brain death. See also **cerebral cortex, cerebral hemisphere. —cerebral,** *adj.*

Cerezyme, a trademark for an analog of the human enzyme beta-glucocerebrosiderase **(imiglucerase)** used for long-term therapy of Type 1 Gaucher's disease.

cerium (Ce) /sir′ē·əm/ [L, *Ceres,* Roman goddess of agriculture], a ductile gray rare earth element. Its atomic number is 58; its atomic mass is 140.13. A compound of cerium, cerium oxalate, is used as a sedative, an antiemetic, and an antitussive.

cerium nitrate, a topical antiseptic used in the treatment of burns to control bacterial and fungal infections.

cerivastatin, an HMG-CoA reductase inhibitor (Baycol) withdrawn from the market in August 2001 after several cases of fatal rhabdomyolysis.

ceroid /sir′oid/ [L, *cera,* wax; Gk, *eidos,* form], a golden, waxy pigment appearing in the cirrhotic livers of some individuals, in the GI tract, in the nervous system, and in the muscles. It is an insoluble, acid-fast, sudanophilic pigment.

ceroma /sirō′mə/ *pl. ceromas, ceromata* [L, *cera,* wax; Gk, *oma,* tumor], a neoplasm that has undergone waxy degeneration.

certifiable /sur′tifī′əbəl/ [L, *certus,* certain, *facere,* to make], **1.** a term pertaining to a patient with a mental illness who has been found incompetent and requires care by a guardian or in a hospital. **2.** pertaining to infectious diseases or dangerous conditions that must be reported to local health authorities.

certificate-of-necessity, certificate-of-need (CON), a statement or certificate issued by a governmental agency for proposed construction or modification of a health facility that ensures that the facility will be needed at the time of its completion. The certificate is issued to the individual or group intending to build or modify the facility for additional services. The process is intended to prevent duplication of services in a community.

certification [L, *certus,* certain, *facere,* to make], **1.** a process in which an individual, an institution, or an educational program is evaluated and recognized as meeting certain predetermined standards. Certification is usually made by a nongovernmental agency. The purpose of certification is to ensure that the standards met are those necessary for safe and ethical practice of the profession or service. **2.** (in nursing) a process in which the professional organization or association verifies that a person who is licensed has met the standards for specialty practice specified by the profession. The purpose of certification is to assure other professionals and the public that the person has mastered the skills necessary to practice a particular specialty and has acquired the standard body of knowledge common to that specialty. Compare **accreditation**. See also **certification in nursing.**

certification for excellence, (in nursing) certification that recognizes professional achievement, advanced education, and superior performance in a specialty or subspecialty field of practice. See also **certification in nursing.**

certification in nursing, one of two processes in which a professional organization formally recognizes the competence of a nurse to practice a subspecialty of nursing. One process, **certification for excellence,** bases recognition on professional achievement, advanced education, and superior performance. The second process, entry level certification, bases recognition on advanced education in a program approved by the certifying organization. Criteria vary according to the particular requirements of the professional organization but always require current licensure as a registered nurse and usually include an examination and certain educational or practice requirements. Submission and evaluation of documented clinical practice and a statement of a philosophy of practice may also be required by some professional organizations.

certified dental assistant (CDA) /sur′tifīd/, a person who has successfully completed the education, training, and testing of the Dental Assisting National Examination or of the American Dental Assistants Association. A dental assistant may also become certified without receiving a formal education by working for 2 years as a full-time chairside dental assistant before taking the certification examination. See also **dental assistant.**

certified emergency nurse (CEN), a nurse who has had training in emergency nursing and successfully completed an examination given by the Board of Certification of Emergency Nursing based on emergency nursing practice in the United States. To remain certified, a CEN must be reexamined every 4 years (or 8 years if specified educational requirements are met within 4 years).

Certified First Assistant (CFA), **1.** credential offered by the National Board of Surgical Technology and Surgical Assisting. **2.** individual who has earned the credential of CFA and performs the roles and duties of a surgical assistant. See also **surgical assistant.**

certified medical transcriptionist. See **medical transcriptionist.**

certified milk, raw milk that is obtained, handled, and marketed in compliance with state health laws. The milk must be produced by disease-free cows that are regularly inspected by a veterinarian and are milked by sterilized equipment in hygienic surroundings. It must contain less than a specified low bacterial count. The sale of raw milk is illegal in some states.

certified nurse administrator (CNA), a nurse who supervises nursing staff, establishes work schedules and budgets, maintains medical supply inventories, and manages resources to ensure high-quality patient care. To apply for certification, a nurse must have an active RN license; hold a baccalaureate degree in nursing (or higher); have held an administrative position as a nurse manager or nurse executive, a faculty position teaching graduate students nursing administration, or a nursing management or executive consultation position,for at least 24 months full-time equivalent in the previous 5 years; have completed 30 hours of continuing education in nursing administration within the previous 3 years; and pass the credentialing examination by the American Nurses Credentialing Center. Nurses seeking to renew their certification must hold an active RN license and meet a variety of professional development requirements.

certified nurse-midwife (CNM), (according to the American College of Nurse-Midwives) "an individual educated in the two disciplines of nursing and midwifery, who possesses evidence of certification according to the requirements of the American College of Nurse-Midwives. Nurse-midwifery practice is the independent management of care of essentially normal newborns and women, antepartally, intrapartally, postpartally, and/or gynecologically, occurring within a health care system which provides for medical consultation, collaborative management, or referral and is in accord with the qualifications, standards, and functions for the practice of nurse-midwifery as defined by the American College of Nurse-Midwives." See also **midwife.**

certified occupational therapy assistant (COTA), an allied health paraprofessional who, under the direction of an occupational therapist, directs an individual's participation in selected tasks to restore, reinforce, and enhance performance; facilitates learning of skills and functions essential for adaptation and productivity; diminishes or corrects disorders; and promotes and maintains health.

Certified Registered Nurse Anesthetist, an advanced practice nurse who provide anesthetics to patients in practice settings for all types of surgeries and procedures. The certified registered nurse anesthetist (CRNA) has completed post-graduate education and passed a national certification examination. Also See **nurse anesthetist.**

certified respiratory therapist (CRT), a health care professional who performs routine care, management, and treatment of patients with respiratory disorders. Certification requires completion of an approved training course and passing of an examination by the National Board for Respiratory Care.

Certified Surgical Technologist (CST), **1.** credential offered by the National Board of Surgical Technology and Surgical Assisting. **2.** an allied health professional who as a member of the surgical team is responsible for providing an optimal surgical environment by performing perioperative duties, including preparing the operating room; gathering necessary equipment and supplies; opening sterile supplies; preparing the sterile field including the back table and Mayo stand set-ups; performing counts; assisting in applying sterile drapes; anticipating the needs of the surgeon during the procedure; passing instrumentation and supplies to the surgeon; caring for specimens; applying sterile dressings; and preparing the O.R. for the next procedure. CSTs are experts in aseptic technique and constantly ensure that all members of the surgical team adhere to the principles of aseptic technique.

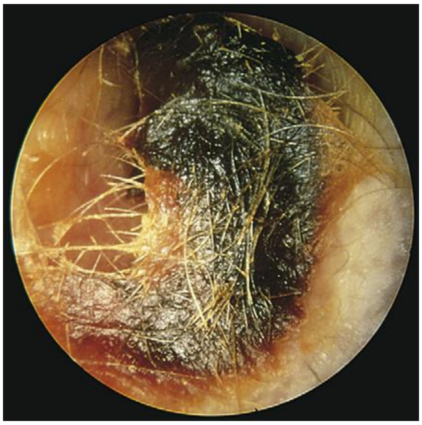
certify /sur′tifī/, **1.** to guarantee formally that certain requirements based on expert knowledge of significant, pertinent facts have been met. **2.** to attest, by a legal process, that someone is insane. **3.** to attest to the fact of someone's death in writing, usually on a form required by a local authority. **4.** to declare that a person has satisfied certain requirements for membership or acceptance into a professional or other group. See also **board certification. — certifiable,** *adj,* **certification,** *n.*

Cerubidine, a trademark for an antineoplastic (DAUNOrubicin hydrochloride).

cerulean /siro͞o′lē·ən/ [L, *caelum,* sky], sky-blue in color.

ceruloplasmin /siro͞o′lōplaz′min/ [L, *caelum,* sky; Gk, *plassein,* to shape], a blue glycoprotein in plasma that transports 96% of the plasma copper. A major decrease is seen in Wilson's disease.

cerumen /siro͞o′mən/ [L, *cera,* wax], a yellowish or brownish waxy secretion produced by vestigial apocrine sweat glands in the external ear canal. Also called **earwax.**



Cerumen *(Swartz, 2009)*

ceruminolytic agent [L, *cera,* wax; Gk, *lysis,* a loosening; L, *agere,* to do], a medication that dissolves or loosens cerumen (earwax) to allow for its removal.

ceruminoma /sero͞o′minō′mə/, an adenocarcinoma in the external auditory meatus.

ceruminosis /siro͞o′minō′sis/, excessive buildup of cerumen (earwax) in the external auditory canal. It can cause discomfort, symptoms of hearing loss, and local irritation leading to the development of infection. Removal of excess cerumen is accomplished by the local use of a wax softening agent followed by careful flushing with an ear syringe. A cerumen spoon is sometimes used to scoop out hardened collections of wax.

ceruminous /siro͞o′minəs/, pertaining to earwax.

ceruminous gland, one of a number of tiny structures in the external ear canal, believed to be modified sweat glands. They secrete a waxy cerumen instead of watery sweat.

cervic-, prefix meaning "neck": *cervicectomy, cervicitis, cervicobrachial.*

cervical /sur′vikəl/ [L, *cervix,* neck], **1.** pertaining to the neck or the region of the neck. **2.** pertaining to the constricted area of a necklike structure, such as the neck of a tooth or the cervix of the uterus.

cervical abortion [L, *cervix* + *ab,* away from, *oriri,* to be born], spontaneous expulsion of a cervical pregnancy.

cervical adenitis [L, *cervix* + Gk, *aden,* gland, *itis,* inflammation], an abnormal condition characterized by enlarged, tender lymph nodes of the neck. It often occurs in association with acute infections of the throat. Most lymph nodes respond well to oral antibiotic treatment. However, some may need to be opened and drained. Children often present with associated fever.

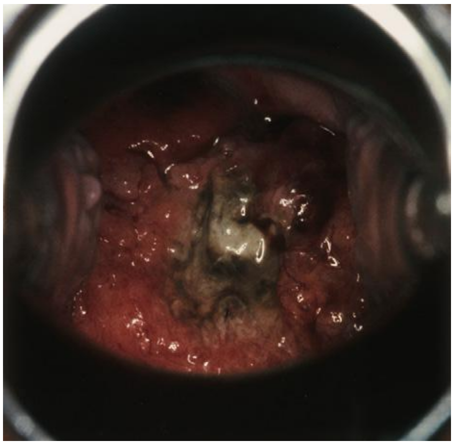
cervical amputation, the removal of the neck (cervix) of the uterus.

cervical artery, an artery that supplies the muscles of the neck.

cervical biopsy, the removal of cervical tissue for microscopic examination to diagnose chronic cervical infection or cervical cancer.

cervical canal, the canal within the uterine cervix, which protrudes into the vagina. The uterine end of the canal is closed at the internal os and, in the nullipara, at the distal end by the external os. The canal is a passageway through which the menstrual flow escapes and, vastly dilated and effaced by labor, through which the infant must pass to be delivered vaginally. Various diagnostic and therapeutic procedures require dilation of the muscular cervix surrounding the canal, including endometrial biopsy, suction and surgical curettage, and radium implantation. Pelvic inflammatory disease is the result of the entry of pathogenic bacteria into the uterus through the cervical canal. Sperm must travel upward through the canal to reach the uterus and fallopian tubes.

cervical cancer, a neoplasm of the uterine cervix that can be detected in the early, curable stage by the Papanicolaou (Pap) test. The exact cause is unknown, but factors that may be associated with the development of cervical cancer are coitus at an early age, relations with many sexual partners, genital herpesvirus infections (such as cytomegalovirus), human papillomavirus (HPV), multiparity, and poor obstetric and gynecological care. Early cervical neoplasia is usually asymptomatic, but there may be a watery vaginal discharge or occasional spotting of blood; advanced lesions may cause a dark, foul-smelling vaginal discharge, leakage from bladder or rectal fistulas, anorexia, weight loss, and back and leg pains. Pap smears of cervical cells are highly important in screening, but definitive diagnoses are based on colposcopic examination and cytological study of specimens obtained by biopsy. Cervical dysplasia may regress, persist, or progress to clinical disease, but carcinoma in situ is considered to be a precursor of invasive carcinoma. About 90% of cervical tumors are squamous cell carcinomas, fewer than 10% are adenocarcinomas, and others are mixtures of these kinds, or, in rare cases, sarcomas. Cervical cancer invades the tissues of adjacent organs and may metastasize through lymphatic channels to distant sites, including the lungs, bone, liver, brain, and paraaortic nodes. Treatment depends on the kind and the extent of the malignancy, the age of the woman, and her general health. Also considered are her wishes in regard to maintaining her reproductive function. Carcinoma in situ may be treated by excisional conization or cryosurgery. Invasive tumors may be treated with radiotherapy or hysterectomy. Chemotherapy has a mainly palliative role. Vaccination against HPV types 16 and 18, which are responsible for most cervical cancer cases, is now recommended for young women as a preventive measure.



Cervical cancer *(Drake, Vogl, and Mitchell, 2010)*

cervical cap, a contraceptive device similar to the diaphragm but much smaller, consisting of a cup that fits directly over the cervix to prevent spermatozoa from entering the cervical canal. It is only 60% effective for women who have already given birth.

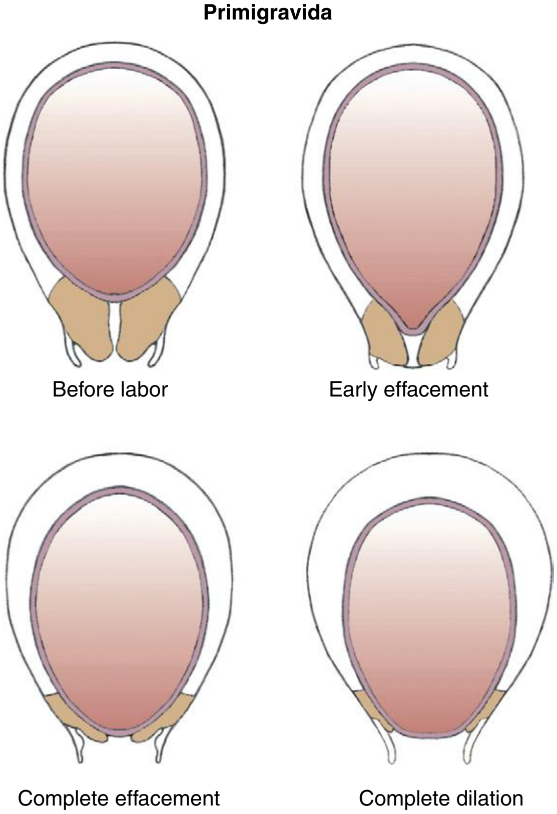
cervical cauterization, the destruction, usually by heat or electrical current or by freezing, of abnormal superficial tissues of the cervix.

cervical conization, the excision of a cone-shaped tissue section from the endocervix, performed to obtain a tissue sample to establish a precise diagnosis. It may be performed under general anesthesia (cold knife cone) or as an in-office procedure (loop electrosurgical excision procedure). See also **cone biopsy.**

cervical cyst [L, *cervix,* neck; GK, *kystis,* bag], a mucous cyst of the uterine cervix caused by closure of the ducts of nabothian glands in the uterine cervix. It results from the healing of an erosion. Also called **nabothian cyst.**

cervical dilation /dil′ā′shən/ [L, *dilatare,* to widen], the diameter of the opening of the cervix in labor as measured on vaginal examination. It is expressed in centimeters or finger breadths; one finger breadth is approximately 2 cm. At full dilation the diameter of the cervical opening is 10 cm.

cervical disk syndrome, an abnormal condition characterized by compression or irritation of the cervical nerve roots in or near the intervertebral foramina before the roots divide into the anterior and posterior rami. When it is caused by ruptured intervertebral disks, degenerative cervical disk disease, or cervical injuries, it may produce varying degrees of malalignment, causing nerve root compression. Most cervical disk syndromes are caused by injuries that involve

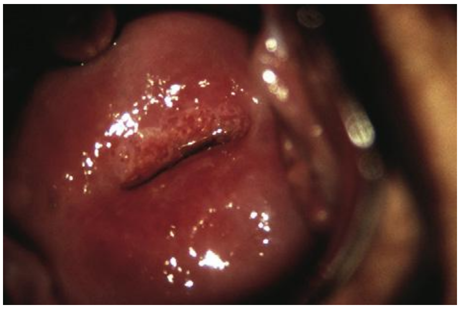


Cervical dilation *(McKinney et al, 2009)*

hyperextension. Edema usually occurs in all cases of cervical disk syndrome. Pain, the most common symptom, usually emanates from the cervical area but may radiate down the arm to the fingers and increase with cervical motion. The pain may increase sharply with coughing, sneezing, or any radical movement. Other signs and symptoms may be paresthesia, headache, blurred vision, decreased skeletal function, and weakened hand grip. Physical examination may reveal varying degrees of muscular atrophy, sensory abnormalities, muscular weakness, and decreased reflexes. Radiographic examination may show a loss of normal lordosis associated with the cervical vertebrae and may also reveal some minor malalignment of the vertebrae. Nonsurgical intervention, which is usually a successful treatment, may include immobilization of the cervical vertebrae to decrease irritation and to provide rest for the traumatized area. Other treatment may include special exercises, heat therapy, and intermittent traction. Mild analgesics are usually successful in controlling the pain associated with cervical disk syndrome, especially when used with immobilization. Surgery is recommended only when signs and symptoms persist despite nonsurgical treatment. The prognosis for this condition is usually good, but recurrence of symptoms is common. Also called **cervical root syndrome.** See also **herniated disk, whiplash injury.**

cervical dysplasia, abnormal tissue development of the uterine cervix, with atypical epithelium that may slowly progress to carcinoma.

cervical erosion [L, *cervix* + *erodere,* to consume], a condition in which the squamous epithelium of the cervix is abraded as a result of irritation caused by infection or trauma such as childbirth and replaced by columnar epithelium.



Cervical erosion *(Greer et al, 2001)*

cervical fistula, an abnormal passage from the cervix to the vagina or bladder. It may be caused by a malignant lesion, radiotherapy, surgical trauma, or injury during childbirth. A cervical fistula communicating with the bladder permits leakage of urine, causing irritation, odor, and embarrassment. See also **branchial fistula.**

cervical infertility, female factor infertility caused by abnormal interaction between the sperm and the cervical mucus.

cervical intraepithelial neoplasia (CIN) /in′trə·ep′ithē′lē·əl/, abnormal changes in the basal layers of the squamous epithelial tissues of the uterus. The disorder is graded according to its pathological progress, from CIN1 to CIN3; CIN3 represents carcinoma of the cervix. The disorder is associated with **human papillomaviruses.**

cervical lordosis, the dorsally concave curvature of the cervical spinal column when seen from the side. Also called *cervical curvature.*

cervical mucus, a secretion of the columnar epithelium lining the upper portion of the cervical canal of the uterus. The mucus that is secreted by endocervical glands changes in appearance and consistency throughout the menstrual cycle. For the first few days after menstruation, little mucus is secreted. As ovulation approaches, increasing amounts of sticky cloudy-white or yellowish secretions are seen. Around the time of ovulation, the volume of mucus increases, and it becomes clear, slippery, and elastic, resembling the uncooked white of an egg. After ovulation the mucus becomes cloudy, thick, sticky, and progressively less profuse until menstruation supervenes to begin the cycle again. See also **mucous plug, ovulation method of family planning.**

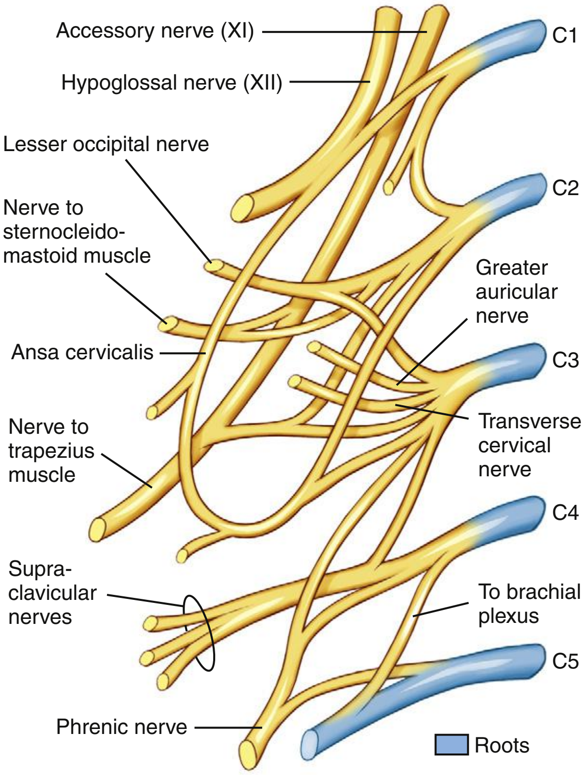
cervical mucus method of family planning, a type of natural family planning. See also **contraception, ovulation method of family planning.**

cervical nerves [L, *cervix,* neck, *nervus,* nerve], the eight pairs of spinal nerves that arise from the cervical segments of the spinal cord, from above the atlas to below the seventh vertebra. The first four supply the head and neck, and the other four mainly innervate the upper limbs, scalp, and back. See also **cervical plexus.**

cervical os. See **external cervical os, internal cervical os.**

cervical pleura, the dome-shaped layer of parietal pleura lining the cervical extension of the pleural cavity. Also called **dome of pleura, pleural cupola.**

cervical plexus, the network of nerves formed by the ventral primary divisions of the first four cervical nerves. Each nerve, except the first, divides into the superior branch and the inferior branch, and both branches unite to form three loops. The plexus is located opposite the cranial aspect of the first four cervical vertebrae. It communicates with certain cranial nerves and numerous muscular and cutaneous branches.



Cervical plexus

cervical plexus block, anesthetic nerve block at any point below the mastoid process from the second cervical vertebra to the sixth cervical vertebra. This method is used for operations on the area between the jaw and clavicle, such as for carotid endarterectomy. Complications may include Horner's syndrome, inadvertent stellate ganglion or brachial plexus block, vertebral artery bleeding or infection, subarachnoid or peridural penetration, phrenic nerve block or palsy manifested by respiratory failure, or laryngeal nerve block, manifested by sudden hoarseness.

cervical polyp [L, *cervix* + Gk, *polys,* mean, *pous,* foot], an outgrowth of columnar epithelial tissue of the endocervical canal, usually attached to the canal wall by a slender pedicle. Often there are no symptoms, but multiple or abraded polyps may cause bleeding, especially with contact during coitus. Polyps are most common in women over 40 years of age. The cause is not known. Treatment of a symptomatic polyp is excision. Scant bleeding and prompt healing usually follow.

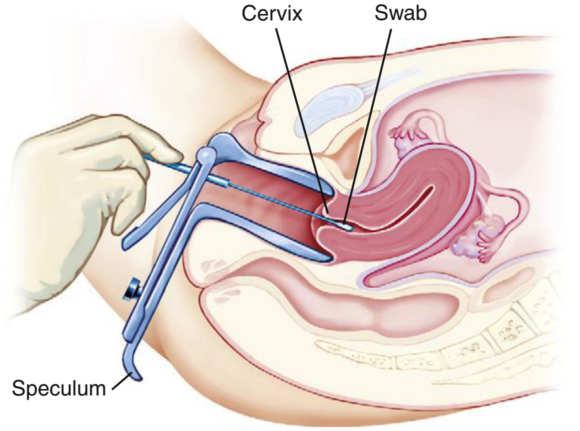
cervical radiculopathy, disease of the cervical nerve roots, often manifesting as neck or shoulder pain.

cervical regions, the various anatomical regions of the neck, including anterior, lateral, and posterior cervical regions and the region over the sternocleidomastoid muscle.

cervical rib, a supernumerary rib that articulates with a cervical vertebra, usually the seventh, but does not reach the sternum.

cervical root syndrome. See **cervical disk syndrome.**

cervical smear [L, *cervix* + AS, *smero,* grease], a small amount of the secretions and superficial cells of the cervix, secured from the external os of the cervix with a sterile applicator or special small wooden or plastic spatula. For a Papanicolaou's smear, it is obtained from the squamocolumnar junction of the uterine cervix and from the vaginal vault and endocervical canal. The specimen is spread on a labeled glass slide and sent for cytological examination. For bacteriological culture and identification, only the applicator is used; the specimen is spread on a glass slide and stained and examined under a microscope or placed in or on a culture medium and sent to a bacteriological laboratory for culture and identification.



Obtaining a cervical smear

cervical spinal fusion, surgery to relieve severe neck pain, as well as pain in shoulders, arms, and hands, caused by abnormal movement or adjustment of adjacent vertebrae, a pinched nerve, or spinal compression. The adjacent vertebrae are joined with metal devices and/or a bone graft made from human bone or a ceramic material. An anterior or posterior surgical approach may be used.

cervical spine (C-spine), that portion of the spine comprising the cervical vertebrae.

cervical spondylosis [L, *cervix* + Gk, *spondylos,* vertebra, *osis,* condition], a form of degenerative joint and disk disease affecting the cervical vertebrae and resulting in compression of the associated nerve roots. Symptoms include pain or loss of feeling in the affected arm and shoulder and stiffness of the cervical spine.

cervical stenosis [L, *cervix* + Gk, *stenos,* narrow, *osis,* condition], a narrowing or complete closure of the canal between the body of the uterus and the cervical os (endocervical canal).

cervical tenaculum. See **tenaculum.**

cervical traction, a system of traction applied to the cervical spine by applying a force to lift the head. Also called **head traction.**

Cervical traction *(Perry, and Potter, and Elkin, 2012)*

cervical triangle, one of two triangular areas formed in the neck by the oblique course of the sternocleidomastoideus. The anterior triangle is bounded by the midline of the throat anteriorly, the sternocleidomastoideus laterally, and the body of the mandible superiorly. The posterior triangle is bounded by the clavicle inferiorly and by the borders of the sternocleidomastoideus and the trapezius superiorly.

cervical vertebra (C), one of the first seven segments of the vertebral column. They differ from the thoracic and lumbar vertebrae through the presence of a vertical costotransverse foramen in each transverse process. The first cervical vertebra (atlas) has no body, supports the head, and contains a smooth, oval facet for articulation with the dens of the second cervical vertebra. The dens extends from the cranial portion of the body of the second cervical vertebra (axis), which has a very large, strong spinous process with a bifid extremity. The seventh cervical vertebra has a very long, prominent spinous process that is nearly horizontal and is often used as a palpable reference for locating the other cervical vertebrae. The bodies of the four remaining cervical vertebrae are small, oval, and broader than the other three in transverse diameter and contain large, triangular foramina within their transverse processes. Their spinous processes are short and bifid. Compare **coccygeal vertebra, lumbar vertebra, sacral vertebra, thoracic vertebra.** See also **vertebra.**

cervicitis /sur′visī′tis/, acute or chronic inflammation of the uterine cervix. **Acute cervicitis** is infection of the cervix marked by redness, edema, and bleeding on contact. Symptoms do not always occur but may include any or all of the following: copious, foul-smelling discharge from the vagina; pelvic pressure or pain; scant bleeding with intercourse; and itching or burning of the external genitalia. The principal causative organisms are ***Trichomonas vaginalis; Candida albicans;*** **gonococcus,** ***Staphylococcus,*** and ***Streptococcus*** *species;* and *Haemophilus vaginalis*. Diagnosis is by microscopic examination, confirmed in some cases by culture and Papanicolaou (Pap) smear. Specific antimicrobial medication may be effective. Acute cervicitis tends to be a recurrent problem because of reexposure to the germ, undertreatment, or predisposing factors such as human immunodeficiency virus infection, multiple sexual partners, or poor nutrition. **Chronic cervicitis** is a persistent inflammation of the cervix that usually occurs among women in their reproductive years. Symptoms include a thick, irritating, malodorous discharge that may in severe cases be accompanied by significant pelvic pain. The cervix looks congested and enlarged, nabothian cysts are often present, and there are signs of eversion of the cervix and often old lacerations from childbirth. A Pap smear should be performed before treatment. The most effective treatments are hot and cold cautery. See also **cautery, cervical cancer, cervical polyp, genital wart, nabothian cyst.**

cervico-, prefix meaning "neck": *cervicodynia, cervicolabial, cervicotomy.*

cervicodynia /sur′vikōdin′ē·ə/, pain in the neck. Also called **trachelodynia.**

cervicogenic dorsalgia, back pain caused by a cervical spine disorder.

cervicogenic headache, (in chiropractic) a condition in which headaches, particularly those classified as muscle tension headaches involving referred pain, are the result of cervical subluxations.

cervicogenicity dysfunction /-jenis′itē/, (in chiropractic) a syndrome of hypomobility, tender points in soft tissues, reduced regional ranges of cervical motion, and static misalignment.

cervicogenic sympathetic syndrome, (in chiropractic) any of a large group of bodily disorders involving the cervical spine and the associated sympathetic trunk of nerve fibers. The effects usually include causalgia and reflex sympathetic dystrophy.

cervicolabial /sur′vikōlā′bē·əl/ [L, *cervix* + *labium,* lip], pertaining to or situated on the lip side of the neck of an incisor or a canine tooth.

cervicoplasty /sur′vikōplas′tē/, plastic surgery performed on either the uterine cervix or the neck.

cervicothoracic /-thôras′ik/, pertaining to the neck and thorax.

cervicothoracic ganglion. See **stellate ganglion.**

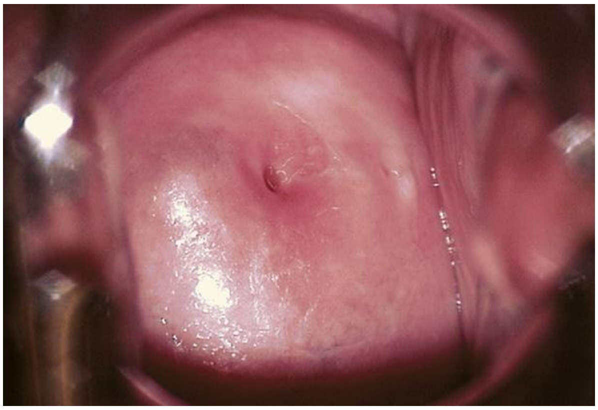
cervicotomy /sur′vikot′əmē/, **1.** incision of the neck. **2.** incision of the uterine cervix.

cervicouterine /sur′vikōyo͞o′tərin/, pertaining to or situated at the cervix of the uterus.

cervicovaginitis /-vaj′inī′tis/, an inflammation of the cervix and vagina.

cervicovesical /sur′vikōves′ikəl/ [L, *cervix* + *vesica,* bladder], pertaining to the cervix of the uterus and the bladder.

cervix /sur′viks/, *pl. cervices* /sur′visēz/, *cervixes* [L, neck], the part of the uterus that protrudes into the cavity of the vagina. The cervix is divided into the supravaginal portion and the vaginal portion. The supravaginal portion is separated ventrally from the bladder by the parametrium, which attaches to the sides of the cervix and contains the uterine arteries. The vaginal portion of the cervix projects into the cavity of the vagina and contains the cervical canal and the internal and external os of the canal. The mucous membrane lining the endocervix is broken by numerous oblique ridges, deep glandular follicles, little cysts, and papillae. Also called **neck of uterus.** See also **effacement.**



Cervix *(Swartz, 2009)*

ceryl alcohol /sē′ril/ [L, *cera,* wax; Ar, *alkohl,* essence], a fatty alcohol present in many waxes. Also called **hexacosanol.**

Cesamet, a trademark for **nabilone.**

cesarean hysterectomy /sizer′ē·ən/ [L, *Caesar lex,* Caesar's law; Gk, *hystera,* womb, *ektomē,* excision], a surgical operation in which the uterus is removed at the time of cesarean section. It is performed most often for complications of cesarean section, usually intractable hemorrhage. Less often it is done to treat preexisting gynecological disease, such as an intraepithelial cervical neoplasia or cancer. It is rarely done electively for sterilization because the danger of hemorrhage is greater when both procedures are performed simultaneously.

cesarean postmortem section [L, *Caesar lex*; L, *post,* after, *mors,* death, *sectio*], the surgical removal of the fetus immediately after the mother's death.

cesarean section (CS) [L, *Caesar lex,* Caesar's law, *sectio*], a surgical procedure in which the abdomen and uterus are incised and a baby is delivered transabdominally. It is performed when abnormal maternal or fetal conditions make vaginal delivery hazardous. Approximately 32% of births in the United States are by cesarean section, increased from only 5% in 1970; the operation is performed less frequently in other countries. Maternal indications for the operation include placenta previa or abruptio placentae and dysfunctional labor. Prior delivery by cesarean section is no longer considered an absolute indication for repeating it in future deliveries. Cesarean birth is less traumatic for babies than difficult midforceps delivery. Fetal indications for the operation include fetal distress, cephalopelvic disproportion, and abnormal presentation, such as breech and transverse lie. The incision in the skin of the abdomen may be horizontal or vertical, regardless of the kind of internal incision into the uterus. Because she must take care of the baby while recovering from major surgery, the mother requires special care that provides for both her postoperative medical needs and her need to nurture the baby, who may also be ill or recovering. Also called *cesarean birth*. See also **classic cesarean section, extraperitoneal cesarean section, low cervical cesarean section.**

cesarean section care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparation and support of the patient delivering a baby by cesarean section. See also **Nursing Interventions Classification.**

cesium (Cs) /sē′zē·əm/ [L, *caesius,* sky blue], an alkali metal element. Its atomic number is 55; its atomic mass is 132.9. Like other alkali metals, cesium emits electrons when exposed to visible light and is used in photoelectric cells and in television cameras. Also spelled **caesium.**

cesium-137 (^{137}Cs), a radioactive material with a half-life of 30.2 years that is used in radiotherapy as a sealed source of gamma rays intended for application to various malignancies that are treated by brachytherapy. Cesium has replaced radium for such applications. See also **brachytherapy.**

cesspool fever. See **typhoid fever.**

cestode. See **tapeworm.**

cestode infection, cestodiasis. See **tapeworm infection.**

cestoid /ses′toid/ [Gk, *kestos,* girdle, *eidos,* form], **1.** cestodelike, or resembling a tapeworm. **2.** a class of platyhelminth flatworms of the Cestoda subclass, usually found in the small intestine.

CET, abbreviation for *certified enterostomal therapist*.

Cetacaine, a trademark for a fixed-combination, anesthetic spray, containing several local anesthetics (benzocaine, butyl aminobenzoate, tetracaine), applied to mucous membranes.

cetirizine, an H_1-histamine antagonist.

■ INDICATIONS: It is used to treat allergy symptoms and rhinitis.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug, lactation, and severe hepatic disease prohibit its use. It also should not be used in newborns or premature infants.

■ ADVERSE EFFECTS: Life-threatening effects include hemolytic anemia, thrombocytopenia, leukopenia, agranulocytosis, pancytopenia, and dysrhythmias (rare). Other serious adverse effects include urinary retention, impotence, diarrhea, vomiting, sedation, confusion, blurred vision, tremors, hypotension, palpitations, bradycardia, and tachycardia. Common side effects are thickening of bronchial secretions, nausea, drowsiness, and headache.

cetrorelix /set′rorel′iks/, a gonadotropin-releasing hormone antagonist used to inhibit premature luteinizing hormone surges in women undergoing controlled ovarian stimulation during infertility treatment, administered subcutaneously.

cetuximab, a miscellaneous antineoplastic, monoclonal antibody that inhibits epidermal growth factor receptors.

■ INDICATIONS: This drug is used alone or in combination with irinotecan for epidermal growth factor receptors expressing metastatic colorectal carcinoma.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or murine proteins prohibits its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include rash, pruritus, acne, and dry skin. Life-threatening side effects include leukopenia, anemia, toxic epidermal necrolysis, angioedema, renal failure, interstitial lung disease, pulmonary embolus, anaphylaxis, sepsis, and infection. Common side effects include headache, insomnia, depression, nausea, diarrhea, vomiting, anorexia, mouth ulceration, dehydration, constipation, abdominal pain, blepharitis, cheilitis, cellulitis, cysts, alopecia, skin or nail disorder, conjunctivitis, asthma, malaise, fever, back pain, cough, dyspnea, and peripheral edema.

cetyl alcohol ($C_{16}H_{33}OH$) /sē′til/ [L, *cetus,* whale; Ar, *alkohl,* essence], a fatty alcohol derived from spermaceti, used as an emulsifier and stiffening agent in creams and ointments. Also called **hexadecanol, palmityl alcohol.**

cetyl palmitate, esters of cetyl alcohol and saturated high-molecular-weight fatty acids, principally palmitic acid, used as an emulsifying and stiffening agent.

cetylpyridinium chloride /sē′təlpī′ridin′ē·əm/, an antiinfective used as a preservative in pharmaceutic preparations and as a topical cleanser and local anesthetic (Cepacol).

■ INDICATIONS: It is prescribed prophylactically to prevent infection of the skin or mucous membranes.

■ CONTRAINDICATION: Known hypersensitivity to this drug is the only contraindication.

■ NOTE: It is inactivated by soap, serum, and tissue fluids; therefore, the surface of the skin must be clean and well rinsed.

CEU, abbreviation for **continuing education unit.**

cevimeline /sevim′älēn/, a cholinergic agonist used as the hydrochloride salt in the treatment of xerostomia associated with Sjögren's syndrome, administered orally.

cevitamic acid. See **ascorbic acid.**

Cf, symbol for the element **californium.**

CF, abbreviation for **cystic fibrosis (CF).**

CFA, abbreviation for **Certified First Assistant.**

cg, abbreviation for **centigram.**

CGC, abbreviation for *Certified Gastrointestinal Clinician*.

CGD, abbreviation for **chronic granulomatous disease.**

cGMP, abbreviation for **cyclic guanosine monophosphate.**

cgs, CGS, abbreviation for **centimeter-gram-second system.**

cGy, abbreviation for **centigray.**

C_2H_2, chemical formula for **acetylene** (ethyne).

C_2H_4, chemical formula for **ethylene.**

C_6H_6, chemical formula for **benzene.**

Ch1, symbol for **Christchurch chromosome.**

Chaddock reflex [Charles G. Chaddock, American neurologist, 1861–1936], an abnormal reflex, induced by firmly stroking the ulnar surface of the forearm, characterized by flexion of the wrist and extension of the fingers in fanlike position. It is seen on the affected side in hemiplegia. Compare **Gordon's reflex, Oppenheim reflex.** See also **Babinski's reflex.**

Chaddock's sign [Charles G. Chaddock], a variation of Babinski's reflex elicited by firmly stroking the side of the foot just distal to the lateral malleolus, characterized by extension of the great toe and fanning of the other toes. It is seen in pyramidal tract disease. See also **Babinski's reflex.**

Chadwick's sign /chad′wiks/ [James R. Chadwick, American gynecologist, 1844–1905], a sign of pregnancy that develops after the sixth week and consists of a dark bluish or purplish-red color of the vaginal or cervical mucosa as a result of increased blood supply to the area.

chafe [L, *calefacere,* to make warm], to irritate the skin by friction, such as when rough material rubs against an unprotected area of the body.

chafing, superficial irritation of the skin by friction.

Chagas' disease /chag′əs/ [Carlos Chagas, Brazilian physician, 1879–1934], a protozoal infection caused by ***Trypanosoma cruzi,*** transmitted to humans by certain species of bloodsucking reduviid (triatomine) bugs, which are found only in the Americas and mainly in poorer areas of Latin America. It may occur in acute or chronic form, both of which can be asymptomatic or life threatening. The most recognized sign of acute infection, which is common in children and rare in adults, is a swelling of the eyelids on the side of the face near the insect bite, known as Romaña's sign. The acute form is also marked by a lesion at the site of the bite, fever, weakness, enlarged spleen and lymph nodes, edema of the face and legs, and tachycardia. This form resolves within 4 months unless complications, such as encephalitis, develop. The chronic form may be manifested by cardiomyopathy or by dilation of the esophagus or colon. Often, infections are asymptomatic. Treatment with nifurtimox and benznidazole is, at best, only partially effective. Natural reservoirs include dogs, armadillos, and rodents. Also called **American trypanosomiasis, Brazilian trypanosomiasis,** *Chagas-Cruz disease,* **Cruz trypanosomiasis, South American trypanosomiasis, *Trypanosoma cruzi.*** See also **trypanosomiasis.**

Chagres fever /chag′ris/ [Chagres River, Panama; L, *febris*], a phlebotomus arbovirus infection transmitted to humans through the bite of a sandfly. The disease is rarely fatal and is characterized by fever, headache, and muscle pains of the chest or abdomen. There may be nausea and vomiting, giddiness, weakness, photophobia, and pain on moving the eyes. The infection usually subsides within a week. Supportive treatment includes analgesics, bed rest, and adequate fluid intake. The disease is most common in Central America. Also called **Panama fever.**

chain [L, *catena*], **1.** a length of several units linked together in a linear pattern, such as a polypeptide chain of amino acids or a chain of atoms forming a chemical molecule. **2.** a group of individual bacteria linked together, such as streptococci formed by a chain of cocci. **3.** the serial relationship of certain structures essential to function, such as the chain of ossicles in the middle ear. Each of the small bones moves successively in response to vibration of the tympanic membrane, thus transmitting the auditory stimulus to the oval window. See also **chain ligature. 4.** a connected series, such as a chain of events.

chaining, a system of learning behaviors in which each response is a stimulus for the next response.

chain ligature [L, *catena* + *ligare,* to bind], an interlocking ligature that ties off a pedicle at several places by passing a long thread through the pedicle at different points.

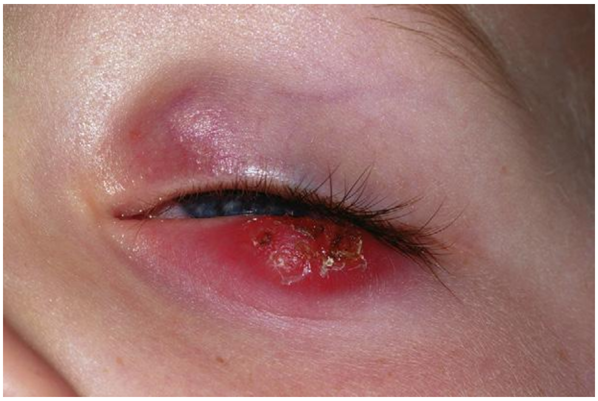
chain reaction, 1. (in chemistry) a reaction that proceeds through one or more reactive intermediates; one of the required reactive intermediates (usually free radicals) is formed in each step of the reaction. Examples include the polymerization of organic monomers into plastics or in the free radical halogenation of hydrocarbons. **2.** (in physics) a reaction that perpetuates itself by the proliferating fission of nuclei and the release of atomic particles that cause more nuclear fissions.

chain reflex, a series of reflexes, each stimulated by the preceding one.

chain-stitch suture, a continuous surgical stitch in which each loop of the suture is secured by the next loop.

chalasia /kəlā′zhə/ [Gk, *chalasis,* relaxation], abnormal relaxation or incompetence of the cardiac sphincter of the stomach, resulting in reflux of the gastric contents into the esophagus with subsequent regurgitation. Conservative treatment in infancy includes feeding several small meals a day to prevent distension of the stomach and holding the baby upright while giving the feeding. The symptoms and treatment are similar to those of a hiatal hernia. See also **gastroesophageal reflux.**

chalazion /kəlā′zion/ [Gk, hailstone], a small, nonmalignant, localized swelling of the eyelid resulting from obstruction and retained secretions of the meibomian glands. Treatment can include warm wet compresses, but the condition often requires surgery for correction. Compare **hordeolum, sty.**



Chalazion *(Albert et al, 2008)*

chalice cell. See **goblet cell.**

chalicosis /kal′ikō′sis/, a type of fibrosis that results from the inhalation of impure calcium dusts. Pure calcium dusts are soluble and are absorbed. Calcium dusts from marble, limestone, or Portland cement usually do not cause fibrosis. Respiratory impairment is generally caused by the presence of free silica in the calcium dust.

chalkitis /kalkī′tis/ [Gk, *chalkos,* brass, *itis,* inflammation], deposits of copper in the ocular tissue that cause inflammation of the eyes and result from rubbing the eyes with the hands after touching or handling brass. Also called **brassy eye.**

challenge, 1. a method of testing the sensitivity of an individual to a hormone, allergen, or other substance by administering a sample. A small amount may be injected to determine whether the immune system will react by producing appropriate antibodies. **2.** a term used to describe the rapid or concentrated infusion of a substance such as potassium or magnesium in the face of a life-threatening deficiency or a rapid infusion of IV fluid to differentiate between fluid deficit or renal failure as the cause of severely decreased urine output.

chalone /kā′lōn/ [Gk, *chalan,* to relax], any one of numerous polypeptide inhibitors that are elaborated by a tissue and function like hormones on specific target organs.

chamaeprosopy /kam′əpros′əpē/ [Gk, *chamai,* low, *prosopon,* face], a facial appearance characterized by a low brow and a broad face. —*chamaeprosopic, adj.*

chamber [Gk, *kamara,* vaulted enclosure], **1.** a hollow but not necessarily empty space or cavity in an organ, as in the anterior and posterior chambers of the eye or the atrial and ventricular chambers of the heart. **2.** a room or closed space used for research or therapeutic purposes, such as a decompression chamber or hyperbaric oxygen chamber.

Chamberlain's line [W.E. Chamberlain, American radiologist, 1891–1947], a line that extends from the posterior of the hard palate to the dorsum of the foramen magnum.

Chamberlen forceps [Peter Chamberlen, English obstetrician, 1560–1631], one of the earliest kinds of obstetric forceps, introduced in the seventeenth century.

chamfer /cham′fər/, the finish line on an extracoronal cavity preparation for a crown restoration in which the junction between the crown and the remaining tooth structure is formed to create a sloping shoulder at the apical terminus of the restoration. See **margin.**

chamomile /kam′əmēl/, an herb with both annual and perennial forms, native to Germany, Hungary, and other areas of Europe.

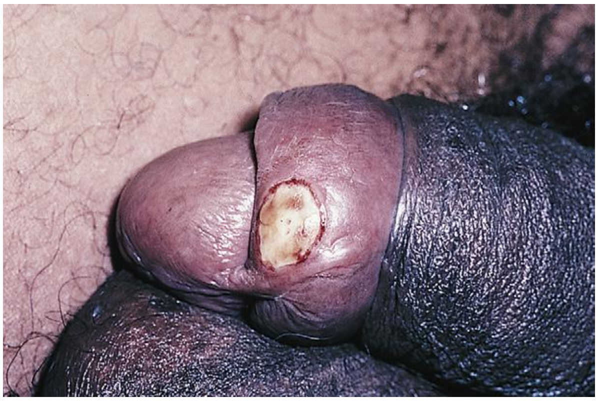
■ USES: It is used externally as an antiseptic and soothing agent for inflamed skin and minor wounds. Internally, it is used as an antispasmodic, gas-relieving, and antiinflammatory agent for the treatment of digestive problems; as a light sleep aid and sedative for adults and children; and as a possible anticancer agent. It is likely safe when used in medicinal amounts for a short term.

■ CONTRAINDICATIONS: It should not be used during pregnancy *(Chamaemelum nobile)* and lactation; it may be used in children. Cross-hypersensitivity may result from allergy to sunflowers, ragweed, or members of the aster family (echinacea, feverfew, milk thistle). People with asthma should also avoid its use.

CHAMPUS, abbreviation for **Civilian Health and Medical Programs for Uniformed Services.** See **TRICARE.**

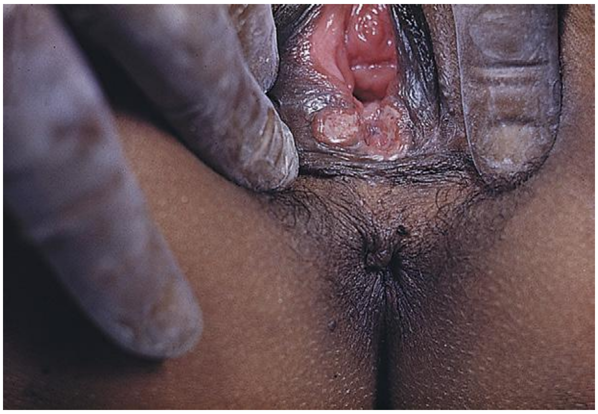
chancr-. See **cancr-.**

chancre /shang′kər/ [Fr, canker], **1.** also called **venereal sore.** a skin lesion, usually of primary syphilis, that begins at the infection site as a papule 10 to 30 days after exposure to the spirochete and develops into a red, bloodless, painless ulcer with a scooped-out appearance. It heals without treatment and leaves no scar. Two or more chancres may develop at the same time, usually in the genital area but sometimes on the hands, face, or other body surface. The chancre teems with *Treponema pallidum* spirochetes and is highly contagious. **2.** a papular lesion or ulcerated area of the skin that marks the point of infection of a nonsyphilitic disease, such as tuberculosis. Compare **chancroid.** See also **syphilis.**



Chancre of primary syphilis *(Callen et al, 2000)*

chancroid /shang′kroid/ [Fr, *chancre,* canker; Gk, *eidos,* form], a highly contagious sexually transmitted disease caused by infection with the bacillus *Haemophilus ducreyi.* It characteristically begins as a papule, usually on the skin of the external genitalia; it then grows and ulcerates, other papules form, and, if untreated, the bacillus spreads, causing buboes in the groin. It is often associated with tender and enlarged inguinal lymph nodes. An intradermal skin test is more reliable than smear and culture techniques in diagnosing this condition. Azithromycin or ceftriaxone are prescribed to treat chancroid. Because the lesion resembles syphilis and lymphogranuloma venereum, the diagnosis must be made before treatment to prevent obscuring simultaneous infections. Symptoms may not appear until 10 days after infection. Also called **venereal ulcer.** Compare **chancre.**



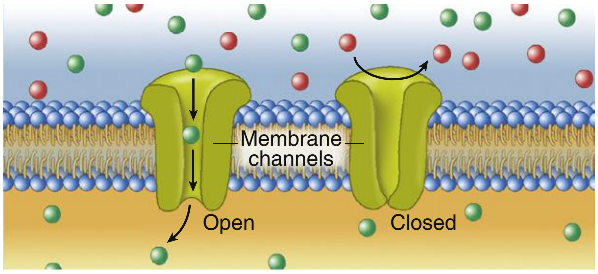
Chancroid *(Callen et al, 2000)*

chancrous /shang′krəs/, describing a condition of chancres or lesions resembling chancres.

change agent, **1.** a role in which communication skills, education, and other resources are applied to help a client adjust to changes caused by illness or disability. **2.** a role to help members of an organization adapt to organizational change or to create organizational change.

change of life. See **menopause**.

channel [L, *canalis,* pipe], **1.** a passageway or groove that conveys fluid, such as the central channels that connect the arterioles with the venules. **2.** membrane-bound globular proteins that allow diffusion of specific ions and molecules across a cell membrane.



Membrane channel *(Patton and Thibodeau, 2010)*

channeling, referral of increased numbers of patients in exchange for discounted prices. It does not apply in Canada.

channel ulcer [L, *canalis,* pipe, *ulcus,* sore], a rare type of peptic ulcer found in the pyloric canal between the stomach and the duodenum. See also **peptic ulcer.**

Chantix, a trademark for **varenicline.**

chaos /kā′əs/, total disorganization with no causal relationships operating.

chaotic atrial tachycardia. See **multifocal atrial tachycardia.**

chaparral, an herbal product harvested from a shrub found in Mexico and the Southwestern United States.

- ■ USES: Use of this herb is not recommended because it is potentially toxic to the liver and kidneys.
- ■ CONTRAINDICATIONS: Do not use it during pregnancy and lactation or in children until more research is completed. Persons with liver or renal disease should also avoid its use. The American Herbal Product Association has recommended that companies not sell chaparral products until the hepatoxicity question has been clarified, but it is still readily available.

Chapman lymphatic reflexes, (in chiropractic) a method of using body wall reflexes to influence the motion of fluids. After a surface locus has been contacted by the tip of the examiner's finger, a firm gentle contact is maintained and a rotary motion is imparted to the finger to express the fluid content of the locus into the surrounding tissues.

chapped /chapt/ [ME, *chappen,* cracked], pertaining to skin that is roughened, cracked, or reddened by exposure to cold or excessive moisture evaporation. Stinging or burning sensations often accompany the disorder. Prevention is achieved through protection against exposure to cold and wind. Treatment includes the avoidance of frequent washing, the replacement of soaps and detergents with superfatted soaps, and the application of emollients. Compare **frostbite. —***chap, v.*

character [Gk, *charassein,* to engrave], **1.** the integrated composite of traits and behavioral tendencies that enable a person to react in a relatively consistent way to the customs and mores of society. Character, as contrasted with personality, implies volition and morality. Compare **personality. 2.** any letter, number, symbol, or punctuation mark, usually composed of 8 bits or 1 byte, that can be transmitted as output by a computer. See also **bit.**

character analysis, a systematic investigation of the personality of an individual with special attention to psychological defenses and motivations, usually undertaken to improve behavior.

character disorder, a chronic, habitual maladaptive and socially unacceptable pattern of behavior and emotional response. See also **personality disorder.**

characteristic /kar′əktəris′tik/ [Gk, *charassein,* to engrave], **1.** *adj*, typical of an individual or other entity. **2.** *n*, a trait that distinguishes an individual or entity.

characteristic curve /ker′əktəris′tik/, a graphic relationship between the optic density (blackness) of an x-ray film and the exposure. Also called **D log E curve, Hurter and Driffield curve, sensitometric curve.**

characteristic radiation, radiation produced when a projectile electron interacts with and displaces an inner-shell electron of a target atom. It is a key process in x-ray production.

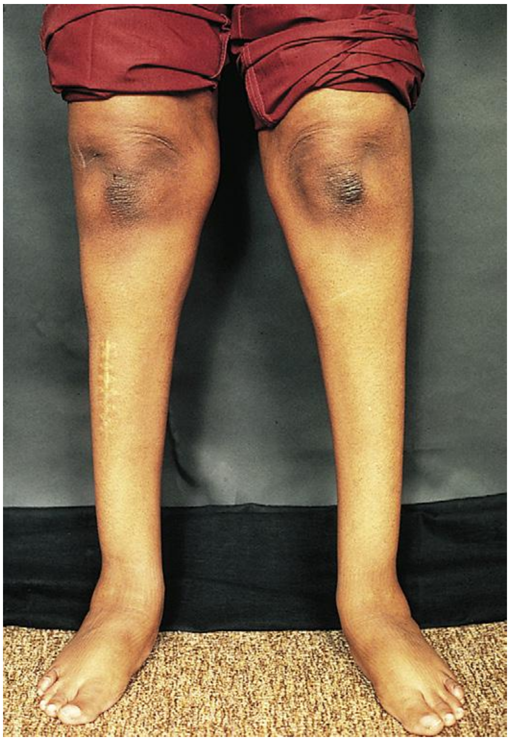
character printer, a printer for computers that produces a fully formed character, such as a letter, number, or symbol, with each impression stroke. Compare **dot-matrix printer.**

charcoal. See **activated charcoal.**

Charcot-Bouchard aneurysm /shärkō′bo͝oshär′/ [Jean M. Charcot, French neurologist, 1825–1893; Charles J. Bouchard, French physician, 1837–1886], a small, round dilation of a small artery in the cerebral cortex or basal ganglia. Charcot-Bouchard aneurysms often occur in individuals with very high blood pressure.

Charcot-Leyden crystal /shärkō′lī′dən/ [Jean M. Charcot; Ernst V. von Leyden, German physician, 1832–1910], any of the proteinaceous crystalline structures shaped like narrow, double pyramids found in the sputum of persons suffering from asthma and found in the feces of dysentery patients. Charcot-Leyden crystals occur in association with the fragmentation of eosinophils. Also called **asthma crystal, leukocytic crystal.**

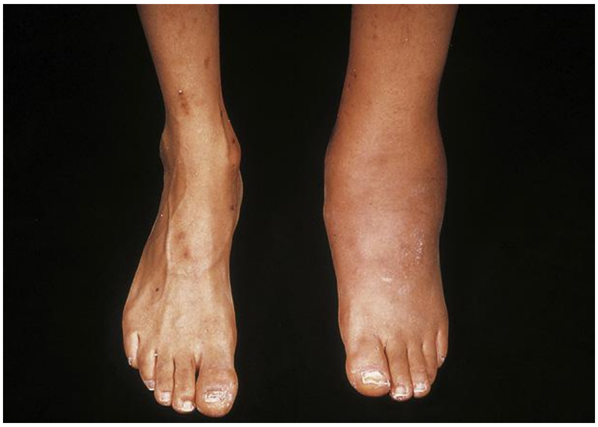
Charcot-Marie-Tooth disease /shärkō′mərē′to͞oth′/ [Jean M. Charcot; Pierre Marie, French neurologist, 1853–1940; Howard H. Tooth, English neurologist, 1856–1925], a progressive hereditary disorder characterized by degeneration of the peroneal muscles of the fibula, resulting in clubfoot, foot drop, and ataxia. Progressive arm weakness can also be present as distal muscles atrophy. Compare **peripheral neuropathy.**



Charcot-Marie-Tooth disease *(Zitelli and Davis, 2007)*

Charcot's fever /shärkōz′/ [Jean M. Charcot], a syndrome characterized by recurrent chills and fever, jaundice, and abdominal pain in the right upper quadrant that occurs with inflammation of the bile ducts. It is caused by the intermittent impaction of a stone in the ducts.

Charcot's foot /shär·kōz′/ [Jean M. Charcot], a deformity of the foot associated with neuropathies.

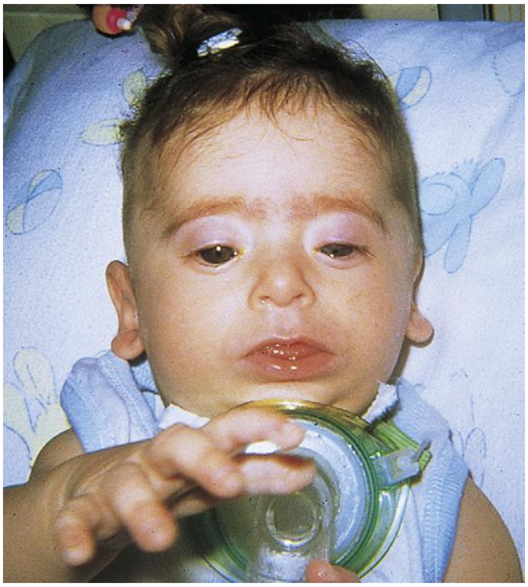


Charcot's foot *(Belchetz and Hammond, 2003)*

Charcot's joint. See **neuropathic joint disease.**

Charcot's triad [Jean M. Charcot; Gk, *trias,* three], a set of three signs of brainstem involvement in multiple sclerosis: intention tremor, nystagmus, and scanning speech.

CHARGE association, a syndrome of associated defects, including *c*oloboma of the eye, *h*eart anomaly, choanal *a*tresia, *r*etardation, and *g*enital and *e*ar anomalies.



Infant with CHARGE association *(Zitelli and Davis, 2007/ Courtesy Dr. W. Tunnessen, Children's Hospital of Philadelphia)*

charge-coupled device (CCD), **1.** an array of semiconductors so arranged that the output of one serves as the input of the next. CCDs are often used to convert light patterns into electrical signals. See also **charge-coupled image sensor. 2.** in dental imaging, an image receptor found within an intraoral sensor.

charge-coupled image sensor, two-dimensional electronic array for converting light patterns into electrical signals.

charge nurse, the nurse assigned to manage the operations of the patient care area for the shift. Responsibilities may include staffing, admissions and discharge, and coordination of activities in the patient care area.

charlatan /shär′lətən/ [Fr, imposter], a totally unqualified individual posing as an expert, especially an individual pretending to be a physician. Also called **quack.** —*charlatanical, adj.*

Charles' law. See **Gay-Lussac's law.**

charley horse /chär′lē hôrs′/, colloquial; a sudden painful condition of the quadriceps or hamstring muscles characterized by soreness and stiffness. It is the result of a strain, tear, or bruise of the muscle; is aggravated by movement; and is often associated with athletic activity. Treatment includes rest and massage. Compare **cramp.**

chart /chärt/ [L, *charta,* paper], **1.** *n, (informal)* a patient record of data in tabular or graphic form. **2.** *v,* to note data in a patient record (computerized or paper), usually at prescribed intervals.

charta /kär′tə/ *pl. chartae* [L, paper], a piece of paper, especially one treated with medicine, as for external application, or with a chemical for a special purpose, such as litmus paper.

charting, the act of compiling data on clinical records or charts (computerized or paper). The charts are updated regularly to keep physicians and other health care workers advised of changes in the patient's condition. The data usually include fluctuations in temperature, pulse, respiration, other variable factors, and much more, including all nursing care. See also **documentation.**

chauffeur's fracture /shō′fərz/ [Fr, stoker; L, *fractura,* break], any fracture of the radial styloid, produced by a twisting or a snapping type of injury.

Chaussier's areola /shôsyāz′/ [François Chaussier, French anatomist, 1746–1828; L, little space], an areola of indurated tissue surrounding a malignant pustule.

CHB, abbreviation for **complete heart block.**

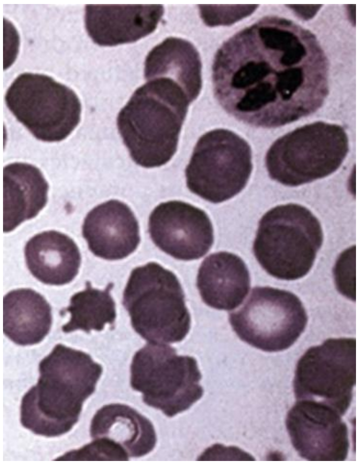
CHC, abbreviation for *community health center.*

CHD, **1.** abbreviation for **coronary heart disease.** See **coronary artery disease. 2.** abbreviation for **congenital heart disease.** See **congenital cardiac anomaly.**

check ligament. See **alar ligament.**

checkup [Fr, *eschec,* acquire; AS, *uf*], a thorough study or examination of the health of an individual.

Chédiak-Higashi syndrome /ched′ē·ak·higä′shē/ [Moises Chédiak, twentieth-century Cuban physician; Ototaka Higashi, twentieth-century Japanese physician], a congenital autosomal-recessive disorder, characterized by partial albinism, photophobia, pale optic fundi, massive leukocytic inclusions, psychomotor abnormalities, recurrent infections, and early death. Antenatal diagnosis can be made by amniocentesis and tissue culture. Treatment includes antibiotics and transfusions.



Chédiak-Higashi syndrome: peripheral blood smear *(Anderson, 2006/Courtesy William Gahl, MD, Clinical Director, National Human Genome Research Institute Head, Section on Human Biochemical Genetics, Medical Genetics Branch Head, Intramural Program, Office of Rare Diseases National Institute of Health)*

cheek [AS, *ceace*], a fleshy prominence, especially the fleshy protuberances on both sides of the face between the eye and the jaw and the ear and the nose and mouth.

cheekbone. See **zygomatic bone.**

cheesy abscess [AS, *cese* + L, *abscedere,* to go away], an abscess that contains a yellowish semisolid, cheeselike material, such as a tuberculous abscess. Also called **caseous abscess.**

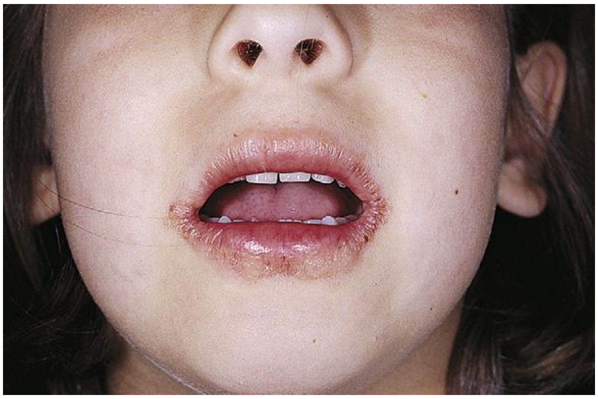
cheesy necrosis, tissue death in which the structures have degenerated into a white, cheesy mass. See also **caseous necrosis.**

cheil-. See **cheilo-.**

cheilectomy /kīlek′təmē/, surgical removal of irregular surfaces in the lining of a joint.

-cheilia, -chilia, suffix meaning "(condition of the) lips": *atelocheilia, xerocheilia.*

cheilitis /kīlī′tis/ [Gk, *cheilos,* lip, *itis,* inflammation], an abnormal condition of the lips characterized by inflammation and cracking of the skin. There are several forms, including those caused by excessive exposure to sunlight, allergic sensitivity to cosmetics, and vitamin deficiency. Compare **cheilosis.**



Irritant cheilitis *(Callen et al, 2000)*

cheilo-, cheil-, prefix meaning "lip": *cheiloangioscopy, cheilocarcinoma, cheiloplasty.*

cheilocarcinoma /kī′lōkär′sinō′mə/, *pl. cheilocarcinomas, cheilocarcinomata,* a malignant epithelial tumor of the lip.

cheiloplasty /kī′ləplas′tē/ [Gk, *cheilos,* lip, *plassein,* to mold], surgical correction of a defect of the lip.

cheilorrhaphy /kīlôr′əfē/ [Gk, *cheilos,* lip, *raphe,* suture], a surgical procedure that sutures the lip, such as in the repair of a congenitally cleft lip or a lacerated lip.

cheilosis /kīlō′sis/, a noninflammatory disorder of the lips and mouth characterized by bilateral scales and fissures, resulting from a deficiency of riboflavin in the diet.

cheir-. See **cheiro-.**

cheiralgia /kīral′jə/ [Gk, *cheir* + *algos,* pain], a pain in the hand, especially that associated with arthritis. —*cheiralgic, adj.*

-cheiria. See **-chiria.**

cheiro-, cheir-, chir-, chiro-, prefix meaning "hand": *cheiromegaly, cheiroplasty.*

cheirognostic /kī′ragnos′tik/ [Gk, *cheir,* hand, *gnostikos,* knowing], pertaining to the ability to distinguish between the left and right hands and sides of the body.

cheiromegaly /kī′rōmeg′əlē/ [Gk, *cheir* + *megas,* large], an abnormal condition characterized by excessively large hands. —*cheiromegalic, adj.*

cheiroplasty /kī′rōplas′tē/, a surgical procedure to restore an injured or congenitally deformed hand to normal use. Also called **chiroplasty.** —*cheiroplastic, adj.*

chelate /kē′lāt/ [Gk, *chele,* claw], **1.** *v,* to form a bond, thus creating a ringlike complex. An example is the interaction of a metal ion and two or more polar groups of a single molecule. **2.** *n,* (in medicine) any coordination compound composed of a central metal ion and an organic molecule with multiple bonds arranged in ring formations, used especially in chemotherapeutic treatments for metal poisoning. **3.** *adj,* pertaining to chelation.

chelating agent /kē′lāting/, a substance that promotes chelation. Chelating agents are used in the treatment of metal poisoning. See also **chelation.**

chelation /kēlā′shən/, a chemical reaction in which there is a combination with a metal to form a ring-shaped molecular complex in which the metal is firmly bound and isolated. See also **chelating agent.**

chelation therapy, the use of a chelating agent to remove toxic metals from the body, the treatment of heavy metal poisoning. In complementary medicine, it is also used to treat atherosclerosis and other disorders.

cheloid, cheloidal. See **keloid.**

cheloidosis. See **keloidosis.**

chemabrasion /kem′əbrā′zhən/ [Gk, *chemeia,* alchemy; L, *ab* + *radere,* to scrape off], a method of treating scars, chromatosis, or other skin disorders by applying chemicals that remove the surface layers of skin cells. See also **chemical cauterization, chemosurgery.**

chemexfoliation. See **chemical peel.**

chemical /kem′əkəl/ [Gk, *chemeia,* alchemy], **1.** *n,* a substance composed of chemical elements or a substance produced by or used in chemical processes. **2.** *adj,* pertaining to chemistry.

chemical action, any process in which elements and/or compounds react with each other to produce a chemical change: For example, hydrogen and oxygen combine to produce water.

chemical affinity [Gk, *chemeia,* alchemy; L, *affinis,* related], **1.** an attraction that results in the formation of molecules from atoms. **2.** an attraction between chemicals caused by polarity, as used in affinity chromatography.

chemical agent, any chemical power, active principle, or substance that can produce an effect in the body by interacting with various body substances, such as aspirin, which produces an analgesic effect.

chemical antidote [Gk, *chemeia* + *anti,* against, *dotos,* that which is given], any substance that reacts chemically with a poison to form a compound that is harmless. There are few true antidotes, and treatment of poisoning depends largely on eliminating the toxic agent before it can be absorbed by the body.

chemical burn, tissue damage caused by exposure to a strong acid or alkali, such as phenol, creosol, mustard gas, or phosphorus. See also **acid burn, acid poisoning, alkali burn, alkali poisoning.**

chemical carcinogen [Gk, *chemeia,* alchemy, *karkinos,* crab, *oma,* tumor, *genein,* to produce], any chemical agent that can induce the development of cancer in living tissue.

chemical cauterization [Gk, *chemeia* + *kauterion,* branding iron], the corroding or burning of living tissue by a caustic chemical substance, such as potassium hydroxide. Also called **chemical cautery, chemocautery.**

chemical cystitis, allergic cystitis occurring in reaction to a chemical substance in the body. See also **drug-induced cystitis.**

chemical disaster, the accidental release of a quantity of toxic chemicals into the environment, resulting in death or injury to workers or members of nearby communities. Examples include the release of methyl isocyanate from a chemical plant in Bhopal, India, at a cost of 2000 lives; and a nuclear accident at Chernobyl, Ukraine, requiring the removal of 160,000 people from their homes.

chemical energy. See **energy.**

chemical equivalent, a drug or chemical containing similar amounts of the same ingredients as another drug or chemical.

chemical fog, a curtain effect on x-ray film that causes the loss of image quality. It appears as a dull gray discoloration and is usually caused by chemical contamination of the developer.

chemical gastritis, inflammation of the stomach caused by the ingestion of a chemical compound. Treatment is determined by the substance ingested. Compare **corrosive gastritis, erosive gastritis.**

chemical indicator, **1.** a commercially prepared device that monitors all or part of the physical conditions of the sterilization cycle. It usually consists of a sensitive ink dye that changes color under certain conditions. **2.** a compound added to a reaction system to show, typically by a change in color, when the process is complete, as in an acid-base titration.

chemical mediator, a neurotransmitter chemical, such as acetylcholine.

chemical name, the exact designation of the chemical structure of a drug as determined by the rules of accepted systems of chemical nomenclature.

chemical peel, a therapy to reduce or improve wrinkles, blemishes, pigment spots, and sun-damaged areas of the skin. Using a chemical solution of phenol, trichloroacetic acid, or alpha hydroxy fruit acid, the top skin layers are peeled away, allowing new, smoother skin with tighter cells to occupy the surface. Immediately after the peel, there may be considerable swelling, which subsides after 7 to 10 days as new skin begins to form. Other chemical solutions used include glycolic acid, retinol, Jessner's solution, beta hydroxy acid, and combinations thereof. Also called **chemexfoliation, chemoexfoliation.**

chemical peritonitis [Gk, *chemeia,* alchemy, *peri,* near, *teinein,* to stretch, *itis,* inflammation], an inflammation of the peritoneum resulting from chemicals, including digestive substances, in the peritoneum.

chemical restraint^1 [Gk, *chemeia,* alchemy; *restringere,* to confine], the use of psychotropics, hypnotics, or anxiolytics to control a potentially violent patient.

chemical restraint^2**,** a nursing intervention from the Nursing Interventions Classification (NIC) defined as administration, monitoring, and discontinuation of psychotropic agents used to control an individual's extreme behavior. See also **Nursing Interventions Classification.**

chemical shift, (in nuclear magnetic resonance spectrometry) the position of a resonance in the substance of interest relative to the position of the resonance of a standard. Nonequivalent atoms of a molecule have different chemical shifts.

chemical shift artifacts, artifacts in magnetic resonance caused by small differences in resonance frequencies of different chemical compounds (e.g., water and fat).

chemical sympathectomy, the removal of a sympathetic nerve tract or ganglion by injection of a corrosive chemical such as phenol.

chemical warfare, the waging of war with poisonous chemicals and gases.

cheminosis /kem′ənō′sis/ [Gk, *chemeia* + *osis,* condition], any disease caused by a chemical substance.

chemist, **1.** a person with special education and training in the structures, characteristics, and actions of chemicals. **2.** in Great Britain, Australia, and New Zealand, a pharmacist.

chemistry /kem′istrē/ [Gk, *chemeia,* alchemy], the science dealing with the elements, their compounds, and the molecular structure and interactions of matter. Classifications of chemistry include **inorganic chemistry** and **organic chemistry.**

chemistry, normal values, the amounts of various substances in the normal human body, determined by testing a large sample of people presumed to be healthy. Normal values are expressed in ranges of numbers, and ranges vary for different age groups and from laboratory to laboratory. For example, a normal concentration of a substance in the blood might be expressed as 5 to 20 mg/dL. Although variations from normal values may be highly significant tools in the diagnoses of certain diseases, in all cases an abnormal result must be cautiously interpreted. See also specific tests.

chemo- /kem′ō-, kē′mō-/, combining form meaning "by chemical reaction" or "a chemical or chemistry": *chemoantigen, chemobiotic, chemokinesis.*

chemoattractant /kē′mō·ətrak′tənt/ [Gk, *chemeia,* alchemy + L, *attrahere,* to draw to], a chemotactic factor that induces positive chemotaxis.

chemocautery. See **chemical cauterization.**

chemodifferentiation /-dif′əren′shē·ā′shən/, a stage in embryonic development that precedes and controls specialization and differentiation of the cells into rudimentary organs.

chemoexfoliation. See **chemical peel.**

chemokine /kē′mōkīn/ [Gk, *chemeia,* alchemy + *kinēsis,* movement], any of a group of low-molecular-weight cytokines, such as interleukin-8, identified on the basis of their ability to induce chemotaxis or chemokinesis in leukocytes (or in particular populations of leukocytes) in inflammation. The group is divided into four subgroups on the basis of genetic, structural, and functional criteria. They function as regulators of the immune system and may also play roles in the circulatory and central nervous systems. See also **cytokine.**

chemokinesis /kē′mōki·nē′sis/ [Gk, *chemeia,* alchemy + *kinesis* movement], increased nondirectional activity of cells caused by the presence of a chemical substance. Compare **chemotaxis.**

chemonucleolysis /-n͞oo′klē·ol′isis-/ [Gk, *chemeia* + L, *nucleus,* nut kernel; Gk, *lysein,* to loosen], a method of dissolving the nucleus pulposus of an intervertebral disk by the injection of a chemolytic agent, such as the enzyme chymopapain. The procedure is used primarily in the treatment of a herniated disk and other intervertebral disk lesions.

chemoprevention, the use of natural, synthetic or biological substances to suppress or prevent a disease such as cancer. Also called chemoprophylaxis.

chemoprophylaxis /-prō′filak′sis/ [Gk, *chemeia* + *prophylax,* advance guard], administration of a medicine or chemical agent with the purpose of disease prevention, such as the use of antimicrobial drugs to prevent the acquisition of pathogens in an endemic area or to prevent their spread from one body area to another.

chemoprotectant, **1.** *adj,* providing protection against the toxic effects of chemotherapy agents. **2.** *n,* an agent that so acts.

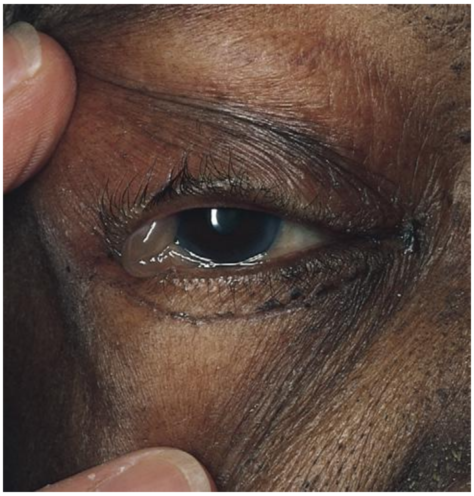
chemoradiotherapy, combined modality therapy using chemotherapy and radiotherapy, designed to reduce the need for surgery by maximizing the interaction between the radiation and the therapeutic agent or agents.

chemoreceptor /-risep′tər/ [Gk, *chemeia* + L, *recipere,* to receive], a sensory nerve cell activated by chemical stimuli. For example, chemoreceptors in the carotid artery are sensitive to the partial pressure of carbon dioxide in the blood; they signal the respiratory center in the brain to increase or decrease the rate of breathing.

chemoreflex /-rē′fleks/, any reflex initiated by the stimulation of chemical receptors, such as those of the carotid and aortic bodies, which respond to changes in carbon dioxide, hydrogen ion, and oxygen concentrations in the blood. See also **chemoreceptor.**

chemoresistance, **1.** a specific resistance by components of a cell to chemical substances. **2.** the resistance of bacteria or a cancer cell to a chemical designed to treat the disorder.

chemosis /kimō′sis/ [Gk, *cheme,* cockle, *osis,* condition], an abnormal edematous swelling of the mucous membrane covering the eyeball and lining the eyelids. Usually the result of local trauma or infection, chemosis may also occur in acute conjunctivitis. Obstruction of normal lymph flow, such as might result from growth of a tumor within the eye socket, may less commonly cause chemosis. Systemic disorders, such as angioneurotic edema, anemia, and Bright's disease, may also cause the condition. Also called **conjunctival edema.**



Chemosis *(Swartz, 2009)*

chemostat /kē′məstat′/, a device that assures a steady rate of cell division in bacterial populations by maintaining a constant environment.

chemosurgery /-sur′jərē/ [Gk, *chemeia* + *cheirourgos*, surgeon], the destruction of malignant, infected, or gangrenous tissue by the application of chemicals. The technique is used successfully to remove skin cancers.

chemotactic /-tak′tik/ [Gk, *chemeia*, alchemy, *taxis*, arrangement], pertaining to a tendency of cells to migrate toward or away from certain chemical stimuli.

chemotaxis /-tak′sis/ [Gk, *chemeia* + *taxis*, arrangement], movement toward or away from a chemical stimulus. Chemotaxis is a cellular function, particularly of neutrophils and monocytes, whose phagocytic activity is influenced by chemical factors released by invading microorganisms.

chemotherapeutic agent /-ther′əpyo͞o′tik/, any chemical used to treat cancer. It is usually used to refer to antineoplastic drugs.

chemotherapeutic index, a system for judging the safety and effectiveness of a drug as a ratio between the dose that is lethal to 50% of animals (LD_{50}) and the median effective (ED_{50}) or minimal curative dose.

chemotherapy /-ther′əpē/, the treatment of cancer, infections, and other diseases such as cancer with chemical agents. The term has been applied over the centuries to a variety of therapies, including malaria therapy with herbs and use of mercury for syphilis. In modern usage, chemotherapy usually entails the use of chemicals to destroy cancer cells on a selective basis. The cytotoxic agents used in cancer treatments generally function in the same manner as ionizing radiation; they do not kill the cancer cells directly but instead impair their ability to replicate. Most of the commonly used anticancer drugs act by interfering with deoxyribonucleic acid and ribonucleic acid activities associated with cell division. Chemotherapeutic agents are often used in combination to intercept cell replication at various points of the cell cycle. These agents are also often used in combination with other cancer treatments such as radiation therapy and targeted therapy for their synergistic effect. For example, a cytotoxic agent may be used to render a tumor cell more sensitive to the effects of ionizing radiation, thus allowing the cancer to be controlled with smaller doses of radiation. Chemotherapy is not selective; it kills healthy cells as well as cancer cells. **—chemotherapeutic,** *adj.*

chemotherapy-induced nausea and vomiting (CINV), nausea and vomiting occurring as a reaction to chemotherapeutic agents.

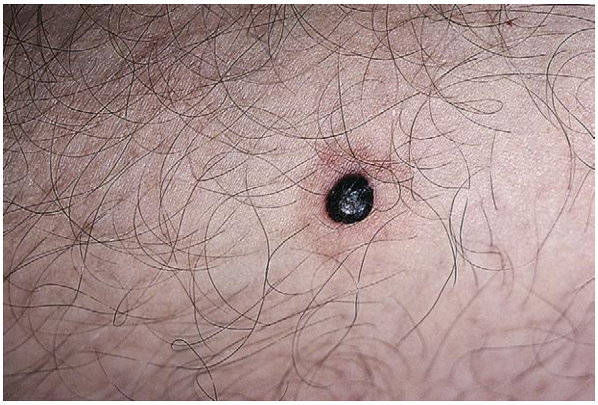
chemotherapy management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting the patient and family to understand the action and minimize side effects of antineoplastic agents. See also **Nursing Interventions Classification.**

chemotherapy (unsealed radioactive), the oral or parenteral administration of a radioisotope, such as iodine 131 (^{131}I), for the treatment of hyperthyroidism or thyroid cancer or phosphorus 32 (^{32}P) for leukemia, polycythemia vera, or peritoneal ascites resulting from widely disseminated carcinoma. ■ METHOD: The patient needs to be isolated during the half-life of the radioisotope (8.1 days for ^{131}I, 14 days for ^{32}P, and 2.7 days for ^{198}Au) to prevent radiation exposure to other persons. ■ INTERVENTIONS: Therapy with radioactive iodine is performed on an outpatient basis. The dose of the isotope is low, so radiation precautions are not needed. The nurse wears a radiation badge when entering the patient's room and limits exposure by performing planned procedures efficiently. Routine nursing functions are kept to a minimum. Disposal of urine, feces, and dressings follows a prespecified protocol. ■ OUTCOME CRITERIA: Radioactive iodine usually counteracts hyperthyroidism and is frequently used in conjunction with surgery in the treatment of thyroid cancer. Radioactive phosphorus often controls polycythemia vera, but other agents are generally more effective in leukemia therapy. Radioactive gold is usually administered as a last resort in advanced lung cancer or peritoneal ascites resulting from malignant disease.

chenodeoxycholic acid /kē′nōdē·ok′sikō′lik/, a secondary bile acid. It is used in vivo to dissolve cholesterol gallstones, particularly in the elderly and poor-risk patients. See also **ursodeoxycholic acid.**

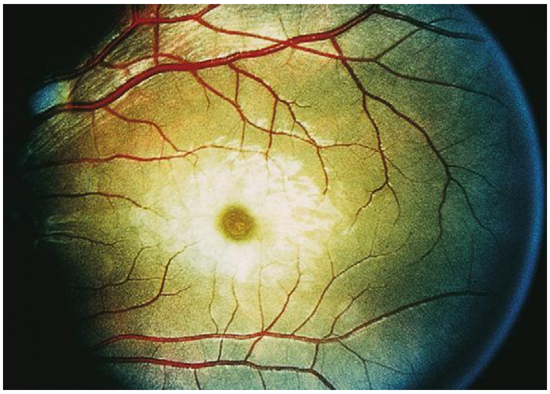
cherophobia /kē′rō′fō′bē·ə/, a morbid aversion to cheerfulness.

cherry angioma [L, *cerasus* + *angeion*, vessel, *oma*, tumor], a small, bright red, clearly circumscribed vascular tumor on the skin. It occurs most often on the trunk but may appear anywhere on the body. The lesion is common; more than 85% of people over 45 years of age have several cherry angiomas. Also called **capillary angioma, capillary hemangioma, De Morgan's spots, senile angioma.**



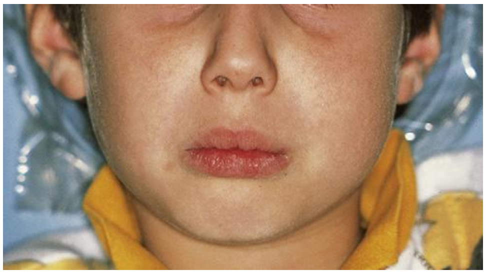
Cherry angioma *(Callen et al, 2000)*

cherry red spot, an abnormal red circular area of the choroid, visible through the fovea centralis of the eye and surrounded by a contrasting white edema. It is associated with cases of infantile cerebral sphingolipidosis and sometimes appears in the late infantile form of amaurotic familial idiocy **(Tay-Sachs disease).** Also called **Tay's spot.**



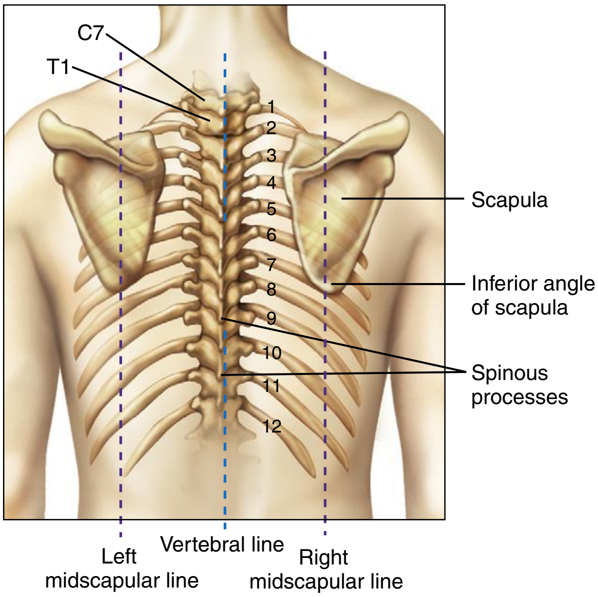
Cherry red spot at the macula *(Kanski and Bowling, 2011)*

cherubism /cher′əbiz′əm/ [Heb, *kerubh*], an abnormal hereditary condition characterized by progressive bilateral swelling at the angle of the mandible, especially in children. In some cases of cherubism, the entire jaw swells and the eyes turn up, enhancing the cherubic facial appearance. The condition tends to regress during adult life.



Cherubism *(Regezi, Sciubba, and Jordan, 2008)*

chest [AS, *box*], **1.** See **thorax**. **2.** the outside front part of the basic thoracic structure. See also **thoracic cage, thoracic cavity.**



Lateral chest landmarks
(Harkreader, Hogan, and Thobaben, 2007)

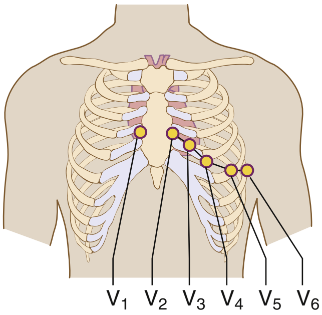
chest bandage, any of several types of fabric dressings for chest injuries, including a three-cornered open chest wrapping, a figure-eight roller bandage spica, or a scultetus pattern of narrow strips that can be overlapped and pinned.

chest binder, a broad bandage or girdle, with or without shoulder straps, that encircles the chest and aids in supplying heat or other therapies. A chest binder also may be used to support the breasts.

chest cavity. See **body cavity.**

chest drainage, the withdrawal of air, blood, or fluids from the chest cavity through a tube commonly inserted into the pleural space. The tube may be connected to a suction device that helps reinflate a collapsed lung.

chest lead /lēd/, **1.** an electrocardiographic conductor in which the exploring positive electrode is placed on the chest or precordium. The indifferent electrode is placed on the patient's back for a chest back (CB) lead, on the front of the chest for a chest front (CF) lead, on the left arm for a chest left (CL) lead, and on the right arm for a chest right (CR) lead. **2.** *(informal)* the tracing produced by such a lead on an electrocardiograph.



Position of precordial chest leads *(Goldman et al, 2008)*

chest pain [AS, *cest,* box; L, *poena,* punishment], a physical complaint that requires immediate diagnosis and evaluation. Chest pain may be symptomatic of cardiac disease, such as angina pectoris, myocardial infarction, aortic stenosis, or pericarditis, or of pulmonary disease, such as pleurisy, pneumonia, or pulmonary embolism or infarction. The source of chest pain may also be musculoskeletal, gastrointestinal, or psychogenic. The use of illegal drugs such as cocaine may also cause chest pain. Over 90% of severe chest pain in adults is caused by coronary disease, spinal root compression, or psychological disturbance. Because of its association with life-threatening heart disease, chest pain causes extreme anxiety, which tends to mask other symptoms that would aid in diagnosis and treatment. Reassuring the person being examined assists in proper diagnosis. Evaluation of chest pain requires determining the quality of the pain—dull, sharp, or crushing, locating the site of the pain—in the center or side of the chest, and determining how long the pain has persisted, how it has developed, and whether it has occurred in the past. The patient is asked to describe the spread of pain to other parts of the body and to identify such factors as exertion, emotional distress, movement, eating, or deep breathing that aggravate or relieve the pain. If the pain is reproducible by palpation during physical examination, it is unlikely to be cardiac in origin. Specific cardiovascular conditions associated with chest pain are myocardial infarction, angina pectoris, pericarditis, and a dissecting aneurysm of the thoracic aorta. Musculoskeletal conditions include rib fractures, swelling of the rib cartilage, and muscle strain. GI conditions associated with chest pain include esophagitis, peptic ulcers, hiatal hernia, gastritis, cholecystitis, and pancreatitis.

chest physiotherapy^1. See **cupping and vibrating, percussion.**

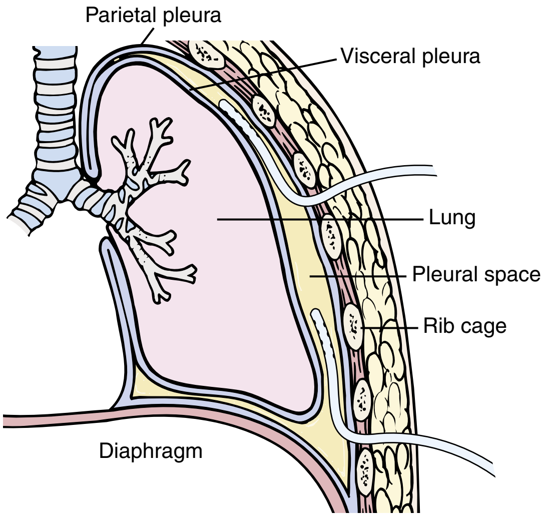
chest physiotherapy^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting the patient to move airway secretions from peripheral airways to more central airways for expectoration and/or suctioning. See also **Nursing Interventions Classification.**

chest prominences and depressions, any unnatural surface features of the chest that may be caused by congenital defects, diseases such as emphysema, enlarged organs, tumors, traumas, or occupational hazards. See also **barrel chest, flail chest, funnel chest, pigeon breast.**

chest regions, the topographic parts or subdivisions of the chest: presternal, mammary, inframammary, and axillary.

chest thump [AS, *cest,* box], a sharp blow delivered to the chest in the precordial area to restore a normal heartbeat after cardiac arrest.

chest tube, a catheter inserted through the rib space of the thorax into the pleural space to remove air and/or fluid, thereby restoring negative pressure in the pleural space. It is attached to a water-seal chest drainage device. It is commonly used after chest surgery and lung collapse.



Placement of chest tubes *(Lewis et al, 2011)*

chest wall percussion. See **percussion.**

chest x-ray, radiographic assessment of the pulmonary and cardiac systems.

chewing gum diarrhea. See **osmotic diarrhea.**

chewing reflex, a pathological sign in brain-damaged adults, characterized by repetitive chewing motions when the mouth is stimulated.

Cheyne's nystagmus /shānz/ [John Cheyne, Scottish physician, 1777–1836], an involuntary eyeball movement with a rhythm that resembles that of Cheyne-Stokes respiration.

Cheyne-Stokes respiration (CSR) [John Cheyne; William Stokes, Irish physician, 1804–1878; L, *respirare* to breathe], an abnormal pattern of respiration, characterized by alternating periods of apnea and deep, rapid breathing. The respiratory cycle begins with slow, shallow breaths that gradually become abnormally rapid and deep. Breathing gradually becomes slower and shallower and is followed by 10 to 20 seconds of apnea before the cycle is repeated. Each episode may last from 45 seconds to 3 minutes. Underlying CSR is a complex alteration in the functioning of the respiratory center in the brain, caused by dysfunction of the diencephalon or by bilateral hemispheric lesions. The respiratory center may have a reduced sensitivity to the concentrations of blood gases, as is seen in cerebrovascular disease, in tumors of the brainstem, and in severe head injury. CSR may be triggered by changes in blood chemical processes, especially in elderly patients with degenerative arterial disease or respiratory diseases, such as bronchopneumonia. In an otherwise healthy person, CSR may be caused by hyperventilation, exposure to high altitudes, or an overdose of a narcotic or hypnotic drug. CSR occurs more frequently during sleep. Also called **agonal respiration, periodic breathing.** Compare **Biot's respiration.**

-chezia, -chesia, suffix meaning "(condition of) defecation, especially involving the discharge of foreign substances": *dyschezia, hematochezia.*

CHF, abbreviation for **congestive heart failure.**

chi /kī/, X, 1.75q>χ the 22nd letter of the Greek alphabet, sometimes used in scientific notation to designate the 22nd in a series.

ch'i, a Chinese concept of a fundamental life energy that flows in orderly ways along meridians, or channels, in the body. The energy can be either positive or negative. See also **acupuncture.**

CHI, abbreviation for **creatinine height index.**

Chiari-Frommel syndrome /kē·är′ēfrom′əl/ [Johann B. Chiari, German obstetrician, 1817–1854; Richard Frommel, German gynecologist, 1854–1912], a hormonal disorder that occurs after pregnancy in which weaning does not spontaneously end lactation. It is usually the result of a decrease in pituitary gonadotropins and an excess of pituitary prolactin and may be accompanied by amenorrhea. Treatment includes observation, hormonal therapy, and investigation to confirm or rule out pituitary tumor.

Chiari's malformation /kē·ä′rēz/ [Hans Chiari, Austrian pathologist, 1851–1916], a congenital anomaly in which the cerebellum and medulla oblongata, which is elongated and flattened, protrude into the spinal canal through the foramen magnum. It is classified into three types according to severity, ranging from prolapse of the cerebellar tonsils into the spinal canal without elongation of the brainstem (type I) to complete herniation of the cerebellum to form an occipital encephalocele (type III). It may be accompanied by hydrocephalus, spina bifida, syringomyelia, and mental defects. The classic form, type II, better known as Arnold-Chiari malformation, is tonsillar herniation with a myelomeningocele, a form of spina bifida. Also called **Chiari's deformity.** See also **Arnold-Chiari malformation.**

Chiari's syndrome. See **Budd-Chiari syndrome.**

chiasm /kī′azəm/ [Gk, *chiasma,* lines that cross], **1.** the crossing of two lines or tracts, as of the optic nerves at the optic chiasm. **2.** (in genetics) the crossing of two chromatids in the prophase of meiosis. **—chiasmal, chiasmic,** *adj.*

chiasma /kī·az′mə/ *pl. chiasmata* [Gk, lines that cross], a visible connection between homologous chromosomes during the first meiotic division in gametogenesis. Chiasmata appear as X-shaped configurations during the late prophase stage and provide the means by which homologous chromosomes exchange genetic material. See also **crossing over.** —*chiasmatic,* **chiasmic,** *adj.*

chiasmal. See **chiasm.**

chiasmapexy /kī·az′məpek′sē/, surgery involving the optic chiasm.

chiasmatypy. See **crossing over.**

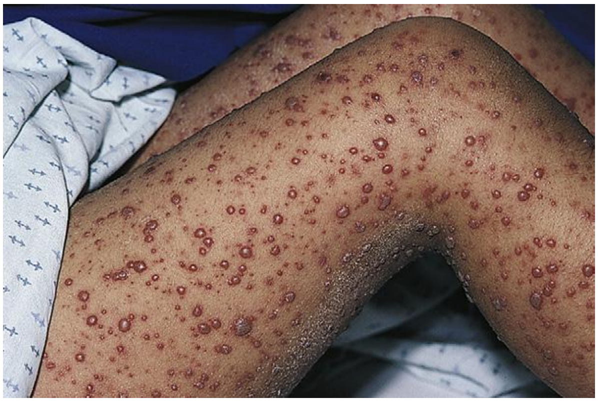
chiasmic. See **chiasm, chiasma.**

chickenpox /chik′ənpoks′/ [AS, *cicen* + ME, *pokke*], an acute, highly contagious viral disease caused by a herpesvirus, varicella zoster virus. It occurs primarily in young children and is characterized by crops of pruritic vesicular eruptions on the skin. The disease is transmitted by direct contact with skin lesions or, more commonly, by droplets spread from the respiratory tract of infected persons, usually in the prodromal period or the early stages of the rash. The vesicular fluid and the scabs are infectious until entirely dry. Indirect transmission through uninfected persons or objects is rare. The diagnosis is usually made by physical examination and by the characteristic appearance of the disease. The virus may be identified by culture of the vesicle fluid. Also called **varicella.**

■ OBSERVATIONS: The incubation period averages 2 to 3 weeks, followed by slight fever, mild headache, malaise, and anorexia occurring about 24 to 36 hours before the rash begins. The prodromal period is usually mild in children but may be severe in adults. The rash, which is highly pruritic, begins as macules and progresses in 1 or 2 days to papules and, finally, to vesicles surrounding an erythematous base and containing clear fluid. Within 24 to 48 hours the vesicles turn cloudy and become umbilicated, are easily broken, and become encrusted. The lesions, which erupt in crops so that all three stages are present simultaneously, first appear on the back and chest and then spread to the face, neck, and limbs; they occur only rarely on the soles and palms. In severe cases, laryngeal or tracheal vesicles in the pharynx, larynx, and trachea may cause dyspnea and dysphagia. Prolonged fever, lymphadenopathy, and extreme irritability from pruritus are other symptoms. The symptoms last from a few days to 2 weeks.

■ INTERVENTIONS: Routine treatment consists of bed rest; medications to reduce fever; applications of topical antipruritics, such as wet compresses, calamine lotion, or a paste made from baking soda and water; or oral antihistamines, given for the relief of itching. Infected vesicles may be treated with neomycin-bacitracin, and systemic antibiotics may be given if the secondary bacterial infection is extensive. People who are susceptible and at risk for severe disease when exposed to the infection may be passively protected with zoster immune globulin, varicella-zoster immune globulin, immune serum globulin, or zoster immune plasma. A vaccine for active immunization is available for individuals 12 months of age and older. Babies born to women in whom chickenpox develops within 5 days of delivery are especially likely to have a severe case of the disease. One attack of the disease usually confers permanent immunity, although recurring episodes of herpes zoster occur, especially in elderly or debilitated people, resulting from reactivation of the virus. Herpes zoster virus, like all herpesviruses, lies dormant in certain sensory nerve roots after primary infection.

■ NURSING CONSIDERATIONS: Chickenpox in childhood is usually benign. Few cases require hospitalization. It may be serious or fatal in immunocompromised people, such as those infected with human immunodeficiency virus, those receiving chemotherapy or radiotherapy for malignant disease, those who have undergone organ transplantation, those with congenital or acquired defects in cell-mediated immunity, or those receiving high doses of steroids. Common complications are secondary bacterial infections, such as abscesses, cellulitis, pneumonia, and sepsis, and hemorrhagic varicella (tiny hemorrhages that may occur in the vesicles or surrounding skin). Less common complications are encephalitis, Reye's syndrome (associated with the use of aspirin), thrombocytopenia, and hepatitis.



Chickenpox *(Callen et al, 2000)*

chiclero ulcer /chikler′ō/ [Mex, *tzictli,* chicle; L, *ulcus*], a kind of American leishmaniasis caused by *Leishmania mexicana*. It is endemic among the workers in the Yucatan and Central America who harvest chicle from the forest. The disease is characterized by cutaneous ulcers on the head that usually heal spontaneously within 6 months, except for those on the pinna of the ear, which may last for years and cause scarring and deformities. See also **American leishmaniasis, leishmaniasis.**

chicory, a perennial herb found in the United States, India, and Egypt.

■ USES: It is used as a coffee substitute, as a source of fructooligosaccharides, as a mild laxative for children, and as a treatment for gout, rheumatism, loss of appetite, and digestive distress. It is generally recognized as safe in foods and may be effective as an appetite stimulant; there is insufficient reliable information for its other indications.

■ CONTRAINDICATIONS: It is contraindicated during pregnancy and lactation and in children. People who are hypersensitive to chicory or asteraceae/composit herbs also should avoid its use, and it is contraindicated for people with gallstones.

χ^2 distribution. See **chi square distribution.**

Chido-Rodgers blood group /chē′dōroj′ərz/, a blood group consisting of nine antigens that are fragments of the C4 component of complement that attaches to the red cell from plasma.

chief cell [Fr, *chef;* L, *cella,* storeroom], **1.** also called **zymogenic cell.** Any one of the columnar epithelial cells or the cuboidal epithelial cells that line the gastric glands and secrete pepsinogen and intrinsic factor, which are needed for the digestion and absorption of vitamin B_{12} and the normal development of red blood cells. Pernicious anemia may be caused by the absence of intrinsic factor. **2.** any one of the epithelioid cells with pale-staining cytoplasm and a large nucleus containing a prominent nucleolus. Cords of such cells form the main substance of the pineal body. **3.** also called **principal cell.** Any one of the polyhedral epithelial cells, within the parathyroid glands, which contain pale, clear cytoplasm and a vesicular nucleus.

chief complaint (CC), a subjective statement made by a patient describing the most significant or serious symptoms or signs of illness or dysfunction that caused him or her to seek health care. It is used most often in a health history.

chief executive officer (CEO, C.E.O.), the most senior official of an organization or institution.

chief resident, a senior resident physician who acts temporarily as the clinical and administrative director of the house staff in a department of the hospital. The period of duty varies, depending on the size of the department, the length of the residency, and the number of house staff members.

chief surgeon, a surgeon appointed or elected head of the surgeons on the staff of a health care facility.

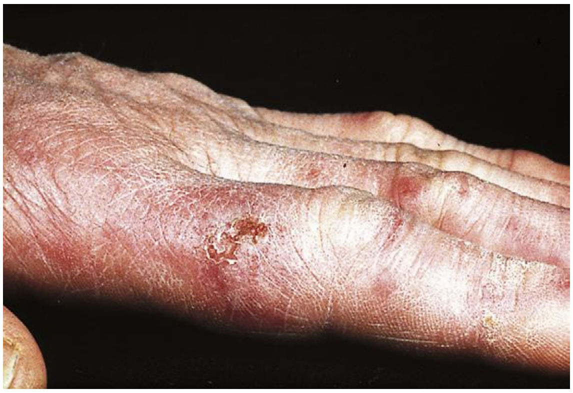
chigger /chig′ər/ [Fr, *chique*], the larva of *Trombicula* mites found in tall grass and weeds. It sticks to the skin and causes irritation and severe itching. Also called **harvest mite, red bug, red mite.** Compare **chigoe.**

chigoe /chig′ō/, a flea, ***Tunga penetrans,*** found in tropical and subtropical America and Africa. The pregnant female flea burrows into the skin of the feet, causing an inflammatory condition that may lead to spontaneous amputation of a toe. Also called **burrowing flea, jigger, sand flea.** Compare **chigger.**

chikungunya /chik′ungun′yə/ [Swahili, that which bends up], a self-limited disease resembling dengue, not transmissible among people, seen mainly in Africa and Southeast Asia, caused by an alphavirus transmitted chiefly by mosquitoes of the genus ***Aedes.*** Its most prominent symptoms are musculoskeletal, and it has occasionally been associated with hemorrhagic fever. It is a possible agent for bioterrorism dispersed as an aerosol or via infected mosquitoes.

chikungunya encephalitis /chik′əngun′yə/ [Swahili, that which bends up; Gk, *enkephalos,* brain, *itis,* inflammation], a togavirus infection characterized by a high fever that begins abruptly, muscle aches, a rash, and pain in the joints. It is transmitted by the bite of a mosquito and occurs mainly in Africa, in Asia, and on some of the Pacific islands, including Guam. The fever may last for a week, then rise again after a remission of several days. Pain in the joints may continue after other symptoms have ceased. Supportive nursing care and symptomatic relief are the only treatments. The disease is almost always self-limiting and rarely fatal.

chilblain /chil′blān/ [AS, *cele,* cold, *bleyn,* blister], redness and swelling of the skin caused by excessive exposure to cold. Burning, itching, blistering, and ulceration that are similar to those characteristic of a thermal burn may occur. Treatment includes protection against cold and injury, gentle warming, and avoidance of tobacco. Also called **pernio.** Compare **frostbite.**



Chilblain *(du Vivier, 1993)*

chilblain lupus erythematosus, a form of discoid lupus erythematosus aggravated by cold, initially resembling chilblains, in which the lesions consist of small, hardened, reddened nodular areas on the exposed areas of the body, especially the finger knuckles.

child [AS, *cild*], **1.** a person of either sex between the time of birth and adolescence. **2.** an unborn or recently born human being; fetus; neonate; infant. **3.** an offspring or descendant; a son or daughter or a member of a particular tribe or clan. **4.** one who is like a child or immature.

child abuse, the physical, sexual, or emotional maltreatment of a child. Child abuse predominantly affects children less than 3 years of age and is the result of multiple and complex factors involving both the parents and the child, compounded by various stressful environmental circumstances, such as inadequate physical and emotional support within the family and any major life change or crisis, especially those crises arising from marital strife. Parents at high risk for abuse are characterized as having unsatisfied needs, difficulty in forming adequate interpersonal relationships, unrealistic expectations of the child, and a lack of nurturing experience, often involving neglect or abuse in their own childhoods. Predisposing factors among children include the temperament, personality, and activity level of the child; order of birth in the family; sensitivity to parental needs; and requirement for special physical or emotional care resulting from illness, premature birth, or congenital or genetic abnormalities. Identification of abused children or potential child abusers is a major concern for all health care workers. Obvious physical marks on a child's body, such as burns, welts, or bruises, and signs of emotional distress, including symptoms of failure to thrive, are common indications of some degree of neglect or abuse. Often, radiograph films to detect healed or new fractures of the extremities or diagnostic tests to identify sexual molestation are necessary. If abuse is suspected, the health care worker is required to make the necessary report. Special counseling services or support groups, such as Parents Anonymous, help families in which a child is abused. The nurse can play a significant role in preventing abuse by promoting a positive parent-child relationship, especially in the neonatal period, by teaching parents proper child care and disciplinary techniques, by explaining normal child development and behavior so that parents can formulate realistic guidelines for discipline, and by identifying parents at risk for child abuse. Compare **child neglect.**

■ OBSERVATIONS: Abuse may reveal itself through physical, sexual, and/or emotional manifestations. Physical signs include unexplained bruising on soft tissue areas, such as the face, back, neck, buttocks, upper arms, thighs, ankles, and back of legs; multiple bruises at different stages of healing; burns; bites; cuts; unexplained head or abdominal injuries; multiple fractures; or x-ray evidence of multiple old fractures. The child may exhibit a fear of being hit or hurt. The child may be wearing long-sleeve shirts or similar clothing to hide injuries. Patterns of sexual abuse are evidenced as torn, stained, or bloody underclothing; bruising, redness, swelling, or bleeding of the genitalia, vagina, or rectum; statements that it hurts to walk or sit; and complaints of pain or itching in the genital area. The child may play out abuse with dolls or playmates. Emotional abuse may be exhibited in the child as inappropriate behavior or developmental delays in speech or social interactions. This may be accompanied by facial tics, rocking motions, and odd reactions to persons in authority. Emotional abuse is often seen in combination with other forms of abuse or neglect. Patterns of neglect are evidenced through a lack of care and attention. The child may have to provide care for him or herself that is inappropriate for his or her age or developmental level. The child may be unresponsive or withdrawn, or may not respond to the caregiver's coaxing. Nonorganic failure to thrive or malnutrition should be considered when a healthy baby appears to have lost weight or physical tone, especially when the infant is

25% below the expected growth curve. Diagnosis is typically made by social service, health care, and legal experts after history, investigation, and physical examination. A physical exam is conducted to show injuries or evidence of past injuries and general state of health and hygiene (height or weight parameters that are less than expected, malnourishment, and unkempt appearance). Information, drawing, or play behaviors from child that include evidence of abuse are also diagnostic tools, as are observation of child-parent interactions (eye contact, touching, verbal interaction, and/or parental concern). Severe injury, disability, developmental delay, mental impairment, and death are all complications of chronic and/or severe physical abuse. Abuse victims have an increased likelihood of becoming abusers.

■ INTERVENTIONS: Initial interventions are geared toward stabilizing injuries and preventing further abuse. If serious signs are obvious, the situation should be reported to the appropriate local sources for immediate investigation. If the child is perceived to be in immediate danger, child protection should be sought through the local child protection agency. If the signs are vague or inconsistent, observations need to be documented and reported to appropriate local sources for investigation. Long-term interventions include monitoring, therapy, and support for child and abuser(s).

■ NURSING CONSIDERATIONS: Nurses serve as a front-line resource for the detection and prevention of child abuse. This includes the identification of high-risk dependent child relationships, such as lack of prenatal care; previous history of child abuse or neglect; prior removal of other children from the home; parents with a history of substance abuse, depression, or other psychiatric illness; parents with a history of domestic violence; parents who were themselves abused as children; lack of adequate support networks or resources; and infants or children with high care demands. The nurse needs to do a thorough assessment for signs of abuse or neglect, monitor parent-child interactions, and report any suspicions through appropriate channels. The nurse is also instrumental in the institution of actions, such as parenting classes, home visits, early intervention, support groups for parents, and counseling to prevent or halt abuse. Social agency referrals should be made for financial assistance, food, clothing, and shelter needs. Education centers on teaching about realistic expectations for child behavior at various stages of development, and about appropriate forms of discipline and on providing information on available community resources, such as Parents Anonymous or Parents United International.

child adaptation to hospitalization, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the adaptive response of a child from 3 years through 17 years of age to hospitalization. See also **Nursing Outcomes Classification.**

childbearing period [AS, *cild* + *beran,* to bear; Gk, *peri,* around, *hodos,* way], the reproductive period in a woman's life, from puberty to menopause. It is the time during which she is physiologically able to conceive children.

childbed fever. See **puerperal fever.**

childbirth. See **birth.**

childbirth center, a health facility where prenatal care and delivery services are made available to low-risk pregnant women by a team of nurse-midwives, obstetricians, pediatricians, and ancillary health professionals.

childbirth preparation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as providing information and support to facilitate childbirth and to enhance the ability of an individual to develop and perform the parental role. See also **Nursing Interventions Classification.**

child development, the various stages of physical, social, and psychological growth that occur from birth through young adulthood. See also **adolescence, development, growth, infant, neonatal period, psychosexual development, psychosocial development, toddler.**

child development: 1 month, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as milestones of physical, cognitive, and psychosocial progression by 1 month of age. See also **Nursing Outcomes Classification.**

child development: 2 months, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as milestones of physical, cognitive, and psychosocial progression by 2 months of age. See also **Nursing Outcomes Classification.**

child development: 4 months, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as milestones of physical, cognitive, and psychosocial progression by 4 months of age. See also **Nursing Outcomes Classification.**

child development: 6 months, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as milestones of physical, cognitive, and psychosocial progression by 6 months of age. See also **Nursing Outcomes Classification.**

child development: 12 months, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as milestones of physical, cognitive, and psychosocial progression by 12 months of age. See also **Nursing Outcomes Classification.**

child development: 2 years, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as milestones of physical, cognitive, and psychosocial progression by 2 years of age. See also **Nursing Outcomes Classification.**

child development: 3 years, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as milestones of physical, cognitive, and psychosocial progression by 3 years of age. See also **Nursing Outcomes Classification.**

child development: 4 years, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as milestones of physical, cognitive, and psychosocial progression by 4 years of age. See also **Nursing Outcomes Classification.**

child development: 5 years, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as milestones of physical, cognitive, and psychosocial progression by 5 years of age. See also **Nursing Outcomes Classification.**

child development: middle childhood, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as milestones of physical, cognitive, and psychosocial progression from 6 years through 11 years of age. See also **Nursing Outcomes Classification.**

child development: adolescence, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as milestones of physical, cognitive, and psychosocial progression from 12 years through 17 years of age. See also **Nursing Outcomes Classification.**

childhood, **1.** the period in human development that extends from birth until the onset of puberty. **2.** the state or quality of being a child. See also **development, growth.**

childhood aphasia, an inability to process language, caused by a brain dysfunction in childhood.

childhood disintegrative disorder, pervasive developmental disorder characterized by marked regression in a variety of skills, including language, social skills or adaptive behavior, play, bowel or bladder control, and motor skills, after at least 2, but less than 10, years of apparently normal development.

childhood myxedema [AS, *cildhad* + Gk, *myxa,* mucus, *oidema,* swelling], a juvenile form of hypothyroidism characterized by atrophy of the thyroid gland after a severe infection of the gland. Also called **juvenile myxedema.**

childhood-onset pervasive developmental disorders, disturbances in thought, affect, social relatedness, and behavior that emerge usually between the ages of 30 months and 12 years of age. An example is autism. See also **pervasive developmental disorders.**

childhood polycystic disease. See **polycystic kidney disease.**

childhood triad, three types of behavior—fire setting, bedwetting, and cruelty to animals—that may predict emerging sociopathy when they occur consistently or in combination.

child life specialist, a professional who specializes in the use of developmental, educational, and therapeutic interventions that help children and their families cope with challenging life events and experiences, such as those related to health care and hospitalization.

child neglect, the failure by parents or guardians to provide for the basic human needs of a child by physical or emotional deprivation that interferes with normal growth and development or that places the child in jeopardy. Compare **child abuse.** See also **failure to thrive, maternal deprivation syndrome.**

child psychology, the study of the mental, emotional, and behavioral development of infants and children. See also **applied psychology.**

Child-Pugh classification, a classification of severity of cirrhosis with five different parameters assigned scores of 1 to 3, with 3 being the most negative or severe finding, that are then added together. The parameters are hepatic encephalopathy, ascites, total bilirubin, serum albumin, and prothrombin time.

child welfare, a service agency sponsored by the community or special organizations that provide for the physical, social, or psychological care of children.

-chilia. See **-cheilia.**

chill [AS, *cele*], **1.** the sensation of cold caused by exposure to a cold environment. **2.** an attack of shivering with pallor and a feeling of coldness, often occurring at the beginning of an infection and accompanied by a rapid rise in temperature.

chilo-, prefix for medical terms relating to the lips. See also **cheilo-.**

Chilomastix /kīʹlōmasʹtiks/, a genus of flagellate protozoa, such as *Chilomastix mesnili,* a nonpathogenic intestinal parasite of humans. Infection with this organism may be the occasional cause of diarrhea in children. Transmission is through the oral-fecal route.

chimera /kimirʹə, kīmirʹə/ [Gk, *khimaros,* fire-breathing monster], an organism carrying cell populations derived from two or more different zygotes of the same or different species. Chimeras include recipients of tissue grafts from other individuals. Compare **mosaic.**

chimerism /kimirʹizəm/, a state in bone marrow transplantation in which bone marrow and host cells exist compatibly without signs of graft-versus-host rejection disease.

chimney-sweeps' cancer. See **scrotal cancer.**

chin, the raised triangular portion of the mandible and the soft tissue over it below the lower lip. It is formed by the mental protuberance.

Chinese herbal medicine, a highly complex system of diagnosis and treatment using medicinal herbs, one of the branches of traditional Chinese medicine. Herbs used range from the nontoxic and rejuvenating, such as ginseng, which are used to support the body's healing system, to highly toxic ones, such as aconite, used in the treatment of disease.

Chinese restaurant syndrome, a group of transient symptoms consisting of tingling and burning sensations of the skin, facial pressure, headache, and chest pain that occur immediately after eating food containing monosodium glutamate, frequently used in Chinese cooking. It is a pharmacological reaction and not an allergic reaction.

Chinese rhubarb, *Rheum palmatum.*

chin reflex, chin-jerk reflex. See **jaw jerk.**

chinstick. See **mouthstick.**

chip [AS, *kippen,* to slice], **1.** *n,* a relatively small piece of a bone or tooth. **2.** *v,* to break off or cut away a small piece. **3.** *n,* a semiconductor in which an integrated circuit is embedded.

chip fracture, any small fragmental fracture, usually one involving a bony process near a joint.

chip graft, a transplant consisting of small pieces of cartilage or bone that are packed into defective bone structures.

chir-. See **cheiro-.**

chiral, (in physical science) describing a compound that cannot be superimposed on its mirror image.

chiralgia /kəralʹjə/, a pain in the hand, particularly one that does not result from a nerve injury or disease.

chirality. See **handedness.**

-chiria, -cheiria, **1.** suffix meaning a "(specified) condition involving hands": *acephalochiria, dichiria.* **2.** suffix meaning a "(specified) condition involving stimulus and its perception": *allochiria, synchiria.*

chiro-. See **cheiro-.**

chiroplasty. See **cheiroplasty.**

chiropodist. See **podiatrist.**

chiropody. See **podiatry.**

chiropractic /kīʹrōprakʹtik/ [Gk, *cheir,* hand, *practikos,* efficient], a system of therapy based on the theory that the state of a person's health is determined in general by the condition of his or her nervous system. In most cases, treatment provided by chiropractors involves the mechanical manipulation of the spinal column. Some practitioners employ radiology for diagnosis and use physiotherapy and diet in addition to spinal manipulation. Chiropractic does not use drugs or surgery, the primary basis of treatment used by medical physicians. A chiropractor is awarded the degree of Doctor of Chiropractic, or D.C., after completing at least 2 years of premedical studies followed by 4 years of training in an approved chiropractic school. Compare **allopathic physician.**

chiropractor /-prakʹtər/, a practitioner of **chiropractic.**

chirospasm. See **writer's cramp.**

chisel fracture, any fracture in which there is oblique detachment of a bone fragment from the head of the radius.

chi square (χ^2) /kī/, (in statistics) a statistic test for an association between observed data and expected data represented by frequencies. The test yields a statement of the probability of the obtained distribution having occurred by chance alone.

chi square distribution /kī skwar/, a theoretical probability distribution of the sum of the squares of a number *(k)* of normally distributed variables whose mean is 0 and standard deviation is 1. The parameter *k* is the number of degrees of freedom. It is widely used for statistical significance in biology and medicine. Also written *χ^2 distribution.*

Chlamydia /kləmidʹē·ə/ [Gk, *chlamys,* cloak], **1.** a microorganism of the genus *Chlamydia.* **2.** a genus of microorganisms that live as intracellular parasites, have a number of properties in common with gram-negative bacteria, and are currently classified as specialized bacteria. Three species of *Chlamydia* have been recognized; all are pathogenic to humans. *Chlamydia trachomatis,* an organism that lives in the conjunctiva of the eye and the epithelium of the urethra and cervix, is responsible for inclusion conjunctivitis and the sexually transmitted diseases lymphogranuloma venereum, pelvic inflammatory disease, and trachoma. *C. trachomatis* is one of the most common sexually transmitted organisms in North America and a frequent cause of sterility. *C. psittaci* is an organism that infects birds and causes a type of pneumonia in humans. *Chlamydia pneumoniae* is the causative organism of Taiwan acute respiratory disease, which is responsible for both upper and lower respiratory tract infections and commonly causes community acquired pneumonias. The incubation period ranges from 3 to 21 days. The diagnosis is made by tissue culture or Gram's stain of endocervical or urethral discharge. Treatment consists of one of the following: **doxycycline, azithromycin, erythromycin,** or **ofloxacin.** Considerations for health care providers include encouraging patients to refer for testing any sexual partners of the past 60 days. The health care provider should educate the patient about condom use, medications, and avoidance of sexual intercourse until drug therapy is completed and symptoms are gone. See also **psittacosis.** **—***chlamydial, adj.*

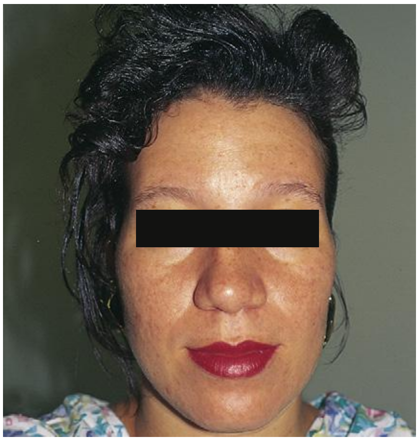
chlamydial perihepatitis, perihepatitis caused by extension of a chlamydial infection.

***Chlamydia pneumoniae* pneumonia** /klə·mid′ē·ə no͞o·mō′-nē·ē/, a mild form of primary atypical pneumonia caused by infection with *C. pneumoniae*, characterized by fever, rales, and infiltration of a middle or lower lobe; the recovery period is usually prolonged.

***Chlamydia* test,** a microscopic examination or blood test used to determine the presence of the many *Chlamydia* species that cause human diseases such as respiratory tract infections, sexually transmitted disease, eye disease, genital and urethral infections, and pelvic inflammatory disease.

***Chlamydia trachomatis* pneumonia** /klə·mid′ē·ə trəkom′ə·tis/, a mild type of bacterial pneumonia, usually seen in infants whose mothers are infected with *C. trachomatis*. Characteristics include coughing, tachypnea, and eosinophilia.

chloasma /klō·az′mə/ [Gk, *chloazein*, to be green], tan or brown pigmentation, particularly of the forehead, cheeks, and nose, commonly associated with pregnancy, the use of oral contraceptives, or hormone replacement therapy. The hyperpigmentation may be permanent or may disappear, only to recur with subsequent pregnancies or use of oral contraceptives, and is frequently treated with bleaching agents such as hydroquinone. Also called **gravidarum chloasma, mask of pregnancy, melasma.**



Chloasma *(Swartz, 2009)*

chloasma traumaticum, a pigmentary discoloration that results from friction on the skin.

chloasma uterinum, a skin discoloration on the face that occurs in pregnant women or in women who take progestin-based oral contraceptives.

chlor-, prefix meaning "green": *chloremia, chlorephidrosis, chlorine.*

chloracne /klôrak′nē/ [Gk, *chloros,* green, *akme,* point], a skin condition characterized by small, black follicular plugs and papules on exposed surfaces, especially on the arms, face, and neck, of workers in contact with chlorinated compounds, such as cutting oils, paints, varnishes, and lacquers. Avoidance of contact with chlorinated compounds or the use of protective garments prevents the condition.

chloral camphor /klôr′əl/, a mixture of equal parts of camphor and chloral hydrate, used externally as a sedative.

chloral hydrate, a sedative and hypnotic.

■ INDICATIONS: It is prescribed for the short-term (less than 2 wks) relief of insomnia, anxiety, or tension and as a sedative/hypnotic for diagnostic procedures.

■ CONTRAINDICATIONS: Liver or kidney dysfunction or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are GI disturbances, skin rash, paradoxic excitement, and hypotension.

chloral hydrate poisoning, an adverse reaction to ingestion of trichloroethylidine glycol, also known as chloral hydrate, which is sometimes used as a hypnotic because of its depressive effects on the central nervous system. Symptoms include irritation of the digestive tract, vomiting, depressed breathing, shock, confusion, and injury to the liver and kidneys.

chlorambucil /klôr′ambo͞o′sil/, an alkylating agent.

■ INDICATIONS: It is prescribed in the treatment of a variety of malignant neoplastic diseases, including chronic lymphocytic leukemia and Hodgkin's disease.

■ CONTRAINDICATIONS: Bone marrow depression or known hypersensitivity to this drug prohibits its use. It is not given during pregnancy or within 28 days of chemotherapy or radiation therapy. Pregnancy should be avoided for 1 month after discontinuing use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are bone marrow depression, GI disturbance, skin rash, and hepatotoxicity.

chloramphenicol /-amfē′nikol/, an antibacterial and anti-rickettsial.

■ INDICATIONS: It is used for the treatment of serious infections when the microorganism is resistant to less toxic antibiotics and also when its ability to penetrate to the site of the infection is superior to less toxic alternative antibiotics.

■ CONTRAINDICATIONS: It is used only when safer drugs are contraindicated; pregnancy, lactation, or known hypersensitivity to this drug also prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are bone marrow depression, aplastic anemia, and gray syndrome (characterized by circulatory collapse, cyanosis, acidosis, abdominal distention, coma, and death).

chlordane poisoning. See **chlorinated organic insecticide poisoning.**

chlordiazepoxide /klôr′dī·az′əpok′sīd/, an antianxiety drug of the benzodiazepine type.

■ INDICATIONS: It is prescribed in the treatment of anxiety, nervous tension, and alcohol withdrawal symptoms.

■ CONTRAINDICATIONS: Acute narrow-angle glaucoma, pregnancy, or known hypersensitivity to this drug prohibits

its use. It should be used with caution in patients who are depressed or have a history of drug dependence.

■ ADVERSE EFFECTS: Adverse effects include respiratory depression. Among the more serious adverse reactions are withdrawal symptoms that appear on discontinuation of treatment. Drowsiness and fatigue commonly occur.

chlorhexidine /-hek′sidēn/, an antimicrobial agent used as a surgical scrub, hand rinse, and topical antiseptic. It is effective against gram-positive organisms, gram-negative organisms, aerobes, facultative anaerobes, and yeast.

chlorhydria. See **hyperchlorhydria.**

-chloric, suffix meaning "referring to or containing chlorine": *hydrochloric, hyperchloric, perchloric*.

chloride /klôr′īd/ [Gk, *chloros,* green], an anion of chlorine. Metal chlorides are salts of hydrochloric acid; the most common is sodium chloride (table salt).

chloride blood test, a blood test performed as part of multiphasic testing of electrolytes. It is performed along with other electrolyte tests to indicate the patient's acid-base balance and hydrational status.

chloride shift, an exchange of chloride ions in red blood cells in peripheral tissues in response to PCO_2 of blood. The shift reverses in the lungs.

chloridometer /klôr′idom′ətər/, an instrument for measuring the level of chlorides in body fluids.

chloriduria, an excessive level of chlorides in the urine.

chlorinated /klôr′ənā′tid/ [Gk, *chloros,* greenish], pertaining to material that contains or has been treated with chlorine.

chlorinated organic insecticide poisoning, poisoning resulting from the inhalation, ingestion, or absorption of chlorophenothane (DDT) and other insecticides containing chlorophenothane, such as heptachlor, dieldrin, and chlordane. It is characterized by vomiting, weakness, malaise, convulsions, tremors, ventricular fibrillation, respiratory failure, and pulmonary edema. Also called **DDT poisoning.**

chlorination [Gk, *chloros,* green], the disinfection or treatment of water or other substances with free chlorine.

chlorine (Cl) /klôr′ēn/, a yellowish green gaseous element of the halogen group. Its atomic number is 17; its atomic weight mass is 35.453. It has a strong, distinctive odor; is irritating to the respiratory tract; and is poisonous if ingested or inhaled. It occurs in nature chiefly as a component of sodium chloride in sea water and in salt deposits. It is used as a bleach and as a disinfectant to purify water for drinking or for use in swimming pools. Chlorine compounds in general use include many solvents, cleaning fluids, and chloroform. Most of the solvents and cleaning fluids containing chlorine are toxic when inhaled or ingested. Chloroform was formerly in general use as an anesthetic.

chloroacetophenone (CN) /klo′ro·as′etofe′nōn/, a commonly used tear gas.

chloroform /klôr′əfôrm′/ [Gk, *chloros* + L, *formica,* ant], **1.** a nonflammable volatile liquid that was the first liquid inhalation anesthetic to be discovered. (Nitrous oxide was the first gaseous inhalation anesthetic agent discovered.) Chloroform has a low margin of safety and significant toxicity. The drug is not used in the United States. **2.** a solvent that is hepatotoxic and nephrotoxic if ingested.

chloroleukemia /klôr′ōlo͞okē′mē·ə/ [GK, *chloros,* green, *leukos,* white, *haima,* blood], a kind of myelogenous leukemia in which specific tumor masses are not seen at autopsy, but body fluids and organs are green. See also **myelogenous leukemia.**

chlorolymphosarcoma /-lim′fōsärkō′mə/ *pl. chlorolymphosarcomas, chlorolymphosarcomata* [Gk, *chloros* + L, *lympha,* water; Gk, *sarx,* flesh, *oma,* tumor], a greenish neoplasm of myeloid tissue occurring in patients with myelogenous leukemia. The mononuclear cells in the peripheral blood are believed to be lymphocytes rather than myeloblasts, such as found with chloroma.

chloroma /klôrō′mə/, *pl. chloromas, chloromata,* a malignant, greenish neoplasm of myeloid tissue that occurs anywhere in the body of patients who have myelogenous leukemia. The green pigment is primarily myeloperoxidase (verdoperoxidase). The tumor tissue fluoresces bright red under ultraviolet light. Also called **chloromyeloma, granulocytic sarcoma, green cancer.**

Chloromycetin, a trademark for an antibacterial and antirickettsial **(chloramphenicol).**

chloromyeloma. See **chloroma.**

chlorophyll /klôr′əfil/ [Gk, *chloros* + *phyllon,* leaf], one of several pigments that absorb light energy and participate in the production of carbohydrates in photosynthetic organisms. Chlorophylls a and b are found in plants, chlorophyll c occurs in brown algae, and chlorophyll d occurs in red algae. Chlorophyll molecules contain a porphyrin ring system that binds a central magnesium ion. See also **photosynthesis.**

chloroprocaine /-prō′kān/, a local anesthetic with a chemical structure similar to that of procaine.

chloroquine /klôr′əkwīn′/, an antimalarial.

■ INDICATIONS: It is prescribed in the treatment of malaria, extraintestinal amebiasis, rheumatoid arthritis, discoid lupus erythematosus, scleroderma, pemphigus, and photoallergic reactions.

■ CONTRAINDICATIONS: Retinal or visual field changes, porphyria, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are GI disturbances, headache, visual disturbances resulting from retinal damage, and pruritus. It can turn the skin blue/black and/or the urine brown/black, bleach the hair, and cause photosensitivity.

chlorosis /klôrō′sis/, obsolete. an iron deficiency anemia of young women characterized by hypochromic, microcytic erythrocytes and a small reduction in the total number of erythrocytes. See also **anemia.**

chlorothiazide /-thī′əzīd/, a thiazide diuretic chemically related to sulfonamides; an antihypertensive.

■ INDICATIONS: It is prescribed in the treatment of hypertension and edema.

■ CONTRAINDICATIONS: Anuria or known hypersensitivity to thiazide medication or to sulfonamide derivatives prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are hypokalemia, hyperglycemia, and hyperuricemia. Hypersensitivity reactions may occur.

chlorpheniramine maleate /-fenir′əmēn/, an antihistamine.

■ INDICATIONS: It is prescribed in the treatment of a variety of hypersensitivity reactions, including rhinitis, skin rash, and pruritus.

■ CONTRAINDICATIONS: Asthma or known hypersensitivity to this drug prohibits its use. It is not given to newborns or lactating mothers.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are skin rash, hypersensitivity reactions, and tachycardia. Drowsiness and dry mouth commonly occur.

chlorpheniramine polistirex, sulfonated styrene-divinylbenzene copolymer complex with chlorpheniramine, having the same actions as the base, used in cough and cold preparations, administered orally.

chlorpheniramine tannate, the tannate salt of chlorpheniramine, having the same actions as the base, used in cough and cold preparations, administered orally.

chlorproMAZINE /-prō′məzēn/, a phenothiazine drug used as an antipsychotic and antiemetic.

■ INDICATIONS: It is prescribed in the treatment of psychotic disorders (mania, schizophrenia), severe nausea and vomiting, and intractable hiccups.

■ CONTRAINDICATIONS: Parkinson's disease, concurrent administration of central nervous system depressants, liver or renal dysfunction, severe hypotension, or known hypersensitivity to this drug or to other phenothiazine medication prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypotension, alteration in cardiac conduction, liver toxicity, a variety of extrapyramidal reactions, blood dyscrasias, and hypersensitivity reactions.

chlorproPAMIDE /-prō′pəmīd/, an oral antidiabetic.

■ INDICATION: It is prescribed in the treatment of non-insulin-dependent diabetes mellitus.

■ CONTRAINDICATIONS: Liver or kidney dysfunction or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse reactions are hematologic derangements and jaundice. Hypoglycemia, GI distress, and rashes are common adverse effects.

chlortetracycline hydrochloride /-tet′rəsī′klēn/, a tetracycline antibiotic used as a topical antiinfective.

■ INDICATIONS: It is prescribed in the treatment of bacterial infections.

■ CONTRAINDICATIONS: It is available topically only and has little systemic effect. Known hypersensitivity to this drug or to other tetracycline medication prohibits its use.

■ ADVERSE EFFECTS: Burning, stinging, and yellowing of the skin may occur.

chlorthalidone /-thal′idōn/, a diuretic and antihypertensive; a sulfonamide derivative.

■ INDICATIONS: It is prescribed in the treatment of high blood pressure and edema.

■ CONTRAINDICATIONS: Anuria or known hypersensitivity to this drug, to other thiazide medication, or to sulfonamide derivatives prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are hypokalemia, hyperglycemia, hyperuricemia, and hypersensitivity reactions.

Chlor-Trimeton, a trademark for an antihistamine **(chlorpheniramine maleate).**

chlorzoxazone /-zok′səzōn/, a skeletal muscle relaxant.

■ INDICATION: It is prescribed for the relief of muscle spasm.

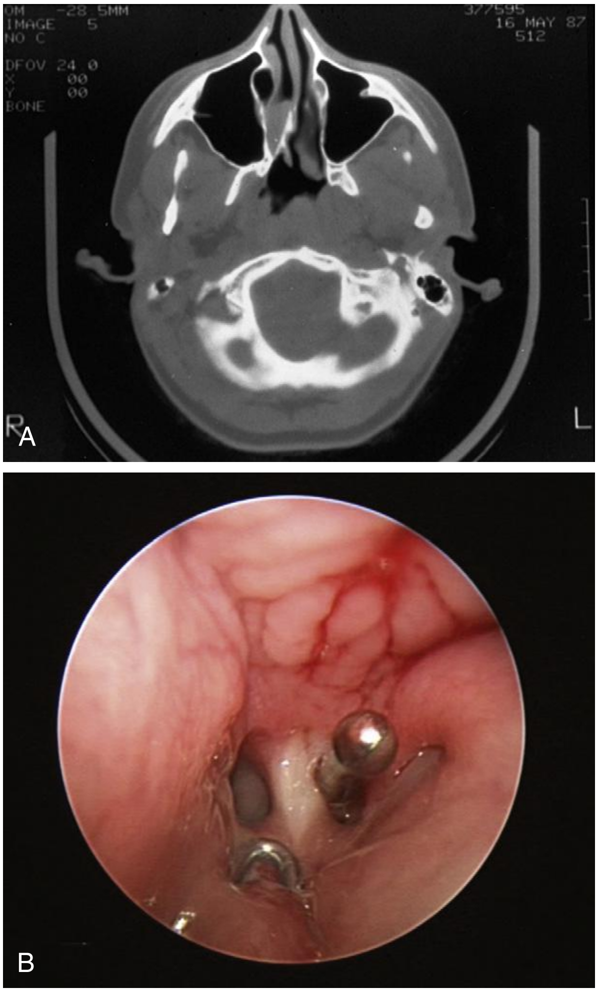
■ CONTRAINDICATIONS: Impaired liver function and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are jaundice and GI bleeding.

CHN, abbreviation for *Certified Hemodialysis Nurse*.

choana /kō′ənə/, *pl.* *choanae* **1.** a funnel-shaped channel. **2.** See **posterior nares.**

choanal atresia /kō′ənəl/ [Gk, *choane,* funnel, *a* + *tresis,* not hole], a congenital anomaly in which a bony or membranous occlusion blocks the passageway between the nose and pharynx. The condition, which is caused by the failure of the nasopharyngeal septum to rupture during embryonic development, can result in serious ventilation problems in the neonate; therefore providing an oral airway or endotracheal intubation may be necessary. The defect is usually repaired surgically shortly after birth.



A, Computed tomography scan demonstrating bony choanal atresia of the right side. B, Puncturing choanal atresia *(Myers and Carrau, 2008)*

chocolate cyst [Mex, *chocolatl* + Gk, *kystis,* bag], a darkly pigmented cyst sometimes found on the ovaries as a result of endometriosis. It results from an accumulation of extrauterine endometrial tissue.

choke [ME, *choken*], to interrupt breathing by compression or obstruction of the larynx or trachea.

choke damp. See **damp.**

choked disc. See **papilledema.**

chokes, a respiratory condition, occurring in decompression sickness, characterized by shortness of breath, substernal pain, and a nonproductive paroxysmal cough caused by bubbles of gas in the blood vessels of the lungs.

choke-saver, a curved forceps that can be inserted into the throat of a person who is choking on a food bolus or similar swallowed object. The tweezerlike device can grasp and retrieve the object.

choking, the condition in which a respiratory passage is blocked by constriction of the neck, an obstruction in the trachea, or swelling of the larynx. It is characterized by decreased movement of air through the airways or sudden coughing and a red face that rapidly becomes cyanotic. The person cannot breathe and clutches his or her throat.

Emergency treatment requires removal of the obstruction and resuscitation if necessary. See also **Heimlich maneuver.**

choking/lung/pulmonary agents, chemicals that cause severe irritation or swelling of the respiratory tract. Agents include ammonia, bromine, chlorine, osmium tetraoxide, phosgene, phosphine, and phosphorus. When inhaled, they cause damage to the lungs, either by their corrosive effects or by cytotoxicity, leading to respiratory distress and death from respiratory failure. Treatment consists of supportive care.

chol-. See **chole-.**

cholagogue /kō′ləgog/ [Gk, *chole*, bile, *agogein*, to draw forth], a drug that stimulates the flow of bile.

cholangiectasis /kōlan′jē·ek′təsis/, dilation of the bile ducts, usually as a sequel to obstruction.

cholangi(o) [word element [Gr.]], *bile duct*.

cholangiocarcinoma /kōlan′jē·ōkär′sinō′mə/, a cancer of the biliary epithelium. Risk factors include ulcerative colitis and infestation of liver flukes. Diagnosis is based on histological evaluation, and the prognosis is poor.

cholangiocellular carcinoma. See **cholangiohepatoma.**

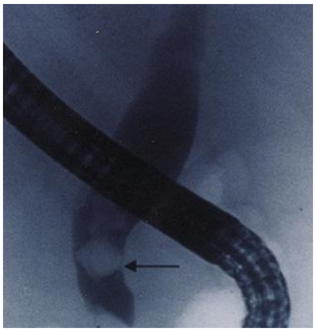
cholangiogram /kōlan′jē·əgram′/, an x-ray film of the bile ducts produced after injection of a radiopaque contrast medium. A cholangiogram is routinely performed before or after biliary tract surgery. A postoperative radiogram may be made after injecting an iodinated contrast medium through an indwelling T-tube. The medium also may be introduced directly into the biliary system or intravenously. See also **cholangiography, cholecystography.**

cholangiography /kōlan′jē·og′rəfē/, a special roentgenographic test procedure for outlining the major bile ducts by the IV injection or direct instillation of a radiopaque contrast material. See also **cholecystography.**

■ METHOD: For IV cholangiography the contrast agent is given slowly by vein, and x-ray films are taken of the region of the gallbladder. Operative and postoperative cholangiography use the injection of contrast material into the common bile duct via a drainage T-tube inserted during surgery to reveal any small, residual gallstones that are present. In percutaneous transhepatic cholangiography the contrast material is injected through a long needle or needle catheter, which is introduced directly through the skin into the substance of the liver. Endoscopic retrograde cholangiography is accomplished by cannulating the ampulla of Vater through a flexible fiberoptic duodenoscope and instilling radiopaque material directly into the common bile duct.

■ INTERVENTIONS: IV cholangiography cannot be used in the presence of severe liver disease or jaundice because the dye will not be concentrated and excreted into the bile. The patient fasts, and fluids are restricted overnight. An early morning cleansing enema is given, usually followed by a sedative. The patient is warned about a brief burning sensation that occurs as the dye is injected. For percutaneous transhepatic cholangiography, sedative premedication is often ordered and a local anesthetic injected at the site of needle puncture. Appropriate evaluation for bleeding tendencies must be carried out before percutaneous transhepatic cholangiography. Bile peritonitis is occasionally a complication of T-tube or percutaneous cholangiography, and close nursing observation is essential after the test is completed. For endoscopic retrograde cholangiography, nothing is given by mouth after midnight, an explanation is given to the patient, dentures are removed, and, to permit administration of medications, IV infusion is begun. The endoscope is passed with the patient in the left lateral position; then the patient is turned to the prone position, the ampulla is cannulated, the dye is injected, and films are taken. Vital signs are observed and the patient is given a light meal 2 to 4 hours after the procedure.

■ OUTCOME CRITERIA: The resulting cholangiograms from any of these procedures are examined for unobstructed outlining of the biliary system. Calculi may be noted as shadows within the opaque medium.



Cholangiography *(Goldman et al, 2008)*

cholangiohepatoma /kōlan′jē·ōhep′ətō′mə/, *pl. cholangiohepatomas, cholangiohepatomata,* a primary carcinoma of the liver that develops in the bile ducts in which an abnormal mixture of liver cord cells and bile ducts exists. Also called **cholangiocarcinoma, cholangiocellular carcinoma.** See also **hepatoma.**

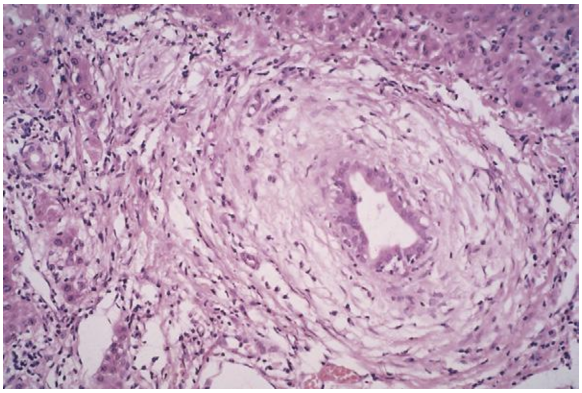
cholangiolitis /-lī′tis/, an abnormal condition characterized by inflammation of the fine tubules of the bile duct system (small bile radicles or cholangioles), which may cause cholangiolitic cirrhosis. —*cholangiolitic, adj.*

cholangioma /kōlan′jē·ō′mə/, *pl. cholangiomas, cholangiomata,* a neoplasm of the bile ducts.

cholangioscopy /kōlan′jē·os′kəpē/, direct examination of the bile ducts with a fiberoptic endoscope.

cholangiostomy /kōlan′jē·os′təmē/ [Gk, *chole,* bile, *angeion*, vessel, *stoma*, mouth], a surgical operation performed to form an opening in a bile duct.

cholangitis /kō′lanjī′tis/, inflammation of the bile ducts, caused either by bacterial invasion or by obstruction of the ducts by calculi or a tumor. The condition is characterized by severe right upper quadrant pain, jaundice (if an obstruction is present), and intermittent fever. Blood tests reveal an elevated level of serum bilirubin. Diagnosis is made by ultrasound evaluation and cholangiography. Treatment uses antibiotics for infection and surgery for acute obstruction. See also **biliary calculus.**



Primary sclerosing cholangitis *(Kumar et al, 2010)*

cholate, any salt or ester of cholic acid; an anion of cholic acid.

chole-, chol-, cholo-, prefix meaning “bile”: *cholecystectomy, cholelithotomy, cholesterase*.

cholecalciferol. See **vitamin D_3.**

cholecystagogue /kō′ləsis′təgog′/, a drug that stimulates emptying of the gallbladder.

cholecystalgia. See **biliary colic.**

cholecystectomy /kō′lisistek′təmē/ [Gk, *chole* + *kystis*, bag, *ektomē*, excision], the surgical removal of the gallbladder, performed to treat cholelithiasis, cholecystitis, and gallbladder cancer. Surgery may be delayed while the acute inflammation is treated. Before surgery an electrocardiogram and tests of hepatic function may be ordered. Under general anesthesia, the gallbladder is excised and the cystic duct ligated, the common duct is explored, and any stones found are removed. The most common complication is disruption of the hepatic or other ducts of the biliary system, requiring surgical correction. Wound infection, hemorrhage, bile leakage, and jaundice may also occur. When possible, cholecystectomy is done as a laparoscopic procedure. See also **cholecystitis, cholelithiasis.**

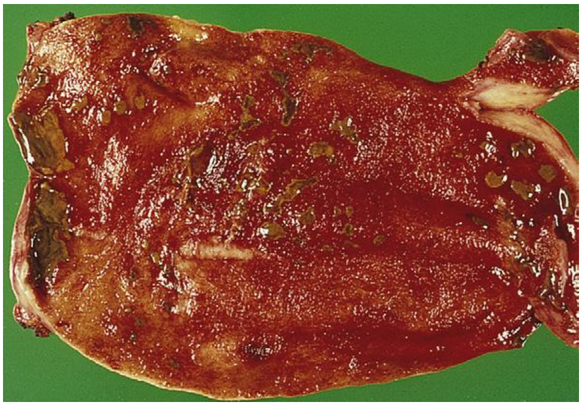
cholecystic /kō′lisis′tik/, pertaining to the gallbladder.

cholecystitis /kō′lisistī′tis/ [Gk, *chole* + *kystis*, bag, *itis*, inflammation], acute or chronic inflammation of the gallbladder. **Acute cholecystitis** is usually caused by a gallstone that cannot pass through the cystic duct. Pain is felt in the right upper quadrant of the abdomen, accompanied by nausea, vomiting, eructation, and flatulence. The patient may exhibit a positive **Murphy’s sign.** Diagnosis is usually made with ultrasound. Surgery is the preferred mode of treatment. **Chronic cholecystitis,** the more common type, has an insidious onset. Pain, often felt at night, may follow a fatty meal. Complications include biliary calculi, pancreatitis, and carcinoma of the gallbladder. Again surgery is the preferred treatment. See also **biliary calculus, cholecystectomy, cholelithiasis.**

■ OBSERVATIONS: Common manifestations for cholecystitis may range from indigestion to moderate to severe abdominal or shoulder pain accompanied by fever and jaundice. Symptoms for acute cholecystitis include colicky pain in right upper quadrant and right lower scapula, nausea and vomiting, and low-grade fever. Manifestations indicative of chronic cholecystitis include anorexia, flatulence, nausea, fat intolerance, episodic or diffuse abdominal pain, and heartburn. The gallbladder may be palpable, and palpation of right upper quadrant may elicit tenderness and stoppage of inspiration (Murphy’s sign). History may show ingestion of a large fatty meal before onset of pain. Ultrasonography is often performed initially to visualize gallstones. A nuclear imaging (hepatobiliary iminodiacetic acid scan) is useful in diagnosing acute cholecystitis. Necrosis and perforation of the gallbladder with generalized peritonitis, cholangitis with or without septic shock, pancreatitis, biliary cirrhosis, and bowel obstruction with perforation and peritonitis are all complications of biliary disease.

■ INTERVENTIONS: Conservative treatment of a cholecystitis attack includes control of pain, prevention of infection, and maintenance of fluid and electrolyte balance. Gastric decompression to reduce stimulation of the gallbladder may be indicated for control of severe nausea and vomiting. Antiinfective drugs are used to prevent infection, analgesics to treat pain, anticholinergics to reduce secretions, and antispasmodics to reduce smooth muscle spasms. Fat soluble vitamins and bile salts may also be prescribed. Laparoscopic cholecystectomy may be indicated to remove the gallbladder in acute disease. Endoscopic balloon or basket procedures may be used to remove stones. An endoscope retrograde cholangiopancreatography with or without stent placements and sphincterotomy may be used to extract ductal stones. Pulverization of stones by lithotripsy or dissolution of stones by oral ursodiol or methyl terbutyl instilled into gallbladder may also be used.

■ NURSING CONSIDERATIONS: Acute care is directed towards pain relief and fluid and electrolyte management. Preoperative care includes education about the surgical experience and reduction of anxiety about impending surgery. Postoperative care focuses on pain management, adequate ventilation, and prevention of postsurgical complications, such as bleeding or infection of surgical site. Education for those with an intact gallbladder includes instruction in a low-fat diet, institution of a consistent exercise program, and maintenance of normal weight. Any weight loss needs to be done slowly (1 to 2 lb a week) to prevent sludgy bile. If stones have been removed, the individual needs to understand that stones can recur and that medical follow-up is necessary.



Acute cholecystitis *(Damjanov and Linder, 2000)*

cholecyst(o) [word element [Gr.], a combining form meaning “gallbladder”.

cholecystoduodenostomy /kō′lēsis′tōdo͞o′ōdənos′təmē/ [Gk, *chole* + *kystis* + L, *duodeni*, twelve fingers], surgical anastomosis of the gallbladder and the duodenum.

cholecystogram /kō′lisis′təgram′/, an x-ray film of the gallbladder made after the ingestion or injection of a radiopaque substance, usually a contrast material containing iodine.

cholecystography /kō′lisistog′rəfē/, an x-ray examination of the gallbladder. At least 12 hours before the study the patient has a fat-free meal and ingests a contrast material containing iodine, usually in the form of tablets. It may also be given intravenously. The iodine, which is opaque to x-rays, is excreted by the liver into the bile in the gallbladder. After the procedure the patient consumes a fatty meal or cholecystokinin, which stimulates the gallbladder to contract, expelling bile and contrast material into the bile duct. Additional x-ray films are taken about 1 hour later. The test is useful in the diagnosis of cholecystitis, cholelithiasis, and tumors and in the differential diagnosis of a mass in the upper right quadrant of the stomach.

cholecystoileostomy /kō′lisis′tō·il′ē·os′təmē/ [Gk, *chole*, bile, *kystis*, bag, *eilein*, to twist, *stoma*, mouth], a surgical procedure performed to connect the gallbladder to the ileum. The connection may occur spontaneously after cholecystitis.

cholecystojejunostomy /kō′lē·sis′tōjəjo͞onos′təmē/ [Gk, *chole* + *kystis* + L, *jejunus*, empty], surgical anastomosis of the gallbladder and the jejunum. The anastomosis may occur spontaneously after cholecystitis.

cholecystokinin /-kī′nin/ [Gk, *chole* + *kystis*, bag, *kinein*, to move], a hormone produced by the mucosa of the upper intestine that stimulates contraction of the gallbladder and secretion of pancreatic enzymes.

cholecystokinin test (CCK test), a test to assess gallbladder function. After IV administration of cholecystokinin, the resultant pancreatic secretion of amylase, trypsin, and lipase is measured by collection through a tube in the duodenum. This test is often combined with the secretin test and is called the **secretin-cholecystokinin test.**

cholecystolithiasis /kō′lisis′tōlithī′əsis/, the presence of gallstones in the gallbladder.

cholecystolithotomy /ko′lisis′tōlithot′ämē/, incision of the gallbladder for removal of gallstones.

cholecystolithotripsy /kō′lisis′tōlith′ətripsē/, a procedure for crushing gallstones in the gallbladder or common bile duct with a lithotrite.

cholecystosonography /kō′lisis′tōsōnog′rəfē/, a method of examining the gallbladder using ultrasound.

choledochal /-dok′əl/ [Gk, *chole,* bile, *dochus,* containing], pertaining to the common bile duct.

choledochojejunostomy /kōled′ədok′ōjē′jo͞onos′təmē/ [Gk, *chole,* bile, *dochus,* containing; L, *jejunus,* empty; Gk, *stoma,* mouth], a surgical procedure in which the bile duct is connected to the jejunum.

choledocholith /kōled′əkōlith′/, a gallstone in the common bile duct.

choledocholithiasis. See **biliary calculus.**

choledocholithotomy /-lithot′əmē/ [Gk, *chole* + *dochus,* containing, *lithos,* stone, *temnein,* to cut], a surgical operation to make an incision in the common bile duct to remove a gallstone.

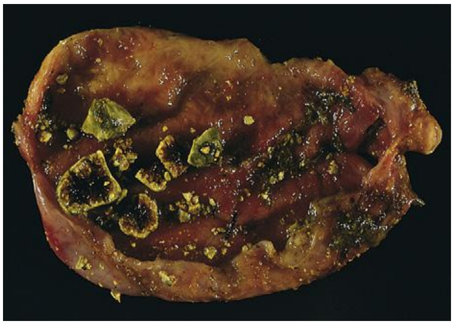
choledocholithotripsy /-lith′ətrip′sē/, a procedure for crushing gallstones in the common bile duct with a lithotrite.

choledocholitis, an inflammation of the common bile duct.

Choledyl, a trademark for a theophylline derivative **(oxtriphylline).**

choleic /kōlē′ik/, pertaining to bile.

cholelithiasis /-lithī′əsis/ [Gk, *chole* + *lithos,* stone, *osis,* condition], the presence of **gallstones** in the gallbladder. The condition affects about 20% of the population above 40 years of age and is more prevalent in women and in persons with cirrhosis of the liver. Many patients complain of unlocalized abdominal discomfort, eructation, and intolerance to certain foods. Others have no symptoms. In patients with severe attacks of biliary pain associated with cholelithiasis, cholecystectomy is recommended to prevent such complications as cholecystitis, cholangitis, and pancreatitis. Also called **cholithiasis.** See also **biliary calculus, cholecystitis.**



Cholelithiasis *(Kumar et al, 2007)*

cholelithic dyspepsia /kō′lilith′ik/ [Gk, *chole* + *lithos,* stone, *dys,* bad, *peptein,* to digest], an abnormal condition characterized by sudden attacks of indigestion associated with dysfunction of the gallbladder. See also **dyspepsia.**

cholelithotomy /-lithot′əmē/, a surgical operation to remove gallstones through an incision in the gallbladder.

cholera /kol′ərə/ [Gk, *chole* + *rhein,* to flow], an acute bacterial infection of the small intestine, characterized by severe watery diarrhea and vomiting, muscular cramps, dehydration, and depletion of electrolytes. The disease is spread by water and food that have been contaminated by feces of persons previously infected. The symptoms are caused by Cholera toxin, which is produced by the infecting organism, ***Vibrio cholerae.*** The profuse, watery diarrhea, as much as a liter an hour, depletes the body of fluids and electrolytes. Complications include circulatory collapse, cyanosis, destruction of kidney tissue, and metabolic acidosis. The rate of mortality is as high as 50% if the infection remains untreated. Treatment includes, first and foremost, replacement of fluids and electrolytes (oral rehydration therapy) or IV fluids and, second, the administration of antibiotics. A cholera vaccine is available for people traveling to areas where the infection is endemic but is of limited efficacy. Other preventive measures include drinking only water that has been boiled or decontaminated by iodine or commercially bottled water and eating only cooked foods. See also ***Vibrio cholerae,*** **vibrio gastroenteritis.**

choleragen /kol′ərəjin/, an exotoxin produced by the cholera vibrio that stimulates the secretion of electrolytes and water into the small intestine in Asiatic cholera, causing diarrhea and the loss of body fluids and weakening the patient.

cholera sicca, an old term for a malignant form of cholera, seen during epidemics, in which the patient experiences a massive outpouring of fluid and electrolytes into the digestive system and dies of toxemia before the usual symptoms of vomiting and diarrhea develop. Mortality is high with this condition, and it is often not recognized as cholera. Also called *cholera siderans,* **dry cholera.**

cholera vaccine, an active immunizing agent against cholera.

■ INDICATION: It is prescribed as an immunization against cholera.

■ CONTRAINDICATIONS: Immunosuppression, acute infection, concomitant administration of corticosteroids, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECT: The most serious adverse reaction is anaphylaxis.

choleresis /kō′lərē′sis/, the secretion of bile by the liver.

choleretic /kō′ləret′ik/ [Gk, *chole* + *eresis,* removal], **1.** *adj,* stimulating the production of bile in the liver either by cholepoiesis or by hydrocholeresis. **2.** *n,* a choleretic agent.

choleric /kol′ərik, kəler′ik/, having a hot temper or an irritable nature.

choleriform /kōler′ifôrm/, resembling cholera. Also called *choleroid.*

cholescintigraphy /kō′ləsintig′rəfē/, examination of the gallbladder and bile ducts by scanning with radionuclides.

cholestasis /-stā′sis/ [Gk, *chole* + *stasis,* standing still], interruption in the flow of bile through any part of the biliary system, from liver to duodenum. It is essential for the physician to discover whether the cause is within the liver (intrahepatic) or outside it (extrahepatic). Intrahepatic causes include hepatitis, drug and alcohol use, metastatic carcinoma, and pregnancy. Extrahepatic causes include presence of an obstructing calculus or tumor in the common bile duct and carcinoma of the pancreas. Symptoms of both types of cholestasis include jaundice, pale and fatty stools, dark urine, and intense itching over the skin. If liver disease is suspected, liver biopsy examination can confirm the suspicion, and attempts can be made to treat the underlying disorder. Extrahepatic cholestasis usually requires surgery. See also

cholestatic hepatitis, hyperbilirubinemia of the newborn. —*cholestatic, adj.*

cholestatic hepatitis, jaundice with bile stasis in inflamed intrahepatic bile ducts, usually caused by the toxic effects of a drug. Signs are persistent jaundice, itching, and elevated alkaline phosphatase levels. These signs usually abate when the hepatitis remits. See also **cholestasis, hepatitis.**

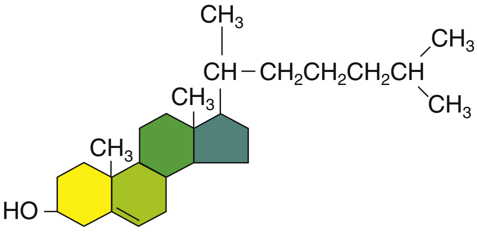
cholestatic jaundice /-stat′ik/, a yellowing of the skin caused by thickening of bile, obstruction of hepatic ducts, or changes in liver cell function.

cholesteatoma /kōles′tē·ətō′mə/ [Gk, *chole* + *stear,* fat, *oma,* tumor], a cystic mass composed of epithelial cells and cholesterol that is found in the middle ear and occurs as a congenital defect or as a serious complication of chronic otitis media. The mass may occlude the middle ear, or enzymes produced by it may destroy the adjacent bones, including the ossicles. Surgery is required to remove a cholesteatoma. See also **otitis media.**

cholesterase /kəles′tərās′/ [Gk, *chole* + *aither,* air; Ger, *saure,* acid; *ase,* enzyme suffix], an enzyme in the blood and other tissues that forms cholesterol and fatty acids by hydrolyzing cholesterol esters.

cholesteremia. See **cholesterolemia.**

cholesterol /kəles′tərôl/ [Gk, *chole* + *steros,* solid], a waxy lipid soluble compound found only in animal tissues. A member of a group of compounds called sterols, it is an integral component of every cell in the body. It facilitates the absorption and transport of fatty acids. Cholesterol acts as the precursor for the synthesis of various steroid hormones, including cortisol, cortisone, and aldosterone in the adrenal glands, and of the sex hormones progesterone, estrogen, and testosterone. It sometimes precipitates along with other compounds in the gallbladder to form gallstones. Cholesterol is found in foods of animal origin and is continuously synthesized in the body, primarily in the liver. Increased levels of low-density lipoprotein cholesterol may be associated with the pathogenesis of atherosclerosis, whereas higher levels of high-density lipoprotein cholesterol appear to lower the person's risk for heart disease. Normal adult levels of blood cholesterol are 150 to 200 mg/dL or 3.9 to 5.2 mmol/L (SI units). Also called **cholesterin.** See also **high-density lipoprotein, low-density lipoprotein, sterol.**



Cholesterol

Chemical structure of cholesterol
(Patton and Thibodeau, 2010)

cholesterol embolism, an embolism resulting from fracture of a plaque of atherosclerosis, most frequently caused by trauma to the aorta during cardiac catheterization.

cholesterolemia /-ē′mē·ə/, **1.** the presence of excessive amounts of cholesterol in the blood. **2.** the abnormal condition of the presence of excessive amounts of cholesterol in the blood. Also called **cholesteremia.** See also **hypercholesterolemia.**

Cholesterol and lipoprotein profile classification

Cholesterol reading	*Classification*
Total cholesterol (mg/dL)	
<200	Desirable
200-239	Borderline high risk
≥240	High risk
LDL cholesterol (mg/dL)	
<100	Optimal
100-129	Near optimal
130-159	Borderline high risk
160-189	High risk
≥190	Very high risk
HDL cholesterol (mg/dL)	
≥60	Optimal
<40	Low
Triglycerides (mg/dL)	
<150	Normal
150-199	Borderline high risk
200-499	High risk
≥500	Very high risk

Data from National Cholesterol Education Program (NCEP): *Third Report of the NCEP Expert Panel on Detection, Evaluation, and Treatment of High Blood cholesterol in Adults (Adult Treatment Panel III),* Washington, DC, 2002, National Institutes of Health.

cholesteroleresis /kəles′tərôler′isis, -erē′sis/ [Gk, *chole, steros* + *eresis,* removal], the increased elimination of cholesterol in the bile.

cholesterol metabolism, the sum of the anabolic and catabolic processes in the synthesis and degradation of cholesterol in the body. Serum cholesterol level is increased when it is ingested and is quickly absorbed. Cholesterol is also synthesized in the liver and can be synthesized by most other body tissues. As more cholesterol is ingested, less is synthesized by the body. Cholesterol is removed from the body by degradation in the liver and excretion in the bile.

cholesterolopoiesis /kəles′tərō′lōpō·ē′sis/ [Gk, *chole* + *steros* + *poiesis,* producing], the elaboration of cholesterol by the liver.

cholesterolosis /kəles′tərəlō′sis/, an abnormal condition, found in about 5% of patients with chronic cholecystitis, in which deposits of cholesterol occur within large macrophages in the submucosa of the gallbladder. This produces a spotty appearance, sometimes referred to as a strawberry gallbladder. Cholesterolosis is often associated with gallstones and may be asymptomatic or accompanied by biliary colic. Also called *cholesterosis.* See also **cholecystitis.**

cholesterol-restricted diet. See **low-cholesterol diet.**

cholesterol test, a blood test used to identify patients who are at risk for arteriosclerotic heart disease. Because cholesterol alone is not a totally accurate predictor of heart disease, this test is usually done as a part of lipid profile testing, which also evaluates levels of lipoproteins and triglycerides.

cholesteryl ester storage disease /kōles′təril/, an inherited disorder in which there is an accumulation of neutral lipids, such as cholesterol esters and glycerides, in body tissues. The disease may be asymptomatic or be characterized by hepatosplenomegaly, fat in the stools (steatorrhea), and adrenal calcification. The cause is a deficiency of the enzyme cholesterol ester hydrolase. There is no specific treatment. A form of the disorder affecting infants, with symptoms in the first weeks after birth, is Wolman's disease.

cholesteryl ester transfer protein (CETP), a plasma glycoprotein that plays a role in the movement of cholesterol from the peripheral tissue to the liver by mediating the transfer of cholesteryl esters from HDL cholesterol to apolipoprotein B–containing proteins, which are then metabolized to lipoproteins that are removed from the circulation by receptors in the liver. Deficiency of this protein, an autosomal-dominant trait, results in markedly higher plasma levels of HDL cholesterol and apolipoprotein A-I. Also called *lipid transfer p. I.*

cholestyramine /-tir′əmēn/, a drug used to treat hypercholesterolemia that acts on the liver's bile acids. It binds to bile acids and causes increased fecal elimination, which causes increased oxidation of cholesterol to bile acids, thereby lowering blood cholesterol levels.

cholestyramine resin, an ion-exchange resin and antihyperlipemic agent.

■ INDICATIONS: It is prescribed for oral administration to increase bile acid excretion in the stool, for the treatment of hyperlipoproteinemia, and for pruritus resulting from partial biliary obstruction.

■ CONTRAINDICATIONS: Complete biliary obstruction or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are fecal impaction, GI disturbances, and depletion of vitamins A, D, and K. Constipation is common. It interferes with the absorption of many other drugs, so other medicines should be given 1 hr before or 4-6 hr after cholestyramine.

-cholia, -choly, suffix meaning "(condition of the) bile": *albuminocholia, syncholia, uricocholia.*

cholic acid, a bile acid synthesized in the liver from cholesterol. Cholan-24-oic acid is stored in the liver bound to coenzyme A and converted to glycine and taurine bile salts before secretion into bile.

choline /kō′lēn/ [Gk, *chole,* bile], a lipotropic substance that can be synthesized by the body. Under certain circumstances it is considered by some to be essential. Found in most animal tissues, choline is a primary component of acetylcholine, the neurotransmitter, and functions with inositol as a basic constituent of lecithin. It prevents fat deposits in the liver and facilitates the movement of fats into the cells. The richest sources of choline are liver, kidneys, brains, wheat germ, brewer's yeast, and egg yolk. See also **inositol, lecithin.**

choline bitartrate, the bitartrate salt of choline, used as a dietary supplement.

choline chloride, the chloride salt of choline, used as a dietary supplement.

choline esters, a group of cholinergic drugs that act at sites or organs where acetylcholine is the neurotransmitter. Examples include bethanechol, carbachol, and methacholine.

choline magnesium trisalicylate, a combination of choline and magnesium salicylates, used as an analgesic, antipyretic, antiinflammatory, and antirheumatic, administered orally.

cholinergic /-ur′jik/ [Gk, *chole* + *ergon,* to work], **1.** pertaining to nerve fibers that liberate acetylcholine at the myoneural junctions. **2.** the tendency to transmit or to be stimulated by or to stimulate the elaboration of acetylcholine. Also called **cholinergic stimulant.** Compare **adrenergic, anticholinergic.**

cholinergic blocking agent, any agent that blocks the action of acetylcholine and substances similar to acetylcholine. Such agents, in effect, block the action of cholinergic nerves that transmit impulses by the release of acetylcholine at their synapses.

cholinergic crisis, a pronounced muscular weakness and respiratory paralysis caused by excessive acetylcholine, often apparent in patients suffering from myasthenia gravis as a result of overmedication with anticholinesterase drugs.

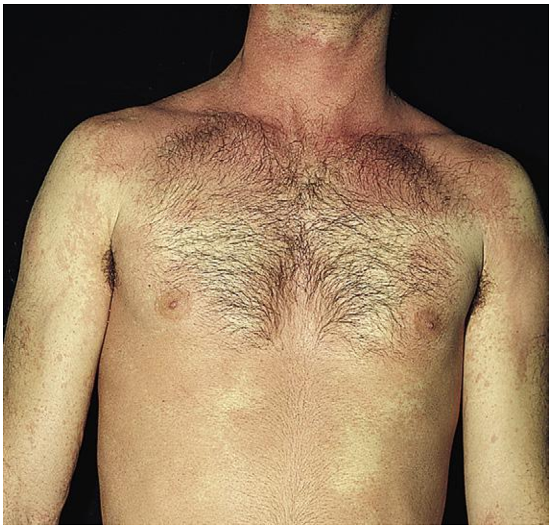
cholinergic fiber [Gr, *chole,* bile, *ergon,* work; L, *fibra*], a nerve fiber of the autonomic nervous system that releases the neurotransmitter acetylcholine. Cholinergic fibers include all preganglionic fibers, all postganglionic sympathetic fibers to sweat glands, and efferent fibers innervating skeletal muscle.

cholinergic nerve, a nerve that releases the neurotransmitter acetylcholine at its synapse. The cholinergic nerves include all the preganglionic sympathetic and preganglionic parasympathetic nerves, the postganglionic parasympathetic nerves, the somatic motor nerves to skeletal muscles, and some nerves to sweat glands and to certain blood vessels.

cholinergic receptor [Gk, *chole,* bile, *ergein,* to work; L, *recipere,* to receive], a specialized sensory nerve ending that responds to the stimulation of acetylcholine.

cholinergic stimulant. See **cholinergic.**

cholinergic urticaria [Gk, *chole* + *ergon,* to work; L, *urtica,* nettle], an abnormal and usually temporary vascular reaction of the skin, often associated with sweating, in susceptible individuals subjected to stress, strong exertion, or hot weather. The condition is characterized by small, pale, itchy papules surrounded by reddish areas. It is caused by the action of acetylcholine on mast cells. Compare **urticaria.**



Cholinergic urticaria *(Callen et al, 2000)*

choline salicylate, the choline salt of salicylic acid, used as an analgesic, antipyretic, antiinflammatory, and antirheumatic, administered orally.

cholinesterase /kō′lines′tərās/, an enzyme that acts as a catalyst in the hydrolysis of acetylcholine to choline and acetate. It provides the off mechanism during cholinergic neurotransmission.

cholinesterase inhibitor. See **anticholinesterase.**

cholinesterase test, a blood test done to identify patients with pseudocholinesterase deficiency before anesthesia or to identify patients who may have been exposed to organophosphate poisoning.

choliopancreatography /kō′lē·ōpan′krē·ātog′rəfē/ [Gk, *chole* + *pan,* all, *kreas,* flesh, *graphein,* to record], the radiographic examination of the bile and pancreatic ducts.

cholo-. See **chole-.**

Cholografin, a trade name of a diagnostic contrast medium used in radiology (iodipamide).

chololithiasis /kō′ləlithī′əsis/. See **cholelithiasis.**

Choloxin, a trademark for an antihyperlipoproteinemic (dextrothyroxine sodium).

-choly. See **-cholia.**

cholylglycine. See **glycocholic acid.**

cholyltaurine, a bile salt, the taurine conjugate of cholic acid. Also called *taurocholic acid.*

chondr-. See **chondro-.**

chondral /kon′drəl/, pertaining to cartilage.

chondralgia /kondral′jə/, pain that appears to originate in cartilage.

chondrectomy /kondrek′təmē/, the surgical excision of a cartilage.

chondri-. See **chondro-.**

-chondria, **1.** suffix meaning a "condition involving granules in cell composition": *lipochondria, mitochondria, plastochondria.* **2.** suffix from Greek *hypochondrion* ("below the cartilage"). The hypochondriac region was regarded as the seat of emotion.

chondrial bone [Gk, *chondros,* cartilage; AS, *ban,* bone], bone that forms under the periosteal membrane. Also called **perichondrial bone.**

chondriocont /kon′drē·ōkont′/, a threadlike or rod-shaped mitochondrion.

chondriome /kon′drē·ōm/ [Gk, *chondros,* cartilage], the total mitochondrial content of a cell, taken as a unit. Also called **chondrioma.**

chondriomite /kon′drē·ōmīt′/ [Gk, *chondros* + *mitos,* thread], a single, granular mitochondrion or a group of such mitochondria that appear in a chain formation.

chondriosome. See **mitochondrion.**

chondritis /kondrī′tis/, any inflammatory condition affecting the cartilage.

chondro-, chondr-, chondri-, prefix meaning "cartilage": *chondroblast, chondroclast, chondrocostal.*

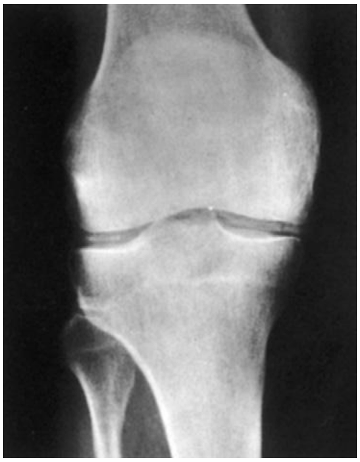
chondroadenoma. See **adenochondroma.**

chondroangioma /kon′drō·an′jē·ō′mə/ *pl. chondroangiomas, chondroangiomata* [Gk, *chondros* + *angeion,* vessel, *oma,* tumor], a benign mesenchymal tumor containing vascular and cartilaginous elements.

chondroblast /kon′drōblast/ [Gk, *chondros* + *blastos,* germ], any one of the cells that develop from the mesenchyma and form cartilage. Chondroblasts play an important role in endochondrial ossification and especially in longitudinal bone growth. Formerly called **chondroplast.**

chondroblastoma /kon′drōblastō′mə/, *pl. chondroblastomas, chondroblastomata,* a benign tumor, derived from precursors of cartilage cells, that develops most frequently in epiphyses of the femur and humerus, especially in young men. The lesions may contain scattered areas of calcification and necrosis. Also called **Codman's tumor.**

chondrocalcinosis /kon′drōkal′sinō′sis/ [Gk, *chondros* + L, *calyx,* lime; Gk, *osis,* condition], an arthritic disease in which calcium deposits are present in the peripheral joints. It resembles gout and often occurs in patients over 50 years of age who have osteoarthritis or diabetes mellitus. It most commonly invades the knee joint. Aspiration of synovial fluid from the affected joints reveals crystals of calcium salts, especially calcium pyrophosphate dihydrate. Inflammation and pain may be relieved by intraarticular injections of hydrocortisone and by antiinflammatory medications. Also called **pseudogout.** Compare **gout.**



Chondrocalcinosis *(Moll, 1997)*

chondrocarcinoma /kon′drōkär′sinō′mə/ *pl. chondrocarcinomas, chondrocarcinomata* [Gk, *chondros* + *karkinos,* crab, *oma,* tumor], a malignant epithelial tumor in which cartilaginous metaplasia is present.

chondroclast /kon′drōklast′/ [Gk, *chondros* + *klasis,* breaking], a giant multinucleated cell associated with the resorption of cartilage. —*chondroclastic, adj.*

chondrocostal /kon′drōkos′təl/ [Gk, *chondros* + L, *costa,* rib], pertaining to the ribs and the costal cartilages.

chondrocyte /kon′drəsīt/ [Gk, *chondros* + *kytos,* cell], any one of the polymorphic cells that form the cartilage of the body. Each contains a nucleus, a relatively large amount of clear cytoplasm, and the common organelles. —*chondrocytic, adj.*

chondrodysplasia /kon′drōdisplā′zhə/ [Gk, *chondros* + *dys,* bad, *plassein,* to form], an inherited disease characterized by abnormal growth at the ends of bones, particularly the long bones of the arms and legs. Bones of the hands and feet may be similarly affected.

chondrodysplasia punctata, an inherited form of dwarfism characterized by skin lesions, radiographic evidence of epiphyseal stippling, and a pug nose. There are two types of the anomaly: a benign Conradi-Hünermann form marked by mild asymmetric limb shortening and a lethal rhizomelic form with marked proximal limb shortening. The Conradi-Hünermann form of the disorder is transmitted by an autosomal-dominant gene and the rhizomelic form by an autosomal-recessive gene.

chondrodystrophia calcificans congenita /-distrō′fē·ə/ [Gk, *chondros* + *dys,* bad, *trophe,* nourishment; L, *calyx,* lime, *congenitus,* born with], an inherited defect characterized by many small opacities in the epiphyses of the long bones. This sign is present on x-ray films of the newborn. Dwarfism; contractures; cataracts; mental retardation; and short, stubby fingers develop as the infant grows into childhood. Also called *chondrodystrophia fetalis calcificans,* **Conradi's disease.**

chondrodystrophic myotonia. See **Schwartz-Jampel syndrome.**

chondrodystrophy /kon′drōdis′trəfē/ [Gk, *chondros* + *dys,* bad, *trophe,* nourishment], a group of disorders in which there is abnormal conversion of cartilage to bone, particularly in the epiphyses of the long bones. Patients are dwarfed, with normal trunks and shortened extremities. See also **achondroplasia.**

chondroectodermal dysplasia /kon′drō·ek′tədur′məl/, an inherited form of dwarfism marked by distal limb shortening, postaxial polydactyly, and cardiovascular abnormalities. It is transmitted by an autosomal recessive gene. Also called **Ellis-van Creveld syndrome.**

chondroendothelioma /kon′drō·en′dōthē′lē·ō′mə/ *pl. chondroendotheliomas, chondroendotheliomata* [Gk, *chondros* + *endon,* within, *thele,* nipple, *oma,* tumor], a benign mesenchymal tumor containing cartilaginous and endothelial components.

chondrofibroma /kon′drōfībrō′mə/, *pl. chondrofibromas, chondrofibromata,* a fibrous tumor that contains cartilaginous components.

chondrogenesis /kon′drōjen′əsis/, the development of cartilage. —*chondrogenetic, adj.*

chondroid /kon′droid/, resembling cartilage.

chondroid lipoma, an uncommon benign fatty neoplasm occurring as a well-circumscribed, yellow, sometimes encapsulated, slowly growing mass under the skin, typically affecting middle-aged adults, usually women, and most often involving the limb girdles or proximal extremities. It is characterized by a lobular growth pattern and is composed of large vacuolated cells resembling lipoblasts.

chondrolipoma /kon′drōlipō′mə/, *pl. chondrolipomas, chondrolipomata,* a benign mesenchymal tumor containing fatty and cartilaginous components.

chondroma /kondrō′mə/, *pl. chondromas, chondromata* a benign, fairly common tumor of cartilage cells that grows slowly within cartilage (enchondroma) or on the surface (ecchondroma). Kinds of chondromas are **joint chondroma** and **synovial chondroma.** See also **ecchondroma, enchondroma. —chondromatous,** *adj.*

-chondroma, suffix meaning a "benign cartilaginous tumor": *hyaloenchondroma, osteochondroma.*

chondromalacia /kon′drōməlā′shə/ [Gk, *chondros* + *malakia,* softness], a softening of cartilage. *Chondromalacia fetalis* is a lethal congenital form of the condition in which a stillborn infant has soft and pliable limbs. *Chondromalacia patellae* occurs in young adults after knee injury and is characterized by swelling, pain, and degenerative changes, which are revealed on x-ray examination.

chondroma sarcomatosum. See **chondrosarcoma.**

chondromatosis /kon′drōmətō′sis/, a condition characterized by the presence of many cartilaginous tumors. A kind of chondromatosis is **synovial chondroma.**

chondromatous. See **chondroma.**

chondromere /kon′drōmir/ [Gk, *chondros* + *meros,* part], a cartilaginous embryonic vertebra and its costal component.

chondromyoma /kon′drōmī·ō′mə/ *pl. chondromyomas, chondromyomata* [Gk, *chondros* + *mys,* muscle, *oma,* tumor], a benign mesenchymal tumor containing myomatous and cartilaginous tissue.

chondromyxofibroma /kon′drōmik′sōfībrō′mə/ [Gk, *chondros* + *myxa,* mucus; L, *fibra,* fiber, *oma,* tumor], a benign tumor that develops from cartilage-forming connective tissue. The lesion, typically a firm, grayish-white mass, tends to occur in the knee and small bones of the foot and may be confused with chondrosarcoma. Also called **chondromyxoid fibroma.**

chondromyxoid /kon′drōmik′soid/ [Gk, *chondros* + *myxa,* mucus, *eidos,* form], composed of cartilaginous and myxoid elements.

chondromyxoid fibroma. See **chondromyxofibroma.**

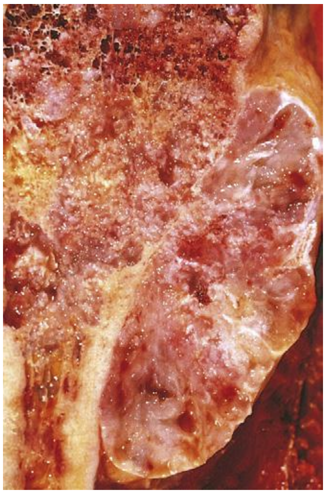
chondrophyte /kon′drōfīt′/ [Gk, *chondros* + *phyton,* growth], an abnormal mass of cartilage. —*chondrophytic, adj.*

chondroplasia /-plā′zhə/ [Gk, *chondros,* cartilage, *plassein,* to form], the formation of cartilage.

chondroplast. See **chondroblast.**

chondroplasty /kon′drōplas′tē/ [Gk, *chondros* + *plassein,* to mold], the surgical repair of cartilage.

chondrosarcoma /kon′drōsärkō′mə/ *pl. chondrosarcomas, chondrosarcomata* [Gk, *chondros* + *sarx,* flesh, *oma,* tumor], a malignant neoplasm of cartilaginous cells or their precursors that occurs most frequently in long bones, the pelvic girdle, and the scapula. The tumor is a large, smooth, lobulated growth composed of nodules of hyaline cartilage that may show slight to marked calcification. Also called **chondroma sarcomatosum. —chondrosarcomatous,** *adj.*



Chondrosarcoma *(Kumar et al, 2007)*

chondrosarcomatosis /kon′drōsär′kōmətō′sis/, a condition characterized by multiple malignant cartilaginous tumors.

chondrosarcomatous. See **chondrosarcoma.**

chondrosis /kondrō′sis/, **1.** the development of the cartilage of the body. **2.** a cartilaginous tumor.

chondrosternal joint. See **sternocostal articulation.**

chondrotomy /kondrot′əmē/, a surgical procedure for dividing a cartilage.

CHOP /chop/, abbreviation for an anticancer drug combination that includes cyclophosphamide, doxorubicin, vincristine, and prednisone.

chopping, a therapeutic exercise to improve the strength and coordination of upper trunk nerves and muscles by lifting the arms overhead and lowering them in a chopping or slashing movement.

chord-, prefix meaning "string, cord": *chordoblastoma, chordoma, chordotomy.*

chorda /kôr′də/, a string filament such as a nerve or tendon.

chordae tendineae. See **tendinous cords.**

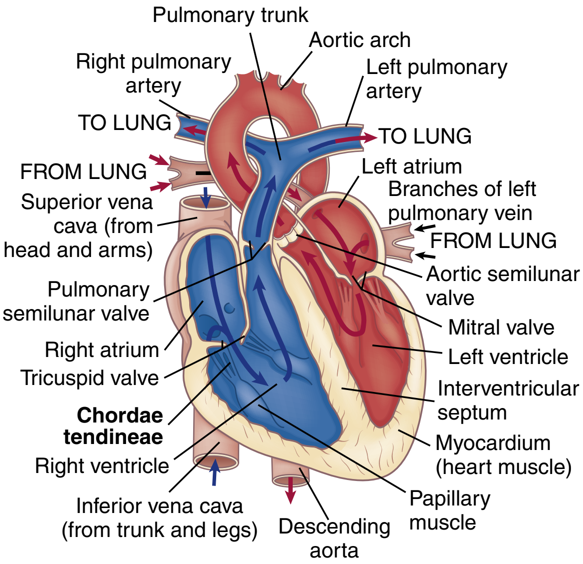
chordal canal. See **notochordal canal.**

chorda spinalis. See **spinal cord.**

chorda tympani, a branch of the facial nerve that carries taste from the anterior two thirds of the tongue and parasympathetic innervation to all salivary glands below the level of the oral fissure.

chorda umbilicalis. See **umbilical cord.**

chordee /kôr′dē, kôr′dā/ [Gk, *chorde,* cord], a congenital defect of the genitourinary tract resulting in a ventral curvature of the penis, caused by presence of a fibrous band of tissue instead of normal skin along the corpus spongiosum. The condition is often associated with hypospadias and is surgically corrected in early childhood. The goals of surgery are to improve the appearance of the genitalia cosmetically for psychological reasons, to construct an organ that allows



Chordae tendineae *(McCance and Huether, 2010)*

the boy to void in a standing position, and to produce a sexually adequate organ.

chordencephalon /kôrd′ensef′əlon/ [Gk, *chorde* + *enkephalos*, brain], the portion of the central nervous system that develops in the early weeks of pregnancy from the neural tube and includes the prosencephalon, the mesencephalon, the rhombencephalon, and the spinal cord. The chordencephalon is segmented and divided into the alar and basal plates. The alar plate becomes the sensory portion of the gray substance of the spinal cord. The basal plate becomes the motor portion of the gray substance. **—chordencephalic,** *adj*.

chorditis /kôrdī′tis/, **1.** inflammation of a spermatic cord. **2.** inflammation of the vocal cords or of the vocal folds.

chorditis nodosa, the formation of small white nodules on one or both vocal cords in persons who use their voices excessively. Also called **chorditis tuberosa**. See also **vocal cord nodule**.

chordoid /kôr′doid/ [Gk, *chorde* + *eidos*, form], resembling the notochord or notochordal tissue.

chordoma /kôrdō′mə/, *pl. chordomas, chordomata*, a rare tumor that develops from the fetal notochord. It is usually located in the midline, behind the sella; it is slow growing but highly invasive.

chordotomy /kôrdot′əmē/ [Gk, *chorde* + *temnein*, to cut], surgery in which the anterolateral tracts of the spinal cord are surgically divided to relieve pain.

chorea /kôrē′ə/ [Gk, *choreia*, dance], a condition characterized by involuntary purposeless, rapid motions, as flexing and extending of the fingers, raising and lowering of the shoulders, or grimacing. The movements often appear to be well coordinated. In some forms the person is also irritable, emotionally unstable, physically weak, restless, and fretful. See also **chorea gravidarum, Huntington's disease, Sydenham's chorea. —choreic** /kôrā′ik/, *adj*.

-chorea, suffix meaning a "(specified) nervous disorder characterized by involuntary muscle twitching": *hemichorea, monochorea, orthochorea*.

chorea gravidarum /kôr′ē·əgrav′idär′əm/, Sydenham's chorea that occurs during the early months of pregnancy with or without a previous history of rheumatic disease. Similar symptoms may develop in a woman who is taking oral contraceptives.

chorea minor. See **Sydenham's chorea.**

choreic. See **chorea.**

choreic ataxia /kôrē′ik/ [Gk, *choreia*, dance, *ataxia*, without order], a form of ataxia in which patients lack muscular coordination and movements are marked by involuntary twitching and abrupt jerking.

choreiform /kərē′əfôrm′/, resembling the rapid jerky movements associated with chorea.

choreiform spasm [Gk, *choreia*, dance; L, *forma* + Gk, *spasmos*], a condition of involuntary muscle contractions that result in dancing motions. In one type powerful contractions of the leg muscles cause a leaping, jumping action. It can also involve arm, shoulder, and neck muscles.

choreoacanthocytosis. See **neuroacanthocytosis.**

choreoathetoid cerebral palsy /kôr′ē·ō·ath′ətoid/, a form of cerebral palsy characterized by choreiform (jerky, ticlike twitching) and athetoid (slow, writhing) movements.

choreoathetosis /kôr′ē·ō·ath′ətō′sis/ [Gk, *choreia*, dance, *athetos*, not fixed], irregular involuntary movements that may involve the face, neck, trunk, extremities, or respiratory muscles, giving an appearance of restlessness. The writhing movements may vary from subtle to wild and ballistic and are commonly associated with administration of levodopa in parkinsonism. Levodopa-induced involuntary movement (dyskinesia) occurs most commonly 1 to 3 hours after administration of the drug.

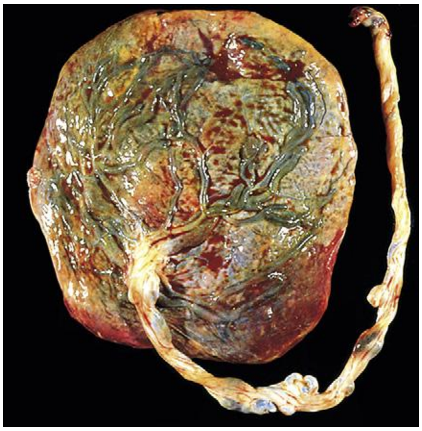
chorio-, prefix meaning "protective fetal membrane": *chorioblastosis, choriocele, chorioma*.

chorioadenoma /kərē′ō·ad′inō′mə/ *pl. chorioadenomas, chorioadenomata* [Gk, *chorion*, skin, *aden*, gland, *oma*, tumor], an epithelial cell tumor of the outermost fetal membrane that is intermediate in the malignant development of a hydatid mole to invasive choriocarcinoma.

chorioadenoma destruens /-des′tro͞o·əns/ [Gk, *chorion* + *aden* + *oma* + L, *destruere*, to pull down], an invasive hydatidiform mole in which the chorionic villi of the mole penetrate into the myometrium and parametrium of the uterus and metastasize to distant parts of the body, most commonly to the lungs. Also called **metastasizing mole.**

chorioamnionic /-am′nē·ot′ik/, pertaining to the chorion and the amnion.

chorioamnionitis /-am′nē·ōnī′tis/ [Gk, *chorion* + *amnion*, fetal membrane, *itis*, inflammation], an inflammatory reaction in the amniotic membranes caused by bacteria or viruses in the amniotic fluid. The membranes become infiltrated with polymorphonuclear leukocytes. This term is sometimes used incorrectly to refer to intraamniotic infection.



Chorioamnionitis *(Kumar et al, 2010)*

choriocarcinoma /kôr′ē·ōkär′sinō′mə/, *pl. choriocarcinomas, choriocarcinomata* an epithelial malignancy of fetal origin that develops from the chorionic portion of the products of conception. The primary tumor usually appears in the uterus as a soft dark red, crumbling mass, may invade and destroy the uterine wall, and may metastasize through lymph or blood vessels, forming secondary hemorrhagic and necrotic tumors in the vaginal wall, vulva, lymph nodes, lungs, liver, and brain. The urine often contains much more chorionic gonadotropin than is expected in pregnancy. The hormone level returns to normal when the tumor is completely removed. This form of cancer, which is more common in older women, responds to chemotherapy with cytotoxic drugs such as methotrexate. Rarely, a choriocarcinoma may arise in a teratoma of the testis, mediastinum, or pineal gland; chemotherapy is usually not effective in treating these tumors. Also called *chorioblastoma,* **chorioepithelioma, chorionic carcinoma, chorionic epithelioma.**

choriocele /kôr′ē·əsēl′/ [Gk, *chorion* + *kele,* hernia], a hernia or protrusion of the tissue of the choroid layer of the eye.

chorioepithelioma. See **choriocarcinoma.**

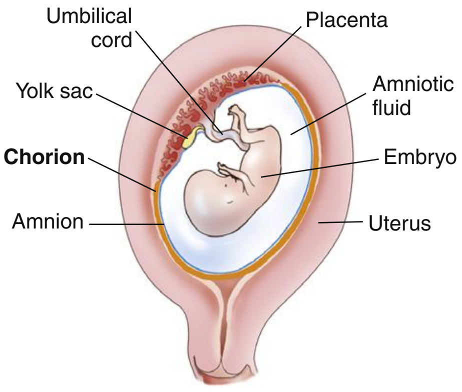
choriogenesis /kôr′ē·ōjen′əsis/, the development of the chorion, which is first evident in the first month of pregnancy. The chorion continues to expand to accommodate the fetus and serves as the outer barrier between the fetus and the uterus. —*choriogenetic, adj.*

choriogonadotropin /ko′re·ōgon′ä-dotro′pin/. See **chorionic gonadotropin.**

choriogonadotropin alfa, human chorionic gonadotropin produced by recombinant technology, used to induce ovulation and pregnancy in certain infertile, anovulatory women, and to increase the numbers of oocytes for patients attempting conception using assisted reproductive technologies, such as gamete intrafallopian transfer or in vitro fertilization. It is administered subcutaneously.

choriomeningitis. See **lymphocytic choriomeningitis.**

chorion /kôr′ē·on/ [Gk, *chorion,* skin], the outermost extraembryonic membrane composed of trophoblast lined with mesoderm. It develops villi about 2 weeks after fertilization and is vascularized by allantoic vessels 1 week later. It gives rise to the placenta and persists until birth as the outer of the two layers of membrane containing the amniotic fluid and the fetus. Compare **amnion.** See also **amniotic sac.**



Chorion *(Leonard, 2009)*

-chorion, suffix meaning a "membrane": *allantochorion, omphalochorion, prochorion.*

chorionic carcinoma, chorionic epithelioma. See **choriocarcinoma.**

chorionic cavity, extraembryonic coelom.

chorionic gonadotropin (CG) /kôr′ē·on′ik/ [Gk, *chorion* + *gone,* seed, *trophe,* nutrition], a chemical component of the urine of pregnant women and pregnant mares. This glycoprotein hormone is secreted by the placental trophoblastic cells. It is composed of two subunits, alpha and beta, and helps maintain the corpus luteum during pregnancy. The alpha subunit is nearly identical to follicle-stimulating, luteinizing, and thyroid-stimulating hormones. The specific hormonal effects of chorionic gonadotropin are activated by the beta portion. They include stimulation of the corpus luteum to secrete estrogen and progesterone and to decrease lymphocyte activation. Chorionic gonadotropin is also administered in the treatment of some cases of cryptorchidism and male hypogonadism and in the induction of ovulation in some infertile women. Also called **human chorionic gonadotropin** (HCG). See also **gonadotropin.**

chorionic plate [Gk, *chorion* + *platys,* flat], the part of the fetal placenta that gives rise to chorionic villi, which attach to the uterus during the early stage of formation of the placenta. It forms the fetal side of the placental disc, and its development is responsible for a normal placenta.

chorionic sac [Gk, *chorion,* skin, *sakkos,* sack], the saclike membrane that develops from the blastocyst wall to envelop the embryo.

chorionic villus [Gk, *chorion* + L, *villus,* shaggy hair], any of the tiny vascular fibrils on the surface of the chorion that infiltrate the maternal blood sinuses of the endometrium and help form the placenta.

chorionic villus sampling (CVS) [Gk, L, shaggy hair, *exemplum*], the sampling of placental tissues for prenatal diagnosis of potential genetic defects. The sample is obtained through a catheter inserted into the cervix. One of the main advantages of having this test instead of amniocentesis is that it can be done earlier in pregnancy. Also called *chorionic villus biopsy (CVB)*. Compare **amniocentesis.**

chorioretinitis /kôr′ē·ōret′inī′tis/, an inflammatory condition of the choroid and retina of the eye, usually as a result of parasitic or bacterial infection. It is characterized by blurred vision, photophobia, and distorted images.

chorioretinopathy /kôr′ē·ōret′ənop′əthē/ [Gk, *chorion* + L, *rete,* net; Gk, *pathos,* disease], a noninflammatory process caused by disease that involves the choroid and the retina. Also called **choroidoretinitis.**

choroid /kôr′oid/ [Gk, *chorion* + *eidos,* form], a vascular layer of tissue between the retina and the sclera of the eye that supplies blood to the outer retina.

choroidal malignant melanoma /kôroi′dəl/ [Gk, *chorion* + *eidos* + L, *malignus,* ill-disposed; Gk, *melas,* black, *oma,* tumor], a tumor of the choroid coat of the eye that grows into the vitreous humor, causing detachment and degeneration of the overlying retina. Typically mound-shaped or mushroom-shaped, the neoplasm may break through the sclera and appear under the conjunctiva.

choroideremia /kôr′oidərē′mē·ə/ [Gk, *chorion,* skin + *eidos,* form + *erēmia,* destitution], hereditary primary degeneration of the retina, transmitted as an X-linked trait and beginning in the first decade of life. In males, the earliest symptom is usually night blindness, followed by constricted visual field and eventual blindness as the degeneration of the pigment epithelium of the retina progresses to complete atrophy. In females, it is nonprogressive; usually there is normal vision and often an atypical pigmentary retinopathy.

choroiditis /kôr′oidī′tis/, an inflammatory condition of the choroid membrane of the eye. See also *chorioretinopathy.*

choroid membrane, a vascular layer of tissue between the retina and the sclera of the eye.

choroidocyclitis /kôroi′dōsiklī′tis/ [Gk, *chorion* + *eidos* + *kyklos*, circle, *itis*, inflammation], an abnormal condition characterized by inflammation of the choroid and the ciliary processes.

choroidopathy /kôr′oidop′əthē/, noninflammatory degeneration of the choroid.

choroidoretinitis. See **chorioretinopathy.**

choroid plexectomy /pleksek′təmē/ [Gk, *chorion* + *eidos* + L, *plexus*, pleated; Gk, *ektomē*, excision], a surgical procedure for the reduction of cerebrospinal fluid production in the ventricles of the brain in hydrocephalus, usually in the newborn. The procedure involves transcortical entry of the lateral ventricles to coagulate or to excise the choroid plexuses and seeks to correct a communicating type of hydrocephalus.

choroid plexus [Gk, *chorion* + *eidos* + L, pleated], any one of the tangled masses of tiny blood vessels contained within the lateral, the third, and the fourth ventricles of the brain, responsible for producing cerebrospinal fluid.

Chotzen's syndrome. See **Saethre-Chotzen syndrome.**

Christchurch chromosome (Ch1) [Christchurch, city in New Zealand], an abnormally small, acrocentric chromosome (either chromosome 21 or chromosome 22), in which the short arm is missing or partially deleted. The aberration is associated with chronic lymphocytic leukemia but has also been found in patients with various other defects. See also **Philadelphia chromosome.**

Christian Science, a religious system founded in 1879 by Mary Baker Eddy [1821–1910] based on the metaphysical teachings of Phineas P. Quimby. It holds that healing should be achieved through spiritual means, that sickness and death are illusions resulting from a false sense of separation from God.

Christian-Weber disease [Henry A. Christian, American physician, 1876–1951; Frederick Parkes Weber, English physician, 1863–1962], a rare form of panniculitis characterized by nodular formations in the subcutaneous tissues and prolonged intermittent relapsing fever.

Christmas disease. See **hemophilia B.**

Christmas factor. See **factor IX.**

Christ-Siemens-Touraine syndrome. See **anhidrotic ectodermal dysplasia.**

-chroia, suffix meaning "(condition of) skin coloration": *cacochroia, cyanochroia, xanthochroia.*

chrom-. See **chromo-.**

chromaffin /krō′məfin/ [Gk, *chroma*, color; L, *affin*, affinity], having an affinity for staining with chromium salts, especially brown staining of the cells of the adrenal, coccygeal, and carotid glands; certain cells of the adrenal medulla; and cells of the paraganglions. Also called **chromaphil** /krō′məfil/.

chromaffin body. See **paraganglion.**

chromaffin cell, any one of the special cells that compose the paraganglia and are connected to the ganglia of the celiac, renal, suprarenal, aortic, and hypogastric plexuses. The chromaffin cells of the adrenal medulla secrete two catecholamines, epinephrine and norepinephrine, which affect smooth muscle, cardiac muscle, and glands in the same way as sympathetic stimulation, by increasing and prolonging sympathetic effects.

chromaffinoma. See **pheochromocytoma.**

chromaphil. See **chromaffin.**

-chromasia, **1.** suffix meaning "(condition of) color (as of cells, skin)": *allochromasia, hyperchromasia, oligochromasia*. **2.** suffix meaning "(condition of the) stainability of tissues": *amblychromasia, anisochromasia, anochromasia*.

chromate ($CrO_4{}^{2-}$), any salt of chromic acid.

chromatic /krōmat′ik/ [Gk, *chroma*, color], **1.** pertaining to color. **2.** stainable by a dye. **3.** pertaining to chromatin. Also called **chromatinic.**

-chromatic. See **-chromic.**

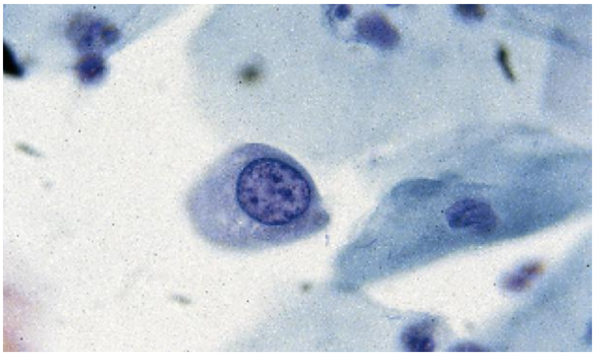
chromatic asymmetry of the iris. See **heterochromia iridis.**

chromatic dispersion [Gk, *chroma* + L, *dis*, apart, *spargere*, to scatter], the splitting of light into its various component wavelengths or frequencies, such as with a prism, to separate and study the different colors.

chromatid /krō′mətid/ [Gk, *chroma*, color], one of the two identical, threadlike filaments of a chromosome. Chromatids are produced by the self-replication of the chromosome during interphase and are held together by a common centromere. During anaphase of mitosis and meiosis II, the chromatids separate to become daughter chromosomes.

chromatid deletion, the breakage of a chromatid, sometimes caused by radiation. If the breakage occurs in the G_1 phase of the cell cycle, before DNA synthesis, subsequent replication will produce two sister chromatids with material missing and two acentromeric fragments called isochromatids.

chromatin /krō′mətin/ [Gk, *chroma*, color], the material within a cell nucleus from which the chromosomes are formed. It consists of fine, threadlike strands of DNA attached to proteins called histones and is readily stained with basic dyes. Chromatin occurs in two forms, euchromatin and heterochromatin, which are distinguishable during the phases of the cell cycle by their different degrees of staining, which in turn depends how tightly they are coiled. During cell division, portions of the chromatin condense and coil to form the chromosomes. Also called **chromoplasm, karyotin.** See also **chromatid, euchromatin, heterochromatin, sex chromatin. —chromatinic,** *adj.*



Rim of chromatin outlining the nuclear membrane

(McKee, 1997)

chromatinic. See **chromatic.**

chromatin-negative, lacking sex chromatin. The term applies to the nuclei of cells in normal males as well as those in individuals with certain chromosomal abnormalities.

chromatin nucleolus. See **karyosome.**

chromatin-positive, containing sex chromatin. The term applies to the nuclei of cells in normal females as well as those in individuals with certain chromosomal abnormalities.

chromatism /krō′mətiz′əm/, [*chroma*, color + *ismos*, condition], **1.** an abnormal condition characterized by hallucinations in which the affected individual sees colored lights. **2.** abnormal pigmentation or aberration.

chromatogram /krōmat′əgram′/, **1.** the record produced by the separation of gaseous substances or dissolved chemical substances moving through a column of absorbent material that filters out the various absorbates in different layers. **2.** any graphic record produced by any chromatographic method.

chromatography /krō′mətog′rəfē/, any one of several processes for separating and analyzing various gaseous or dissolved chemical materials. Some kinds of chromatography are **column chromatography, displacement chromatography, gas chromatography, ion-exchange chromatography,** and **paper chromatography.** —*chromatographic, adj.*

chromatopsia /krō′mətop′sē·ə/ [Gk, *chroma* + *opsis,* vision], **1.** an abnormal visual condition that makes colorless objects appear tinged with color. **2.** a form of color blindness characterized by the imperfect perception of various colors. It may be caused by a deficiency in one or more of the retinal cones or by defective nerve circuits that convey color-associated impulses to the cerebral cortex. The most common defect in color sense is the inability to distinguish red from green, a defect evident in about 10% of men and 1% of women. Compare **chromesthesia.**

chromatosis /-ō′sis/, condition of abnormal skin pigmentation in any part of the body. See also **chloasma, vitiligo.**

chromaturia /-o͝or′ē·ə/ [Gk, *chroma,* color, *ouron,* urine], the production of urine that has an abnormal color.

-chrome, suffix that distinguishes chromium alloys: *hallachrome, nichrome, nicochrome.*

-chromemia, suffix meaning "(condition of the) hemoglobin in the blood": *hyperchromemia, lipochromemia, polychromemia.*

chromesthesia /krō′misthē′zhə/ [Gk, *chroma* + *aisthesis,* feeling], **1.** the color sense that depends on the mixture of wavelengths in the light that enters the eye and the response of the different types of retinal cones associated with color vision. The human eye can distinguish hundreds of different colors that are combinations of the basic light wavelengths for red, green, and blue. Some of the retinal cones can be stimulated by the whole visual spectrum, and variable stimulation of all the cones can produce all the color sensations known to humans. Changes in the pigments within the cones affect color vision, and defects in the cones cause various kinds of color blindness. **2.** an abnormal condition characterized by the confusion of other senses, such as taste and smell, with imagined sensations of color. Compare **chromatopsia.**

chromhidrosis /krō′midrō′sis/ [Gk, *chroma* + *hidros,* sweat], a rare, functional disorder in which apocrine sweat glands secrete colored sweat. The sweat may be yellow, blue, green, or black and often also fluoresces. A known cause is occupational exposure to copper, catechols, or ferrous oxide. Industrial nurses should be aware of this benign condition.

-chromia, suffix meaning a "state or condition of pigmentation": *metachromia, normochromia, orthochromia.*

-chromic, -chromatic, suffix meaning color: *bichromic, hypochromic.*

chromic catgut /krō′mik/ [Gk, *chroma,* color; L, *catta;* AS, *guttas*], surgical catgut that has been treated with chromium trioxide to strengthen it. It is an absorbable suture.

chromic myopia, a kind of color blindness characterized by the ability to distinguish colors only of those objects that are close to the eye.

chromium (Cr) /krō′mē·əm/ [Gk, *chroma,* color], a hard, brittle metallic element. Its atomic number is 24; its atomic mass is 51.99. It does not occur naturally in pure form but exists in combination with iron and oxygen in chromite, a mineral found chiefly in Africa, Albania, Russia, and Turkey. Chromium strongly resists corrosion and is used extensively to plate other metals, harden steel, and, in combination with other elements, form colored compounds. Stainless steels are more than 10% chromium and strongly resist rusting. Traces of chromium occur in plants and animals, and there is evidence that this element may be important in human nutrition, especially in carbohydrate metabolism. Some experts estimate that the safe and adequate daily intake of chromium ranges from 0.1 to 0.2 mg, depending on the age of the individual. Workers in chromite mines are susceptible to pneumoconiosis caused by the inhalation of chromite dust particles that lodge in the lung. Chromate salts have been identified as potential carcinogens. Chromium 51 isotope is used in blood studies.

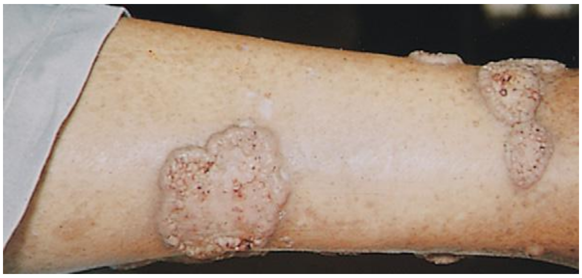
chromium alum, a chemical commonly used to fix, or harden, the emulsion of an x-ray film during manual processing.

chromium Cr 51 edetate, a complex of chromium 51 with edetic acid, used in the measurement of the glomerular filtration rate.

chromo-, chrom-, chromat-, chromato-, prefix meaning "color": *chromocrinia, chromocyte, chromotrichia.*

chromobacteriosis /krō′məbaktir′ē·ō′sis/, an extremely rare, usually fatal systemic infection caused by a gram-negative bacillus *Chromobacterium violaceum.* It is found in fresh water in tropic and subtropic regions and enters the body through a break in the skin. The disease is characterized by sepsis, multiple liver abscesses, and severe prostration. Early diagnosis, surgical drainage of abscesses, and administration of chloramphenicol markedly improve the chance of survival.

chromoblastomycosis /krō′mōblas′tōmīkō′sis/ [Gk, *chroma* + *blastos,* germ, *mykes,* fungus, *osis,* condition], a chronic infectious skin disease caused by any multiple species to two genera of fungi Cladosporium and Phialophora found in the soil. Infection is characterized by the appearance of pruritic, warty nodules that develop in a cut or other break in the skin, occurring typically on the leg or foot. What may first appear as a small dull-red lesion gradually develops into a large ulcerated growth appearing like cauliflower tips in structure. Over a period of weeks or months additional warty growths may appear elsewhere on the skin along the path of lymphatic drainage. Common complications are secondary infection, lymphedema, and ulceration. Treatment includes surgical excision and, in some cases, topical application of systemic antibiotics. Flucytosine is the most commonly used antifungal agent. Also called **chromomycosis, verrucous dermatitis.** See also **mycosis** specific fungal infections.



Chromoblastomycosis *(Murray et al, 2002)*

chromocenter. See **karyosome.**

chromocystoscopy. See **cystochromoscopy.**

chromogen /krō′mōjən/, a substance that absorbs light, producing color.

chromolipid, chromolipoid. See **lipochrome.**

chromomere /krō′məmir/ [Gk, *chroma* + *meros,* part], any of the series of beadlike structures that lie along the chromonema of a chromosome during the early stages of cell division. Chromomeres are most often seen in prophase II of meiosis. The position of each chromomere is relatively constant for each chromosome and probably reflects the chromosome's DNA coiling pattern. Also called **idiomere.** See also **karyomere.**

chromomycosis. See **chromoblastomycosis.**

chromonema /krō′mənē′mə/ *pl.* *chromonemata* [Gk, *chroma* + *nema,* thread], the part of a chromosome along which the chromomeres lie during cell division. Also called *chromoneme*. See also **chromosome.** —*chromonemal, chromonematic, chromonemic, adj.*

chromophilic /krō′məfil′ik/ [Gk, *chroma* + *philein,* to love], denoting a cell, tissue, or microorganism that is easily stained, particularly certain leukocytes. Compare **chromophobic.**

chromophobe. See **chromophobia.**

chromophobe adenoma. See **chromophobic adenoma.**

chromophobia /krō′məfō′bē·ə/ [Gk, *chroma* + *phobos,* fear], **1.** the resistance of certain cells and tissues to stains. **2.** a morbid aversion to colors. —**chromophobe,** *n.*

chromophobic /krō′məfō′bik/, denoting a cell, tissue, or microorganism that is not easily stained, particularly certain cells of the anterior lobe of the pituitary gland. Compare **chromophilic.**

chromophobic adenoma, a tumor of the pituitary gland composed of cells that do not stain with acid or basic dyes. Diabetes insipidus and other conditions resulting from deficiency of one or more pituitary hormones are associated with this tumor. Also called **chromophobe adenoma.**

chromoplasm. See **chromatin.**

chromosensitive, descriptive of a substance that is affected by and responds to changes in chemical composition.

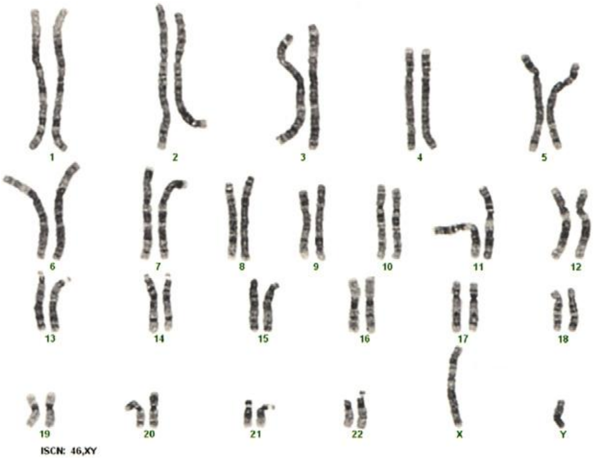
chromosomal. See **chromosome.**

chromosomal aberration /-sō′məl/ [Gk, *chroma* + *soma,* body; L, *aberrare,* to wander], any change in the structure or number of any of the chromosomes of a given species. In humans, a number of physical disabilities and disorders are directly associated with aberrations of both the autosomes and the sex chromosomes, including Down, Turner's, and Klinefelter's syndromes. The incidence of most chromosomal disorders is significantly higher than that of single-gene disorders. See also **trisomy.**

chromosomal nomenclature, a standard nomenclature system for identifying chromosomes in an individual as well as any deletions or additions of specific chromosomes or parts of chromosomes. The full complement of human chromosomes is represented as 46, XX for a normal female and 46, XY for a normal male. The pairs of autosomes are numbered from 1 to 22 according to decreasing length and are divided into seven groups: 1 through 3, group A; 4 and 5, group B; 6 through 12, group C; 13 through 15, group D; 16 through 18, group E; 19 and 20, group F; and 21 and 22, group G. Chromosomal aberrations are designated by indicating the total chromosomal number, sex complement, and group or specific chromosome in which the addition or deletion occurs. For example, 47, XY, G + indicates a male with an extra chromosome in the G group; 47, XX, 21 + indicates a female with an extra chromosome 21, a chromosomal aberration that results in Down syndrome. The short arm of a chromosome is designated by *p,* the long arm by *q,* and a translocation by *t*. See also **Denver classification.**

chromosomal sex [Gk, *chroma,* color, *soma,* body; L, *sexus,* male or female], the sex of an individual as determined, in mammals, by the presence or absence of a Y chromosome.

chromosome /krō′məsōm/ [Gk, *chroma* + *soma,* body], any of the threadlike structures in the nucleus of a cell that function in the transmission of genetic information. Each consists of a double strand of DNA attached to proteins called histones. The genes, which contain the genetic material that controls the inheritance of traits, are arranged in a linear pattern along the length of each DNA strand. Chromosomes are readily stainable with basic dyes and can be seen easily during cell division, when they are compactly coiled and in their most condensed state. During interphase the chromosomes disperse into chromatin and undergo self-replication, forming identical chromatids that separate during mitosis so that each new cell receives a full set of chromosomes. Each species has a characteristic number of chromosomes in each somatic cell. In humans, there are 46 chromosomes, including 22 homologous pairs of autosomes and 1 pair of sex chromosomes. One member of each pair is derived from each parent. Kinds of chromosomes include **Christchurch chromosomes, daughter chromosomes, gametic chromosomes, giant chromosomes, homologous chromosomes, monosomes, Philadelphia chromosomes, sex chromosomes, somatic chromosomes,** and **W chromosomes.** See also **centromere, chromatid, chromatin, Denver classification, gene, karyotype, mitosis. —chromosomal,** *adj.*



Chromosomes *(Courtesy The Clinical Section, Laboratory of Pathology, National Cancer Institute, National Institutes of Health, Bethesda, Maryland)*

chromosome 5p-syndrome. See **cat-cry syndrome.**

chromosome analysis, a laboratory procedure that isolates the chromosome pairs so that they may be visualized.

chromosome banding. See **banding.**

chromosome coil, the spiral formed by the coiling of two or more chromonemata in a chromosome.

chromosome complement, the normal number of chromosomes found in the somatic cells of a given species. In humans it is 46, consisting of 22 pairs of homologous autosomes and 1 pair of sex chromosomes.

chromosome karyotype test, a blood test used to study an individual's chromosome makeup to determine chromosomal defects associated with disease or the risk of developing disease. It is useful in evaluating congenital anomalies, mental retardation, and delayed puberty, as well as in the prenatal diagnosis of serious congenital diseases such as Klinefelter syndrome and Down syndrome and other suspected genetic disorders.

chromosome mapping. See **mapping.**

chromosome painting. See **fluorescent in situ hybridization.**

Analysis of human chromosomes

Description of chromosomes					*Number of chromosomes in all body (somatic) cells*	
Size	*Position of centromere*	*Group*	*Autosomes*	*Sex chromosomes*	*Male*	*Female*
Large	Metacentric or submetacentric	A	1, 2, 3		6	6
Large	Submetacentric	B	4, 5		4	4
Medium	Metacentric and submetacentric	C	6, 7, 8, 9, 10, 11, 12	X	15	16
Medium	Acrocentric (subterminal)	D	13, 14, 15		6	6
Small	Metacentric and submetacentric	E	16, 17, 18		6	6
Smallest	Metacentric	F	19, 20		4	4
Small	Acrocentric (subterminal)	G	21, 22	Y	5	4
				TOTAL	46	46

chromosome puff, a band of accumulated chromatin located at a specific site on a giant chromosome. It is indicative of gene activity, specifically DNA and RNA synthesis at that site. Such bands appear at certain chromosomal locations within a given tissue at specific developmental stages in insects and are significant in the study of the mode of genetic transmission.

chromosome walking, a molecular genetic technique by which overlapping molecular clones that span large chromosomal intervals are isolated.

chromotherapy /krō′məther′əpē/, a system of treating disease with colored lights chosen from specific regions of the spectrum.

chromotrope /krō′mətrōp/ [Gk, *chroma* + *trepein,* to turn], **1.** a component of tissue that stains metachromatically with metachromatic dyes. **2.** any one of several dyes differentiated by numeric suffixes. **—***chromotropic, adj.*

chron-. See **chrono-.**

chronaxy /krō′naksē/ [Gk, *chronos,* time, *axia,* value], (in electroneuromyography) a measure of the shortest duration of an electrical stimulus needed to excite nerve or muscle tissue.

-chronia, -chrone, **1.** suffix meaning "(condition of) processes with respect to time": *isochronia, heterochronia, synchronia.* **2.** suffix meaning "(condition of) chronaxy between muscle and nerve": *isochronia.* **3.** suffix meaning the "time of formation of a part or tissue": *heterochronia, synchronia.*

chronic /kron′ik/ [Gk, *chronos,* time], (of a disease or disorder) persisting for a long period, often for the remainder of a person's lifetime. Compare **acute.**

chronic abscess. See **abscess.**

chronic active hepatitis (CAH), a potentially fatal form of hepatitis complicated by portal inflammation and extending into the parenchyma. There may be progressive destruction of the liver lobule with necrosis and fibrosis leading to scarring and cirrhosis. Possible causes include viral infections, drugs, and autoimmune reactions.

chronic airflow limitation. See **chronic obstructive pulmonary disease.**

chronic airway obstruction, a type of pulmonary disorder, such as emphysema or chronic bronchitis, in which the upper or lower airway is chronically obstructed. The patient, when at rest, breathes at a normal rate and may have prolongation of the expiratory phase with pursed-lip breathing. The patient may be barrelchested and have large supraclavicular fossae. During inspiration, the intercostal spaces retract, and accessory muscles are used.

chronic alcoholic delirium. See **Korsakoff's psychosis.**

chronic alcoholism, a pathological condition resulting from the habitual use of alcohol in excessive amounts. The syndrome involves complex cultural, psychological, social, and physiological factors and usually impairs an individual's health and ability to function normally in society. Symptoms of the disease include anorexia, diarrhea, weight loss, neurological and psychiatric disturbances (most notably depression), and fatty deterioration of the liver, sometimes leading to cirrhosis. Treatment depends on the severity of the disease and its resulting complications; nutritional therapy, use of tranquilizers in the detoxification process, and hospitalization may be necessary. Alcoholism is not often detected in patients admitted to the hospital for care after an accident or for esophagitis, gastritis, peripheral neuropathy, anemia, or depression, all of which are secondary effects of alcoholism. If the patient is to undergo an operation, it is imperative that the anesthesiologist be notified of the condition, which can affect sensitivity to anesthetics. Alcoholism is a family disease, and the health professional can be instrumental in guiding the patient's family to seek treatment. Long-term support for alcoholics and their families is offered by such organizations as Alcoholics Anonymous, Al-Anon, Alateen, and rehabilitation facilities for alcoholism. Compare **acute alcoholism.** See also **alcoholism.**

chronic anterior poliomyelitis, an inflammation of the gray matter in the spinal cord, resulting in atrophy of muscles of the upper extremities and neck, with long periods of remission of symptoms. See also **poliomyelitis.**

chronic appendicitis, a type of appendicitis characterized by thickening or scarring of the vermiform appendix, caused by previous inflammation.

chronic bacterial prostatitis. See **prostatitis.**

chronic bronchitis, a very common, debilitating pulmonary disease, characterized by greatly increased production of mucus by the glands of the trachea and bronchi and resulting in a cough with expectoration for at least 3 months of the year for more than 2 consecutive years.

■ OBSERVATIONS: The condition has a strong association with smoking. Productive cough and chronic inflammation, often with wheezing or rhonchi, are universal features, followed by progressive dyspnea on exertion, repeated purulent respiratory infections, airway narrowing and obstruction, and often respiratory failure. Cor pulmonale with right ventricular heart failure is a common result. In some patients secondary polycythemia results from chronic hypoxemia. Prolonged expiratory phase, prominent cough, cyanosis, and acute attacks of respiratory distress with rapid, labored respirations may result. Common laboratory findings include elevated hematocrit, with or without respiratory acidosis; abnormal liver function caused by right-sided heart failure and hepatic congestion; pathogenic bacteria in the sputum; abnormal pulmonary function test results; and often chest x-ray signs of increased bronchial markings.

■ INTERVENTIONS: Patients with chronic bronchitis should be immunized against influenza and pneumococcal infections. Broad-spectrum antibiotics are usually prescribed during acute exacerbations of symptoms. Bronchodilators, such as albuterol, and sympathomimetic drugs, such as terbutaline and metaproterenol, are prescribed to prevent worsening of the condition. Adrenergics and anticholinergics, like albuterol and Atrovent, are used to maintain lung function. Heart failure is managed with appropriate medication.

■ NURSING CONSIDERATIONS: The nurse encourages the patient to discontinue smoking and to avoid exposure to toxic inhalants, such as hair sprays, aerosol insecticides, and occupational irritants and poisons. The use of low-flow oxygen in the home requires patient/family education and monitoring. Exercise, especially walking, is often indicated. See also **asthma, chronic obstructive pulmonary disease, cor pulmonale, emphysema, respiratory failure.**

chronic calcific pancreatitis, pancreatitis with calcification in the ducts, usually associated with exocrine insufficiency and diabetes mellitus.

chronic care. See **care of the chronically ill.**

chronic carrier, an individual who acts as host to pathogenic organisms for an extended period without displaying any signs of disease.

chronic cervicitis. See **cervicitis.**

chronic cholecystitis. See **cholecystitis.**

chronic chorea. See **Huntington's disease.**

chronic cystic mastitis. See **fibrocystic disease of the breast.**

chronic delirium [Gk, *chronos,* time; L, *delirare,* to rave], a form of delirium in which the patient shows signs of an altered level of awareness but is afebrile. The condition is sometimes associated with exhaustion, malnutrition, and wasting.

chronic dieting syndrome, the extreme practice of following fad diets, often leading to harmful physical and psychological effects. Also called **dieting syndrome.**

chronic disease, a disease that persists over a long period. The symptoms of chronic disease are sometimes less severe than those of the acute phase of the same disease. Chronic disease may be progressive, result in complete or partial disability, or even lead to death. Examples of chronic disease include diabetes mellitus, emphysema, and arthritis. See also **acute disease.**

chronic endoarteritis [Gk, *chronos,* time, *endon,* within, *arteria,* airpipe, *itis,* inflammation], persistent inflammation of the tunica intima of an arterial wall. It may be accompanied by fatty degeneration of arterial tissue and calcium deposits. Also called **endarteritis deformans.**

chronic endocarditis [Gk, *chronos,* time, *endon,* within, *kardia,* heart, *itis,* inflammation], persistent inflammation of the endocardium that usually follows an attack of acute endocarditis, syphilis, or an atheroma. It frequently involves the cardiac valves, making them incompetent. Also called **valvular endocarditis.**

chronic erosive gastritis. See **erosive gastritis.**

chronic fatigue syndrome (CFS), a condition characterized by disabling fatigue, accompanied by a constellation of symptoms, including muscle pain, multijoint pain without swelling, painful cervical or axillary adenopathy, sore throat, headache, impaired memory or concentration, unrefreshing sleep, and postexertional malaise. This diagnosis requires that a patient have four or more symptoms concurrently that persist for 6 or more months. The diagnosis is one of exclusion. Also called *immune dysfunction syndrome*.

chronic gastritis. See **gastritis.**

chronic glaucoma. See **glaucoma.**

chronic glomerulonephritis, a noninfectious disease of the glomeruli of the kidney characterized by proteinuria, hematuria, edema, and decreased production of urine. Of unknown cause, it is asymptomatic for years. The symptoms develop slowly, and the disease progresses to kidney failure. Transplantation and dialysis are the only treatments available. See also **postinfectious glomerulonephritis, subacute glomerulonephritis, uremia.**

chronic gout [Gk, *chronos,* time; L, *gutta,* drop], a persistent disorder of purine metabolism, characterized by abnormally high levels of serum uric acid and attacks of arthritis, with deposits of urates in the joints. The disorder may be familial and if untreated can lead to renal failure. See also **gout.**

chronic granulocytic leukemia. See **chronic myelocytic leukemia.**

chronic granulomatous disease, sex-linked recessive disorder in which myeloperoxidase is diminished in the primary granules of neutrophils, causing delayed intracellular killing of fungi and bacteria by neutrophils.

chronic hepatitis [Gk, *chronos,* time, *hēpar,* liver, *itis,* inflammation], a state in which symptoms of hepatitis continue for several months and may increase in severity. In some cases of hepatitis B, the patient may become a lifelong carrier of the antigen and may show prolonged evidence of the infection. See also **alcoholic hepatitis, anicteric hepatitis, cholestatic hepatitis, hepatitis, hepatitis A, hepatitis B, hepatitis C, hepatitis D, hepatitis E.**

chronic hyperplastic rhinitis [Gk, *chronos,* time, *hyper,* excess, *plassein,* to form, *rhis,* nose, *itis,* inflammation], chronic inflammation of the mucous membranes of the nose, with polyp formation.

chronic hyperplastic sinusitis [Gk, *chronos,* time, *hyper,* excess, *plassein,* to form; L, *sinus,* hollow; Gk, *itis,* inflammation], chronic sinus inflammation, with polyp formation in the nose and sinuses.

chronic hypertrophic emphysema. See **panacinar emphysema.**

chronic hypertrophic rhinitis [Gk, *chronos,* time, *hyper,* excess, *trophe,* nourishment, *rhis,* nose, *itis,* inflammation], a condition of chronic inflammation of the nasal mucosa associated with enlargement of the mucous membrane.

chronic hypoxia, a usually slow, insidious reduction in tissue oxygenation resulting from gradually destructive or fibrotic lung diseases, congenital or acquired heart disorders, or chronic blood loss. The patient experiences persistent mental and physical fatigue, shows sluggish mental responses, and complains of a loss of ability to perform physical tasks. Unless treated, the condition may lead to disability. There may be some physiological adjustment to the lack of oxygen as occurs in individuals who move from sea level to mountainous areas, where oxygen pressures are reduced. Compare **acute hypoxia.**

chronic idiopathic xanthomatosis, Hand-Schüller-Christian disease.

chronic illness, any disorder that persists over a long period and affects physical, emotional, intellectual, vocational, social, or spiritual functioning.

chronic immune thrombocytopenic purpura. See **immune thrombocytopenic purpura.**

chronic inflammatory demyelinating polyneuropathy (CIDP), a slowly progressive autoimmune neurological disorder with demyelination of the peripheral nerves and nerve roots, characterized by progressive weakness and impaired sensory function (loss of reflexes) in the limbs and enlargement of the peripheral nerves and usually by elevated protein in the cerebrospinal fluid. It occurs most commonly in young adults, particularly males. Presenting symptoms often include tingling or numbness of the digits, weakness of the limbs, hyporeflexia or areflexia, fatigue, and abnormal sensations. It is similar to **Guillain-Barré syndrome** but has a slower onset and lasts much longer.

chronic inflammatory demyelinating polyradiculoneuropathy, a rare form of symmetrical motor neuron paralysis similar to Guillain-Barré syndrome but progressing more slowly or in a fluctuating pattern.

chronic interstitial nephritis. See **interstitial nephritis.**

chronic intestinal ischemia. See **intestinal angina.**

chronic intractable pain [Gk, *chronos,* time; L, *intractabilis* + *poena,* penalty], persistent pain that fails to respond to nonnarcotic analgesics and other treatment measures.

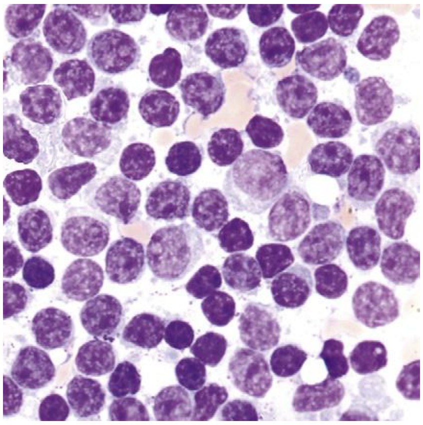
chronicity /krōnis′itē/, a state of being chronic.

chronic leg ulcer [Gk, *chronos,* time; ONorse, *leggr* + L, *ulcus,* ulcer], a slow-healing ulcer of the leg (usually the lower leg), typically associated with varicose veins, deep venous insufficiency, or a similar circulatory obstacle. Nonvenous causes of leg ulceration include arterial disease; ulcers may also be caused by trauma or have a bacterial, mycotic, hematologic, neoplastic, neurological, or systemic origin. Treatment includes elevation of the leg two or three times daily, elastic support applied to the limb of the ambulatory patient, and avoidance of maceration of the wound.

chronic lingual papillitis [Gk, *chronos* + L, *lingua,* tongue, *papilla,* nipple; Gk, *itis*], an inflammatory disorder of the tongue, sometimes extending to the buccal mucosa and palate. It is characterized by irregularly scattered red patches, thinning of the lingual papillae, severe burning pain, and shedding of epidermal tissue. The disorder affects middle-aged individuals, especially women, and occurs in attacks alternating with remissions that last weeks or months. Also called **Moeller's glossitis.**

chronic low blood pressure, a condition in which systolic and diastolic blood pressures are consistently below their normal values (approximately 120 and 70 mm Hg, respectively, in a young adult).

chronic lymphocytic leukemia (CLL) [Gk, *chronos* + L, *lympha,* water; Gk, *kytos,* cell, *leukos,* white, *haima,* blood], a neoplasm of blood-forming tissues, characterized by a proliferation of small, long-lived lymphocytes, chiefly B cells, in bone marrow, blood, liver, and lymphoid organs. CLL is the rarest type of leukemia and the only leukemia to which there is a possible inheritable genetic predisposition. CLL is rare in persons less than 50 years of age, increases in frequency with age, and is more common in men than in women. The disease has an insidious onset and progresses to cause malaise, ready fatigability, anorexia, weight loss, nocturnal sweating, lymphadenopathy, and hepatosplenomegaly. Most patients can continue normal activities for years; 25% die of unrelated diseases. No treatment is curative, but remissions may be induced by chemotherapy or irradiation. See also **acute lymphocytic leukemia.**



Chronic lymphocytic leukemia *(Carr and Rodak, 2008)*

chronic mastitis. See **mastitis.**

chronic mountain sickness [Gk, *chronos,* time; L, *montana;* AS, *soec*], a form of altitude sickness in which the increased production of red cells results in polycythemia. Some symptoms, such as headache, weakness, and limb aches, occasionally develop in indigenous mountain dwellers as well as in persons who have become acclimatized to the higher altitudes. See also **altitude sickness.**

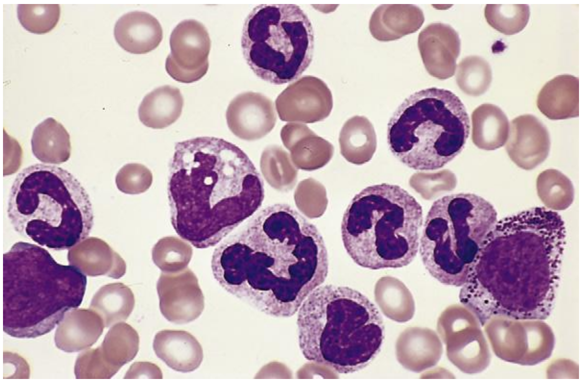
chronic mucocutaneous candidiasis, a heterogeneous group of disorders, unified by impaired cell-mediated immunity against ***Candida*** species; a rare form of candidiasis characterized by candidal infection lesions of the skin, mucous membranes, GI tract, and respiratory tract. This disease usually occurs during the first year of life or with immune system dysfunction but can develop at any time. It affects both males and females and may be associated with an inherited defect of the cell-mediated immune system that allows autoantibodies to develop against target organs. The humoral immune system functions normally in this disease. The onset of infections associated with the disease may precede endocrinopathy.

■ OBSERVATIONS: Chronic mucocutaneous candidiasis may affect the skin, the mucous membranes, the nails, and the vagina, usually causing large, circular lesions. Associated viral infections may lead to endocrinopathy and hepatitis. Infections of the mouth, nose, and palate may cause problems with speech and eating. Tetany and hypocalcemia are the most common symptoms associated with the endocrinopathy and are usually confined to the organ involved. Other complications associated with chronic mucocutaneous candidiasis may include diabetes, Addison's disease, hypothyroidism, and pernicious anemia. In some patients psychiatric problems develop as a result of disfigurements and extensive endocrinal disorders. Diagnosis of this disease usually includes laboratory tests, which commonly show a normal T cell count and normal immunological responses to antigens other than *Candida albicans*. The endocrinopathy associated with this disease may include nonimmunological aberrations, such as hypocalcemia, abnormal hepatic function, hyperglycemia, iron deficiency, and abnormal vitamin B_{12} absorption. Other immunodeficiency diseases associated with chronic *Candida* infection must be excluded by diagnosis. Such immunodeficiency diseases as DiGeorge's syndrome, ataxia-telangiectasia, and severe combined immunodeficiency disease all cause serious immunological defects. Required after diagnosis of chronic mucocutaneous candidiasis are evaluations of numerous physiological mechanisms, such as adrenal, gonadal, pancreatic, parathyroid, pituitary, and thyroid functions. Chronic mucocutaneous candidiasis is progressive and usually leads to endocrinopathy.

■ INTERVENTIONS: Chronic mucocutaneous candidiasis resists treatment with topical antifungal agents, miconazole, and nystatin. Endocrinopathies associated with the disease must be treated individually by hormone replacement; some success in this regard has been reported with experimental injections of thymosin and levamisole. Most success in treating severe cases has been achieved with transfer factor from a *Candida*-positive donor, with IV amphotericin B. Some success against systemic infection may also be possible with amphotericin B, but that agent is highly nephrotoxic. Some patients respond fairly well to fetal thymus transplantation. Plastic surgery may aid patients in coping with disfigurements caused by the disease. Treatment may also include oral or intramuscular iron replacement.

■ NURSING CONSIDERATIONS: Patients with chronic mucocutaneous candidiasis must be closely monitored for signs of other associated diseases, such as Addison's disease, diabetes, hepatitis, and pernicious anemia. Patients suffering psychologically from disfigurements associated with the disease often respond positively to the counsel, encouragement, and kindness of the nursing staff. Amphotericin B, a nephrotoxin, is involved in the treatment. Therefore the patient must be carefully monitored for renal function. Patients benefit from calm explanations of the progressive manifestations of the disease and the importance of regular endocrinological checkups.

chronic myelocytic leukemia (CML), a malignant neoplasm of blood-forming tissues, characterized by a proliferation of granular leukocytes and, often, of megakaryocytes. The disease occurs most frequently in adults older than 50 years of age and begins insidiously. Its progress is marked by malaise, fatigue, heat intolerance, bleeding gums, purpura, skin lesions, weight loss, hyperuricemia, abdominal discomfort, and massive splenomegaly. Differential blood count and bone-marrow biopsies are performed to aid in the diagnosis. The alkaline phosphatase activity of the leukocytes is low, and the Philadelphia chromosome is present in myeloblasts in most patients with CML. Therapy with an oral alkylating agent is usual, but advanced CML is refractory to chemotherapy. Also called **chronic granulocytic leukemia** (CGL), **chronic myelogenous leukemia (CML),** *chronic myeloid leukemia,* **splenomedullary leukemia,** *splenomyelogenous leukemia*. See also **acute myelocytic leukemia.**



Chronic myelocytic leukemia

(Kumar et al, 2007/Courtesy Dr. Robert W. McKenna, Department of Pathology, University of Texas Southwestern Medical School)

chronic myelogenous leukemia /mī′əlōsit′ik/, Myeloproliferative neoplasm characterized by the unregulated and excessive production of cells of the myelocytic maturation series and presence of the BCR/ABL 1 mutation. Compare **acute lymphocytic leukemia, chronic lymphocytic leukemia, leukemoid reaction.** See also **acute myelocytic leukemia, chronic myelocytic leukemia, leukocytosis.**

chronic myocarditis [Gk, *chronos,* time, *mys,* muscle, *kardia,* heart, *itis,* inflammation], inflammation of the myocardium that persists after an acute bacterial infection. Chronic myocarditis is characterized by degeneration of muscle tissue and fibrosis or infiltration of interstitial tissues. See also **myocarditis.**

chronic nephritis [Gk, *chronos,* time, *nephros,* kidney, *itis,* inflammation], a form of kidney inflammation usually secondary to another disease, such as chronic pyelonephritis. In chronic interstitial nephritis the kidney becomes small and granular with thickening of arteries and arterioles and proliferation of interstitial tissue. There may be functional abnormalities, such as urea retention, hematuria, and casts.

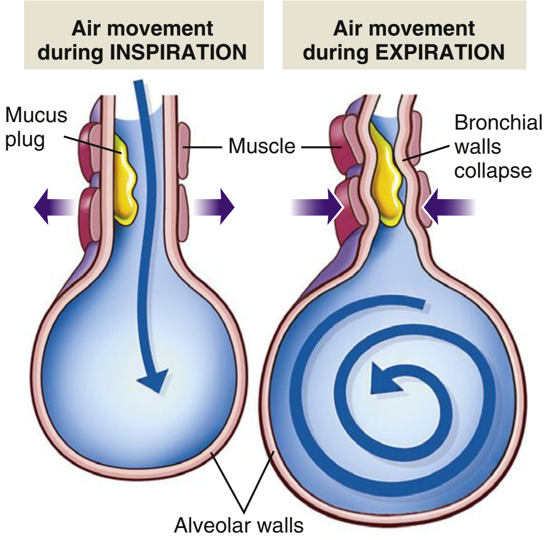
chronic nephropathy, a kidney disorder characterized by generalized or local damage to the tubulointerstitial areas of the kidney. The condition frequently results from more than a single cause, such as diabetes and a bacterial infection. Toxins, in the form of drugs or heavy metals, including cadmium or lead, are common causes, as are gout, cystinosis, and other metabolic disorders. Sickle cell disease is one of several inherited factors that may contribute to chronic nephropathy, but the condition can also develop from no known cause. Symptoms include polyuria, renal acidosis, edema, proteinuria, and blood in the urine. Treatment varies with correction of underlying causal factors. See also **kidney disease.**

chronic nonerosive gastritis, any type of chronic gastritis that does not involve deep penetration of the gastric mucosa.

chronic obstructive lung disease. See **chronic obstructive pulmonary disease.**

chronic obstructive pancreatitis, pancreatitis caused by dilatation of one of the major ducts proximal to an obstruction, usually from a tumor or scarring, which may be the result of earlier acute pancreatitis. Removal of the obstruction may improve pancreatic function.

chronic obstructive pulmonary disease (COPD), a progressive and irreversible condition characterized by diminished inspiratory and expiratory capacity of the lungs. The condition is aggravated by cigarette smoking and air pollution. COPDs include asthma, chronic bronchiectasis, chronic bronchitis, and emphysema. Also called **chronic obstructive lung disease.**



Air movement during INSPIRATION
Air movement during EXPIRATION
Mucus plug
Muscle
Bronchial walls collapse
Alveolar walls

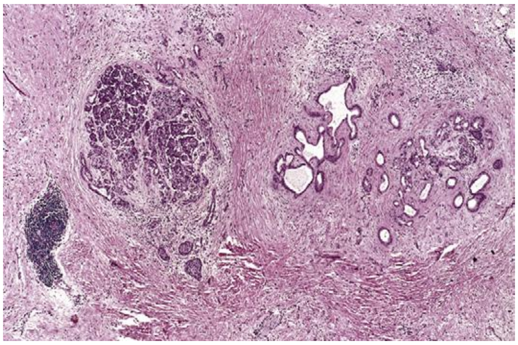
Air trapping in chronic obstructive pulmonary disease

(Huether and McCance, 2008)

chronic (open-angle) glaucoma. See **glaucoma.**

chronic pain, pain that continues or recurs over a prolonged period, caused by various diseases or abnormal conditions. Chronic pain may be less intense than acute pain. The person with chronic pain does not usually display increased pulse and rapid respiration because these autonomic reactions to pain cannot be sustained for long periods. Some factors that can complicate the treatment of persons with chronic pain are scarring, continuing psychological stress, and medication. Compare **acute pain.** See also **pain; pain, chronic; pain intervention; pain mechanism.**

chronic pancreatitis [Gk, *chronos,* time, *peri,* near, *teinein*- all, *kreas,* flesh, *itis,* inflammation], chronic inflammation of the pancreas with fibrosis and calcification of the gland. It may follow repeated acute attacks and can lead to diabetes. Causes include alcohol abuse, genetic diseases such as cystic fibrosis, and conditions obstructing the pancreatic duct.



Chronic pancreatitis *(Kumar et al, 2007)*

chronic peritonitis [Gk, *chronos,* time, *peri,* near, *tenein,* to stretch, *itis,* inflammation], a form of peritonitis in which the peritoneum thickens and ascites develops. The condition is usually associated with another disorder, such as pericarditis or polyserositis.

chronic pharyngitis. See **pharyngitis.**

chronic pigmented purpura, any of a group of benign dermatoses of unknown cause, not associated with underlying systemic disease, consisting of minimal inflammation with tiny hemorrhages from capillaries in the upper dermis, visible as red dots on the skin. Included are lichen aureus, pigmented purpuric lichenoid dermatitis, purpura annularis telangiectodes, and Schamberg disease.

chronic progressive myelopathy, gradually progressive spastic paraparesis associated with infection by human T-lymphotropic virus 1, characterized by progressive difficulty in walking and weakness of the lower extremity, sensory disturbances, and urinary incontinence, with no evidence of spinal compression or motor neuron involvement. Also called **HTLV-1-associated myelopathy, tropical spastic paraparesis.**

chronic prostatitis. See **prostatitis.**

chronic purulent synovitis. **1.** inflammation of the lining of a joint with the presence of pus. **2.** See **chronic synovitis.**

chronic pyelonephritis. See **pyelonephritis.**

chronic regional pain syndrome. See **reflex sympathetic dystrophy.**

chronic rejection, immune rejection of transplanted tissue that may continue for several months.

chronic renal failure (CRF), gradual loss of kidney function, with progressively more severe renal insufficiency until the stage called chronic irreversible kidney failure or end-stage renal disease. Symptoms may include polyuria, anorexia or nausea, dehydration, and neurological symptoms. See also **renal failure.**

chronic rheumatism [Gk, *chronos,* time, *rheumatismos,* that which flows], a persistent, nonspecific, painful condition of the musculoskeletal tissues, including nonarticular forms of arthritis. See also **rheumatism.**

chronic synovitis [Gk, *chronos,* time, *syn,* together; L, *ovum,* egg; Gk, *itis,* inflammation], chronic inflammation of the synovial membrane of a joint. Kinds of chronic synovitis include **chronic purulent synovitis** and **chronic serous synovitis.** See also **synovitis.**

chronic tetanus [Gk, *chronos,* time, *tetanos,* convulsive tension], **1.** a form of tetanus with a delayed onset, slow progression of the disease, and milder than usual symptoms. **2.** a reactivated tetanus infection in a healed wound.

chronic thromboembolic pulmonary hypertension, persistent pulmonary hypertension caused by obstruction of a major pulmonary artery by an unresolved embolus or multiple small pulmonary emboli.

chronic tuberculous mastitis, a rare infection of the breast resulting from extension of tuberculosis of underlying ribs. The condition is also characterized by multiple sinus tracts and the presence of tuberculosis elsewhere in the body.

chronic tubulointerstitial nephritis, tubulointerstitial nephritis that has progressed to the point at which there is interstitial fibrosis with shrunken kidneys, a lowered glomerular filtration rate, and danger of renal failure.

chronic undifferentiated schizophrenia, a condition marked by the symptoms of more than one of the classic types of schizophrenia—simple, paranoid, or catatonic. See also **acute schizophrenia.**

chrono-, chron-, prefix meaning “time”: *chronognosis, chronophobia, chronotropism.*

chronobiologist /kron′o-bi-ol′ah-jist/, a specialist in chronobiology.

chronobiology, the study of the effects of time on living systems.

chronograph /kron′əgraf/ [Gk, *chronos* + *graphein,* to record], a device that records small intervals of time, such as a stopwatch. —*chronographic, adj.*

chronological /kron′əloj′ik/ [Gk, *chronos* + *logos,* reason], **1.** arranged in time sequence. **2.** pertaining to chronology. Also *chronologic.*

chronological age, the age of an individual expressed as time that has elapsed since birth. The age of an infant is expressed in hours, days, or months; the age of children and adults is expressed in years.

chronopsychophysiology /kron′ōsī′kofis′ē·ol′əjē/, the science of physiological cyclic processes in the body.

chronotherapeutics /kron′ōther′əpyo͞o′tiks/, a branch of medicine concerned with effects of circadian rhythms in human health, such as the hour of the day when asthma symptoms or heart attacks are most likely to occur, the best time of day for treating certain complaints, and the best times to administer medication or chemotherapy to enhance activity or lessen toxicity. Practitioners of chronotherapeutics also believe that there is a best time of the month for performing breast cancer surgery and that cholesterol levels are higher and heart attacks are more common during the winter months.

chronotropism /krənot′rəpiz′əm/ [Gk, *chronos* + *trepein,* to turn], the act or process of affecting the regularity of a periodic function, especially interference with the rate of the heartbeat. —*chronotropic, adj.*

chrys-, prefix meaning “gold”: *chrysotherapy, chrysoderma.*

Chrysanthemum /krisan′thəməm/, a genus of perennial flowering herbs of the family Compositae, native to the Balkans and the Middle East. They are a common cause of contact dermatitis, and their powdered flowers are insecticidal and scabicidal and a source of pyrethrins.

chrysarobin /kris′ərō′bin/, a substance obtained from the wood of araboa trees and used as an irritant in the treatment of parasitic skin diseases and psoriasis.

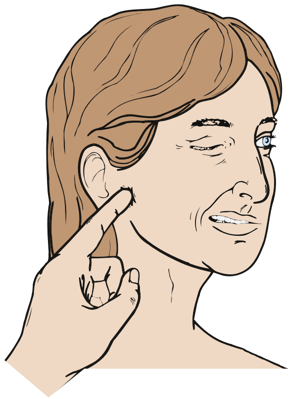
chrysiasis /krəsī′əsis/ [Gk, *chrysos,* gold, *osis,* condition], an abnormal condition that may develop after gold therapy, characterized by the deposition of gold in body tissues. Also called **auriasis.**

chrysotherapy /kris′ōther′əpē/ [Gk, *chrysos* + *therapeia,* treatment], the treatment of any disease with gold salts. —*chrysotherapeutic, adj.*

Chua K'a, a holistic counseling system of muscle tension release that emphasizes clarification and cleansing of the mind and emotions.

Churg-Strauss syndrome /churg′strous′/ [Jacob Churg, twentieth-century American pathologist; Lotte Strauss, twentieth-century American pathologist], a form of systemic necrotizing vasculitis in which there is prominent lung involvement with severe asthma, eosinophilia, and granulomatous reactions. If present, skin lesions consist of tender subcutaneous nodules and bruiselike spots. The cause is unknown. See also **vasculitis.**

Chvostek's sign, Chvostek-Weiss sign /khvôsh′teks/ [Franz Chvostek, Austrian surgeon, 1835–1884], an abnormal spasm of the facial muscles elicited by light taps on the cheek to stimulate the facial nerve in patients who are hypocalcemic. It is a sign of tetany. Checking for this sign is especially important after thyroid or parathyroid surgery.



Chvostek's sign *(Lewis et al, 2011)*

chyl-. See **chylo-.**

chyle /kīl/ [Gk, *chylos,* juice], the cloudy or turbid, white or pale yellow liquid products of digestion taken up by the small intestine. Consisting mainly of emulsified fats, chyle passes through fingerlike projections in the small intestine, called lacteals, and into the lymphatic system for transport to the venous circulation at the thoracic duct in the neck. Also called **chylus. —chylous,** *adj.*

chyle cistern, a dilation at the beginning of the thoracic duct, situated ventrally to the body of the second lumbar vertebra, on the right side of and dorsally to the aorta. It receives the two lumbar lymphatic trunks and the intestinal lymphatic trunk. Also called **Pecquet's cistern.**

chylemia /kīlē′mē·ə/, a condition in which chyle appears in the blood.

chyli-. See **chylo-.**

-chylia, suffix meaning "(condition of the) digestive juices, or chyle": *dyschylia, euchylia, polychylia.*

chyliform ascites. See **chylous ascites.**

chylo-, chyl-, chyli-, prefix meaning "chyle": *chylocyst, chylophonic, chylosis.*

chylocele /kī′ləsēl/, a cystic lesion caused by an effusion of chylous fluid into the tunica vaginalis of the testes.

chyloid /kī′loid/, resembling the chyle that fills the lacteals of the small intestine during the digestion of fatty foods.

chylomediastinum /kī′lōmē′dē·astī′nəm/ [Gk, *chylos,* juice; L, *mediastinus,* midway], the presence of chyle in the mediastinum.

chylomicron /kī′lōmī′kron/ [Gk, *chylos* + *mikros,* small], minute lipoproteins measuring less than 0.5 μm in diameter. Chylomicrons consist of about 90 triglycerides with small amounts of cholesterol, phospholipids, fat-soluble vitamins, and protein. They are synthesized in the GI tract and carry dietary fat from the intestinal mucosa via the thoracic lymphatic duct into the plasma and ultimately to the liver and tissues. The remnant chylomicron particles are removed by the liver.

chylosus ascites. See **chylous ascites.**

chylothorax /kī′lōthôr′aks/ [Gk, *chylos* + *thorax,* chest], a condition marked by the effusion of chyle from the thoracic duct into the pleural space. The cause is usually a traumatic injury to the neck or a tumor that invades the thoracic duct. Treatment is directed at repairing damage to the duct.

chylous /kī′ləs/ [Gk, *chylos,* juice], pertaining to or resembling chyle.

chylous ascites, an abnormal condition characterized by an accumulation of chyle in the peritoneal cavity. Chylous ascites results from an obstruction in the thoracic duct that may be caused by a tumor or by a destructive lesion, resulting in rupture of a lymph vessel. Also called **ascites adiposus, chyliform ascites, chylosus ascites, fatty ascites, milky ascites.** See also **ascites.**

chyluria /kīlŏŏr′ē·ə/ [Gk, *chylos* + *ouron,* urine], a milky appearance of the urine caused by the presence of chyle.

chylus. See **chyle.**

chymase /kī′mās/, a serine protease present in human mast cells, most prominent in skin and connective tissue, where it can cleave angiotensin and stimulate mucous glands.

chyme /kīm/ [Gk, *chymos,* juice], the viscous, semifluid contents of the stomach present during digestion of a meal. Chyme then passes through the pylorus into the duodenum, where further digestion occurs.

-chymia, -chymy, suffix meaning "(condition of) partly digested food in the duodenum": *achymia, ischochymia, oligochymia.*

chymopapain /kī′mōpəpā′ēn/ [Gk, *chymos* + Sp, *papaya*], a proteolytic enzyme isolated from the fruit of *Carica papaya* and related to papain. It is used in the treatment of prolapsed intervertebral or herniated disks.

chymosin. See **rennin.**

chymotrypsin /kī′mōtrip′sin/ [Gk, *chymos* + *tryein,* to rub, *pepsin,* digestion], **1.** a proteolytic enzyme produced by the pancreas that catalyzes the hydrolysis of casein and gelatin. **2.** a yellow crystalline powder prepared from an extract of ox pancreas that is used in treating digestive disorders in which the enzyme is present in less than normal amounts or is totally lacking.

chymotrypsinogen /kī′mōtripsin′əjən/, a substance produced in the pancreas that is the zymogen precursor to the enzyme chymotrypsin. It is converted to chymotrypsin by trypsin.

-chymy. See **-chymia.**

Ci, abbreviation for **curie.**

CI, **1.** abbreviation for **Colour Index. 2.** abbreviation for *convergence insufficiency.*

Cialis, a trademark for **tadalafil.**

cibophobia /sē′bə-/ [L, *cibus,* food; Gk, *phobos,* fear], an abnormal or morbid aversion to food or to eating.

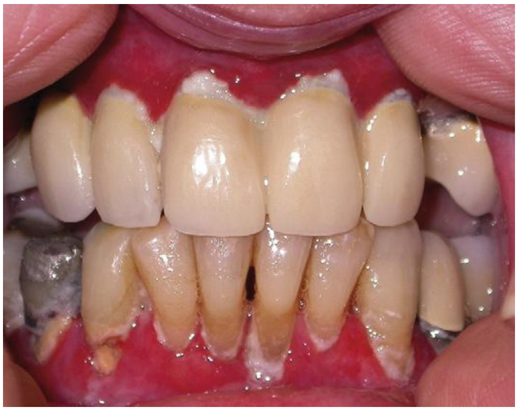
CIC, abbreviation for *Certified Infection Control.*

cicatrices. See **cicatrix.**

cicatricial alopecia /sisətrish′əl/, a form of baldness produced by scar formation in dermatoses such as lupus erythematosus, usually progressing to permanent baldness.

cicatricial entropion. See **cicatrix, entropion.**

cicatricial pemphigoid [L, *cicatrix,* scar; Gk, *pemphix,* blister or bubble + *eidos,* form], a benign, chronic, usually bilateral, subepidermal blistering disease chiefly involving the mucous membranes, especially those of the mouth and eye. It heals by scarring and may lead to slow shrinkage of the affected tissues, and to blindness if untreated. Also called **benign mucosal pemphigoid.**



Cicatricial pemphigoid *(Marks and Miller, 2006)*

cicatricial scar [L, *cicatrix,* scar; Gk, *eschara,* scab], a fibrous scar that remains after a wound has healed.

cicatricial stenosis [L, *cicatrix,* scar; Gk, *stenos,* narrow, *osis,* condition], the narrowing of a duct or tube caused by the formation of scar tissue.

cicatrix /sik′ətriks, sikā′triks/ *pl*. **cicatrices** [L, scar], scar tissue that is avascular, pale, contracted, and firm after the earlier phase of skin healing characterized by redness and softness. Also called **scar.** —*cicatricial* /sik′ətrish′əl/, *adj.,* **cicatrize,** *v.*

cicatrize /sik′ətrīz/ [L, *cicatrix,* scar], to heal so as to form a scar.

ciclopirox /sī′kləpī′roks/, a topical antifungal agent.

■ INDICATIONS: It is prescribed in the treatment of tinea and candidiasis.

■ CONTRAINDICATION: Known sensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse reactions are local reactions of irritation, pruritus at the application site, burning, and worsening of clinical signs and symptoms.

ciclosporin. See **cyclosporin.**

cicutism /sik′yo͞otiz′əm/ [L, *Cicuta,* hemlock; Gk, *ismos,* process], poisoning caused by water hemlock, resulting in cyanosis, dilated pupils, convulsions, and coma.

CID, abbreviation for **cytomegalic inclusion disease.**

-cide, -cid, suffix meaning “killing”: *amebicide, herbicide, protozoacide*.

-cidin, suffix designating a natural antibiotic.

cidofovir, an antiviral.

■ INDICATION: It is used to treat cytomegalovirus retinitis in patients with AIDS.

■ CONTRAINDICATIONS: Known hypersensitivity to acyclovir or this drug prohibits its use.

■ ADVERSE EFFECTS: Life-threatening effects include coma, hemorrhage, hematuria, granulocytopenia, thrombocytopenia, irreversible neutropenia, anemia, and eosinophilia. Other serious adverse effects include confusion, psychosis, tremors, somnolence, arrhythmias, hypertension/hypotension, retinal detachment in cytomegalovirus retinitis, abnormal liver function tests, increased creatinine, increased blood urea nitrogen, and phlebitis.

cigarette smoking, the inhalation of the gases and hydrocarbon vapors generated by slowly burning tobacco in cigarettes. The practice stems partly from the effect on the nervous system of the nicotine contained in the smoke. In addition to nicotine, nearly 1000 other chemicals have been identified in cigarette smoke, including carcinogenic polycyclic aromatic alcohols, cocarcinogenic phenols and fatty acids, carbon monoxide, hydrogen sulfide, hydrocyanic acid, nitrogen oxides, and various irritants that suppress protease inhibition and impair alveolar macrophage function. Cigarette smoke is addictive and is considered more dangerous than pipe or cigar smoke because it is less irritating and therefore more likely to be inhaled. See also **lung cancer, nicotine.**

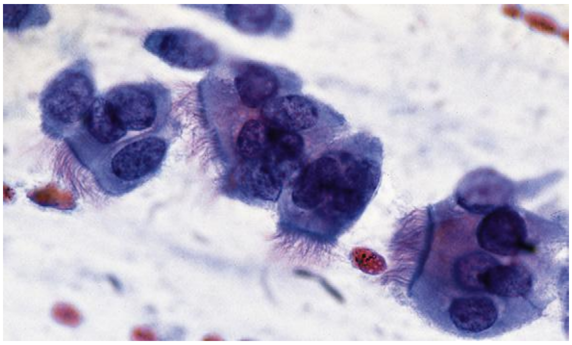
ciguatera /se′gwäta′rəh/, a form of fish poisoning, marked by GI and neurological symptoms, caused by ingestion of tropical or subtropical marine fish, such as the barracuda, grouper, or snapper that have accumulated ciguatoxin in their tissues. Ciguatoxin is heat resistant and is not detoxified by cooking. This form of poisoning is often misdiagnosed as multiple sclerosis.

ciguatera poisoning /sē′gwəter′ə/ [Sp, *cigua,* sea snail; L, *potio,* drink], a nonbacterial food poisoning that results from eating fish contaminated with the ciguatoxin. Many of the over 300 varieties of fish from the Caribbean or South Pacific have been implicated; barracuda is a common source. The toxin is believed to block acetylcholinesterase activity. Characteristics of ciguatera poisoning are vomiting, diarrhea, tingling or numbness of extremities and the skin around the mouth, itching, muscle weakness, pain, and respiratory paralysis. Cold liquids feel hot to the surfaces of the mouth and throat. No specific treatment has been developed.

ciguatoxin /se′gwätok′sin/, a heat-stable toxin originating in a dinoflagellate as a pretoxin and concentrating in active form in the tissue of certain marine fish (usually tropical reef fish), causing ciguatera in humans who eat the fish.

cili-, **1.** prefix meaning “eyelid”: *ciliectomy, cilioretinal, cilioscleral*. **2.** prefix meaning “eyelash”: *ciliary, cilium*. **3.** prefix meaning “minute vibratile”: *ciliated, ciliogenesis*.

cilia /sil′ē·ə/ *sing*. **cilium** [L, eyelids or eyelashes], **1.** the eyelids or eyelashes. **2.** small, hairlike processes projecting from epithelial cells on the outer surfaces of some cells, aiding metabolism by producing motion, eddies, or current in a fluid. In the lung, cilia wave mucus, pus, and dust upward.



Cilia *(McKee, 1997)*

ciliary /sil′ē·er′ē/ [L, *cilia*], pertaining to the eyelashes or eyelids.

ciliary artery, any of the branches of the ophthalmic artery that, along with the retinal artery, supply the eye.

ciliary body [L, *cilia*], the thickened part of the vascular tunic of the eye that joins the iris with the anterior portion of the choroid. It is composed of the ciliary crown, ciliary processes and folds, ciliary orbiculus, ciliary muscle, and a basal lamina.

ciliary canal, the spaces of the iridocorneal angle.

ciliary disc, the thin part of the ciliary body extending between its crown and the ora serrata retinae.

ciliary ganglion, a small parasympathetic ganglion in the orbit of the eye, which controls pupillary and accommodative reflexes.

ciliary gland, one of the numerous tiny, modified sweat glands arranged in several rows near the free margins of the eyelids. The apertures of the glands lie near the attachments of the eyelashes. Acute localized bacterial infection of one or more of the ciliary glands causes external sties. Also called **glands of Moll Zeis.** Compare **tarsal gland.**

ciliary margin, the peripheral border of the iris, continuous with the ciliary body.

ciliary movement, the upward waving motion of the hairlike processes projecting from the epithelium of the respiratory tract and from certain microorganisms.

ciliary mucus transport, the movement of mucus-trapped particles from the upper respiratory tract to the lower pharynx, propelled by the motion of microscopic cilia lining the tract.

ciliary muscle, a semitransparent circular band of smooth muscle fibers attached to the choroid of the eye, the chief agent in glowing lens adjustment of the eye to assume a more spherical shape. It draws the ciliary process centripetally, relaxing the suspensory ligament of the crystalline lens and allowing the lens to become more convex.

ciliary process, any one of about 80 tiny fleshy projections on the posterior surface of the iris, forming a frill around the margin of the crystalline lens of the eye. The processes compose one of the two zones of the ciliary body of the eye and are formed by infolding of the various layers of the choroid. They secrete nutrient fluids to nourish the lens, cornea, and vitreous body. See also **ciliary body.**

ciliary reflex. See **accommodation reflex.**

ciliary ring, a small grooved band of tissue, about 4 mm wide, that forms the posterior part of the ciliary body of the eye. It extends from the ora serrata of the retina to the ciliary processes and is thicker near the ciliary processes as a result of the thickness of the ciliary muscle.

ciliary zone, an outer circular area on the anterior surface of the iris, separated from the inner circular area by the angular line. The ciliary zone contains the stroma of the iris. Also called **zonula ciliaris.**

Ciliata /sil′ē·ā′tə/, a class of protozoa of the subphylum Ciliophora, characterized by cilia throughout the life cycle. The class includes the subclasses Euciliata and Protociliata. The only significant ciliate affecting humans is the intestinal parasite ***Balantidium coli,*** which causes dysentery.

ciliate /sil′ē·it/, of or having cilia, as certain epithelial cells of the body or protozoa of the class Ciliata.

ciliated epithelium /sil′ē·ā′tid/ [L, *cilia* + Gk, *epi,* upon, *thele,* nipple], any epithelial tissue that projects cilia from its surface, such as portions of the epithelium in the respiratory tract.

Ciliophora, a phylum of protozoa whose members, called ciliates, use cilia for locomotion and feeding.

ciliospinal /sil′ē·ōspī′nəl/, pertaining to a relationship between the ciliary body of the eye and the spinal cord.

ciliospinal reflex [L, *cilia* + *spina,* backbone, *reflectere,* to bend back], a normal brainstem reflex initiated by scratching or pinching the skin of the neck or face, causing dilation of the pupil. Also called **pupillary skin reflex.**

cilium. See **cilia.**

-cillin, suffix designating a penicillin.

cilostazol, a platelet aggregation inhibitor.

■ INDICATION: It is used to treat intermittent claudication.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug, congestive heart failure, active liver disease, blood dyscrasias, and active bleeding prohibits its use.

■ ADVERSE EFFECTS: Life-threatening effects include atrial fibrillation/flutter, cerebral infarct, cerebral ischemia, congestive heart failure, cardiac arrest, myocardial infarction, nodal dysrhythmias, bleeding (epistaxis, hematuria, conjunctival hemorrhage, GI bleeding), agranulocytosis, neutropenia, and thrombocytopenia. Serious adverse effects include palpitations, tachycardia, vomiting, colitis, cholelithiasis, ulcer, and diabetes mellitus. Common side effects include vertigo, diarrhea, rash, back pain, headache, infection, myalgia, peripheral edema, cough, pharyngitis, and rhinitis.

cimbia /sim′bē·ə/, a girdlelike band of white fibers that extends across the surface of the cerebral peduncle.

cimetidine /simet′idēn/, an H_2-receptor antagonist.

■ INDICATIONS: It is prescribed to inhibit the production and secretion of acid in the stomach in the treatment of gastroesophageal reflux disease, pancreatitis, duodenal ulcers, and hypersecretory conditions. It is also used in the treatment of warts.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are diarrhea, dizziness, rash, confusion (usually in elderly patients given large doses), and gynecomastia. Cimetidine inhibits several forms of cytochrome P_{450} and, therefore, has effects on many other drugs.

Cimex lectularius. See **bedbug.**

CIN, abbreviation for **cervical intraepithelial neoplasia.**

cinacalcet, a calcium receptor agonist that directly lowers parathyroid hormone levels by increasing sensitivity of calcium-sensing receptors to extracellular calcium.

■ INDICATIONS: This drug is used to treat hypercalcemia in parathyroid carcinoma and secondary hyperparathyroidism in chronic kidney disease requiring dialysis.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include dizziness, hypertension, nausea, diarrhea, vomiting, anorexia, access infection, noncardiac chest pain, asthenia, and myalgia.

cinchona /singkō′nə, chinchō′nə/ [countess of Chinchon, Peru], the dried bark of the stem or root of species of *Cinchona,* containing the alkaloids quinine and quinidine.

cinchonine, an alkaloid of cinchona used as an antimalarial agent, chiefly in the form of the sulfate salt, administered orally.

cinchonism /sin′kōniz′əm/, a condition resulting from excessive ingestion of cinchona bark or its alkaloid derivatives (quinine or quinidine). Cinchonism is characterized by hearing loss, headache, tinnitus, and signs of cerebral congestion. See also **quinine.**

cine-, kine-, kinesio-, prefix meaning "movement": *cineangiogram, cinefluorography, cineradiography.*

cineangiocardiogram /sin′ē·an′jē·ōkär′dē·əgram′/, a radiograph produced by cineangiocardiography.

cineangiocardiography /sin′ē·an′jē·ōkär′dē·og′rəfē/ [Gk, *kinesis,* movement, *angeion,* vessel, *kardia,* heart, *graphein,* to record], the production of images of the cardiovascular system by a combination of fluoroscopic, radiographic, and motion-picture techniques. See also **cineradiography.**

cineangiogram /sin′ē·an′jē·əgram′/, a motion-picture recording of a blood vessel or of a portion of the cardiovascular system obtained after injecting a patient with a nontoxic radiopaque medium.

cineangiograph /sin′ē·an′jē·əgraf′/, a movie camera used for recording fluorescent images of the cardiovascular system.

cine film /sin′ē/, a type of motion picture film used in cineradiography, usually in cardiac catheterization or GI studies.

cinefluorography. See **cineradiography.**

cinematics. See **kinematics.**

cineplastic amputation. See **kineplasty.**

cineradiography /sin′irā′dē·og′rəfē/ [Gk, *kinesis*, movement; L, *radiere*, to shine; Gk, *graphein*, to record], the filming with a movie camera of the images that appear on a fluorescent screen, especially images of body structures following injection of a nontoxic radiopaque medium. Cineradiography incorporates the techniques of cinematography, fluoroscopy, and radiography as a diagnostic technique. Also called **cinefluorography,** *cineroentgenofluorography*. See also **cineangiocardiography.**

cinesia. See **kinesia.**

-cinesis, -cinesia. See **-kinesis.**

cingulate /sing′gyəlit/ [L, *cingulum*, girdle], **1.** having a zone or a girdle, usually with transverse markings. **2.** pertaining to a cingulum.

cingulate sulcus. See **callosomarginal fissure.**

cingulectomy /sing′gyo͞olek′təmē/ [L, *cingulum* + Gk, *ektomē*, excision], the surgical excision of a portion of the cingulate gyrus in the frontal lobe of the brain and the immediately surrounding tissue.

cingulotomy /sing′gyo͞olot′əmē/ [L, *cingulum* + *temnein*, to cut], a procedure in brain surgery to alleviate intractable pain by producing lesions in the tissue of the cingulate gyrus of the frontal lobe. The operation interrupts the fibers of the white matter in the gyrus by the stereotactic application of heat or cold.

cinnamon /sin′əmən/ [Gk, *kinnamomon*], the aromatic inner bark of several species of *Cinnamomum*, a tree native to the East Indies and China. Saigon cinnamon is commonly used as a carminative, an aromatic stimulant, and a spice. —*cinnamic, adj.*

CINV, abbreviation for **chemotherapy-induced nausea and vomiting.**

CIPM, abbreviation for **Comité International des Poids et Mesures** (International Committee for Weights and Measures).

circa [L, *circa*, about], approximate, as an approximate date or number.

circadian dysrhythmia /sərkā′dē·ən, sur′kədē′ən/ [L, *circa*, about, *dies*, day; Gk, *dys*, bad, *rhythmos*, *rhythm*], the biological and psychological stress effects of jet lag, or rapid travel through several time zones. In addition to a shift in normal eating and sleeping patterns, disruption of medication schedules and other therapies may occur.

circadian rhythm [L, *circa*, about, *dies*, day; Gk, *rhythmos*, *rhythm*], a pattern based on a 24-hour cycle, especially the repetition of certain physiological phenomena, such as sleeping and eating.

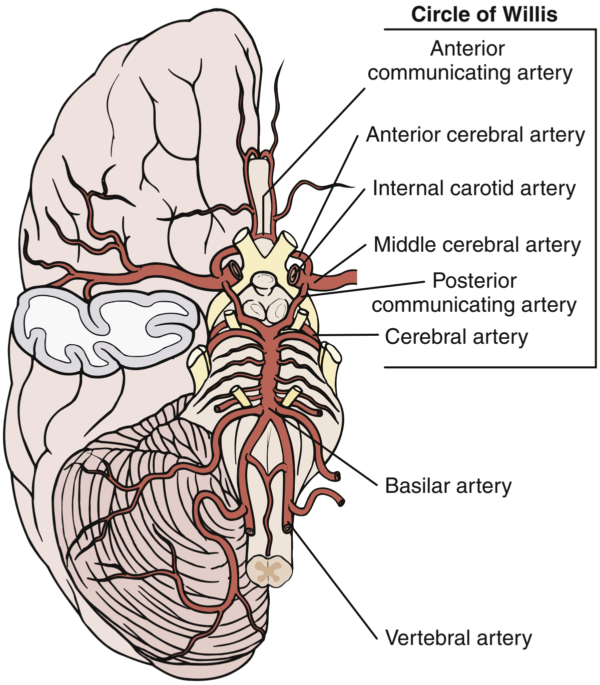
circinate /sur′sināt/ [L, *circinare*, to make round], having a ring-shaped outline or formation; annular.

circle [L, *circulus*], (in anatomy) a circular or nearly circular structure of the body, such as the circle of Willis and circle of Zinn. —**circular,** *adj.*

circle of Carus. See **curve of Carus.**

circle of least confusion, **1.** (in optics) a disc representing the image of a theoretical point made by a spherocylindrical lens. **2.** smallest cross-section of the blur circle between two focal lines formed by an astigmatic lens.

circle of Willis [Thomas Willis, English physician, 1621–1675], a vascular network at the base of the brain formed by the interconnection of the middle cerebral, anterior cerebral, posterior cerebral, basilar, anterior communicating, and posterior communicating arteries.



Circle of Willis *(Monahan et al, 2007)*

CircOlectric (COL) bed, a trademark for an electronically controlled bed that can be vertically rotated 210 degrees, allowing a patient to move vertically from the prone to supine position. It is used especially in orthopedics and in the treatment of patients with severe burns and decubitus ulcers. The bed consists of a strong aluminum circular frame supporting an anterior and a posterior straight frame within the exterior aluminum circle. The patient is “sandwiched” and secured between the two straight frames during rotation. Compare **Foster bed, hyperextension bed, Stryker wedge frame.**

circuit /sur′kit/ [L, *circuitus*, going around], a course or pathway, particularly one through which an electric current passes. Current passes through a closed or continuous circuit and stops if the circuit is open, interrupted, or broken. See also **volt.**

circuit training, a method of physical exercise in which activities are arranged in sets and the participant moves quickly from one activity to another with a minimum of rest between activities.

circular. See **circle.**

circular bandage /sur′kyələr/ [L, *circularis*, round], a bandage wrapped around an injured part, usually a limb or a digit.

circular fiber, any one of the many fibers in the free gingiva that encircle the teeth. Compare **alveolar crestal fiber, apical fiber.**

circular fold, one of the numerous annular projections in the small intestine. They vary in size and frequency in the duodenum, the jejunum, and the ileum and are formed by mucous and submucous tissue. Also called **plica circularis, valve of Kerkring.**

circulation /sur′kyəlā′shən/ [L, *circulatio*, to go around], movement of an object or substance through a circular course so that it returns to its starting point, such as the circulation of blood through the circuitous network of arteries and veins.

circulation rate [L, *circulatio,* to go around, *ratum,* calculation], the rate of blood flow, usually expressed as the amount of blood pumped through the heart per minute. The rate varies with such factors as blood volume and cardiac contractility.

circulation status, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as unobstructed, unidirectional blood flow at an appropriate pressure through large vessels of the systemic and pulmonary circuits. See also **Nursing Outcomes Classification.**

circulation time, the time required for blood to flow from one part of the body to another. Timing a particle of blood involves injecting a traceable dye or radioisotope into a vein and timing its reappearance in an artery at the point of injection. Alternatively, a substance that can be tasted, such as saccharin, can be injected and the time it takes to travel to the tongue noted. The resulting time helps determine problems with heart failure and decreased cardiac output.

circulatory care: arterial insufficiency, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion of arterial circulation. See also **Nursing Interventions Classification.**

circulatory care: mechanical assist device, a nursing intervention from the Nursing Interventions Classification (NIC) defined as temporary support of the circulation through the use of mechanical devices or pumps. See also **Nursing Interventions Classification.**

circulatory care: venous insufficiency, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion of venous circulation. See also **Nursing Interventions Classification.**

circulatory failure [L, *circulatio* + *fallere,* to deceive], inability of the cardiovascular system to supply the cells of the body with enough oxygenated blood to meet their metabolic demands. The condition may result from abnormal cardiac function, as in myocardial infarction; from an inadequate circulating volume of blood, as occurs in hemorrhage; or from mass systemic vasodilation, as may occur in gram-negative septicemia. See also **shock.**

circulatory fluid. See **blood, lymph.**

circulatory overload [L, *circulatio,* to go around; AS, *ofer* + ME, *lod*], an elevation in blood pressure caused by an increased blood volume, as by transfusion. The condition can lead to heart failure or pulmonary edema.

circulatory precautions, a nursing intervention from the Nursing Interventions Classification (NIC) defined as protection of a localized area with limited perfusion. See also **Nursing Interventions Classification.**

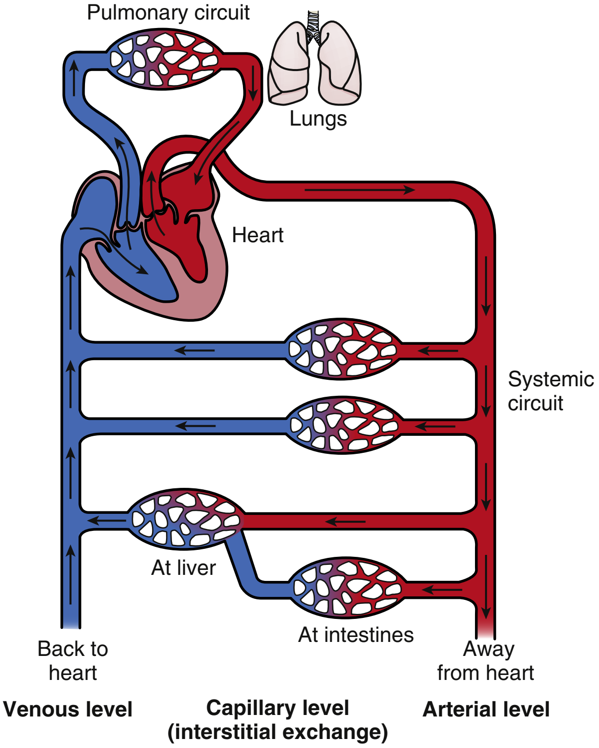
circulatory system, the network of channels through which the nutrient fluids (blood) of the body circulate.

circum-, prefix meaning "around": *circumanal, circumgemmal, circumvascular.*

circumanal /sur′kəmā′nəl/ [L, *circum,* around, *anus*], pertaining to the area surrounding the anus.

circumcision /-sizh′ən/ [L, *circum,* around, *cadere,* to cut], a surgical procedure in which the prepuce of the penis or the prepuce of the clitoris is excised. Circumcision is widely performed on newborn boys. The operation is performed on newborns with penile block anesthesia, using one of several kinds of clamp. It is sometimes performed on adult males in the treatment of phimosis and balanitis. Ritual circumcision is required by the religions of approximately one sixth of the world's population.

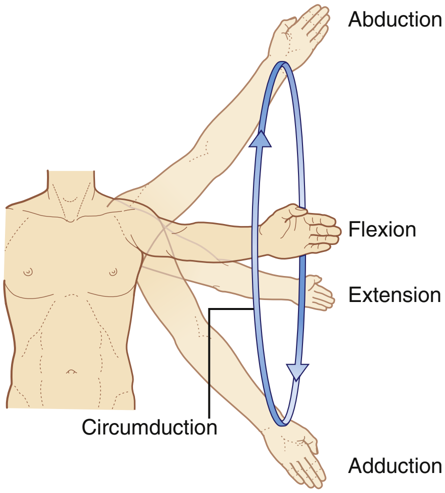
circumcision care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preprocedural and postprocedural support to males undergoing circumcision. See also **Nursing Interventions Classification.**



Circulatory system to the capillary level *(Phillips, 2007)*

circumcorneal /-kôr′nē·əl/, pertaining to the area of the eye surrounding the cornea.

circumduction /sur′kəmduk′shən/ [L, *circum* + *ducere,* to lead], **1.** one of the four basic movements allowed by the various joints of the skeleton. It is a combination of abduction, adduction, extension, and flexion. An example is the motion of a bone whose head articulates with a cavity, such as the femur with the acetabulum. The motion of the bone circumscribes a cone, the apex of which is in the cavity and the base of which is described by the distal end of the bone. **2.** the circular movement of a limb or of the eye. Compare **angular movement, gliding, rotation.**



Circumduction *(Drake, Vogl, and Mitchell, 2010)*

circumference /surkum′fərens/ [L, *circum,* around, *ferre,* to bear], **1.** the perimeter or periphery of a circle. **2.** a circular plane surface of a joint.

circumferential /sərkum′fəren′shəl/, encircling; pertaining to a circumference or perimeter.

circumferential fibrocartilage [L, *circum* + *ferre,* to bring, *fibra,* fiber, *cartilago*], a structure made of fibrocartilage, in which fibrocartilaginous rims surround the margins of various articular cavities, such as the glenoid labra of the hip and the shoulder. The rims deepen such cavities and protect their edges. Compare **connecting fibrocartilage, interarticular fibrocartilage, stratiform fibrocartilage.**

circumferential implantation. See **superficial implantation.**

circumflex /sur′kəmfleks/ [L, *circum,* around, *flexcere,* to bend], winding around; pertaining to blood vessels or nerves that wind around other body structures, as in the circumflex coronary artery.

circumlocution /-lōko͞o′shən/, the subconscious or learned use of pantomime, nonverbal communication, or word substitution by a patient because a word is difficult to retrieve or has been forgotten. See also **anomia.**

circummarginate placenta, a placenta with a thinner ring of membranous tissue on the fetal surface than that of a circumvallate placenta. It is associated rarely with fetal malformation but usually has no clinical significance.

circumoral /sur′kəmôr′əl/ [L, *circum* + *os,* mouth], pertaining to the area of the face around the mouth.

circumoral pallor [L, *circum,* around, *os,* mouth, *pallor,* paleness], paleness of the skin area around the mouth, a possible sign of scarlet fever.

circumscribed /-skrībd′/ [L, *circum,* around, *scribere,* to draw], within a well-defined area, or in one with definite boundaries or limits.

circumscribed abscess [L, *circum,* around, *scribere,* to draw, *abscedere,* to go away], an abscess separated from surrounding tissues by a wall of fibroblasts. It can be drained or aspirated like a noncircumscribed abscess by a surgeon or interventional radiologist.

circumscribed abscess of bone. See **Brodie's abscess.**

circumscribed pleurisy. See **encysted pleurisy.**

circumscribed scleroderma, localized scleroderma. See also **morphea.**

circum-speech [L, *circum* + AS, *spaec*], (in psychiatry) behavioral characteristics associated with conversation. The characteristics include body language, maintenance of personal space between individuals, hand sweeps, head nods, and task-oriented activities such as walking or knitting while carrying on a conversation.

circumstantiality /-stan′shē·al′itē/ [L, *circum* + *stare,* to stand], (in psychiatry) a speech pattern in which a patient has difficulty in separating relevant from irrelevant information while describing an event. The patient often includes all details and presents them in a sequential order, with the result that the main thread of thought becomes lost as one association leads to another. Frequently the person may need to have questions repeated because the main point of answers has become lost in the confusion of unnecessary detail. Compare **flight of ideas.**

circumvallate papilla. See **papilla.**

circus movement, **1.** an unusual and involuntary rolling or somersaulting caused by injured neural structures that control body posture, such as the cerebral pedicles or the vestibular apparatus. **2.** an unusual circular gait caused by injury to the brain or spinal cord. **3.** a mechanism associated with the excitatory wave of the atrium of the heart and atrial flutter or fibrillation. The wave travels a circular path characterized by a gap between the refractory and the excitatory tissue, usually resulting in conduction of only a fraction of the impulses to the ventricle.

cirrh-, prefix meaning "yellow": *cirrhosis.*

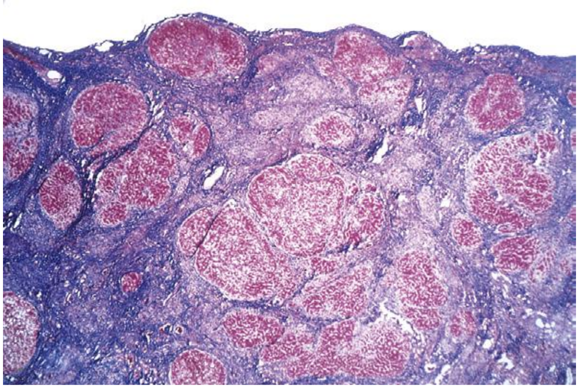
cirrhosis /sirō′sis/ [Gk, *kirrhos,* yellow-orange, *osis,* condition], a chronic degenerative disease of the liver in which the lobes are covered with fibrous tissue, the parenchyma degenerates, and the lobules are infiltrated with fat. Gluconeogenesis, detoxification of drugs and alcohol, bilirubin metabolism, vitamin absorption, GI function, hormonal metabolism, and other functions of the liver deteriorate. Blood flow through the liver is obstructed, causing back pressure and leading to portal hypertension and esophageal varices. Unless the cause of the disease is removed, hepatic coma, GI hemorrhage, and kidney failure may occur. Cirrhosis is most commonly the result of chronic alcohol abuse; other causes include nutritional deprivation, hepatitis, and cardiac problems. The symptoms of cirrhosis are the same regardless of the cause: nausea, fatigue, anorexia, weight loss, ascites, varicosities, and spider angiomas. Diagnosis is made definitively by biopsy, but radiographic and physical examinations and several blood tests of liver function are serially performed to monitor the course of the disease. Treatment depends on the cause. The liver has remarkable ability to regenerate, but recovery may be very slow.

■ OBSERVATIONS: Cirrhosis is often asymptomatic in early disease or may manifest as abdominal pain, diarrhea, nausea, vomiting, fatigue, and fever. As the disease progresses, manifestations such as chronic dyspepsia, constipation, anorexia, weight loss, pruritus, easy bruising, bleeding gums, nosebleeds, upper gastrointestinal bleeding, and enlarged liver are seen. Late disease is accompanied by telangiectasis, spider angiomas, enlarged breasts, testicular atrophy, jaundice, impotence, enlarged spleen, depression, abdominal vein distention, ascites, encephalopathy, and peripheral neuropathy. Diagnostic tests include abnormal liver function studies, including elevations in alkaline phosphatase, aminotransferase, and alanine aminotransferase. A CBC may show evidence of anemia, leukopenia, or thrombocytopenia. Protein metabolism tests show decreased total protein, decreased albumin, and increased globulin. Cholesterol levels are decreased as a result of abnormalities in fat metabolism. Prothrombin time is prolonged, and bilirubin metabolism is abnormal. Blood glucose may be reduced. Ultrasonography is used to reveal hepatosplenomegaly and enlarged portal veins. Liver scans show reduced liver uptake. Liver biopsy will show definitive histological changes in the liver cells and reveal altered structure in the lobes. Ascitic fluid may be tapped and drawn for differential analysis. Complications include bleeding esophageal varices, which can lead to massive hemorrhage; hepatorenal syndrome, which leads to renal failure; and hepatic encephalopathy, which leads to coma and death.

■ INTERVENTIONS: The first step is elimination of toxic agents, such as alcohol or drugs. Therapy is aimed at liver cell regeneration and the prevention or treatment of symptoms. This includes rest to reduce metabolic demands on the liver; a high-calorie, high-protein (unless hepatic encephalopathy is present), high-carbohydrate, and low-fat, low-sodium diet; diuretics to reduce edema; digestants to promote fat digestion; supplemental vitamins; and stool softeners. Ascites may be treated with abdominal paracentesis or peritoneovenous shunt. Esophageal varices may be treated by using blood and blood products, gastric lavage, or esophageal balloon to stem bleeding. Variceal sclerosis may be performed via endoscopy to eliminate the varicosities. A portal systemic shunt may be surgically placed to treat resistant esophageal varices.

A transjugular intrahepatic portosystemic shunt may be used to divert portal blood from the liver to relieve portal hypertension. Renal dialysis is used to treat renal failure. Hepatic encephalopathy is managed by reducing ammonia formation through reduced protein intake, administering lactulose to decrease pH in the intestines, and administering antibiotics to reduce bacterial flora in the colon. Liver transplantation may be the only hope for those with advanced disease.

■ NURSING CONSIDERATIONS: Nursing care for individuals with acute disease is multifaceted, complex, and dictated by the stage of the disease and presenting symptomatology. The focus is on strength conservation. This includes balancing rest and activity and correcting nutritional imbalances. Edema and ascites produce itching and impaired skin integrity. Skin care requires careful diligence to prevent excoriation and breakdown. Ascites can also produce shortness of breath from pressure placed on the diaphragm. This requires careful positioning and monitoring of respiratory rate and rhythm. Sensory perception may be decreased secondary to peripheral neuropathy. This places the individual at increased risk for injury and requires the implementation of injury prevention protocols. Infection control measures should also be in effect to reduce the possibility of infection from environmental pathogens in these susceptible individuals. Careful monitoring is needed to spot early signs of life-threatening complications, such as hepatic encephalopathy or esophageal bleeding. In the individual with hepatic encephalopathy, the focus is on monitoring systems affected by increased ammonia levels and assessing whether levels are effectively being reduced. Assessment of alertness (orientation, reflexes, and pupil reaction), and sensory and motor abnormalities (incoordination or hyperreflexia) is necessary. Adequate hydration must be maintained with careful monitoring for fluid and electrolyte and acid base imbalances, reduction of protein, prevention of constipation, and strict bed rest. Signs of esophageal bleeding, such as hematemesis or bloody stools, should be treated as an emergency because bleeding must be stopped quickly. Chronic care focuses on education. Individuals need to understand that this disease is chronic in nature and requires continuous care to reduce or prevent serious complications. Prompt treatment needs to be sought at any sign of complication. Instruction is needed about diet, medication use and restrictions, skin care, infection protection, and importance of complete alcohol abstinence. Referrals may be made to substance abuse programs and community or home health care agencies.



Alcohol cirrhosis *(Kumar et al, 2007)*

cirsoid aneurysm. See **racemose aneurysm.**

cis arrangement. See **cis configuration.**

cisatracurium, a nondepolarizing neuromuscular blocker.

■ INDICATIONS: It is used to facilitate endotracheal intubation and skeletal muscle relaxation during mechanical ventilation, surgery, or general anesthesia.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Life-threatening effects include prolonged apnea, bronchospasm, cyanosis, and respiratory depression. Other serious adverse effects include bradycardia, tachycardia, and increased/decreased blood pressure.

cis configuration /sis/, **1.** the presence of the dominant alleles of two or more pairs of genes on one chromosome and the recessive alleles on the homologous chromosome. **2.** the presence of the mutant genes of a pair of pseudoalleles on one chromosome and the wild-type genes on the homologous chromosome. Compare **coupling, trans configuration. 3.** (in chemistry) a form of geometric or steroisomerism in which two substituent groups are on the same side of a double bond or aliphatic ring. Also known as Z (zusammen) configuration. also called **cis arrangement, cis position.**

cisplatin /sisplat′in/, an antineoplastic.

■ INDICATIONS: It is prescribed in combination with vinblastine and bleomycin in the treatment of neoplasms such as metastatic testicular, prostatic, and ovarian tumors, and Hodgkin's lymphoma.

■ CONTRAINDICATIONS: Preexisting renal dysfunction, myelosuppression, hearing impairment, or known hypersensitivity to this drug or other drugs containing platinum prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse reactions are nephrotoxicity, ototoxicity, myelosuppression, severe nausea, anorexia, vomiting, and allergic reactions.

cis position. See **cis configuration** def 3.

cistern /sis′tərn/ [L, *cisterna,* vessel], a storage reservoir for fluids.

cisterna /sistur′nə/ *pl. cisternae* [L, vessel], a cavity that serves as a reservoir for lymph or other body fluids. Kinds of cisternae include *cisterna chyli* and *cisterna subarachnoidea.*

cisternal puncture /sistur′nəl/ [L, vessel, *punctura,* a piercing], the insertion of a needle into the cerebellomedullary cistern to withdraw cerebrospinal fluid for examination, usually performed with fluoroscopic guidance. The puncture is made between the atlas and the occipital bone.

cistron /sis′tron/ [L, *cis,* this side, *trans,* across], a fragment or portion of DNA that codes for a specific polypeptide. It is the smallest unit functioning as a transmitter of genetic information. In modern molecular genetics the cistron is essentially synonymous with the gene. It can include regions preceding and following the coding DNA as well as introns.—*cistronic, adj.*

cisvestitism /sisves′titiz′əm/ [L, *cis,* this side, *vestis,* garment], the practice of wearing attire appropriate to the sex of the individual involved but not suitable to the age, occupation, or status of the wearer, as when a male bookkeeper impersonates a male police officer by wearing a police uniform.

cit, abbreviation for *citrate anion.*

citalopram, an antidepressant in the selective serotonin-reuptake inhibitor class.

■ INDICATION: It is used to treat major depressive disorder.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. It should not be used with MAO inhibitors. It interacts with several forms of cytochrome P_{450} and therefore influences many other drugs.

■ ADVERSE EFFECTS: Life-threatening effects include convulsions, hemorrhage, first-degree atrioventricular block, and myocardial infarction. Other serious adverse effects include hallucinations, delusions, psychosis, vomiting, asthma, hyperventilation, respiratory infection, dyspnea, bronchitis, pneumonia, angina pectoris, hypertension, palpitations, tachycardia, bradycardia, thrombophlebitis, arthritis, amenorrhea, cystitis, urine retention, and viral infection. Common side effects are numerous, affecting the GI, integumentary, respiratory, cardiovascular, genitourinary, and central nervous systems. Some are also systemic.

Citanest Hydrochloride, a trademark for a local anesthetic **(prilocaine hydrochloride).**

citicoline /sit′ikō′lin/, a natural substance that is a component of cell membranes. A pharmaceutic version is used to help stroke victims by inducing injured membranes to repair themselves, limiting cell death. The substance, manufactured by the human body, also helps the brain tissues to repair or replace circuits needed for normal functions. Citicoline treatment can be administered within 24 hours of a stroke.

citrate /sit′rāt, sī′trāt/ [L, *kitron,* citron], **1.** an anion of citric acid. **2.** the act of treating with a citrate or citric acid. **—citration,** *n.*

citrated plasma, Plasma from blood collected and mixed with sodium citrate, which prevents clotting. Citrated plasma is most often used for coagulation testing.

citric acid /sit′rik/ [Gk, *kitron,* citron; L, *acidus,* sour], a white, crystalline organic acid soluble in water and alcohol. It is extracted from citrus fruits, especially lemons and limes, or obtained by fermentation of sugars and is used as an acidulating agent, an antioxidant, and a flavoring agent in foods, carbonated beverages, and certain pharmaceutic products, especially laxatives. Compare **ascorbic acid.**

citric acid cycle [Gk, *kitron,* citron; L, *acidus,* sour; Gk, *kyklos,* circle], a sequence of enzymatic reactions involving the metabolism of carbon chains of sugars, fatty acids, and amino acids to yield carbon dioxide, water, and high-energy phosphate bonds. The cycle is initiated when pyruvate combines with coenzyme A (CoA) to form a two-carbon unit, acetyl-CoA, which enters the cycle by combining with four-carbon oxaloacetic acid to form six-carbon citric acid. In subsequent steps, isocitric acid, produced from citric acid, is oxidized to oxalosuccinic acid, which loses carbon dioxide to form alpha-ketoglutaric acid. Succinic acid, resulting from the oxidative decarboxylation of alpha-ketoglutaric acid, is oxidized to fumaric acid, and its oxidation regenerates oxaloacetic acid, which condenses with acetyl-CoA, closing the cycle. The citric acid cycle provides a major source of adenosine triphosphate energy and also produces intermediate molecules that are starting points for a number of vital metabolic pathways including amino acid synthesis. Also called **Krebs cycle, tricarboxylic acid cycle.** See also **acetylcoenzyme A.**

citrin /sit′rin/ [Gk, *kitron,* citron], a crystalline flavonoid concentrate that is used as a source of bioflavonoid.

citrovorum factor. See **folinic acid.**

citrulline /sitrul′ēn/ [L, *Citrullus,* watermelon], an amino acid produced from ornithine during the urea cycle. It is subsequently transformed to arginine by the transfer of a nitrogen atom from aspartate.

citrullinemia /-ē′mē·ə/, a disorder of amino acid metabolism caused by a deficiency of the enzyme argininosuccinic acid synthetase. The clinical features include vomiting, convulsions, and coma. It is treated with a low-protein diet that provides an essential amino acid mixture, ketoacid analogs of amino acids, and arginine.

Civilian Health and Medical Programs for Uniformed Services (CHAMPUS). See **TRICARE.**

CJPH, abbreviation for ***Canadian Journal of Public Health.***

C/kg, a unit of radiation exposure in the SI system, coulombs per kilogram of air. 1 roentgen lm= 2.58 × 10^{-4} C/kg.

CK isoenzyme fraction, one of several blood-borne enzymes that are released after myocardial necrosis. The isoenzyme of creatine kinase (CK) is identified as MB isomer, or MB-CK, and is a diagnostic clue to heart damage. Formerly called **creatine phosphokinase.** See also **aspartate aminotransferase, lactate dehydrogenase.**

cL, abbreviation for **centiliter.**

Cl, symbol for the element **chlorine.**

clade /klād/, a grouping of genetic variants within a single species.

Claforan, a trademark for an antibiotic **(cefotaxime sodium).**

claim, an itemized statement of services and costs from a health care provider or facility submitted to the insured for payment.

claims-made policy [L, *clamere,* to cry out; ME, *maken* + L, *politicus,* the state], a professional liability insurance policy that covers the holder for the period in which a claim of malpractice is made. The alleged act of malpractice may have occurred at some previous time, but the policy insures the holder when the claim is made. Compare **occurrence policy.**

clairvoyance /klervoi′əns/, the alleged power or ability to perceive or to be aware of objects or events without the use of the physical senses. Also called **clairsentience.** See also **extrasensory perception, parapsychology, telepathy.**

clamp [AS, *clam,* to hold together], an instrument with serrated jaws and locking handles, used for gripping, holding, joining, supporting, or compressing an organ, vessel, or tissue. In surgery, clamps generally are used for hemostasis and clamping tissue.

clamp forceps. See **pedicle clamp.**

clam poisoning. See **shellfish poisoning.**

clang association /klang/ [L, *clangere,* to resound, *associare,* to unite], the mental connection between dissociated ideas made because of similarity in the sounds of the words used to describe the ideas. The phenomenon occurs frequently in schizophrenia. See also **loose association.**

clap. See **gonorrhea.**

clapping [AS, *cloeppan,* to beat], (in massage) the procedure of making percussive movements on a patient's body, usually on the chest wall or back, by lowering the cupped palms alternately in a series of rapid, stimulating blows. In this procedure the movement of the hands is from the wrist. Clapping stimulates the circulation and refreshes the skin. It is often done to improve the comfort of bedridden patients, especially during administration of a bed bath. Also called **percussion.**

Clapton's line [Edward Clapton, English physician, 1830–1909], a greenish line at the base of the teeth, indicative of copper poisoning.

clarification /kler′ifikā′shən/ [L, *clarus,* clear, *facere,* to make], (in psychology) an intervention technique designed to guide the patient in focusing on and recognizing gaps and inconsistencies in his or her statements.

clarify /kler′əfī/, (in chemistry) to clear a turbid liquid by allowing any suspended matter to settle, by adding a substance that precipitates any suspended matter, or by heating. **—clarification,** *n.*

Clark's rule [Cecil Clark, twentieth century British physician; L, *regula,* model], a method of calculating the approximate pediatric dosage of a drug for a child by using this formula: weight in pounds/150 × adult dose. It is now considered obsolete. See also **pediatric dosage.**

-clasia, suffix meaning a "(specified) condition involving crushing or breaking up": *aortoclasia, colloidoclasia, osteoclasia*.

clasmat-, clasmato-, prefix meaning "a piece broken off, or fragmentation": *clasmatocyte, clasmatodendrosis, clasmatosis*.

clasp [ME, *clippen,* to embrace], **1.** (in dentistry) a sleevelike fitting that is fastened over a tooth to hold a partial denture in place. **2.** (in surgery) any device for holding together tissues, especially bones.

clasp arm, an extension, usually from a minor connector, of the clasp of a removable partial denture, that provides retention, reciprocation, or stabilization to an abutment tooth.

clasp-knife reflex, an abnormal sign in which a spastic limb resists passive motion and then suddenly gives way, similarly to the motion of the blade of a jackknife. It is an indication of damage to the pyramidal tract.

clasp-knife spasticity, clasp-knife rigidity.

clasp torsion, the twisting of a retentive clasp arm on a removable partial denture.

classical conditioning, a form of learning in which a previously neutral stimulus begins to elicit a given response through associative training. Also called **respondent conditioning.** See also **conditioned reflex.**

classical Western massage, methods of massage based on European concepts of anatomy and physiology and using five basic techniques: effleurage, pétrissage, friction, tapotement, and vibration.

classic cesarean section [L, *classicus,* first-class, *Caesar lex,* Caesar's law, *sectio,* a cutting], a method for surgically delivering a baby through a vertical midline incision of the upper segment of the uterus. For many practitioners this is the fastest method of cesarean delivery. However, it produces a weaker scar, and, because the upper segment is thicker and more vascular, more bleeding occurs during surgery than from the **low cervical cesarean section.** Compare **extraperitoneal cesarean section.** See also **cesarean section.**

classic tomography [L, *classicus* + Gk, *tome,* section, *graphein,* to record], a method that moves the x-ray source and the x-ray plate during an exposure to produce an image in which all but a particular plane is blurred out. This allows an approximate isolation of the image of a detail, which might otherwise be obscured by overlying or underlying structures. This technique is especially valuable in visualizing air-filled structures such as the lungs and paranasal sinuses. See also **computed tomography.**

classic typhus. See **epidemic typhus.**

classic visceral leishmaniasis, a form of leishmaniasis caused by *Leishmania donovani,* transmitted by the sandfly *Phlebotomus argentipes,* usually affecting older children or young adults. Humans are the only reservoir hosts. It occurs primarily in eastern India and Bangladesh.

classification /klas′ifikā′shən/ [L, *classis,* collection, *facere,* to make], (in research) a process in data analysis in which data are grouped according to previously determined characteristics. **—classify,** *v.*

classification of caries [L, *classis,* collection, *facere,* to make, *caries,* decay], a system for dividing dental caries into several classes based on the part of the tooth they affect. Class I caries are pits and fissures in the occlusal surfaces of posterior teeth or the lingual surfaces of maxillary incisors. Class II caries affect the proximal surfaces of premolars and molars but have not broken through to the occlusal surfaces. Class III caries affect the proximal surfaces of incisors and canines, excluding the incisal angles. Class IV caries affect the proximal surfaces of incisors and canines, including the incisal angles. Class V pertains to caries that affect the gingival third of the labial, buccal, and lingual surfaces. A modification of this classification system (not included in Black's Classification) adds another group, Class VI, consisting of caries on the incisal edges and cusp tips. Classification of caries provides dentists a basis for design of cavity preparations according to the type of restorative material used. Also called **Black's Classification of Caries, artificial classification of caries.** See also **cavity classification.**

classification of malocclusion. See **Angle's Classification of Malocclusion (modified).**

classification schemes, systems of organizing data or information, usually involving categories of items with similar characteristics. Examples of classification schemes include that of the North American Nursing Diagnoses Association and the ***Diagnostic and Statistical Manual of Mental Disorders (DSM),*** prepared by the American Psychiatric Association.

classify. See **classification.**

class II biological safety cabinet, a container that recirculates air through a high-efficiency filter. It is usually located in a hospital pharmacy and is used to prepare chemotherapeutic agents in an environment that protects personnel from exposure.

-clast, suffix meaning "something that breaks": *angioclast, cranioclast, myeloclast*.

-clastic, suffix meaning "causing disintegration": *hemoclastic, histoclastic, lipoclastic*.

claudication /klô′dikā′shən/ [L, *claudicatio,* a limping], cramplike pains in the calves caused by poor circulation of the blood to the leg muscles. The condition is commonly associated with atherosclerosis. The disorder is usually manifested after walking and is relieved by rest. Claudication may require arterial bypass grafting, such as femoral popliteal bypass. Claudication must be differentiated from rest pain, a condition that requires surgical intervention and signals limb threat.

claustra. See **claustrum.**

claustrophobia /klôs′trə-/ [L, *claustrum,* a closing; Gk, *phobos,* fear], a morbid fear of being in or becoming trapped in enclosed or narrow places. The phenomenon is observed more often in women than in men and can generally be traced to some traumatic situation involving enclosed spaces, usually occurring in childhood. Treatment consists of psychotherapy to uncover the cause of the phobic reaction, followed by behavior therapy, specifically systematic desensitization or flooding technique.

claustrum /klôs′trəm/ *pl.* **claustra** [L, a closing], **1.** a barrier, as a membrane that partially closes an aperture. **2.** a thin sheet of gray matter, composed chiefly of spindle cells, situated lateral to the external capsule of the brain and separating the internal capsule from white matter of the insula. Also called *claustrum of insula*.

clavicle /klav′ikəl/ [L, *clavicula,* little key], a long curved, horizontal bone directly above the first rib, forming the ventral portion of the shoulder girdle. It articulates medially with the sternum and laterally with the acromion of the scapula and accommodates the attachment of numerous muscles. It is shorter, thinner, less curved, and smoother in the female than in the male and is thicker, more curved, and more prominently ridged for muscle attachment in persons performing consistent strenuous manual labor. Also called *(informal)* **collarbone.**

clavicle strap, strapping applied to immobilize the clavicle during fracture healing.

clavicular /kləvik′yələr/, pertaining to the clavicle (collarbone).

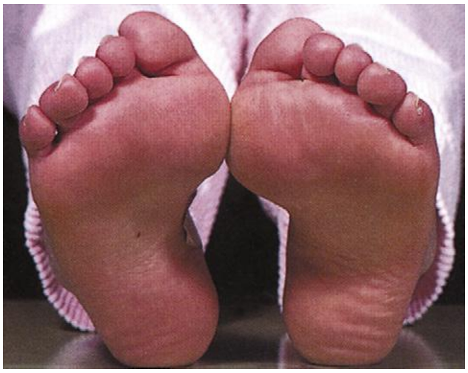
clavicular notch [L, *clavicula* + OFr, *enochier*], one of a pair of oval depressions at the superior end of the sternum. A clavicular notch is situated on each side of the sternum and articulates with the clavicle from the same side.

clavipectoral fascia, a thick sheet of connective tissue that connects the clavicle to the floor of the axilla.

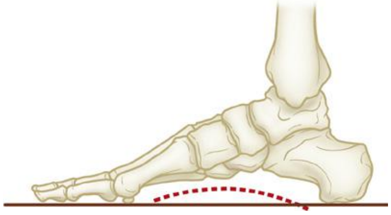
clavipectoral triangle, an anatomical triangle formed by the clavicle, the deltoid, and the pectoralis major. It contains the cephalic vein. Also called **deltopectoral triangle.**

clavus. See **corn.**

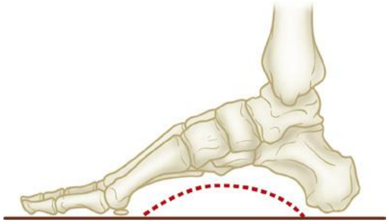
clawfoot, a deformity of the foot characterized by an excessively high arch with hyperextension of the toes at the metatarsophalangeal joints, flexion at the interphalangeal joints, and shortening of the Achilles tendon. The condition may be present at birth or appear later as a result of contractures or an imbalance of the muscles of the foot, as in neuromuscular diseases such as Friedreich's ataxia and peroneal muscular atrophy. Surgical treatment is indicated in severe cases, especially in children. In milder forms, the pain from the excessive pressure under the metatarsal heads can be relieved by sponge, rubber, or leather insoles fitted into the shoes. Also called **gampsodactyly, griffe des orteils, pes cavus, talipes cavus.**



Clawfoot *(Perkins, 2002)*



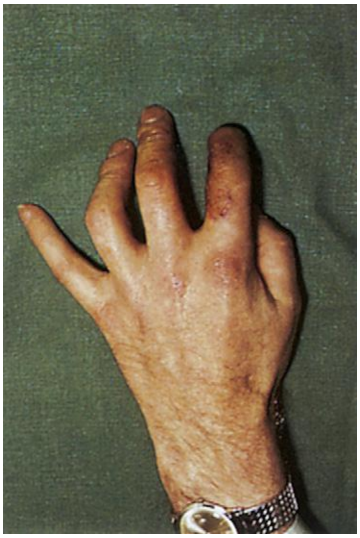
Expected arch



Clawfoot of pes cavus

Clawfoot *(Seidel et al, 2011)*

clawhand [AS, *clawu* + *hand*], an abnormal condition of the hand characterized by extreme flexion of the middle and distal phalanges and hyperextension of the metacarpophalangeal joints. It is caused by atrophy of the interosseous muscles. Also called **main en griffe.**



Clawhand (main en griffe) *(Moll, 1997)*

claw-type traction frame, an orthopedic apparatus that holds various pieces of traction equipment, such as pulleys, ropes, and the weights that suspend or apply traction to various parts of the body. It consists of two metal uprights, one at the head of the bed and the other at the foot. Both uprights are secured to the bed by clawlike attachments and support an overhead metal bar secured to the uprights by metal clamps. Compare **Balkan traction frame, IV-type traction frame.**

clean-catch specimen, a urine specimen that is as free of bacterial contamination as possible without the use of a catheter. This type of specimen is needed to test urine for culture and sensitivity. The nurse instructs the client on the method. After appropriate cleansing of the external genitalia, the client begins the urinary stream, allowing the initial portion to escape. The initial stream cleans or flushes the urethral orifice and meatus of resident bacteria. During the middle portion of voiding, the client collects the specimen. The procedure is easiest while using toilet facilities.

Towelettes
CLINIPAD

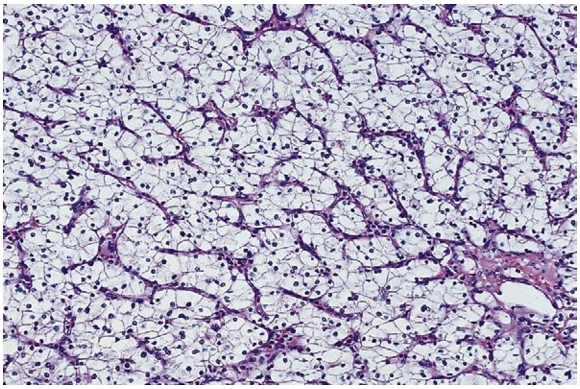
Clean-catch specimen *(Perry, Potter, and Elkin, 2012)*

cleansing enema, an enema, usually composed of soapsuds, administered to remove all formed fecal material from the colon. See also **soapsuds enema.**

clearance *(C)* /klir′əns/ [L, *clarus,* clear], the removal of a substance from the blood via the kidneys. Kidney function can be tested by measuring the amount of a specific substance excreted in the urine in a given length of time.

clear cell [L, *clarus* + *cella,* storeroom], **1.** a type of cell found in the parathyroid gland that does not take on a color with the ordinary tissue stains used for microscopic examination. **2.** the principal cell of most renal cell carcinomas and occasionally of ovarian and parathyroid tumors. **3.** a specific type of epidermal cell, probably of neural origin, that has a dark-staining nucleus but clear cytoplasm with hematoxylin and eosin stain.

clear cell carcinoma, **1.** a malignant tumor of the tubular epithelium of the kidney. Characteristically the malignant cells contain abundant clear cytoplasm. See also **renal cell carcinoma.** **2.** an uncommon ovarian neoplasm characterized by cells with clear cytoplasm.



Clear cell renal cell carcinoma *(Fletcher, 2007)*

clear cell carcinoma of the kidney. See **renal cell carcinoma.**

clearing agent, a chemical, such as ammonium thiosulfate, used in the processing of exposed x-ray film to remove unexposed and undeveloped silver halides from the emulsion.

clearing test, a range of motion test that moves the joint to its limits, stretching the capsule and other soft tissues in an attempt to reproduce symptoms. If the range of motion is normal and no symptoms are produced, the joint is cleared as a cause of a musculoskeletal disorder.

clear-liquid diet [L, *clarus* + *liquere,* to flow], a diet that supplies fluids and provides minimal fiber, primarily to relieve thirst and maintain water balance. Liquid is at room temperature and consists primarily of dissolved sugar and flavored liquids, such as ginger ale, sweetened tea or coffee, fat-free broth, plain gelatin desserts, and strained fruit juices. The diet is often used postoperatively until bowel function returns. It is nutritionally inadequate and should not be used for more than two days.

cleavage /klē′vij/ [AS, *cleofan,* to split], **1.** the series of repeated mitotic cell divisions that occur in an ovum immediately after fertilization. It transforms the single-celled zygote into a multicellular embryo capable of growth and differentiation. During cleavage, the embryo remains uniform in size as its cells, or blastomeres, become smaller with each division. Kinds of cleavage include **determinate cleavage, equal cleavage, indeterminate cleavage, partial cleavage, total cleavage,** and **unequal cleavage.** **2.** the act or process of splitting, primarily a complex molecule into two or more simpler molecules.—**cleave,** *v.*

cleavage cavity. See **blastocoele.**

cleavage cell. See **blastomere.**

cleavage fracture, any fracture that splits cartilage with the avulsion of a small piece of bone from the distal portion of the lateral condyle of the humerus.

cleavage line, any one of a number of linear striations in the skin that delineate the general structural pattern, direction, and tension of the subcutaneous fibrous tissue. They correspond closely to the crease lines on the surface of the skin and are present in all areas of the body but are visible only in certain sites, such as the palms of the hands and soles of the feet. In general the lines run obliquely, lying in the direction in which the skin stretches the least, perpendicular to the direction of the greatest stretch. Incisions made parallel to these lines heal with much less scarring than those made perpendicular to them. To a certain degree, cleavage lines determine the direction and arrangement of lesions in skin diseases. Also called **Langer's line.**

cleavage nucleus. See **segmentation nucleus.**

cleavage plane, **1.** the area in a fertilized ovum where cleavage takes place; the axis along which any cell division occurs. **2.** any plane within the body where organs or structures can be separated with minimal damage to surrounding tissue.

cleave. See **cleavage.**

cleft [ME, *clift*], **1.** division. **2.** a fissure, especially one that originates in the embryo, as the branchial cleft or the facial cleft.

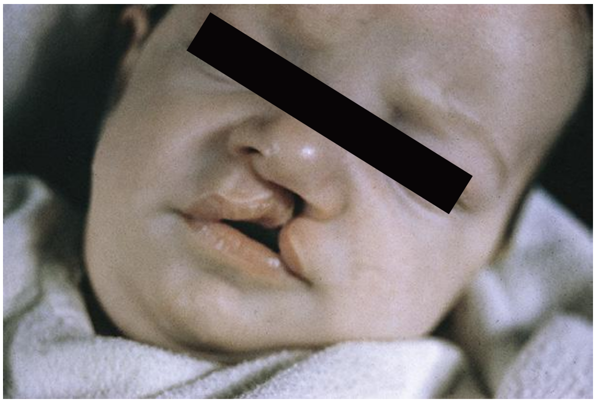
cleft cheek, a transverse facial cleft, appearing as an abnormally large mouth. It is caused by the failure of the maxillary and mandibular processes to fuse during embryonic facial development.

cleft foot, an abnormal condition in which the division between third and fourth toes extends into the metatarsus of the foot.

cleft hand, a hand that develops in two parts because of the failure of a digit and metacarpal to form normally during embryonic development.

cleft jaw, an abnormal jaw resulting from failure of the left and right mandibles to fuse properly during embryonic development.

cleft lip, a congenital anomaly consisting of one or more clefts in the upper lip that result from the failure in the embryo of the maxillary and median nasal processes to close. Treatment is surgical repair in infancy. Also called **harelip.** See also **cleft palate.**



Cleft lip *(Regezi, Sciubba, and Jordan, 2008)*

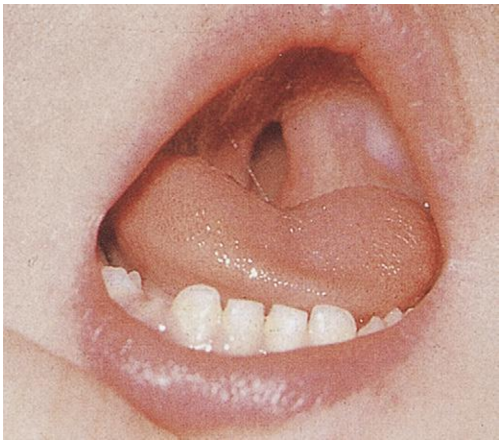
cleft-lip repair, the surgical correction of a unilateral or bilateral congenital interruption of the upper lip, usually resulting from the embryological failure of the median nasal and maxillary processes to unite.

■ METHOD: A cleft lip may sometimes be repaired during the infant's first 48 hours of life, but some surgeons follow a "rule of 10s" and perform the operation when the child is 10 weeks old, weighs 10 or more pounds, and has a hemoglobin level of at least 10 g/dL. Before surgery, elbow restraints, used to prevent the infant from touching the incision, are prepared in the proper size and are sent to the operating room with the patient. After surgery the infant is maintained with ventilatory support as necessary until respirations are normal. Essential observations include assessment for respiratory stridor or obstruction, excessive bleeding, separation of the incision, and redness under the elbow restraints used to keep the hands from the mouth. The wire bow applied to the infant's upper lip and taped to the cheeks to prevent tension on the sutures is kept in place. If it becomes loose, it is reapplied with tincture of benzoin. The infant is given clear liquids and juices through a syringe (Asepto) or special feeding unit. Parenteral fluids are administered until oral intake is adequate. Milk products, solids, and a nipple or pacifier are not allowed. The diet and manner of feeding may vary, but the infant is fed while held with the head up or is placed in a cardiac chair and burped after the intake of each ounce of food. Fluid intake and output are measured. The elbow restraints are worn at all times except when range-of-motion exercises are performed, one arm at a time, while skin care is administered to that limb.

■ INTERVENTIONS: The nurse provides preoperative and postoperative care and prepares for the infant's discharge by ensuring that the parents understand the proper diet and feeding schedule and technique. The nurse emphasizes the importance of using elbow restraints, maintaining motion and skin integrity of the arms, preventing injury to the surgical area, and reporting symptoms of infection, including separation of the incision, excessive swelling, redness, bleeding, and drainage.

■ OUTCOME CRITERIA: Modern surgical techniques permit remarkable repair of cleft lips. In some cases a second operation is required to eliminate the scar.

cleft palate, a congenital defect characterized by a fissure in the midline of the palate, resulting from the failure of the two sides to fuse during embryonic development. The fissure may be complete, extending through both the hard and soft palates into the nasal cavities, or it may show any degree of incomplete or partial cleft. The condition exhibits prevalence variations according to race, and is often associated with a cleft in the upper lip. Together these abnormalities are the most common of the craniofacial malformations, accounting for half of the total number of defects. Feeding is best accomplished with special devices. Surgical repair of the defect is usually done in the first year of life. Care of the child requires a team approach that can include an oral and maxillofacial surgeon, a plastic surgeon, orthodontist, dentist, nurse, speech and hearing therapists, and social workers. Long-term postoperative problems, including speech impairment and hearing loss, improper tooth development and alignment, chronic respiratory and ear infections, and varying levels of emotional and social maladjustment, may be largely prevented by modern techniques and reconstructive surgery. See also **cleft lip.**



Cleft palate *(Greig and Garden, 1996)*

cleft-palate repair, the surgical correction of a congenital fissure in the midline of the partition separating the oral and nasal cavities. Palatal clefts range from a simple separation in the uvula to an extensive fissure involving the soft and hard palates and extending forward unilaterally or bilaterally through the alveolar ridge. A cleft lip often accompanies a cleft palate. Repair of a cleft palate is usually undertaken when a child is at least 6 months old and must be achieved before normal speech can be produced.

■ METHOD: Before surgery, properly sized elbow restraints to prevent the child from touching the mouth are prepared and sent to the operating room with the patient. After surgery the child is kept in a moist oxygen-rich environment by using a tent device (Croupette) until respirations are normal and is observed for signs of airway obstruction or excessive bleeding. Parenteral fluids are administered until the oral intake is adequate. Clear liquids and juices are given by cup only; straws, nipples, pacifiers, utensils, or toys may not be put into the mouth. Milk products and solids are contraindicated, but the kind of feeding ordered may vary. The child is fed in a high chair when possible, and a bib is used to accommodate drooling. Only circumoral mouth care is administered; the teeth are not brushed. Fluid intake and output are measured. The elbow restraints are worn continuously, except when daily range-of-motion exercises are performed and skin care is administered, to one arm at a time. With improvement the child is permitted to walk as tolerated.

■ INTERVENTIONS: Before discharge the nurse ensures that the parents understand the required diet and the need to feed by cup only, to use elbow restraints, to maintain the motion and skin integrity of the arms, and to prevent injury to the mouth. The nurse reminds the parents to administer the required medication in the proper dosage and on schedule and to report symptoms of incision infection, such as drainage, mouth odor, or bleeding.

■ OUTCOME CRITERIA: Depending on the extent and nature of a cleft palate, it may be repaired in one or in several operations. Some experts believe that early repair of a defect in the bony palate can lead to structural malrelations and advise delaying the operation until the child is between 5 and 7 years of age and has achieved more bone growth. Successful repair often greatly improves the child's oronasopharyngeal physiological function, speech, and appearance.

cleft-palate speech, faulty speech caused by a cleft palate, often characterized by hypernasality; difficulty with pressure consonants, voice, and articulation; and other problems resulting from the velopharyngeal insufficiency.

cleft sternum, a fissure in the sternum caused by a failure in embryonic development.

cleft tongue [ME, *clift* + AS, *tunge*], a tongue divided by a longitudinal fissure. Also called **bifid tongue.**

cleft uvula, an abnormal congenital condition in which the uvula is split into halves as a result of the failure of the posterior palatine folds to unite.

cleido-, cleid-, prefix meaning "clavicle" or collarbone: *cleidocostal, cleidocranial, cleidomastoid*.

cleidocranial dysostosis /klī′dōkrā′nē·əl/ [Gk, *kleis,* key, *kranion,* skull, *dys,* bad, *osteon,* bone], a rare abnormal hereditary condition characterized by defective ossification of the cranial bones and by the complete or partial absence of the clavicles. It is transmitted as an autosomal-dominant trait. The defective ossification of the cranial bones delays the closing of the cranial sutures and produces large fontanels. The complete or partial absence of the clavicles allows the shoulders to be drawn together. This condition also involves dental and vertebral anomalies. Also called **cleidocranial dysplasia, dystrophia.** See also **dysostosis.**

cleidocranial dysplasia, a disease that affects the development of the bones and teeth. Often associated with failure of exfoliation and eruption of teeth, the presence of unerupted supernumerary teeth, and an underdeveloped maxilla.

clemastine /klemas′tēn/, an antihistamine.

■ INDICATIONS: It is prescribed in the treatment of symptoms of allergic rhinitis, pruritus, or conjunctivitis.

■ CONTRAINDICATIONS: Use by lactating mothers or those undergoing monamine oxidase inhibitor therapy or having known sensitivity to this drug or other antihistamines is contraindicated. It is also contraindicated with narrow-angle glaucoma, asthma, symptomatic prostatic hypertrophy, and bladder-neck destruction.

■ ADVERSE EFFECTS: Among the most serious adverse reactions are hypersensitivity, skin rash, and tachycardia. Transient drowsiness commonly occurs.

clenching /klench′ing/ [ME, *clenchen*], the clamping and pressing of the jaws and teeth together in centric occlusion, frequently associated with acute nervous tension or physical effort, such as pushing or lifting a heavy object or performing a difficult task. See also **bruxism.**

Cleocin, a trademark for an antibacterial (clindamycin).

cleoid /klē′oid/ [ME, *cle,* claw + Gk, *eidos,* form], a carving instrument with a blade shaped like a pointed spade or claw, with cutting edges on both sides used to contour dental amalgam while in its plastic state. Usually associated with a discoid, a disc-shaped carving instrument on its opposite end.

cleptomania. See **kleptomania.**

clergyman's sore throat, loss of the voice from overuse, as by clergymen. Also called *dysphonia clericorum*.

click [Fr, *cliquer,* to clash], an extra heart sound that occurs during systole. See also **ejection click, systolic click.**

clicking /klik′ing/ [Fr, *cliquer,* to clash], a series of sounds, such as the snapping, cracking, or crepitant noise evident on excursions of the mandibular condyle. The sound is associated with dysfunction of the temporomandibular joint.

click-murmur syndrome. See **Barlow's syndrome.**

client /klī′ənt/ [L, *clinare,* to lean], **1.** a person who is recipient of a professional service. **2.** a recipient of health care regardless of the state of health. **3.** a patient.

client-centered therapy, 1. a nondirective method of group or individual psychotherapy, originated by Carl Rogers, in which the therapist's role is to listen to and then reflect or restate without judgment or interpretation the words of the client. The goal of the therapy is personal growth achieved by the client's increased awareness and understanding of his or her attitudes, feelings, and behavior. **2.** An approach to treatment whereby the health care provider includes the client in every part of the evaluation and intervention programs, including the decision about the plan of action.

client interview. See **patient interview.**

client satisfaction, 1. a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of positive perception of care provided by nursing staff. See also **Nursing Outcomes Classification. 2.** general approval of the organization and delivery of health care services by the patient.

client satisfaction: access to care resources, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of positive perception of access to nursing staff, supplies, and equipment needed for care. See also **Nursing Outcomes Classification.**

client satisfaction: caring, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of positive perception of nursing staff's concern for the client. See also **Nursing Outcomes Classification.**

client satisfaction: case management, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of positive perception of case management services. See also **Nursing Outcomes Classification.**

client satisfaction: communication, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of positive perception of information exchanged between client and nursing staff. See also **Nursing Outcomes Classification.**

client satisfaction: continuity of care, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of positive perception of coordination of care as the client moves from one care setting to another. See also **Nursing Outcomes Classification.**

client satisfaction: cultural needs fulfillment, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of positive perception of integration of cultural beliefs, values, and social structures into nursing care. See also **Nursing Outcomes Classification.**

client satisfaction: functional assistance, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of positive perception of nursing assistance to achieve mobility and self-care. See also **Nursing Outcomes Classification.**

client satisfaction: pain management, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of positive perception of nursing care to relieve pain. See also **Nursing Outcomes Classification.**

client satisfaction: physical care, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of positive perception of nursing care to maintain body functions and cleanliness. See also **Nursing Outcomes Classification.**

client satisfaction: physical environment, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of positive perception of living environment, treatment environment, and equipment and supplies in acute or long-term care settings. See also **Nursing Outcomes Classification.**

client satisfaction: protection of rights, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of positive perception of protection of a client's legal and moral rights provided by nursing staff. See also **Nursing Outcomes Classification.**

client satisfaction: psychological care, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of positive perception of nursing assistance to cope with emotional issues and perform mental activities. See also **Nursing Outcomes Classification.**

client satisfaction: safety, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of positive perception of procedures, information, and nursing care to prevent harm or injury. See also **Nursing Outcomes Classification.**

client satisfaction: symptom control, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of positive perception of nursing care to relieve symptoms of illness. See also **Nursing Outcomes Classification.**

client satisfaction: teaching, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of positive perception of instruction provided by nursing staff to improve knowledge, understanding, and participation in care. See also **Nursing Outcomes Classification.**

client satisfaction: technical aspects of care, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of positive perception of nursing staff's knowledge and expertise used in providing care. See also **Nursing Outcomes Classification.**

client/server system, a computer configuration in which the workload is divided between a client computer and a server, as might be used in a health care management plan.

climacteric. **1.** See **menopause. 2.** See **andropause.**

climate /klī′mit/ [Gk, *klima,* inclination], **1.** a composite of the prevailing weather conditions that characterize any particular geographic region, including air pressure, temperature, precipitation, sunshine, and humidity. Because these factors affect health, they must be considered in the diagnosis and treatment of certain illnesses, especially those affecting respiration. **2.** the general condition surrounding something, as in a climate of goodwill. **—***climatic, adj.*

climax /klī′maks/ [Gk, *klimax,* ladder], a peak of intensity, such as a sexual orgasm or the high point of a fever.

climbing fiber [ME, *climben* + L, *fibra*], a type of nerve fiber that carries impulses to the Purkinje cells of the cerebellar cortex.

clindamycin hydrochloride /klin′dəmī′sin/, an antibacterial.

■ INDICATIONS: It is prescribed in the treatment of certain serious bacterial infections (including anaerobic and some gram-positive organisms).

■ CONTRAINDICATION: Hypersensitivity to this drug or to lincomycin prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are pseudomembranous colitis, severe GI disturbances, and hypersensitivity.

clinic [Gk, *kline,* bed], **1.** an ambulatory care site where persons who do not require hospitalization receive medical care. **2.** a group practice of doctors, such as the Mayo Clinic. **3.** a meeting place for doctors, nurses, and medical students where instruction can be given at the bedside of a patient or in a similar setting. **4.** a seminar or other scientific medical meeting. **5.** a detailed published report of the diagnosis and treatment of a health care problem.

-clinic, suffix meaning "places set aside for medical treatment": *policlinic, polyclinic, psychoclinic.*

clinical /klin′ikəl/ [Gk, *kline,* bed], **1.** pertaining to a clinic. **2.** pertaining to direct bedside medical or nursing care. **3.** pertaining to materials or equipment used in the care of a sick person. **4.** pertaining to experience of students in an educational program or experience.

clinical analysis, the use of laboratory data, including blood tests, urinalysis, and microscopic tissue studies, in determining a diagnosis and treatment regimen.

clinical assessment, an evaluation of a patient's physical condition and prognosis based on information gathered from physical and laboratory examinations and the patient's medical history.

clinical assistant, a person who follows standard operating procedures to collect and prepare specimens and who performs appropriate laboratory tests. Clinical assistants complete a post-secondary clinical assistant program.

clinical crown, that portion of enamel visibly present in the oral cavity; the visible portion of the tooth that is coronal to the deepest part of the gingival crevice. Compare **anatomical crown.**

clinical-crown/clinical-root ratio, the length of the part of a tooth that is coronal to the junctional epithelium divided by the length of the tooth's root that is apical to the junctional epithelium. The ratio is useful in the diagnosis and prognosis of periodontal disease and treatment planning for fixed or removable prosthodontic restorations. Also called **crown/root ratio.**

clinical cytogenetics, the branch of genetics that studies the relationship between chromosomal aberrations and pathological conditions.

clinical diagnosis, a diagnosis made on the basis of knowledge obtained by medical history and physical examination alone, without benefit of laboratory tests or x-ray films.

clinical disease, a stage in the history of a pathological condition that begins with anatomical or physiological changes that are sufficient to produce recognizable signs and symptoms of a disease.

clinical epidemiology, the application of the science of epidemiology in a clinical setting. Emphasis is on a medically defined population, as opposed to statistically formulated disease trends derived from examination of larger population categories.

clinical genetics, a branch of genetics that studies inherited disorders and investigates the possible factors that may influence the occurrence of pathological conditions. Also called **medical genetics.**

clinical guidelines,

clinical horizon, the imaginary line above which detectable signs and symptoms of a disease first begin to appear. Compare **subclinical.**

clinical humidity therapy, respiratory therapy in which water vapor is added to the therapeutic gases to make breathing them more comfortable.

clinical judgment, the application of information based on actual observation of a patient combined with subjective and objective data that lead to a conclusion. See also **clinical reasoning.**

clinical laboratory, a laboratory in which tests directly related to the care of patients are performed. Such laboratories use material obtained from patients for testing, as compared with research laboratories, where animal and other sources of test material are also used.

clinical laboratory scientist/medical technologist (CLS/MT), an allied health professional who, in conjunction with pathologists or other physicians or medical scientists, performs specialized chemical, microscopic, and bacteriological tests of blood, tissue, and fluids. In addition to possessing the skills of clinical laboratory technicians/medical laboratory technicians, clinical laboratory scientists/medical technologists perform complex analyses, fine-line discrimination, and error correction. They have knowledge of physiological conditions affecting test results so they can develop data that may be used by a physician in determining the presence, extent, and, as far as possible, cause of a disease. They are held accountable for accurate results, establish and monitor quality assurance programs, and modify procedures as necessary. Preparation includes a baccalaureate degree and at least 1 year of professional/clinical education. Also called **clinical laboratory scientist**.

clinical laboratory technician/medical laboratory technician—associate degree, a clinical laboratory technician and allied health professional who, under the supervision of a pathologist or other physician, clinical laboratory scientist/medical technologist, or other medical scientist, performs specialized chemical, microscopic, and bacteriological tests of blood, tissue, and fluids. The technician can demonstrate discrimination between similar items and correction of errors by the use of preset strategies, is able to recognize factors that directly affect procedures and results, and monitors quality assurance procedures. Preparation is usually 2 academic years, with the graduate receiving an associate's degree.

clinical laboratory technician/medical laboratory technician—certificate, an allied health professional who, under the supervision of a pathologist or other physician, clinical laboratory scientist/medical technologist, or other medical scientist, performs routine, uncomplicated laboratory tests of blood, tissue, and fluids. Clinical education is usually 12 months, with the graduate receiving a certificate. This certificate is no longer being offered for new students.

clinical laboratory technician. See **medical laboratory technician.**

clinical medicine, a system of health maintenance based on direct observation of and communication with a patient.

clinical nurse leader, a registered nurse with a master's degree who oversees the integration of care for patients using evidence-based practice.

clinical nurse specialist (CNS), an advanced practice registered nurse who holds a master's degree in nursing and who has acquired advanced knowledge and clinical skills in a specific area of nursing practice. The CNS, as a practitioner, assumes a leadership role in the distribution of clinical care to a specific patient population while interacting within the total health care system. The unique functions of the CNS are based on clinical expertise and judgment and include caring for patients, delegating responsibility, teaching other staff members, and influencing and effecting change with respect to the needs of the patient and family and the total health care system. Historically, CNS has included research involvement.

clinical-pathological conference, a teaching conference in which a case is presented to a clinician, who then demonstrates the process of reasoning that leads to his or her diagnosis. A pathologist then presents an anatomical diagnosis, based on the study of tissue removed at surgery or obtained in autopsy. Often the students will have been asked to suggest a diagnosis based on the same information presented to the clinician. A discussion usually follows and serves to demonstrate the origin of errors present in any of the diagnoses offered. The pathologist's diagnosis is usually the definitive one. The clinical-pathological conference is the model for the long series called "case report" in the *New England Journal of Medicine* and is a part of the curricula of most medical schools.

clinical pathology, the laboratory study of disease by a pathologist using techniques appropriate to the specimen being studied. Among the many branches of clinical pathology are hematology, microbiology, clinical chemistry, immunology, toxicology, and the blood bank.

clinical pathway, a description of practices likely to result in favorable outcomes for patients with a particular diagnosis that uses prospectively defined resources to minimize cost. It may be based on research, literature, or common practice. Also called **critical pathway.** See also **practice guideline.**

clinical pearl, a short, straightforward piece of clinical advice.

clinical pelvimetry, a process used to assess the size of the birth canal by means of the systematic vaginal palpation of specific bony landmarks in the pelvis and an estimation of the distances between them. Internal pelvic diameters are not accessible to direct measurement; they must be inferred. Clinical pelvimetry is usually performed by a **midwife** or an **obstetrician** during the first prenatal examination of a pregnant woman. Findings are commonly recorded in terms such as adequate, borderline, or inadequate, rather than in centimeters or inches. Compare **x-ray pelvimetry.** See also **birth canal, cephalopelvic disproportion, contraction, dystocia.**

clinical practice guideline, systematically developed statements to assist practitioner and patient decisions about appropriate health care in specific clinical circumstances.

clinical psychology, the branch of psychology concerned with the diagnosis, treatment, and prevention of a wide range of personality and behavioral disorders. See also **applied psychology.**

clinical reasoning, higher order thinking in which the health care provider, guided by best evidence or theory, observes and relates concepts and phenomena to develop an understanding of their significance. See **clinical judgment.**

clinical research center, an organization, often associated with a medical school or a teaching hospital, that studies, analyzes, correlates, and describes medical cases. Such centers usually have extensive laboratory facilities and specialized staffs of physicians and medical technicians. Clinical research centers often offer free or very inexpensive medical care for patients participating in various research programs and often produce significant new medical information distributed through articles, journals, reports, seminars, and lectures. Funding for such facilities may be generated through minimal fees charged for various medical services and through grants.

clinical specialist, a physician or nurse who has advanced training in a particular field of practice.

clinical thermometer [Gk, *kline,* bed, *thermē,* heat, *metron,* measure], an electronic thermometer with disposable sheaths, designed for measuring body temperature. Measurement can be oral, rectal, axillary, or facial. Formerly called **bedside thermometer.**

clinical thermometry, a method for determining temperature in heated tissue.

clinical trial exemption (CTX), authorization to administer an investigational agent to patients or volunteer subjects under specified conditions of a particular research study in a clinical setting.

clinical trials, organized studies to provide large bodies of clinical data for statistically valid evaluation of treatment to determine safety and efficacy.

clinician /klinish′ən/, a health professional whose practice is based on direct observation and treatment of a patient, as distinguished from other types of health workers, such as laboratory technicians and those employed in research.

clinic without walls, a health care organization formed by the merger of selected functions, such as administrative, billing and collections, purchasing, personnel, and payroll, of various physician groups without the merger of any physical facilities.

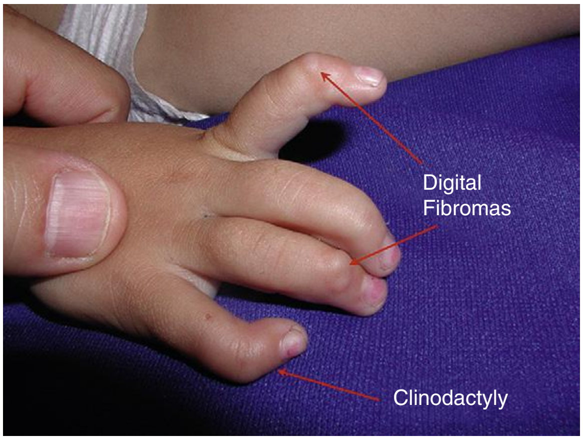
Clinitest, a trademark for reagent tablets used to test for the presence of reducing sugars, such as glucose, in the urine. The tablets contain copper sulfate, and the procedure is a modified version of **Benedict's qualitative test.** It is rarely used in current practice.

Clinitron bed. See **fluidized air bed.**

clino-, prefix meaning “to bend or make lie down” or a “sloping shape”: *clinodactyl, clinostatic, clinostatism*.

clinocephaly /klī′nōsef′əlē/ [Gk, *klinein*, to bend, *kephale*, head], a congenital anomaly of the head in which the upper surface of the skull is saddle-shaped or concave. Also called *clinocephalism*. —*clinocephalic, clinocephalous, adj*.

clinodactyly /klī′nōdak′təlē/ [Gk, *klinein* + *daktylos*, finger], a congenital anomaly characterized by abnormal lateral or medial bending of one or more fingers or toes. Also called *clinodactylism*. —*clinodactylic, clinodactylous, adj*.



Clinodactyly *(Izadpanah et al, 2007)*

clinoid processes /klī′noid/ [Gk, *kline*, bed, *eidos*, form; L, *processus*], the anterior, middle, and posterior processes of the sphenoid bone at the base of the skull.

clinometer /klīnom′ətər/, an instrument used to measure angular convergence of the eyes or the degree of paralysis of extraocular muscles. Also called **clinoscope.**

Clinoril, a trademark for a nonsteroidal antiinflammatory drug **(sulindac).**

clinoscope. See **clinometer.**

clip [AS, *clyppan*, to embrace], a surgical device used for grasping the skin to align the edges of a wound and to stop bleeding, especially of the smaller blood vessels. It is also used in radiography for localization.

clitoridectomy /klit′əridek′təmē/, the excising of all or part of the clitoris, and sometimes part of the labia, a form of ritual mutilation performed on over 100 million girls and women in more than 40 countries. It is usually performed at 4 to 12 years of age, without anesthesia, with crude cutting tools, and with few or no precautions against infection. The reasons for this ancient practice are very complex, including the male desire to control female sexuality. As of June 1996, the U.S. Board of Immigration Appeals recognized genital mutilation as a form of persecution and a basis for asylum for girls and women. In the United States itself an estimated 40,000 immigrant girls are clitoridectomized every year; federal legislation is pending to prohibit the practice, which several states have outlawed already. Defenders of clitoridectomy sometimes refer to it as **female circumcision** a deliberately misleading euphemism that should be avoided. See also **female genital mutilation.**

clitoridotomy, **1.** an incision into the clitoris. **2.** removal or splitting of the clitoral hood, comparable to male circumcision, with associated risks of infection and scarring. It is done culturally by lay providers.

clitoris /klit′əris/ [Gk, *kleitoris*], the vaginal erectile structure of the female homologous to the corpora cavernosa of the penis. It consists of two corpora cavernosa within a dense layer of fibrous membrane, joined along their inner surfaces by an incomplete fibrous septum. It is situated beneath the anterior labia commissure, partially hidden between the anterior extremities of the labia minora and partly covered by a prepuce. —*clitoral, adj*.

clitoritis /klit′ôrī′tis/, inflammation of the clitoris.

clivus /klī′vəs/ [L, slope], an inclined surface, as on the sphenoid bone.

CLL, abbreviation for **chronic lymphocytic leukemia.**

cloaca /klō·ā′kə/ *pl. cloacae* [L, sewer], **1.** (in embryology) the end of the hindgut before the developmental division into the rectum, the bladder, and the primitive genital structures. **2.** (in pathology) an opening into the sheath of tissue around a necrotic bone.

cloacal fold, a slight elevation located just lateral to the cloacal membrane early in the fifth week of embryonic development. Cloacal folds later divide into urogenital folds and anal folds.

cloacal membrane /klō·ā′kəl/, a thin sheath that separates the internal and external portions of the cloaca in the developing embryo. It is formed from endoderm and ectoderm and closes the fetal anus during early prenatal development; it later ruptures and is absorbed so that the anal canal becomes continuous with the rectum. Also called **anal membrane.**

cloacal septum. See **urorectal septum.**

cloacal sphincter, the developing muscle surrounding the caudal end of the cloaca in the embryo. Its posterior part will become the external anal sphincter and its anterior part becomes the superficial transverse perineal, bulbospongiosus, and ischiocavernosus muscles.

clobetasol propionate /klōbet′əsol prō′pyōnāt/, a topical corticosteroid antiinflammatory.

■ INDICATIONS: It is prescribed for the short-term treatment of inflammation and pruritus associated with certain moderate to severe types of dermatitis.

■ CONTRAINDICATIONS: It is contraindicated for prolonged use, for applications to large areas of poor skin integrity, and with the use of occlusive dressing.

■ ADVERSE EFFECTS: Adverse reactions may include hyperglycemia, glycosuria, Cushing’s syndrome, and suppression of hypothalamic-pituitary-adrenal functions. Because of the greater ratio of skin surface to body weight in children, they are at risk of absorbing a greater proportion of topical steroid.

clocortolone pivalate /klōkôr′təlōn piv′əlāt/, a topical corticosteroid antiinflammatory.

■ INDICATION: It is prescribed for the short-term treatment of inflammation and pruritus associated with certain moderate to severe types of dermatitis.

■ CONTRAINDICATIONS: Viral and fungal diseases of the skin or local impairment of circulation prohibits its use.

■ ADVERSE REACTIONS: Among the more serious adverse reactions are systemic side effects that may result from prolonged or excessive application. Local irritation of the skin may occur.

clofibrate /klō′fəbrāt/, an antihyperlipidemic.

■ INDICATIONS: It is prescribed in the treatment of high blood levels of triglycerides occurring alone or in combination with high cholesterol levels.

■ CONTRAINDICATIONS: Liver or kidney dysfunction, pregnancy, lactation, biliary cirrhosis, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are nausea, diarrhea, weight gain, and a syndrome resembling influenza. This drug interacts with many other drugs and should not be used together with the HMG-CoA reductase inhibitors (statins) used to lower plasma cholesterol levels because this combination has an increased risk for myositis and rhabdomyolysis.

Clomid, a trademark for a nonsteroidal fertility drug **(clomiPHENE citrate).**

clomiPHENE citrate /klō′məfēn/, a nonsteroidal drug that acts to stimulate ovulation by interacting with estrogen receptors in the hypothalamus in a manner that leads to the release of pituitary gonadotropins.

■ INDICATIONS: It is prescribed primarily for the treatment of anovulation and oligoovulation in women desiring pregnancy.

■ CONTRAINDICATIONS: Abnormal vaginal bleeding, liver dysfunction, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are enlargement of the ovaries, hot flashes, blurred vision, gastric upset, rashes, and abdominal pain.

clomiPHENE stimulation test, a test used to evaluate gonadal function in males who show signs of abnormal pubertal development. ClomiPHENE, a nonsteroidal analog of estrogen, stimulates the hypothalamic-pituitary system to raise follicle-stimulating hormone and luteinizing hormone levels of the blood. Failure to respond to clomiPHENE indicates hypothalamic-pituitary disease, possibly a pituitary tumor. See also **clomiPHENE citrate, gonadotropin.**

clomiPRAMINE /klōmip′rämēn/, **1.** a tricyclic antidepressant of the dibenzazepine class, used in the form of the hydrochloride salt, also used as an antianxiety agent and investigationally to relieve symptoms of obsessive-compulsive disorder. **2.** a tricyclic antidepressant with anxiolytic activity, also used in treatment of obsessive-compulsive disorder, panic disorder, bulimia nervosa, cataplexy associated with narcolepsy, and chronic, severe pain, used as the hydrochloride salt.

clonal /klō′nəl/, pertaining to a clone.

clonal marker, a defective or functionally unidentified DNA sequence in a clone of cancer cells. Such sequences are used to monitor the growth of cancer cells after chemical or other treatments.

clonal selection theory. See **antibody-specific model.**

clonazepam /klōnaz′əpam/, a benzodiazepine anticonvulsant.

■ INDICATIONS: It is prescribed in the treatment of absence seizures in patients unresponsive to succinimides, of atonic and myolonic seizures, and of panic disorder.

■ CONTRAINDICATIONS: Liver disease, acute narrow-angle glaucoma, pregnancy, or known hypersensitivity to this drug or to other benzodiazepine drugs prohibits its use. It is not given during lactation. Interactions with alcohol may increase phenytoin levels. The herbs kava-kava and valerian may increase sedation.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are thrombocytopenia, leukocytosis, eosinophilia, and respiratory depression.

clone [Gk, *klon,* a plant cutting], a group of genetically identical cells or organisms derived from a single common cell or organism through mitosis. **—clonal,** *adj.*

-clonia, suffix meaning "(condition involving) spasms": *logoclonia, myoclonia, polyclonia.*

clonic /klon′ik/ [Gk, *klonos,* tumult], pertaining to increased reflex activity, as in upper motor neuron lesions when repetitive muscular contractions and relaxations in rapid succession are induced by stretching. See also **clonus.**

clonic convulsion [Gk, *klonos,* tumult; L, *convulsio,* cramp], a form of seizure characterized by rhythmic alternate involuntary contraction and relaxation of muscle groups.

clonicity /klōnis′itē/, a state of clonus.

clonic spasm [Gk, *klonos,* tumult, *spasmos*], involuntary alternating contractions and relaxations of muscles.

clonidine hydrochloride /klō′nədēn/, an alpha$_2$-agonist used as an antihypertensive. It stimulates alpha$_2$-adrenergic receptors in the brainstem to decrease sympathetic nervous system outflow. It is also administered epidurally to treat pain.

■ INDICATIONS: It is prescribed alone or in combination for the reduction of high blood pressure and is an adjunct for the treatment of cancer pain when pain persists during intraspinal opiate treatments.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions is a withdrawal syndrome that occurs on discontinuation of the medication characterized by tachycardia, a rapid increase in blood pressure, and anxiety. Drowsiness, sexual dysfunction, and dry mouth commonly occur.

cloning /klō′ning/, a procedure for producing multiple copies of genetically identical organisms or cells or of individual genes. Organisms may be cloned by transplanting blastocysts from one embryo into an empty zona pellucida, or nuclei from the cells of one individual into enucleated oocytes. Cells may be cloned by growing them in culture under conditions that promote cell reproduction. Genes may be cloned by isolating them from the genome of one organism and incorporating them into the genome of an asexually reproducing organism, such as a bacterium or a yeast.

clonogenic cell /klō′nōjen′ik/, a cell that can proliferate into a colony of genetically identical cells.

clonorchiasis /klō′nôrkī′əsis/, an infestation of the Chinese liver fluke, *Clonorchis sinensis*. It is a known risk factor for development of cholangiocarcinoma. See also ***Clonorchis sinensis,* schistosomiasis.**

Clonorchis sinensis /klōnôr′kis sinen′sis/, the Chinese or Oriental liver fluke, a trematode that is acquired by humans who eat raw, imperfectly cooked, pickled, salted, or smoked fish that is the intermediate host of the parasite. The fluke exists in a dormant stage as a cercaria, encysted in the skin of a fish and unable to continue its life cycle until ingested by a warm-blooded animal, in which the larvae mature and produce eggs. The eggs are excreted in the feces of the host to enter water, where the new generation evolves first in aquatic snails and then in fish. In human hosts the liver fluke lives in the bile ducts and gallbladder, causing chronic liver disease with enlargement of the liver, diarrhea, edema, and, eventually, death. Cholangitis, cholelithiasis, pancreatitis, and cholangiosarcoma are common complications and may be fatal. The adult fluke can survive in the biliary duct of its host for up to 50 years. Treatment is with praziquantel or albendazole. Also called ***Opisthorchis sinensis.***

clonus (C) /klō′nəs/ [Gk, *klonos,* tumult], an abnormal pattern of neuromuscular activity, characterized by rapidly alternating involuntary contraction and relaxation of skeletal muscle. Compare **tonus.** **—clonic,** *adj.*

C-loop, a surgically formed loop of bowel with a C-shape.

clopidogrel, a platelet aggregation inhibitor.

■ INDICATIONS: It is used to reduce the risk of stroke and myocardial infarction in high-risk patients.

■ CONTRAINDICATIONS: Known hypersensitivity, active bleeding, and increased risk for bleeding (e.g., peptic ulcers) prohibits its use.

■ ADVERSE EFFECTS: Intracranial hemorrhage is a potential life-threatening side effect. Other adverse effects include rash, pruritus, nausea, vomiting, diarrhea, epistaxis, purpura, edema, hypertension, chest pain, headache, dizziness, musculoskeletal pain, upper respiratory tract infection, bronchitis, urinary tract infection, and hypercholesterolemia.

Cloquet's hernia, a femoral hernia. See **crural hernia.**

clor, abbreviation for a *chloride anion*.

clorazepate dipotassium /klôraz′əpāt dī-potassium/, a benzodiazepine antianxiety drug.

■ INDICATIONS: It is prescribed in the treatment of anxiety, nervous tension, and alcohol withdrawal.

■ CONTRAINDICATIONS: Psychosis, acute narrow-angle glaucoma, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are withdrawal symptoms that occur on discontinuation of treatment. Drowsiness and fatigue commonly occur.

closed amputation [L, *claudere,* to shut, *amputare,* to cut away], an amputation in which one or two broad flaps of muscular and cutaneous tissue are retained to form a cover over the end of the bone. It is performed only when no infection is present. Compare **open amputation.**

closed-angle glaucoma. See **glaucoma.**

closed bite [L, *claudere* + AS, *bitan*], an abnormal overbite; a decrease in the occlusal vertical dimension produced by various factors, such as tooth abrasion and insufficient eruption of supportive posterior teeth. Compare **open bite.**

closed-cavity tympanomastoidectomy, tympanomastoidectomy with tympanoplasty and maintenance of an intact posterior wall of the ear canal.

closed-chain, (in organic chemistry) pertaining to a compound in which the carbon atoms are bonded to form a closed ring. Also called **carbocyclic.**

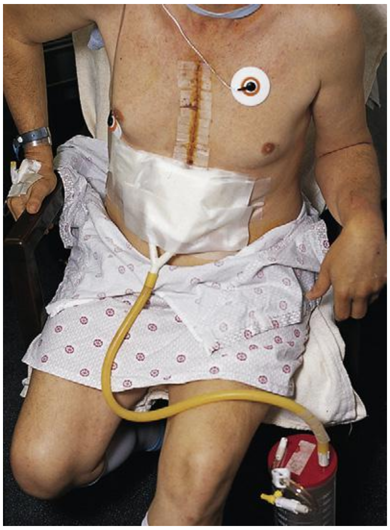
closed-chain exercise, exercise in which the distal aspect of the extremity is in contact with a support surface such as the floor or a balance board.

closed-circuit breathing, rebreathing of a contained gas mixture, either directly or after recirculation of the gas through a water-absorbing or carbon dioxide–absorbing unit. An example is breathing through a spirometer.

closed-circuit helium dilution, a technique for measuring residual lung volume and functional residual capacity in which a patient breathes through a spirometer containing a known concentration of helium.

closed dislocation [L, *claudere,* to shut, *dis,* apart, *locare,* to place], a joint dislocation not accompanied by a break in the skin.

closed drainage. See **drainage.**



Closed chest drainage system *(Perry, Potter, and Elkin, 2012)*

closed fracture [L, *claudere,* to shut, *fractura*], an uncomplicated fracture in which the bone does not break the skin. It usually heals readily. Formerly called **simple fracture.** Compare **compound fracture.**

closed group, (in psychotherapy) a group in which all members are admitted at the same time and vacancies that occur in the membership are not filled.

closed loop, a biological feedback system in which a substance produced in the body affects the mechanism that causes its own production.

closed-panel HMO, (in the United States) a health maintenance organization (HMO) in which physicians are either employees of the HMO or belong to a group of physicians that contracts with it. See also **health maintenance organization.**

closed physician-hospital organization (PHO), (in the United States) an organization of selected physicians on a hospital medical staff who have proved to be high-quality, cost-effective practitioners.

closed reduction of fractures [L, *claudere,* to shut, *reducere,* to lead back, *fractura*], the manual correction of the alignment, angulation, and rotation of fractures without incision.

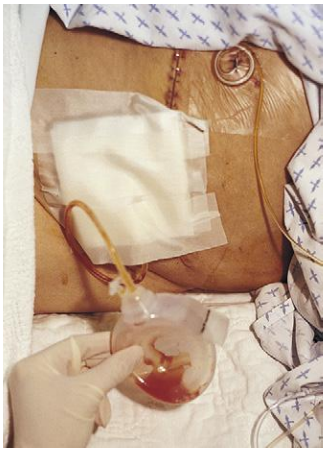
closed system, a system that does not interact with its environment.

closed-system helium dilution method, a technique for measuring functional residual capacity and residual volume. It is based on the principle that if a known volume and concentration of helium are added to a patient's respiratory system, the helium will be diluted in proportion to the lung volume to which it is added. Helium, an inert gas, is not significantly absorbed from the lungs by the blood.

closed-wound suction, any one of several techniques for draining potentially harmful fluids, such as blood, pus, serosanguineous fluid, and tissue secretions, from surgical wounds. Such fluids interfere with wound healing and often promote infection. Postoperative drainage aids the healing process by removing dead spaces where extravascular fluids collect and helps draw healing tissues together. Closed-wound suction is often an important part of postoperative treatment and may be accomplished with a variety of reliable devices that create a gentle negative pressure to drain away undesirable exudates. The technique is used as an aid to many operations, such as mastectomies, breast augmentations, plastic and reconstructive procedures, and urological and urogenital procedures. It is generally used whenever the wound drainage is greater than 100 mL in 24 hours. Closed-wound suction devices usually consist of disposable transparent containers attached to suction tubes and portable suction pumps.

■ METHOD: After thoroughly irrigating the wound to remove blood clots and debris, the surgeon inserts the perforated tubing into the wound and draws it out through healthy tissue, approximately 5 cm from the incision line. When silicone tubing is used, the tube is passed through a stab wound made adjacent to the surgical wound. With the drainage tubing emerging away from the incision line, the suction system remains completely closed. Air cannot infiltrate the wound and cause contamination. When the suction tube has been inserted, the wound is closed, and a light dressing is applied. Because the tubing drains most fluids, the dressing usually does not require frequent changing. Closed-wound suction usually continues postoperatively for 2 or 3 days or until the wound stops exuding fluid. Suction is much longer after mastectomies. The surgeon then removes the suction tubing, and all drainage components of the suction device are discarded.

■ INTERVENTIONS: While the suction is functioning, the transparent tubing and reservoir are checked regularly as a precaution against clogging and for monitoring of the volume of exudate drawn from the wound. In some individuals, closed-wound suction systems can also accommodate antibiotic drips, which are connected to accessory tubing placed within the wound beside the suction tube. Closed-wound suction also allows irrigation of the wound with special flow controls to permit a periodic change in the flow direction of solutions.



Closed-wound suction *(Perry, Potter, and Elkin, 2012)*

closing capacity (CC), a measure of lung volume equal to the sum of closing volume and residual volume.

closing volume (CV), the volume of gas remaining in the lungs when the small airways begin to close during a controlled maximum exhalation.

clostridial /klostrid′ē·əl/ [Gk, *kloster,* spindle], pertaining to anaerobic spore-forming bacteria of the genus *Clostridium*.

clostridial myonecrosis. See **myonecrosis.**

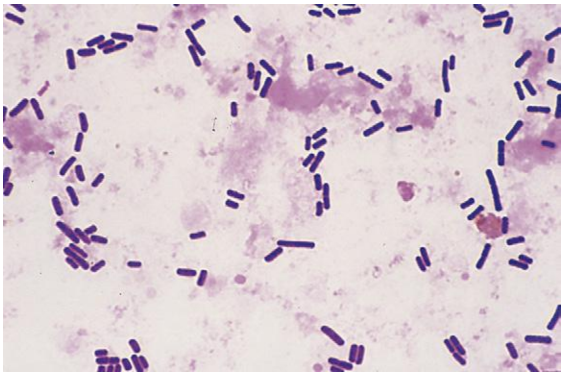
clostridial toxin assay, a stool test to diagnose ***Clostridium difficile*** bacterial infection of the intestine.

Clostridium /-ē·əm/ [Gk, *kloster,* spindle], a genus of spore-forming anaerobic bacteria of the Bacillaceae family: *Clostridium novyi, C. septicum,* and *C. bifermentans* are involved in gas gangrene; *C. botulinum* causes botulism and produces the toxin Botox used in some cosmetic procedures; *C. perfringens* causes food poisoning, cellulitis, and wound infections; *C. tetani* is the cause of tetanus.

Clostridium botulinum [Gk, *kloster,* spindle], a species of anaerobic bacteria that causes botulism in humans and botulism-like diseases in other animals. Botulinus food poisoning results from ingesting food containing preformed toxins produced by the species. It is a proteolytic pathogen commonly present in soil, where its endospores can survive for years. Their resistance to heat makes them an important source of poisoning in improperly cooked or canned foods.

Clostridium difficile /difis′ilē/, A common inhabitant of the colon flora in human infants and sometimes in adults. It produces a toxin that causes pseudomembranous enterocolitis in persons receiving antibiotic therapy causing watery diarrhea. The species affects guinea pigs and rabbits as well as humans.

Clostridium perfringens [Gk, *kloster,* spindle], a species of anaerobic gram-positive bacteria capable of causing gas gangrene and food poisoning in humans and various digestive and urinary tract diseases in livestock. The oval spores of the bacteria are found in the soil and in the intestinal tracts of humans and animals. It is the third most common form of food poisoning in the United States and the United Kingdom. Incubation time is 6 to 24 hours, usually 10-12 hours. Symptoms include abdominal cramps and diarrhea. Vomiting is rare. Also called *Clostridium welchii*.



Clostridium perfringens *(Kumar et al, 2010)*

closure /klō′zhər/ [L, *claudere,* to shut], **1.** the surgical closing of a wound by suture or staple. **2.** a visual phenomenon in which the mind sees an entire figure when only a portion is actually visible. See also **flask closure. 3.** the ending of something, as in closure of the grieving process.

closylate /klos′ilāt/, a contraction for *p-chlorobenzene-sulfonate*.

clot. See **blood clot.**

clothes lice. See ***Pediculus humanus corporis.***

clot retraction, the shrinking of a semisolid mass formed by the coagulation of blood, lymph, or other fluid. A normal standing blood clot is completely retracted in about 24 hours, although the time depends on such factors as the number of platelets in the clot.

clot retraction test, a blood test used to evaluate bleeding disorders such as thrombocytopenia and Glanzmann's thrombasthenia. It measures the time required for blood in a test tube to form a clot and for the clot's edges to retract from the sides of the glass tube. This test is no longer used in most laboratories.

clotrimazole /klōtrim′əzōl/, a broad-spectrum antifungal agent of the imidazole group used in topical applications to treat fungal and yeast infections, including **tinea pedis, tinea cruris, tinea corporis, tinea versicolor,** oral candidiasis, and vaginal candidiasis.

■ INDICATIONS: It is prescribed in the treatment of superficial fungal infections and candidal vulvovaginitis. Oral troches are used for prophylaxis against fungal infections in neutropenic patients.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. It is not prescribed for ophthalmic use; contact with eyes should be avoided.

■ ADVERSE EFFECTS: The most serious adverse reactions are severe hypersensitivity reactions of the skin. The use of oral troches often causes liver enzyme abnormalities.

clotting. See **blood clotting.**

clotting time [AS, *clott*], the time required for blood to form a clot, tested by collecting 4 mL of blood in a glass tube and examining it for clot formation. The first appearance of a clot is noted and timed. The normal coagulation time in glass tubes is 5 to 15 minutes. This simple test has been used to diagnose hemophilia, but it does not detect mild coagulation disorders. Its chief application is in monitoring anticoagulant therapy. It is rarely used in clinical practice. Also called **coagulation time.** Compare **bleeding time.**

cloud baby [AS, *clud* + *babe*], an obsolete term for a newborn who appears well and healthy but is a carrier of infectious bacterial or viral organisms. The infant may contaminate the surrounding environment as airborne droplets from the respiratory tract form clouds of the organisms. A cloud baby may be the source of a nursery epidemic, especially one caused by a staphylococcal organism.

clouded sensorium. See **clouding of consciousness.**

clouding of consciousness, a mental state in which a patient is confused about or is not fully aware of the immediate surroundings. Also called **clouded sensorium.**

cloudy swelling. See **granular degeneration.**

clove /klōv/ [L, *clavus,* nail], the dried flower bud of *Eugenia caryophyllata*. It contains the lactone caryophyllin and a volatile oil used as a dental analgesic, a germicide, and a salve. Clove is also used as a spice and a carminative against nausea, vomiting, and flatulence.

clove-hitch sling, a bandage that begins with a clove-hitch knot at the center. The loop made is fitted to the hand. The two loose ends are extended over and behind the shoulders and tied beside the neck. Longer ends may be drawn down the back of the shoulders and under each axilla to be tied over the chest. It provides support for an injured upper extremity.

cloverleaf nail /klō′vərlēf′/ [AS, *clafre* + *leaf* + *nagel*], a surgical nail shaped in cross section like a cloverleaf, used especially in the repair of fractures of the femur.

cloverleaf skull deformity, a congenital defect characterized by a trilobed skull, resulting from the premature closure of multiple cranial sutures during embryonic development. The condition is associated with hydrocephalus, facial anomalies, and skeletal deformities.

cloxacillin sodium /klok′səsil′in/, a penicillinase-resistant penicillin used for bacterial infections.

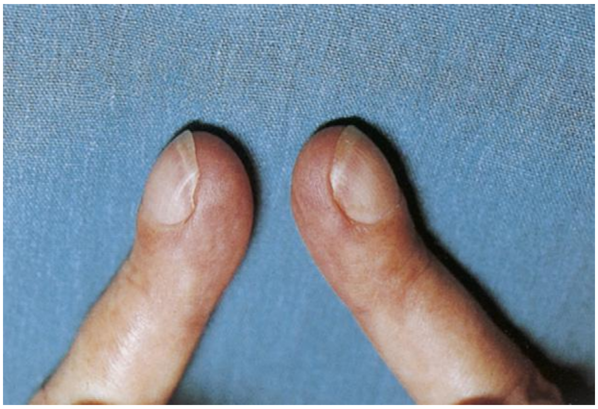
- INDICATIONS: It is prescribed in the treatment of serious bacterial infections, primarily those caused by penicillinase-producing strains of staphylococci.
- CONTRAINDICATION: Known hypersensitivity to this drug or to any penicillin prohibits its use.
- ADVERSE EFFECTS: Among the more serious adverse reactions are GI discomfort, rash, and hypersensitivity.

CLS/MT, abbreviation for **clinical laboratory scientist/medical technologist.**

CLT/MLT, abbreviation for *clinical laboratory technician/medical laboratory technician*.

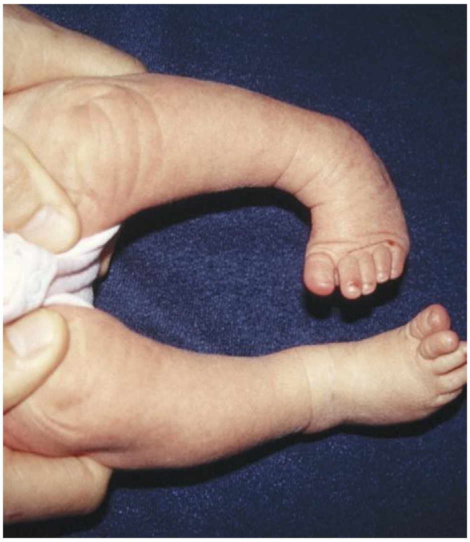
clubbed penis [ME, *clubbe* + L, *penis*]. See **penile curvature.**

clubbing [ME, *clubbe*], an abnormal enlargement of the distal phalanges with a flattening of the curvature of the nail margin at the cuticle, where the nail meets the cuticle. It usually is associated with cyanotic heart disease or advanced chronic pulmonary disease but sometimes occurs with biliary cirrhosis, colitis, chronic dysentery, thyrotoxicosis, and sickle cell anemia. Clubbing occurs in all the digits but is most easily seen in the fingers. Advanced clubbing is obvious, but early clubbing may be difficult to diagnose. Clubbing is present if the transverse diameter of the base of the fingernail is greater than the transverse diameter of the most distal joint of the digit. The nail base angle measures more than 160°. See also **Schamroth window test.**



Clubbing *(Moll, 1997)*

clubfoot [ME, *clubbe* + AS, *fot*], a congenital deformity of the foot, sometimes resulting from intrauterine constriction and characterized by unilateral or bilateral deviation of the metatarsal bones of the forefoot. Ninety-five percent of clubfoot deformities are **equinovarus,** characterized by medial deviation and plantar flexion of the forefoot, but a few are **calcaneovalgus,** or **calcaneovarus,** characterized by lateral deviation and dorsiflexion either outward from or inward toward the midline of the body. Treatment depends on the extent and rigidity of the deformity. Splints and casts in infancy may produce complete correction. Surgery in several steps may be necessary to achieve normal function. See also **Denis Browne splint, talipes.**



Clubfoot *(James and Ashwill, 2007)*

club hair, a hair in the resting, or final, stage of the growth cycle, before shedding, the bulb of which has become a club-shaped mass. See also **hair.**

cluster analysis [AS, *clyster,* growing together; Gk, *analyein,* to loosen], (in statistics) a complex technique of data analysis of numeric scale scores that produces clusters of variables related to one another. The technique is performed with computer software or statistics programs.

cluster breathing, a breathing pattern in which a closely grouped series of respirations is followed by apnea. The activity is associated with a lesion in the lower pontine region of the brainstem. See also **Biot's respiration, Cheyne-Stokes respiration.**

cluster headache, a condition characterized by attacks of intense unilateral pain, occurring most often over the eye and forehead. It is accompanied by flushing and watering of the eyes and nose. Cluster headaches are more common in males and are associated with alcohol use. The attacks occur in groups with a duration of several hours. See also **histamine headache.**

clusterin /klus′terin/, a multifunctional glycoprotein with roles in the metabolism and transport of lipids and membrane fragments, secretion of hormones, reproductive biology, inhibition of assembly of the membrane attack complex of complement activation, programmed cell death, and modulation of intercell interactions. Its expression is enhanced in tissue injury and remodeling, and in degenerative diseases such as Alzheimer's disease.

cluster-of-differentiation (CD) antigen, one of a group of cell-surface molecules that are used to classify leukocytes into subsets.

cluttering [ME, *clotter*], a speech disorder of dysfluency characterized by a rapid delivery with uneven rhythmic patterns and omission or transposition of various speech sounds or syllables. The condition is commonly associated with other learning disabilities, such as difficulty in learning to speak, read, and spell.

clysis /klī′sis/ [Gk, *klyster,* washout], the nonoral insertion or injection of a fluid into tissue spaces, the rectum, or the abdominal cavity, such as the administration of an enema. It is used when IV access is not possible.

cm, abbreviation for **centimeter.**

Cm, symbol for the element **curium.**

cm^2, abbreviation for **square centimeter.**

cm^3, abbreviation for **cubic centimeter.**

CMA, abbreviation for *Canadian Medical Association*.

***CMAJ*,** abbreviation for ***Canadian Medical Association Journal*.**

CMC, abbreviation for *carpometacarpal*. See **carpometacarpal joint.**

CMF, an anticancer drug combination of *c*yclophosphamide, *m*ethotrexate, and *f*luorouracil.

CMHC, abbreviation for **community mental health center.**

CMI, abbreviation for **computer-managed instruction.**

CML, abbreviation for **chronic myelogenous leukemia.**

cmm, abbreviation for **cubic millimeter.**

CMRNG, abbreviation for *chromosomally mediated resistant Neisseria gonorrhoeae*.

CMS, abbreviation for *Centers for Medicare and Medicaid Services*, an agency of the U.S. Department of Health and Human Services. Formerly called the **Health Care Financing Administration.**

CMT, abbreviation for **certified medical transcriptionist.** See **medical transcriptionist.**

CMV, abbreviation for **cytomegalovirus.**

CN, abbreviation for **chloroacetophenone.**

CNA, **1.** abbreviation for **Canadian Nurses Association.** **2.** abbreviation for **certified nurse administrator. 3.** abbreviation for *certified nursing assistant*.

CNAA, abbreviation for *certified nurse administrator, advanced*.

CNATS, abbreviation for **Canadian Nurses Association Testing Service.**

-cnemia, suffix meaning "(condition of the) leg below the knee": *bucnemia, cacocnemia, microcnemia*.

CNF, abbreviation for **Canadian Nurses Foundation.**

CNHV, abbreviation for **central neurogenic hyperventilation.**

Cnidaria, a phylum of invertebrate animals that includes jellyfish, sea anemones, hydroids, and corals. Formerly called **Coelenterata.**

CNM, abbreviation for **certified nurse-midwife.**

CNNT, abbreviation for *Council of Nephrology Nurses and Technicians*.

CNOR, abbreviation for *Certified Perioperative Nurse*.

CNP, **1.** abbreviation for **community nurse practitioner.** **2.** abbreviation for *certified nurse practitioner*.

CNRN, abbreviation for *certified neuroscience registered nurse*.

CNRS, abbreviation for **Canadian Nurses Respiratory Society.**

CNS, **1.** abbreviation for **central nervous system.** **2.** abbreviation for **clinical nurse specialist.**

CNSN, abbreviation for *certified nutrition support nurse*.

CNS sympathomimetic, a drug, such as cocaine or an amphetamine, whose effects mimic those of symptomimetic nervous system stimulation.

CNS syndrome. See **central nervous system syndrome.**

Co, symbol for the element **cobalt.**

CO, **1.** formula for **carbon monoxide. 2.** abbreviation for **cardiac output.**

co-, col-, com-, con-, cor-, prefix meaning "together, with": *coadaptation, coagulate, coarctate*.

CO_2, formula for **carbon dioxide.**

CoA, abbreviation for **coenzyme A.**

coagglutination /kō′əglo͞o′tənā′shən/ [L, *cum* + *agglutinare,* to glue], a clumping of red blood cells by mixtures of protein antigens and their antisera.

coagulability /kō·ag′yələbil′itē/ [L, *coagulare,* to curdle], the state of being able to coagulate or form blood clots.

coagulant /kō·ag′yələnt/ [L, *coagulare,* to curdle], an agent that causes a coagulum, or blood clot, to form.

coagulase /kō·ag′yəlās/ [L, *coagulare,* to curdle], an enzyme produced by bacteria, particularly *Staphylococcus aureus,* that promotes the formation of fibrin from fibrinogen to form thrombi.

coagulate /kō·ag′yəlāt/, to undergo or cause to undergo the chemical process whereby a fluid becomes curdled or clotted. **—coagulated,** *adj*.

coagulated /kō·ag′yəlā′tid/, curdled; changed to a clotted state.

coagulation /kō·ag′yəlā′shən/ [L, *coagulare,* to curdle], **1.** the process of transforming a liquid into a solid, especially of the blood. See also **blood clotting. 2.** (in colloid chemistry) the transforming of the liquid dispersion medium into a gelatinous mass. **3.** the hardening of tissue by some physical means, as by electrocoagulation or photocoagulation.**—coagulable**, *adj*.

coagulation cascade, the series of steps beginning with activation of the intrinsic or extrinsic pathways of coagulation and proceeding through the common pathway of coagulation to the formation of the fibrin clot. Each step involves activation of a proenzyme (zymogen), the activated form catalyzing activation of the following step. See also **common pathway of coagulation, extrinsic pathway of coagulation, intrinsic pathway of coagulation.**

coagulation current, an electric current delivered by a needle ball or variously shaped points to bind tissues together. See also **electrocautery, electrocoagulation.**

coagulation factor, plasma proteins in the coagulation system that circulate as inactive zymogens or cofactors. When activated by tissue damage, they form complexes that ultimately produce thrombin, an enzyme that cleaves fibrinogen to produce a fibrin clot and stops the bleeding. See also **blood clotting, coagulation, fibrinogen, hemophilia A, hemophilia B, hemophilia C, factor II** through **factor XIII.**

coagulation factor IX (human), a purified, sterile, dried concentrate of factor IX derived from pooled human plasma, used in the prophylaxis and treatment of bleeding in patients with hemophilia B, administered intravenously.

coagulation factor IX (recombinant), a sterile, dried concentrate of factor IX prepared by recombinant means, used in the prophylaxis and treatment of bleeding in patients with hemophilia B, administered intravenously.

coagulation factors concentration test, a set of blood tests used to measure the quantity of a number of specific factors suspected to be responsible for defects in hemostasis and to help the clinician determine the appropriate treatment. Deficiencies of these factors may result from inherited genetic defects, acquired diseases, or drug therapy.

coagulation factor VIIa, recombinant, an antihemophilic.

■ INDICATIONS: This drug is prescribed to prevent the bleeding associated with hemophilia A or B when inhibitors to Factor VIII or IX are present.

■ CONTRAINDICATIONS: Factors that prohibit its use include known hypersensitivity to this product or to mouse-, hamster-, or bovine-derived products.

■ ADVERSE EFFECTS: Life-threatening side effects include hemorrhage, hemarthrosis, decreased fibrinogen plasma, diffuse intravascular coagulation, coagulation disorder, and thrombosis. Other adverse effects include fever, headache, hypertension, bradycardia, pain, redness at the injection site, pruritus, purpura, and rash.

coagulation necrosis, necrosis in which tissue becomes a dry, opaque, eosinophilic mass containing outlines of anucleated cells. It results from the denaturation of proteins following hypoxic injury, such as that caused by ischemia in infarction. Also called **avascular necrosis, ischemic necrosis.**

coagulation pathways. See **common pathway of coagulation, extrinsic pathway of coagulation, intrinsic pathway of coagulation.**

coagulation time. See **clotting time.**

coagulative /kō·ag′yəlā′tiv/, **1.** *adj*, causing blood clot formation. **2.** *n*, an agent that assists in the formation of blood clots.

coagulopathy /kō·ag′yəlop′əthē/, a pathological condition that reduces the ability of the blood to coagulate, resulting in uncontrolled bleeding.

coalesce /kō′əles′/ [L, *coalescere,* to grow together], **1.** to grow together. **2.** to unite.

coal tar, a topical drug for treating eczema.

■ INDICATIONS: It is prescribed in the treatment of chronic skin conditions, such as dandruff, seborrheal dermatitis, and psoriasis.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are skin irritation and local hypersensitivity reactions.

coal tar creosote, creosote obtained by high temperature carbonization of bituminous coal. It is a brown-to-black, oily liquid, a mixture of aromatic hydrocarbons, tar acids, and tar bases, mainly used as a wood preservative. It is toxic to humans and other animals by contact, ingestion, or inhalation, and coal tar is a human carcinogen. Animals may suffer skin irritation from recently treated wood or ulceration of the esophagus if they chew on it.

coal worker's pneumoconiosis. See **anthracosis.**

Coanda effect, a phenomenon of fluid movement similar to the Bernoulli effect in which passage of a stream of gas next to a wall results in a pocket of turbulence between the wall and the gas flow. The turbulence forms a low-pressure bubble that makes the gas stream adhere to the wall. The principle is used in fluidic ventilators.

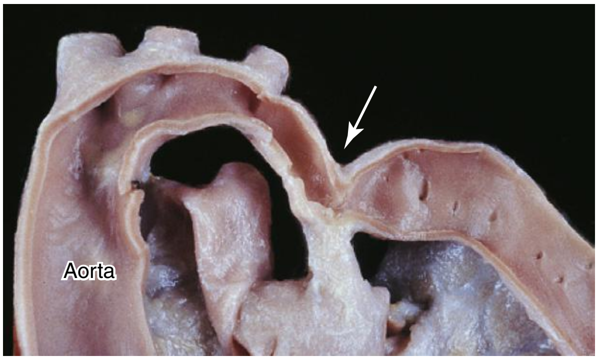
coaptation splint /kō′aptā′shən/ [L, *coaptare,* to fit together; ME *splinte*], a small splint fitted to a fractured limb to prevent overriding of the fragments of bone during adjustment of the fracture. A longer splint usually covers the small one to provide more support and fixation of the entire limb.

coarct /kō·ärkt′/ [L, *coarctare,* to press together], the act of narrowing or constricting, especially the lumen of a blood vessel.

coarctate retina /kō·ärk′tāt/ [L, *coarctare,* to press together, *rete,* net], a funnel-shaped retina caused by a leakage of fluid between the retina and the choroid.

coarctation /kō′ärktā′shən/, a compression, shriveling, or stricture of the walls of a vessel, such as the aorta.

coarctation of the aorta, a congenital cardiac anomaly characterized by a localized narrowing of the aorta. It results in increased pressure proximal to the defect and decreased pressure distal to it. The most common site of coarctation is just beyond the origin of the left subclavian artery from the aorta, resulting in high blood pressure in the upper extremities and head and low blood pressure in the lower extremities. Symptoms are directly related to the pressure changes created by the constriction. Clinical manifestations include dizziness, headaches, fainting, epistaxis, reduced or absent femoral pulses, and muscle cramps in the legs from tissue anoxia during increased exercise. Diagnosis is based on characteristic pressure changes in the upper and lower body and specific radiological and echocardiographic findings, including notching of the lower ribs, left ventricular hypertrophy, and dilation of the aorta proximal to the stricture. A murmur may or may not be present. Surgical repair is recommended for minor defects because of the high incidence of untreated complications, including aortic rupture, hypertension, infective endocarditis, subarachnoid hemorrhage, and congestive heart failure.



Coarction of the aorta *(Damjanov and Linder, 2000)*

coarse /kôrs/ [ME, *cors,* common], (in physiology) involving a wide range of movements, such as those associated with tremors and other involuntary motions of the skeletal muscle.

coarse crackle [ME, *cors,* common, *krakelen*], an abnormal inspiratory breathing sound caused by air moving through an excessive amount of fluid in an airway, as in pulmonary edema.

coarse fremitus, a rough, loud, tremulous vibration of the chest wall noted on palpation of the chest during a physical examination as the person inhales and exhales. It is most common in pulmonary conditions characterized by consolidation. See also **fremitus.**

coarse tremor [ME, *cors,* common; L, *tremor,* shaking], a tremor in which the movements are relatively slow and may involve larger muscle groups.

coat [ME, *cote*], **1.** a membrane that covers the outside of an organ or part. **2.** one of the layers of a wall of an organ or part, especially a canal or a vessel.

coated tablet [ME, *cote* + Fr, *tablette*], a solid disc of one or more pharmaceutic agents that is (1) coated with sugar or a flavoring to mask the taste or (2) enteric-coated, meaning that it is coated with a substance that resists dissolution in the stomach but allows release of the medication in the intestine.

coated tongue [ME, *cote* + AS, *tunge*], a tongue with a white, yellow, or brown furred surface, representing a possible accumulation of mycelia, bacteria, food debris, or desquamated epithelial cells. There are many possible causes, ranging from a fungal infection to sleeping with the mouth open. Also called **furred tongue.**

Coats' disease, Coats' retinitis. See **exudative retinopathy.**

cobalamin /kōbôl′əmin/ [Ger, *kobold,* mine goblin], a generic term for a chemical portion of the vitamin B_{12} molecule. See also **cyanocobalamin.**

cobalt (Co) /kō′bôlt/ [Ger, *kobold,* mine goblin], a metallic element that occurs in the minerals cobaltite, smaltite, and linnaeite. Its atomic number is 27. Its atomic mass is 58.93. Extensive deposits of cobalt minerals are found in Ontario, Canada. Pure cobalt is obtained by reducing the oxide with aluminum or carbon. It is used in special alloys, such as Alnico. Cobalt is a component of vitamin B_{12}, is found in most common foods, and is readily absorbed by the GI tract. This element is common in the human diet, but the precise daily intake requirement is not known, and cobalt deficiency in humans has not been seen. Cobaltous chloride has been given to some patients with certain types of anemia because of cobalt's capacity to produce polycythemia. Accidental intoxication by cobaltous chloride, especially by children, may produce cyanosis, coma, and death. Some amounts of cobalt stimulate the production of erythropoietin, by a process not yet understood, but large doses depress erythrocyte production. The only disease for which the use of cobalt is still advocated is normochromic, normocytic anemia associated with renal failure. The radioisotope ^{60}Co or cobalt-60 emits gamma rays and is often used as an encapsulated radiation source in the treatment of cancer.

cobalt-60 (^{60}Co), a radioactive isotope of the element cobalt with a mass of 60 and a half-life of 5.2 years. ^{60}Co emits high-energy gamma rays and is the most frequently used radioisotope in radiotherapy. It must be stored in a position well shielded by lead or uranium.

cobalt lung. See **hard metal disease.**

cobalt poisoning, poisoning from long-term excessive exposure to cobalt, seen in those who work with it. It was formerly seen in beer drinkers because cobalt was added to beer as a foam stabilizer. Symptoms include nausea, vomiting, tinnitus, nerve deafness, and cardiomyopathy.

Coban, a trademark for an elastic pressure wrap applied to reduce edema. It adheres to itself and may be used as a secondary dressing for patients allergic to tape. See also **cohesive bandage.**

Cobb collar, congenital stenosis of the bulbar urethra.

COBOL /kō′bol/, abbreviation for *common business oriented language,* a high-level compiler computer language for programming.

cobra /kō′brä/, any of numerous extremely poisonous elapid snakes commonly found in Africa, Asia, and India. They are capable of expanding the neck region to form a hood and have two comparatively short, erect, deep grooved fangs. A serum obtained from animals inoculated with cobra venom is used in counteracting the effects of the venom. Species include the *Asian cobra* and *king cobra* of Asia and the *Egyptian cobra* found throughout Africa and the Arabian peninsula. See also **snakebite**.

COBRA /kō′brə/, abbreviation for **Consolidated Omnibus Reconciliation Act.**

Cobra head deformity, the appearance of a ureterocele in excretory urography, with the distal ureter slightly dilated and projecting into the bladder and an area of lesser density visible around it.

cobra venom solution [L, *colubra,* snake, *venenum,* venom, *solutus,* dissolved], a sterile physiological salt solution containing minute amounts of cobralysin, the hemolytic substance in cobra venom.

coca, a species of South American shrubs native to Bolivia and Peru and cultivated in Indonesia. The leaves are dried and then chewed for their stimulant effect by some of the people of the region. It is a natural source of cocaine.

cocaine baby /kōkān′/, an infant with birth defects caused by exposure to cocaine in utero. Contributing causes may include poor sperm quality of a male cocaine user, poor nutritional habits and/or alcohol or tobacco abuse by the mother during pregnancy, and the direct effect of the drug itself, which can cross the placental barrier.

cocaine hydrochloride, a white crystalline powder used as a local anesthetic. It was originally derived from coca leaves but can also be prepared synthetically. Cocaine is a Schedule I drug under the Controlled Substances Act of 1970.

■ INDICATIONS: In solution it is sometimes used as a topical anesthetic applied to mucous membranes. Its vasoconstrictive action slows bleeding and limits absorption. Prolonged or frequent use may damage the mucous membranes.

■ CONTRAINDICATIONS: It is incompatible with all alkaloid precipitants, mercurials, and silver nitrate. Central nervous system overstimulation may result from use with monoamine oxidase inhibitors, amphetamines, or guanethidine. Combination with epinephrine or norepinephrine can lead to cardiac arrhythmias or ventricular fibrillation. Persons with severe cardiovascular disease, thyrotoxicosis, hypotension, or hypertension should not take this drug.

■ ADVERSE REACTIONS: Among the most serious adverse reactions are excitement, depression, euphoria, restlessness, tremors, vertigo, nausea, vomiting, hypotension, hypertension, abdominal cramps, exophthalmia, mydriasis, peripheral vascular collapse, tachypnea, tachycardia, chills, fever, coma, and death from respiratory failure.

■ NOTE: Cocaine hydrochloride solution should be freshly made; it deteriorates rapidly on standing and cannot be heat-sterilized.

cocaine hydrochloride poisoning [Sp, *coca* + *HCl* + L, *potio,* drink], toxic effects of exposure to the colorless crystalline alkaloid derived from coca leaves. Although used as a local analgesic for a century, cocaine is highly toxic with moderate vasoconstrictor activity and serious psychotropic effects. Symptoms include nervous excitement, restlessness, incoherent speech, fever, hypertension, stroke, and cardiac arrhythmias, leading to convulsions, collapse, respiratory arrest, and death. The euphoric effect of cocaine lasts about 30 minutes. A crystalline form of cocaine with the street names **crack** and **rock** is smoked.

cocarcinogen /kōkär′sənəjən/ [L, *cum,* together with; Gk, *karkinos,* crab, *genein,* to produce], an agent that alone does not transform a normal cell into a cancerous state but in concert with another agent can effect the transformation.

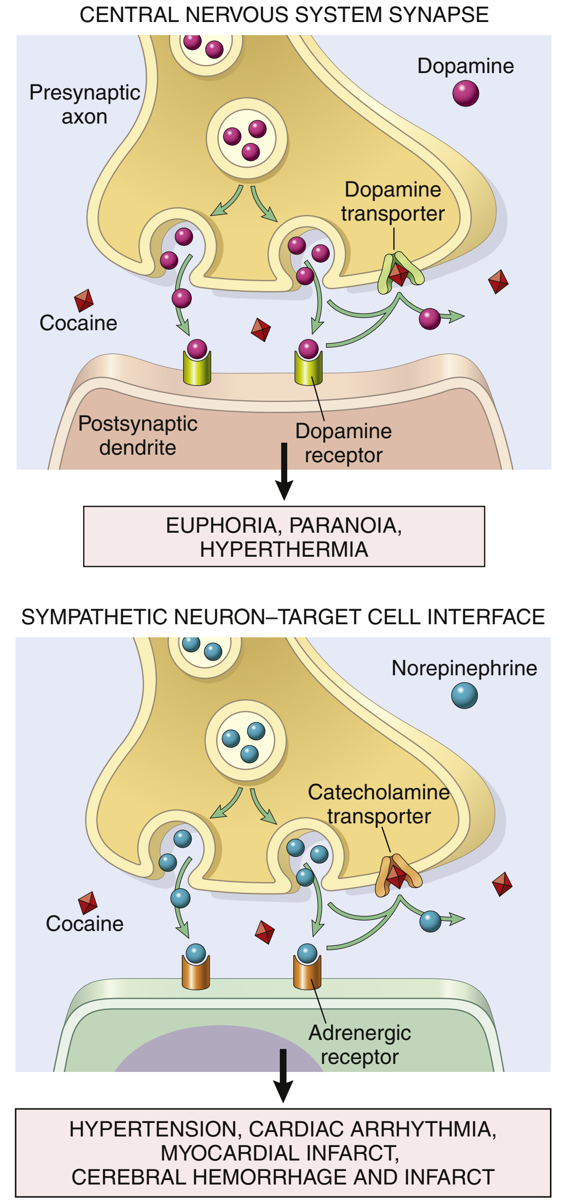
coccal. See **coccus.**

cocci-, cocco-, prefix meaning "seed, berry; or a spherical bacterial cell": *coccobacillus, coccogenous, coccoid.*

Coccidia, a subclass of parasitic protozoa found in humans, other vertebrates, and some invertebrates. Among the species of coccidians pathogenic to humans is ***Cyclospora cayetanensis.*** See also **coccidiosis.**

coccidian, **1.** *adj,* pertaining to Coccidia. **2.** *n,* a protozoan in the subclass Coccidia.

Coccidioides /kok·sid′ē·oi′dēz/, a pathogenic dimorphic genus of Fungi Imperfecti of the form-class Euascomycetes, form-family Onygenacaea. In soil it grows as a mycelium with infectious units called arthrospores; in tissue as a spherule with endospores. *C. immitis* causes coccidioidomycosis and fungal pneumonia.



CENTRAL NERVOUS SYSTEM SYNAPSE

Effect of cocaine on neurotransmission *(Kumar et al, 2010)*

coccidioidomycosis /koksid′ē·oi′dōmīkō′sis/ [Gk, *kokkos,* berry, *eidos,* form, *mykes,* fungus, *osis,* condition], an infectious fungal disease caused by the inhalation of spores of the protozoon *Coccidioides immitis* or *C. posadasii,* which is carried on windborne dust particles. The disease is endemic in hot, dry regions of the southwestern United States and Central and South America and is an opportunistic disease associated with human immunodeficiency virus infection and leukemia. Primary infection is characterized by symptoms resembling those of the common cold or pulmonary infection. Secondary infection, occurring after a period of remission and lasting from weeks to years, is marked by low-grade fever, anorexia and weight loss, cyanosis, dyspnea, hemoptysis, focal skin lesions resembling erythema nodosum, and arthritic pain in the bones and joints. The diagnosis is made by finding that the patient has been living in or visiting an endemic area and by identifying *C. immitis* in sputum, exudate, or tissue. Treatment usually consists of bed rest and the administration of antibiotics, such as amphotericin B or fluconazole. Also called **desert fever, desert rheumatism, San Joaquin fever, valley fever.**

coccidiosis /kok′sidē·ō′sis/ [Gk, *kokkos* + *osis,* condition], a parasitic disease of tropical and subtropical regions caused by the ingestion of oocysts of the protozoon *Isospora belli* or *I. hominis.* Symptoms include fever, malaise, abdominal discomfort, and watery diarrhea. The infection is usually self-limited, lasting 1 to 2 weeks, but occasionally it persists, resulting in malabsorption syndrome and, rarely, death. No specific therapy has been found. Compare **coccidioidomycosis.**

cocco-. See **cocci-.**

coccoid /kok′oid/ [Gk, *kokkos,* berry, *eidos,* form], having a spherical shape; resembling a micrococcus.

coccus /kok′əs/ *pl.* **cocci** [Gk, *kokkos,* berry], a bacterium that is round, spheric, or oval, such as gonococcus, pneumococcus, staphylococcus, and streptococcus. **—coccal,** *adj.*

-coccus, suffix meaning a "berry-shaped organism": *dermococcus, enterococcus, pneumococcus.*

coccyalgia /kok′si·al′jə/, a pain in or near the coccyx.

coccyg-, coccygo-, prefix meaning "coccyx": *coccygeal, coccygectomy, coccygodynia.*

coccygeal. See **coccyx.**

coccygeal body. See **coccyx.**

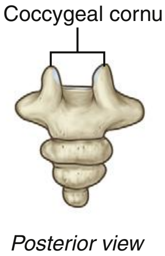
coccygeal vertebra, one of the four segments of the vertebral column that fuse to form the adult coccyx. They are considered rudimentary vertebrae and have no pedicles, laminae, or spinous processes. Compare **cervical vertebra, lumbar vertebra, sacral vertebra, thoracic vertebra.** See also **coccyx, vertebra.**

coccyges. See **coccyx.**

coccygeus /koksij′ē·əs/ [Gk, *kokkyx,* cuckoo's beak], one of two muscles in the pelvic diaphragm. Stretching across the pelvic cavity like a hammock, it is a triangular sheet of muscle and tendinous fibers. It acts to draw the coccyx ventrally, helping to support the pelvic floor. Compare **levator ani.**

coccygodynia /kok′sigōdin′ē·ə/, a pain in the coccygeal area. Also called **coccyalgia,** *coccydynia.*

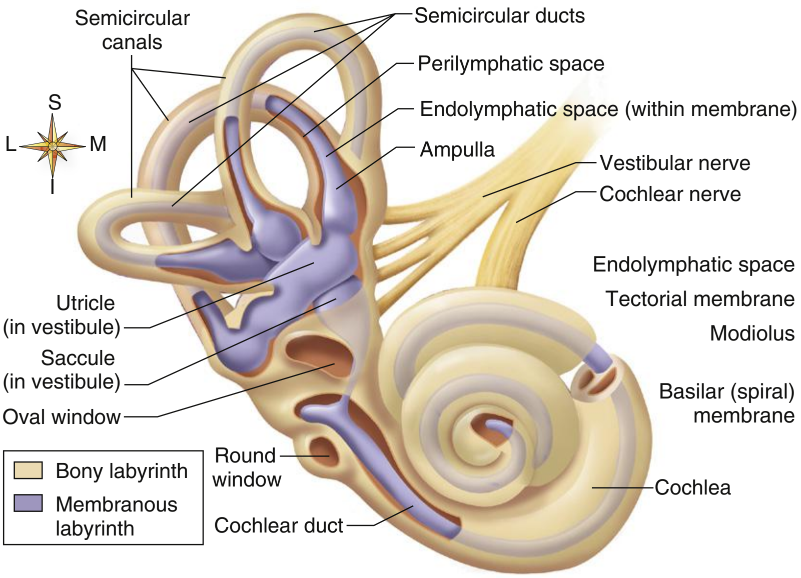
coccyx /kok′siks/ *pl.* **coccyges** [Gk, *kokkyx,* cuckoo's beak], the beaklike bone joined to the sacrum by a disk of fibrocartilage at the base of the vertebral column. It is formed by the union of three to five probably vestigial rudimentary vertebrae. The pieces of the coccyx fuse together in males at an earlier period in life than in females. In both the coccyx becomes fused with the sacrum by the sixth decade of life. The coccyx is freely movable on the sacrum during pregnancy. **—coccygeal** /koksij′ē·əl/, *adj.*



Coccygeal cornu
Posterior view

Coccyx *(Drake, Vogl, and Mitchell, 2010)*

cochineal /koch′inēl′/ [L, *coccineus,* bright red], a red dye prepared from the dried female insects of the species *Coccus*



Semicircular canals

Membranous labyrinth
Cochlear duct

Cochlea *(Patton and Thibodeau, 2010)*

cacti containing young larvae. During the preparation of the dye the larvae are extracted with an aqueous solution of alum. The resulting dye has been used in coloring medicines.

cochlea /kok′lē·ə/ [L, snail shell], the auditory portion of the inner ear. It is a spiral tunnel about 30 mm long with two full and three quarter-turns, resembling a tiny snail shell and containing the sense organ for hearing. —*cochlear, adj.*

cochlear canal /kok′lē·ər/ [L *cochlea* + *canalis* channel], a bony spiral tunnel within the cochlea of the internal ear. It contains one opening that communicates with the tympanic cavity, a second that connects with the vestibule, and a third that leads to a tiny canal opening on the inferior surface of the temporal bone.

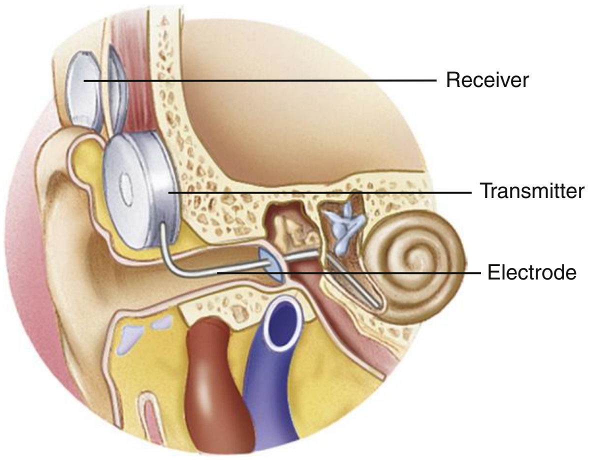
cochlear hearing loss, sensorineural hearing loss resulting from a defect in the receptor or transducing mechanisms of the cochlea.

cochlear implant, an electronic device that is surgically implanted into the cochlea of a deaf individual. A transmitter placed outside the scalp sends signals to a receiver under the scalp, which in turn transmits an electrical code to the auditory nerve. A microphone is located behind the ear to collect the sound waves that are transmitted through a microprocessor. The microprocessor analyzes the sound waves and relays data back to electrodes in the implanted device. The patient receives electrical pulses that are translated into sound vibrations that can be distinguished as neural sensations. Although the implant does not transmit speech in the same manner as it would be perceived by a person with normal hearing, it allows the individual to perceive and distinguish sounds that would not otherwise be audible to him or her and to use those sounds along with other environmental cues to improve communication. Also called **cochlear prosthesis.**

cochlear nerve [L, *cochlea,* snail shell, *nervus,* nerve], one of the main divisions of the eighth cranial nerve, with fibers that arise in spiral ganglion cells of the spiral organ and terminate in the dorsal and ventral cochlear nuclei of the brainstem. See also **vestibulocochlear nerve.**

cochlear prosthesis. See **cochlear implant.**

cochlear toxicity, poisonous effects of drugs that may result in hearing disorders, such as sensorineural hearing loss and tinnitus.



Receiver
Transmitter
Electrode

Cochlear implant *(Patton and Thibodeau, 2010)*

cochlear window. See **round window.**

cochleovestibular /kok′lē·ō′vestib′yələr/, pertaining to the cochlea and vestibule of the ear.

Cochrane Reviews, a database providing access to abstracts and summaries to support evidence-based decision making.

Cockayne's syndrome /kok·ānz′/ [Edward Alfred Cockayne, English physician, 1880–1956], an autosomal-recessive syndrome of dwarfism with retinal atrophy and deafness, associated with progeria, prognathism, mental retardation, and photosensitivity.

cockroach, the common name of members of the Blattidae family of insects that infest homes, workplaces, and other areas inhabited by humans. Cockroaches transmit a number of disease agents, including bacteria, protozoa, and eggs of parasitic worms.

cockscomb papilloma /kok′skōm/ [AS, *cocc* + *camb* + L, *papilla,* nipple; Gk, *oma,* tumor], a benign small red lesion that may project from the uterine cervix during pregnancy. It regresses after delivery.

American Nurses Association code of ethics

1. The nurse, in all professional relationships, practices with compassion and respect for the inherent dignity, worth, and uniqueness of every individual, unrestricted by considerations of social or economic status, personal attributes, or the nature of health problems.
2. The nurse's primary commitment is to the patient, whether an individual, family, group, or community.
3. The nurse promotes, advocates for, and strives to protect the health, safety, and rights of the patient.
4. The nurse is responsible and accountable for individual nursing practice and determines the appropriate delegation of tasks consistent with the nurse's obligation to provide optimum patient care.
5. The nurse owes the same duties to self as to others, including the responsibility to preserve integrity and safety, to maintain competence, and to continue personal and professional growth.
6. The nurse participates in establishing, maintaining, and improving heath care environments and conditions of employment conducive to the provision of quality health care and consistent with the values of the profession through individual and collective action.
7. The nurse participates in the advancement of the profession through contributions to practice, education, administration, and knowledge development.
8. The nurse collaborates with other health professionals and the public in promoting community, national, and international efforts to meet health needs.
9. The profession of nursing, as represented by associations and their members, is responsible for articulating nursing values, for maintaining the integrity of the profession and its practice, and for shaping social policy.

From American Nurses Association, *Code of ethics for nurses with interpretive statements,* © 2001 American Nurses Publishing, American Nurses Foundation/American Nurses Association, Washington, DC.

cocktail [AS, *cocc* + *toegel,*], *(informal)* an unofficial mixture of drugs, usually in solution, combined to achieve a specific purpose. This term is frequently used when combining medications to treat patients who are HIV positive.

cockup splint, a splint used to immobilize the wrist and leave the fingers free.

coconsciousness /kōkon′shəsnəs/, (in psychiatry) conscious states the patient is not aware of because they are not in the focus of attention but on the fringe of the content of consciousness. Thus something can be recalled and drawn into consciousness only when the conditions of consciousness are favorable.

cocontraction /kō′kəntrak′shən/, the simultaneous contraction of agonist and antagonist muscles around a joint.

COD, abbreviation for *cause of death.*

code [L, *caudex,* book], **1.** (in law) a published body of statutes, such as a civil code. **2.** a collection of standards and rules of behavior, such as a dress code. **3.** a symbolic means of representing information for communication or transfer, such as a genetic code. **4.** a system of notation that allows information to be transmitted rapidly, such as Morse code, or in secrecy, such as a cryptographic code. **5.** *(informal)* a discreet signal used to summon a special team to resuscitate a patient, as in "Code zero, 3 west" announced over a public address system to summon the team to the west wing of the third floor without alarming patients or visitors. "To code" means to cease respirations and/or heart function. See also **no code. 6.** to enter data by use of a given programming language into a computer. Compare **decode, encode.**

Code for Nurses, a set of guidelines for carrying out nursing responsibilities adopted by the American Nurses Association (ANA) in 1985. In 1994, the American Nurses Association determined that these guidelines were nonnegotiable and determined that each nurse had an obligation to adhere to the Code, and in 2001 a completely revised version of the Code of Ethics for Nurses was accepted by the ANA.

codeine phosphate, an opioid analgesic and antitussive.
■ INDICATIONS: It is prescribed to suppress cough and to relieve mild to moderate pain.
■ CONTRAINDICATION: Known hypersensitivity to opiates is the only contraindication.
■ ADVERSE EFFECTS: Among the more serious adverse reactions are depression of the central nervous system, paradoxic excitement, and drug dependence.

codeine sulfate, a water-soluble salt of monomethylmorphine, an alkaloid derived from opium. It is used as a mild hypnotic, analgesic, and cough reflex suppressant. Dependency on the drug is possible, but is less likely to produce addiction than is morphine.

code management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as coordination of emergency measures to sustain life. See also **Nursing Interventions Classification.**

code of ethics, a statement encompassing the set of rules based on values and the standards of conduct to which practitioners of a profession are expected to conform. See also **Code for Nurses, Hippocratic Oath.**

codependent, a state of close association with a person who is dependent on or addicted to a potentially destructive behavior, such as substance abuse, gambling, or smoking. The codependent person facilitates the behavior of the dependent one.

code team, a specially trained and equipped team of physicians, nurses, and technicians that is available to provide advanced cardiac life support when summoned by an emergency code set by the institution. A code team usually includes a physician, registered nurse, respiratory therapist, and pharmacist.

coding [L, *caudex,* book], the process of organizing information into categories, which are assigned codes for the purposes of sorting, storing, and retrieving the data.

coding strand. See **sense strand.**

cod-liver oil, a pale-yellow, partially destearinated fatty oil extracted from the fresh livers of *Gadus morrhua* and other fish of the family Gadidae. A rich source of fat-soluble vitamins A and D, it is useful in the treatment of nutritional deficiency of those vitamins. The oil must be stored in a cool, dark place, or it becomes rancid. See also **osteomalacia, rickets, tetany.**

Codman's exercise [Ernest A. Codman, American surgeon, 1869–1940; L, *exercere,* to keep at work], mild exercises for restoring range of motion and function in the arms or shoulders after injury and immobilization of the limbs. The patient flexes the trunk and supports the upper body with the uninvolved extremity. The involved extremity hangs free and can be moved in pendulum fashion through motion of the trunk without active contraction of the shoulder muscles.

Codman's tumor. See **chondroblastoma.**

codominance /kōdom′ənənts/ [L, *cum,* together with, *dominare,* to rule], the equal degree of dominance of two alleles or traits fully expressed in a phenotype, as when a person inherits both the I^A and I^B genes of the ABO blood group and has type AB blood. **—codominant,** *adj.*

codominant inheritance, the transmission of a trait or condition in which both alleles of a pair are given full expression in a heterozygote, as in the alleles for the AB or MNS blood group antigens and the leukocyte antigens.

codon /kō′don/, a unit of three adjacent nucleotides along a DNA or messenger RNA molecule that designates a specific amino acid to be incorporated into a polypeptide. The order of the codons along the DNA or messenger RNA determines the sequence of the amino acids in the polypeptide. Also called **trinucleotide.** See also **anticodon, genetic code.**

coefficient /kō′efish′ənt/ [L, *cum,* together with, *efficere,* to effect], a mathematic relationship between factors that can be used to measure or evaluate a characteristic under specified conditions. Examples include Henry's law, which measures **solubility coefficient;** Graham's law, which calculates **diffusion coefficient;** and the **oxygen-utilization coefficient,** which measures the amount of oxygen in a patient's venous blood in terms of the proportion of oxygen in his or her arterial blood.

coel-, prefix meaning "colon," denoting relationship to a cavity or space: *coelarium.*

-coele, suffix form of **"coel-".**

coelentera. See **coelenteron.**

Coelenterata. See **Cnidaria.**

coelenteron /sēlen′tərон/ *pl.* **coelentera** [Gk, *koilos,* hollow, *enteron,* intestine], the digestive cavity of animals in the phylum Cnidaria, such as the hydra and the jellyfish. See also **archenteron.**

coelom /sē′ləm/ [Gk, *koilos,* hollow], the body cavity of the developing embryo. It is situated between the layers of lateral mesoderm and in mammals gives rise to the pericardial, pleural, and peritoneal cavities. A kind of coelom is **extraembryonic coelom.** Also called **somatic cavity.** —*celomic, coelomic, adj.*

coelosomy /sē′ləsō′mē/ [Gk, *koilos* + *soma,* body], a congenital anomaly characterized by protrusion of the viscera from the body cavity.

coenesthesia, coenesthesis. See **cenesthesia.**

coenogenesis. See **cenogenesis.**

coenzyme /kō·en′zīm/ [L, *cum,* together with, *en,* in, *zyme,* ferment], a nonprotein substance that combines with an apoenzyme to form a complete enzyme or holoenzyme. Coenzymes include some of the vitamins, such as B_1 and B_2, and have smaller molecules than enzymes. Coenzymes are dialyzable and heat-stable and usually dissociate readily from the protein portions of the enzymes with which they combine. See also **acetylcoenzyme A.**

coenzyme A (CoA) [L, *cum* + *en,* into, *zyme,* ferment], an important metabolite in the citric acid cycle. Although not a true enzyme, it plays a significant role in the transfer of acetyl groups and the metabolism of acids and amino acids.

coenzyme Q, any of several quinines that function as electron-carrying coenzymes involved in the electron transport chain or in aerobic cellular respiration. Also known as coenzyme Q10 and ubiquinone.

coffee [Ar, *qahwah*], the dried and roasted ripe seeds of *Coffea arabica, C. liberica,* and *C. robusta* trees that may have originated in Africa and now grow in almost all tropical areas. Coffee contains the alkaloid caffeine and is the basis for a stimulating drink that has been used in treating the common headache, chronic asthma, and narcotic poisoning.

coffee-ground vomitus, dark brown vomitus the color and consistency of coffee grounds, composed of gastric juices and old blood and indicative of slow upper GI bleeding. Compare **hematemesis.**

Coffin-Lowry syndrome /kof′in lou′rē/ [Grange S. Coffin, American pediatrician, b. 1923; R. Brian Lowry, Irish-born Canadian physician, 20th century], a condition with onset in the postnatal period characterized by incapability of speech; severe mental deficiency; and muscle, ligament, and skeletal abnormalities. It is transmitted with X-linked intermediate inheritance.

Coffin-Siris syndrome /kof′in sir′is/ [G.S. Coffin; Evelyn Siris, American radiologist, 1914–1987], hypoplasia or absence of the fifth fingers and toenails associated with growth and mental deficiencies; coarse facies; mild microcephaly; hypotonia; lax joints; mild hirsutism; and occasionally cardiac, vertebral, or GI anomalies.

Cogan's oculomotor apraxia /ko′gənz/ [David Glendenning Cogan, American ophthalmologist, 1908–1993], an absence or defect of horizontal eye movements, so that when the patient tries to look at an object off to one side, the head must turn to bring the eyes into line with the object and the eyes exhibit nystagmus. The cause is probably a brain lesion. Also called **Cogan's syndrome.**

Cogentin, a trademark for an antiparkinson drug **(benztropine mesylate).**

Cognex, a trademark for a cognition enhancer and analeptic (tacrine). It is a reversible cholinesterase inhibitor and may have a role in early Alzheimer's disease to improve some cognitive functions. It does not affect the prognosis of the disease.

cognition^1 /kognish′ən/ [L, *cognoscere,* to know], the mental process characterized by knowing, thinking, learning, understanding, and judging. Compare **conation.** —**cognitive,** *adj.*

cognition^2**,** a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability to execute complex mental processes. See also **Nursing Outcomes Classification.**

cognitive /kog′nitiv/, pertaining to the mental processes of comprehension, judgment, memory, and reasoning, as contrasted with emotional and volitional processes.

cognitive behavioral therapy, an approach to problem solving which helps persons understand thoughts and develop strategies to change behaviors.

cognitive development, the developmental process by which an infant becomes an intelligent person, acquiring knowledge with growth and improving his or her ability to think, learn, reason, and abstract. Jean Piaget demonstrated the orderly sequence of this process from early infancy through childhood. See also **psychosexual development, psychosocial development.**

cognitive dissonance [L, *cognoscere,* to know, *dis,* opposite of, *sonare,* to sound], a state of tension resulting from a discrepancy in a person's emotional and intellectual frame of reference for interpreting and coping with his or her environment. It usually occurs when new information contradicts existing assumptions or knowledge.

cognitive distortion, errors in thinking that continue even when there is obvious contradictory evidence. Examples of cognitive distortions include all-or-nothing thinking, overgeneralization, labeling, mental filter, disqualifying the positive, jumping to conclusions (mind reading), magnification or minimization (catastrophizing), emotional reasoning ("should" & "must" statements), and personalization.

cognitive function, an intellectual process by which one becomes aware of, perceives, or comprehends ideas. It involves all aspects of perception, thinking, reasoning, and remembering. Compare **conation.**

cognitive learning, **1.** learning that is concerned with acquisition of problem-solving abilities and with intelligence and conscious thought. **2.** a theory that defines learning as a behavioral change based on the acquisition of information about the environment.

cognitive orientation, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability to identify person, place, and time accurately. See also **Nursing Outcomes Classification.**

cognitive psychology, the study of the development of thought, language, and intelligence in humans.

cognitive restoration, an intervention technique designed to restore cognitive functioning.

cognitive restructuring^1, a change in attitudes, values, or beliefs that alters a person's self-expression. It occurs as a result of insight or behavioral achievement.

cognitive restructuring^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as challenging a patient to alter distorted thought patterns and view self and the world more realistically. See also **Nursing Interventions Classification.**

cognitive stimulation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion of awareness and comprehension of surroundings by utilization of planned stimuli. See also **Nursing Interventions Classification.**

cognitive structuring, the process of reviewing with a patient the changes that have occurred in his or her thinking in order to instill a sense of those changes, and of his or her role in bringing about those changes.

cognitive therapy, any of the various methods of treating mental and emotional disorders that help a person change attitudes, perceptions, and patterns of thinking, from rational to realistic thoughts about self and situations. Therapeutic approaches include behavior therapy, existential therapy, Gestalt therapy, and transactional analysis.

cogwheel respiration, a breathing pattern characterized by a repeated series of brief interruptions of inhalation and exhalation.

cogwheel rigidity [ME, *cugge,* tooth on a gear; AS, *hweol* + L, *rigiditas,* unbending], an abnormal rigor in muscle tissue characterized by jerky movements when the muscle is passively stretched. The condition is often found in cases of Parkinson's disease.

cohabitate /kōhab′itāt/, to live together in a relationship when not married.

Cohen technique, a type of ureteroneocystostomy in which the ureter is excised from the bladder and reimplanted in a new submucosal tunnel that is directed laterally across the trigone (transtrigonal) towards the contralateral side.

cohere /kōhir′/ [L, *cohaerere,* to cling together], to stick together, as similar molecules of a common substance.

coherence /kōhir′əns/, **1.** the property of sticking together, as the molecules within a common substance. **2.** (in psychology) the logical pattern of expression and thought evident in the speech of a normal, stable individual. **—***coherent, adj.*

cohesive bandage /kōhē′siv/, a dressing material that will adhere to itself but not to other surfaces.

cohesiveness /kōhē′sivnəs/ [L, *cohaerere,* to cling together], **1.** (in psychiatry) a force that attracts members to a group and causes them to remain in it. **2.** (in dentistry) a property of annealed pure gold that allows it to fuse together under pressure and to closely adapt to the walls of a tooth preparation, making possible the use of 24–carat gold sheets or pellets as dental restorative material in single-tooth restorations. **3.** the property of the forces of attraction within an object that holds it together as compared to adhesion which is the forces of attraction existing between two different objects or surfaces that hold them together.

cohesive terminus, a single-stranded end projecting from a double-stranded DNA segment that can be joined by molecular genetic techniques to an introduced DNA fragment. Also called **sticky end.**

COHN, abbreviation for *certified occupational health nurse*.

cohort /kō′hôrt/ [L, *cohortem,* large group], (in statistics) a collection or sampling of individuals who share a common characteristic, such as members of the same age or the same sex.

cohort study, (in research) a study concerning a specific subpopulation, such as the children born between December and May in 1975 or those born in the same months in 1955. See also **prospective study.**

coil. See **intrauterine device.**

coiled tubular gland [L, *colligere,* to gather together, *tubulus,* small tube, *glans,* acorn], one of the many multicellular glands that contain a coiled, tube-shaped secretory portion, such as the sweat glands.

coil spring contraceptive diaphragm, a kind of contraceptive diaphragm in which the flexible metal spring that forms the rim is a coiled, circular spring. The rubber dome of the diaphragm is approximately 3.8 cm deep, and the diameter of the rubber-covered rim is from 55 to 100 mm. Seven sizes, in increments of 0.5 cm, allow the clinician to fit the diaphragm to the individual woman. This kind of diaphragm is prescribed for a woman whose vaginal musculature offers good support, whose uterus is not acutely retroflexed or anteflexed, and whose vagina, neither very long nor very short, has a deeper than usual arch behind the symphysis pubis.

coincidence counting /kō·in′sidəns/ [L, *coincidere,* to occur together], the detection of two photons that arrive at separate counters simultaneously as the result of annihilation of a positron (created during a radioactive decay) and an electron. Coincidence counting greatly reduces the significance of any background radiation in radiography.

coinfection /ko′in-fek′shun/, simultaneous infection of a cell or organism by separate pathogens, as by hepatitis B and hepatitis D viruses.

coinnervation. See **cocontraction.**

coital headache /kō′itəl/, an uncommon type of headache, mainly affecting men, that begins during or immediately after coitus. The complaint may last for several minutes to several hours.

coitus /kō′itəs/ [L, *coire,* to come together], the sexual union of two people of opposite sex in which the penis is introduced into the vagina, typically resulting in mutual excitation and usually orgasm. Also called **coition, copulation, sexual intercourse. —***coital, adj.*

coitus interruptus. See **withdrawal method.**

COL, abbreviation for *CircOlectric*. See **CircOlectric (COL) bed.**

col-, colo-, colon-, colonic-, prefix meaning "colon": *colocolic, colodyspepsia, colololysis*.

Colace, a trademark for a stool softener (docusate sodium sulfosuccinate).

colation /kōlā′shən/ [L, *colare,* to strain], the act of filtering or straining, as urine is often strained for medical examination.

ColBENEMID, a trademark for an antigout medication (probenecid-colchicine combination product).

colchicine /kol′chəsēn/ [Gk, *kolchikon*], a gout suppressant that suppresses leukocyte mobility and phagocytosis in joints.

■ INDICATIONS: It may be prescribed in the treatment of acute gout and prophylaxis of recurrent gouty arthritis.

■ CONTRAINDICATIONS: Ulcer, ulcerative colitis, or known hypersensitivity to this drug prohibits its use. The drug is highly toxic and is not given to elderly, debilitated patients or to those who have chronic renal, hepatic, cardiovascular, or GI disease.

■ ADVERSE EFFECTS: Among the most serious adverse reactions are severe GI distress including diarrhea with blood, bone marrow depression, peripheral neuritis, liver dysfunction, and alopecia. It is in pregnancy category D.

cold [AS, *kald*], **1.** *adj,* the absence of heat. **2.** *n,* a contagious viral infection of the upper respiratory tract, usually caused by a strain of rhinovirus. It is characterized by rhinitis, tearing, low-grade fever, and malaise and is treated symptomatically with rest, mild analgesia, decongestants, and increased fluid intake. Also called **common cold. 3.** *adj,* a distant method of relating; not friendly.

COLD /kōld/, abbreviation for *chronic obstructive lung disease*. See **chronic obstructive pulmonary disease.**

cold abscess, an abscess that does not show common signs of heat, redness, and swelling. See also **abscess.**

cold agglutinin, a nonspecific antibody, found on the surface of red blood cells in certain diseases, that may cause clumping of the cells at temperatures below 36° C and may cause hemolysis. The phenomenon does not occur at body temperature. Mycoplasma pneumonia, infectious mononucleosis, and many lymphoproliferative disorders are associated with cold agglutinins.

cold agglutinin disease [AS, *kald* + L, *agglutinare,* to glue, *dis,* without; Fr, *aise,* ease], a disorder characterized by autoantibodies that agglutinate red blood cells at below normal body temperatures. They occur in the sera of patients with mycoplasmal pneumonia.

cold bath, a bath in which the water temperature is approximately 50° F (10° C) to 65° F (18° C), used primarily to reduce body temperature.

cold-blooded, unable to regulate body heat. Fish, reptiles, and amphibians, which have internal temperatures that are close to the temperatures of the environments in which they live, are cold-blooded. Also called **poikilothermic.** Compare **warm-blooded.**

cold caloric irrigation, a procedure for testing the integrity of brainstem function. It is carried out by irrigating the external auditory canal of the patient with a cold saline solution while the head is flexed at approximately 30 degrees, after checking the patency of the ear canal. The stimulus results in jerky but regular eye movements (nystagmus) in a normal patient. Absence of the reaction may be a sign of a lesion at the pontine level of the brainstem.

cold cautery. See **cryocautery.**

cold compress [AS, *kald* + L, *comprimere,* to press together], a pad of damp, thickly folded, soft absorbent cloth, dipped into cold water, wrung out, and applied to a body part for the relief of pain or reduction of inflammation or as a comfort measure.

cold-curing resin. See **self-curing resin.**

cold environment, a human environment arbitrarily designated as one in which the temperature is below 10° C (50° F). Nearly two thirds of the world population, including most of North America, Europe, and Asia north of the Indian subcontinent, live in a naturally cold environment for at least a part of each year. The human body generally begins to experience some functional impairment when unprotected in temperatures below 15° C (59° F). The hands and fingers lose sensitivity, and the risk of errors and accidents increases. The body's hemostatic mechanism reacts with vasoconstriction, reducing heat loss to the environment but cooling the skin with a resultant chilling of the extremities. When vasoconstriction no longer eases the thermal strain between the skin and the environment, muscular hypertonus and shivering become mechanisms for maintaining body temperature.

cold hemoglobinuria. See **hemoglobinuria.**

cold injury, any of several abnormal and often serious physical conditions caused by exposure to cold temperatures. See also **chilblain, frostbite, hypothermia, immersion foot.**

cold mist tent. See **Croupette.**

cold pack [AS, *kald;* ME, *pakke*], a method of lowering body temperature by wrapping the patient in a blanket or sheet that has been dipped into cold water and wrung out. It is generally no longer done.

cold-pressor test, a test for the tendency to develop essential hypertension. One hand of the individual is immersed in ice water for about 60 seconds. An excessive rise in the blood pressure or an unusual delay in the return of normal blood pressure when the hand is removed from the water is believed to indicate that the individual is at risk for hypertension.

cold-sensitive mutation, a genetic alteration resulting in a gene that functions only at high temperature.

cold sore. See **herpes simplex.**

cold stress. See **hypothermia.**

cold ulcer, a small gangrenous ulceration on an extremity caused by poor circulation.

cold urticaria [AS, *kald* + L, *urtica,* nettle], wheals caused by exposure to cold temperatures. Compare **cholinergic urticaria.**

cold-wet-sheet pack, a form of somatic therapy for agitated patients. The patient is swathed in cold, wet sheets, which are then warmed by body heat. The warmth and immobilization are reported to be soothing to very agitated patients.

colectomy /kəlek′təmē/ [Gk, *kolon,* colon, *ektomē,* excision], surgical excision of part or all of the colon, performed to treat cancer of the colon, diverticulitis, or severe chronic ulcerative colitis. For several days before surgery a low-residue diet is prescribed. Antibiotics, bowel-cleansing enemas, or an oral bowel preparation solution are given to reduce the number of bacteria in the bowel. Parenteral fluids and electrolytes are given, and a nasogastric tube is passed. The nurse gives postoperative care as for any abdominal surgery. The nasogastric tube is connected to suction and remains in place until bowel sounds are heard. See also **abdominal surgery.**

coleotomy /kō′lē·ot′əmē/, a surgical incision into the pericardium or the vagina.

colesevelam /ko′lesev′elam/, a polymer that binds bile acids in the intestine and prevents them from being reabsorbed, resulting in decreased serum levels of total cholesterol, low-density lipoprotein cholesterol (LDL-C), and apolipoprotein B and increased levels of high-density lipoprotein cholesterol. It is administered orally as the hydrochloride salt. It is an adjunctive therapy to reduce elevated LDL-C levels in patients with primary hypercholesterolemia.

Colestid, a trademark for an antihyperlipidemic **(colestipol hydrochloride).**

colestipol hydrochloride /kōles′tipol/, an antihyperlipidemic that acts by sequestering bile acids in the intestine for excretion, thus reducing plasma levels of cholesterol when the liver removes cholesterol to synthesize new bile.

■ INDICATIONS: It is prescribed in the treatment of hypercholesterolemia and xanthoma.

■ CONTRAINDICATIONS: Biliary obstruction or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are skin rash; fecal impaction; and a deficiency of vitamins A, D, and K.

colfosceril /kolfos′eril/, a synthetic pulmonary surfactant used as the palmitate ester in combination with tyloxapol and as an alcohol in prophylaxis and treatment of neonatal respiratory distress syndrome, instilled into the endotracheal tube for intratracheal administration.

colic /kol′ik/ [Gk, *kolikos,* colon pain], **1.** *n,* sharp visceral pain resulting from torsion, obstruction, or smooth muscle spasm of a hollow or tubular organ, such as a ureter or the intestines. Kinds of colic include **biliary colic, infantile colic,** and **renal colic. 2.** *adj,* pertaining to the colon. **—colicky,** *adj.*

colicinogen /kol′isin′əjən/ [*(E.) coli* + L, *caedere,* to kill; Gk, *genein,* to produce], an extrachromosomal segment of DNA in some strains of ***Escherichia coli*** that induces secretion of a colicin, a protein lethal to other strains of the bacterium. Colicins attach to specific receptors on the cell membrane and impair the synthesis of macromolecules or the production of energy. Also called **colicinogenic factor.**

colicky. See **colic.**

coliform /kol′ifôrm/ [*(E.) coli* + L, *forma,* form], **1.** pertaining to the colon-aerogenes group, or the *Escherichia coli* species of microorganisms, which comprises most of the intestinal flora in humans and other animals. Presence of coliforms is used as a standard indication of water pollution with fecal matter. **2.** having the characteristic of a sieve or cribriform structure, such as some of the porous bones of the skull.

colistimethate sodium /kō′listim′əthāt/, an antibiotic. Also called **colistin sulfomethate sodium.**

■ INDICATIONS: It is prescribed in the treatment of GI infections caused by certain gram-negative microorganisms and as a topical medication.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are nephrotoxicity and neurotoxicity.

colistin sulfate /kōlis′tin/, an antibacterial and steroid agent.

■ INDICATIONS: It is prescribed topically in the treatment of infections of the outer ear and systemically for the treatment of serious gram-negative infections and gastroenteritis caused by ***Escherichia coli.***

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

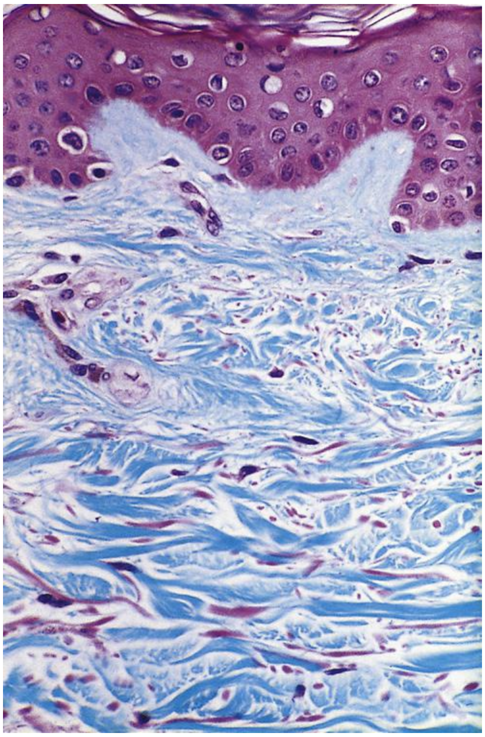
■ ADVERSE EFFECTS: Among the more serious systemic reactions are respiratory arrest, renal toxicity, and neuromuscular blockade.

colistin sulfomethate sodium. See **colistimethate sodium.**

colitis /kōlī′tis/, an inflammatory condition of the large intestine. Inflammatory bowel disease is characterized by severe diarrhea, bleeding, and ulceration of the mucosa of the intestine. Weight loss and pain are significant. Steroids, fluids, electrolytes, antibiotics, and careful attention to diet are the usual modes of therapy. Most of the diseases of this group are of unknown origin. Kinds of inflammatory bowel disease include **Crohn's disease** and **ulcerative colitis.** *—colitic, adj.*

collaborative power structure /kəlab′ərətiv′/, an arrangement whereby adult members of a functional family make major decisions and are in agreement about power distribution.

collagen /kol′əjən/ [Gk, *kolla,* glue, *genein,* to produce], a fibrous insoluble protein consisting of bundles of tiny reticular fibrils that combine to form the white glistening inelastic fibers of the tendons, the ligaments, and the fascia. It is found in connective tissue, including skin, bone, ligaments, and cartilage. It represents 30% of total body protein. **—collagenous,** *adj.*



Collagen *(du Vivier, 1993)*

collagenase /kəlaj′ənās/, a medication applied as an ointment for debridement of decubitus ulcers, burns, and other epidermal lesions. It is also injected into the penis for treatment of Peyronie's disease and into the wrist, ankle, etc. for the treatment of Dupuytren's disease (restricted movement caused by thickening of the fascia). It is an enzyme preparation derived from the fermentation of *Clostridium histolyticum.*

collagen disease, an abnormal condition characterized by extensive disruption of the connective tissue, often involving inflammation and fibrinoid degeneration. Collagen diseases include polyarteritis nodosa, systemic lupus erythematosus, osteoarthritis, and rheumatoid arthritis. See also **collagen vascular disease.**

collagen injection, a reconstructive technique in cosmetic surgery to enhance the lips or fatten sunken facial skin.

collagenoblast /kəlaj′ənōblast′/ [Gk, *kolla* + *genein* + *blastos,* germ], a cell that differentiates from a fibroblast and functions in the formation of collagen. It can also transform into cartilage and bone tissue by metaplasia.

collagenous. See **collagen.**

collagenous colitis /kəlajənəs kolī′tis/, a type of colitis of unknown cause, characterized by deposits of collagenous material beneath the epithelium of the colon, with crampy abdominal pain; marked reduction in fluid and electrolyte absorption, leading to watery diarrhea; and no mucosal ulceration.

collagenous fiber /kəlaj′ənəs/, any one of the tough, white protein fibers that constitute much of the intercellular substance and the connective tissue of the body. Collagenous fibers contain collagen. They are often arranged in bundles that strengthen the tissues in which they are imbedded.

collagen shield, a material derived from porcine scleral tissue, used in promotion of corneal healing. The shield enhances the penetration and effective time of subconjunctival antibiotics and corticosteroids. The collagen shield is designed to dissolve within 12 hours.

collagen vascular disease, any of a group of acquired disorders that have in common diffuse immunological and inflammatory changes in small blood vessels and connective tissue. Common features include arthritis, skin lesions, iritis and episcleritis, pericarditis, pleuritis, subcutaneous nodules, myocarditis, vasculitis, and nephritis. Also often associated are Coombs' test–positive hemolytic anemia, thrombocytopenia, leukopenia, B and T cell abnormalities, antinuclear antibodies, cryoglobulins, rheumatoid factors, false-positive serological test results for syphilis, alterations in serum complement, and immunological abnormalities. The diseases usually included in this category are mixed connective tissue disease, necrotizing vasculitis, and other vasculopathies; polymyositis; relapsing polychondritis; rheumatic fever; rheumatoid arthritis; scleroderma; and systemic lupus erythematosus. The cause of most of these diseases is unknown. Hereditary factors and deficiencies, autoimmunity, environmental antigens, infections, allergies, and antigen-antibody complexes in various combinations are probably involved. Also called **connective tissue disease.**

collapse /kəlaps′/ [L, *collabi,* to fall together], **1.** nontechnical. a state of extreme depression or a condition of complete exhaustion caused by physical or psychosomatic problems. **2.** an abnormal condition characterized by shock. **3.** the abnormal sagging of an organ or the obliteration of its cavity.

collapse of the lung [L, *collabi,* to fall together; AS, *lungen*], a reduction in the volume of a lung. The condition results from increased intrapleural pressure caused by accumulation of air or fluid in the pleural cavity or from a loss of internal pressure and elastic recoil of the lung. See also **atelectasis, hemothorax, pneumothorax.**

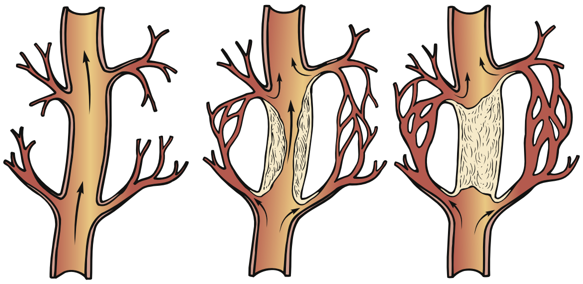
collapsing pulse. See **Corrigan's pulse.**

collar [L, *collum,* neck], any structure that encircles another, usually around its neck, such as the periosteal bone collars that form around the diaphyses of young bones.

collarbone. See **clavicle.**

collateral /kōlat′ərəl/ [L, *cum,* together with, *lateralis,* side], **1.** secondary or accessory. **2.** (in anatomy) a small branch, such as any one of the arterioles or venules in the body, as in collateral circulation.

collateral circulation [L, *cum* + *latus,* side, *circulare,* to go around], an accessory blood pathway developed through enlargement of secondary vessels after obstruction of a main channel.



Collateral circulation forming around a vessel occlusion *(Lewis et al, 2011)*

collateral fissure, a fissure separating the subcalcarine and subcollateral gyri of the cerebral hemisphere.

collateral innervation, reinnervation of denervated neurons caused by sprouting of uninjured axons in the vicinity.

collateral ligaments of interphalangeal joints of foot, fibrous bands, one on either side of each of the interphalangeal joints of the toes.

collateral ligaments of interphalangeal joints of hand, massive fibrous bands on each side of the interphalangeal joints of the fingers. They are placed diagonally, the proximal ends being near the dorsal, and the distal ends near the palmar margins of the digits.

collateral ligaments of the metacarpophalangeal joints, massive, strong fibrous bands on either side of each metacarpophalangeal joint, holding the two bones involved in each joint firmly together.

collateral ligaments of the metatarsophalangeal joints, strong fibrous bands on either side of each metatarsophalangeal joint, holding the two bones involved in each joint firmly together.

collateral pulp canal, a branch of a tooth's pulp canal that emerges from the root at a place other than the apex. Also called **branching canal.** Compare **accessory root canal.**

collateral ventilation, the ventilation of alveoli in the lungs through indirect pathways, such as Kohn's pores in alveolar septa or anastomosing bronchioles.

collateral vessel [L, *cum* + *latus,* side, *vascellum,* small vase], a branch of an artery or vein used as an accessory to the blood vessel from which it arises.

collecting system, a group of renal calices and its pelvis considered as a unit.

collecting tubule [L, *colligere,* to gather, *tubulus,* small tube], any one of the many relatively straight tubules of the kidney that funnel urine into papillary ducts in the renal pelvis. The small collecting tubules play an important role in maintaining the fluid balance of the body by allowing water to osmose through their membranes into the interstitial fluid in the renal medulla. Antidiuretic hormone in the blood makes the collecting tubules permeable to water. If no antidiuretic hormone is present in the blood, membranes of the collecting tubules are practically impermeable to water. See also **Bowman's capsule, kidney.**

collective bargaining /kəlek′tiv/, the use of collective action by employees in negotiating working conditions and economic issues with their employer.

collective hysteria. See **major hysteria.**

collective unconscious [L, *colligere,* to gather; AS, *un,* not; L, *conscious,* aware], (in analytic psychology) that portion of the unconscious common to all humans. Also called **racial unconscious.** See also **analytic psychology.**

collector, (in medicine) a device with various modifications, used for gathering secretions from the bronchi and esophagus for bacteriological and cytological examination.

college [L, *collegium,* society], **1.** an institution of higher learning. **2.** an organization of individuals with common professional training and interests, as the American College of Nurse-Midwives, the American College of Cardiology, or the American College of Surgeons.

College of American Pathologists (CAP), a national professional organization of physicians who specialize in pathology.

Colles' fascia /kol′ēz/ [Abraham Colles, Irish surgeon, 1773–1843; L, band], the deep inner layer of the subcutaneous, superficial fascia of the perineum, constituting a distinctive structure in the urogenital region of the body. It is a strong, smooth sheet of tissue containing elastic fibers that give it a characteristic yellow tint.

Colles' fracture [Abraham Colles], a break in or near the distal radius within 1 inch of the joint of the wrist, which causes displacement of the hand to a dorsal and lateral position. Also called **silver-fork fracture.**

colligative /kol′igā′tiv/ [L, *colligere,* to gather], (in physical chemistry) pertaining to those properties of matter (especially solutions) that depend on the numbers of particles, such as molecules and ions, rather than the chemical identity of any one particle. Colligative properties of solutions include boiling point, freezing point, vapor, pressure, and osmotic pressure.

collimate [L, *collineare,* to align], to make parallel.

collimator /kol′imā′tər/ [L, *collinare,* to bring into alignment], a device for limiting the size and shape of a radiation beam. It is used to reduce scatter radiation, thereby decreasing the patient dose needed and increasing radiographic quality.

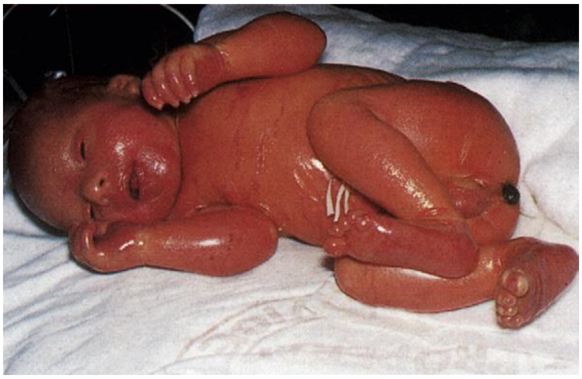
colliquation /kol′ikwā′shən/ [L, *cum,* together with, *liquifacere,* to make liquid], **1.** the degeneration of a body tissue to a liquid state, usually associated with necrotic tissue. **2.** abnormal discharge of a body fluid.

colliquative /kol′ikwā′tiv/, characterized by a profuse fluid discharge, as in suppurating wounds and body structures that are infected.

collision tumor /kəlizh′ən/ [L, *cum,* together with, *laedere,* to strike], a tumor formed when two separate growths, developing close to each other, join. See also **carcinoma.**

collodion /kəlō′dē·ən/ [Gk, *kolla,* glue, *eidos,* form], a clear or a slightly opaque, highly inflammable liquid composed of pyroxylin, ether, and alcohol. It dries to a strong, transparent film that is used as a surgical dressing.

collodion baby, an infant whose skin at birth is covered with a scaly, parchmentlike membrane. See also **harlequin fetus, lamellar exfoliation.**



Collodion baby

(Graham-Brown and Bourke, 2007/Courtesy Dr. D.A. Burns)

colloid /kol′oid/ [Gk, *kolla,* glue, *eidos,* form], a state or division of matter in which large molecules or aggregates of molecules (1 to 100 nm in size) do not precipitate and are dispersed in another medium. In a suspension colloid the particles are insoluble and the medium may be solid, liquid, or gas. In an emulsion colloid the particles are usually water, and the medium is any of several complex hydrophilic, organic substances that become evenly dispersed among the particles of water. Compare **solution, suspension.**

colloidal solution /koloi′dəl/ [Gk, *kolla,* glue, *eidos,* form; L, *solutus,* dissolved], a solution in which small particles, such as large polymeric molecules, are homogenously dispersed through a liquid medium. See also **colloid.**

colloidal sulfur, a form of very finely divided sulfur that is used in the treatment of acne and other skin disorders.

colloid bath, a bath taken in water that contains such substances as bran, gelatin, and starch, used to relieve irritation and inflammation. See also **emollient bath.**

colloid chemistry, the science dealing with the composition and nature of chemical colloids.

colloid corpuscle, a starchlike body of little pathological significance found in the nervous tissue, prostate, and pulmonary alveoli. Also called **corpus amylaceum.** See also **amyloid.**

colloid cyst [Gk, *kolla,* glue, *eidos,* form, *kystis,* bag], **1.** a thyroid gland follicle distended with thyroid secretion. **2.** a cyst in the third ventricle, leading to hydrocephalus. **3.** a cyst with gelatinous contents.

colloid osmotic pressure. See **oncotic pressure.**

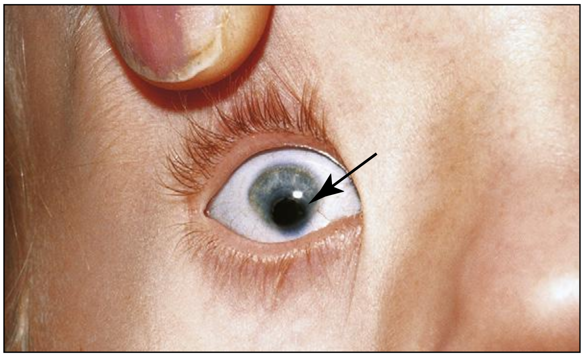
colloid substance, a jellylike substance formed in the deterioration of the protoplasm of tissues.

colloid suspension [Gk, *kolla,* glue, *eidos,* form; L, *suspendere,* to hang], a system of solids dispersed in a liquid medium, with particles generally smaller than 100 nm.

collum /kol′əm/, the anatomical necklike structure between the head and shoulders.

collyrium /kolir′ē·əm/, an eyewash or an ophthalmic liquid containing medications to be instilled into the eye.

coloboma /kol′əbō′mə/ *pl. colobomas, colobomata* [Gk, *koloboma,* defect], a congenital or pathological defect in the ocular tissue of the body, usually affecting the iris, ciliary body, or choroid by forming a cleft that extends inferiorly. Colobomas are usually the result of the failure of part of the fetal fissure to close. —*colobomatous, adj.*

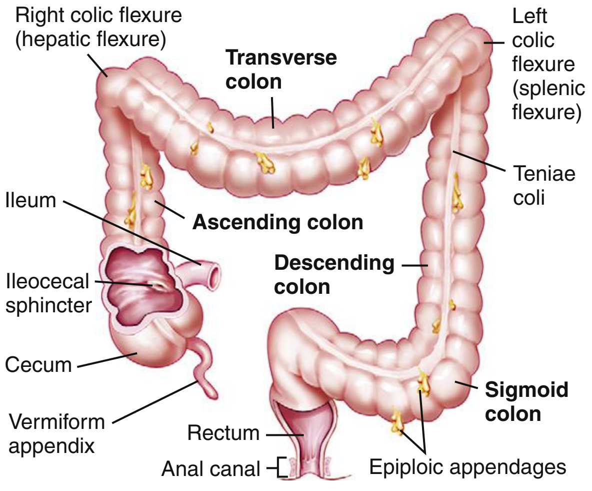


Coloboma *(David and Hoyt, 2005)*

coloenteritis. See **enterocolitis.**

colon /kō′lən/ [Gk, *kolon*], the portion of the large intestine extending from the cecum to the rectum. It has four segments: the ascending colon, transverse colon, descending colon, and sigmoid colon. —**colonic** /kəlon′ik/, *adj.*

colon hydrotherapy, an extended and more complete form of an enema as well as a method of removing waste from the large intestine without using drugs. Colon hydrotherapy is used to treat constipation or impaction, as preparation for diagnostic studies of the large intestine (barium enema, sigmoidoscopy, or colonoscopy), and as preparation before or after surgery. The procedure is also used for bowel training for paraplegics or tetraplegics, those with arthritis,



Colon

and patients who have suspected autointoxication or intestinal toxemia.

colonic. See **colon.**

-colonic /kōlon′ik/, suffix meaning "relating to the colon": *pericolonic, rectocolonic, vesicocolonic*.

colonic fistula [Gk, *kolon* + L, pipe], an abnormal passage from the colon to the surface of the body or an internal organ or structure. In regional enteritis chronic inflammation may lead to the formation of a fistula between two adjacent loops of bowel. An external opening from the colon to the surface of the abdomen may be created surgically after the removal of a malignant or severely ulcerated segment of the bowel. See also **colostomy.**

colonic intussusception, intussusception involving two segments of the colon; telescoping of the colon. One section of the colon tunnels over the adjacent section, resulting in bowel obstruction.

colonic irrigation, a procedure for washing the inner wall of the colon by filling it with water, then draining it. It is not considered an enema, but rather a technique for removing any material that may be present high in the colon.

colonic volvulus, volvulus or spasmodic contraction involving any portion of the colon, causing colic. The most common types are cecal volvulus, sigmoid volvulus, and transverse colon volvulus.

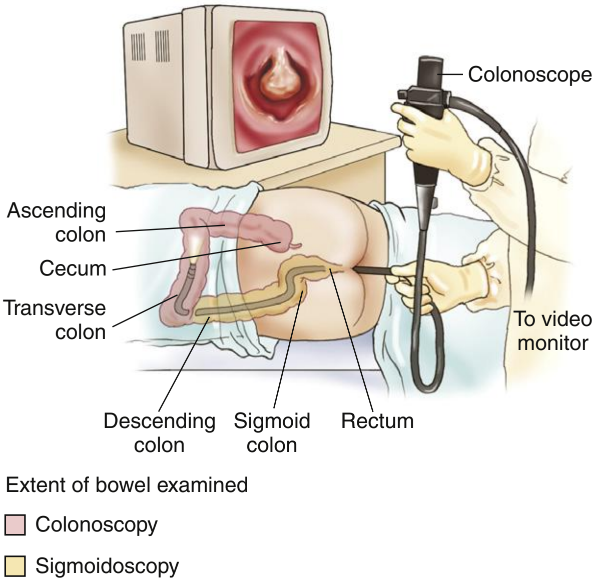
colonization /kol′ənīzā′shən/, **1.** the invasion of a new habitat by a new species. **2.** the presence and multiplication of microorganisms without tissue invasion or damage. The colonies develop when a bacterial cell begins reproducing.

colono-, combining form meaning the "part of the large intestine between the cecum and rectum": *cecocolon, colonoscope*.

colonography /ko′lonog′rah-fe/, imaging of the colon, as by computed tomography or magnetic resonance imaging.

colonoscope /kō′lənōskōp′/ [Gk, *kolon* + *skopein,* to watch], a long, flexible endoscope, usually fiberoptic, that permits examination of the interior of the entire colon. See also **endoscope.**

colonoscopy /kō′lənos′kəpē/, the examination of the mucosal lining of the colon by using a colonoscope, an elongated endoscope. It requires the cleansing of the client's large intestine, clear liquids the evening before the exam, and nothing by mouth after midnight. The client is usually sedated with IV medication and is placed in a state of twilight sleep.



Colonoscopy *(White and Klein, 1991)*

colon stasis. See **atonic constipation.**

colony /kol′ənē/ [L, *colonia*], **1.** (in bacteriology) a mass of microorganisms in a culture that originates from a single cell. Some kinds of colonies, according to different configurations, are smooth colonies, rough colonies, and dwarf colonies. **2.** (in cell biology) a mass of cells in a culture or in certain experimental tissues, such as a spleen colony.

colony counter, a device used for counting colonies of bacteria growing in a culture. It usually consists of an illuminated, transparent plate divided into sections of known area. Petri dishes containing colonies of bacteria are placed over the plate, and the colonies are counted according to the number within the areas viewed.

colony-stimulating factor (CSF), a growth factor that allows cells to pass a restriction point in their reproductive cycle. It is no longer needed after cells have entered the DNA synthesis phase.

coloproctectomy /kō′ləproktek′təmē/, surgical removal of the colon and rectum.

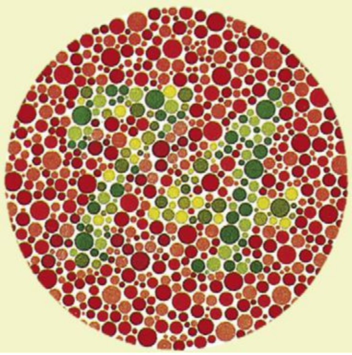
coloproctitis /kō′ləpraktī′tis/, an inflammation of both the colon and rectum. Also called **colorectitis, rectocolitis.**

coloptosis /kō′lōptō′sis/ [Gk, *kolon* + *ptosis*, fall], the prolapse or downward displacement of the colon, especially of the transverse portion.

-color, suffix meaning "hue or hues": *cuticolor, tricolor, versicolor.*

Colorado tick fever, a relatively mild, self-limited arbovirus infection transmitted to humans by the bite of the wood tick *Dermacentor andersoni*. It is endemic in the mountainous regions above 5000 feet in the western United States and Canada and is most prevalent in the spring and summer months. The virus has been isolated from *D. andersoni* ticks in Alberta and British Columbia. It occurs most frequently in those with recreational or occupational exposure (hiking or fishing) in enzootic loci. Symptoms, which appear 3 to 6 days after the tick bite, occur in two phases separated by a period of remission and include chills, fever, and headache; pain in the eyes, legs, and back; and sensitivity to light. Treatment is supportive; analgesics can be given for headache and other pains. Also called **American mountain fever, mountain fever, mountain tick fever.** Compare **Rocky Mountain spotted fever.**

color blindness [L, color; AS *blint*], an abnormal condition characterized by an inability to distinguish colors of the spectrum clearly. In most cases it is not a blindness but a weakness in perceiving colors distinctly. There are two forms of color blindness: **Daltonism,** the more common form, is characterized by an inability to distinguish reds from greens. It is an inherited, sex-linked disorder. **Total color blindness,** or **achromatic vision,** is characterized by an inability to perceive any color at all. Only white, gray, and black are seen. It may be the result of a defect in or absence of the cones in the retina. Also spelled **colour blindness.**

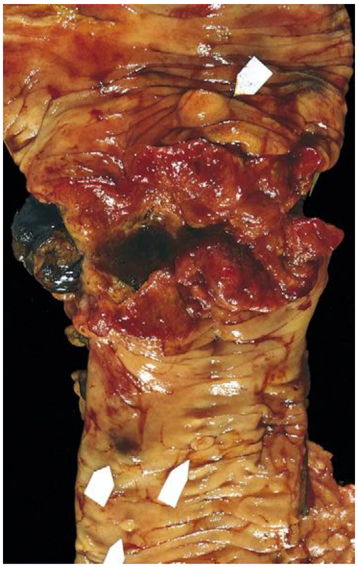


Color blindness chart *(Courtesy S. Ishihara, Washington University Department of Ophthalmology)*

color dysnomia /disnō′mē·ə/ [L, color; Gk, *dys*, difficult, *onoma*, name], an inability to name colors despite an ability to match and distinguish them. It may be caused by expressive dysphasia.

colorectal /kō′lōrek′təl/ [Gk, *kolon*, colon + L, *rectus*, straight], pertaining to or affecting the colon and rectum.

colorectal cancer /kō′lərek′təl/ [Gk, *kolon*, colon; L, *rectus*, straight], a malignant neoplastic disease of the large intestine, characterized by a change in bowel habits; the passing of blood (melena), which may be occult initially; and anemias. Malignant tumors of the large bowel usually occur after 50 years of age, are slightly more frequent in women than in men, and are common in the Western world. They are rare in children. Inherited syndromes (FAP, HNPCC) significantly increase the risk of colorectal cancer. The risk of large bowel cancer is also increased in patients with chronic ulcerative colitis, villous adenomas, and especially familial adenomatous polyposis of the colon. 75% of all colorectal cancers have no known predisposing factors, but people who have a high-fat diet and low activity levels may be more likely than others to have this cancer. In the vermiform appendix, carcinoid is the most common tumor. Most lesions of the large bowel are adenocarcinomas. These tumors have a long preinvasive stage, and, when they invade, they tend to grow slowly. Rectal tumors may cause pain, bleeding, and a feeling of incomplete evacuation. They may metastasize slowly through lymphatic channels and veins and occasionally prolapse through the anus. Typical napkin ring tumors in the sigmoid and descending colon grow circumferentially and constrict the intestinal lumen, causing partial obstruction and production of flat or pencil-shaped stools. Manifestations include progressive abdominal distension, pain, vomiting, constipation, cramps, and bright red blood on the stool's surface. Malignant lesions in the ascending colon are usually large growths that may be palpable on physical examination; they generally cause severe anemia and nausea. There may be dark red or mahogany-colored blood mixed with the stool. The diagnosis of colorectal cancer is based on digital rectal examination, testing for blood in the stool, proctosigmoidoscopic examination of the sigmoid, and x-ray studies of the GI tract. Colonoscopy is the definitive test for colorectal cancer. Suspicious polyps may be removed for histological study, often through a sigmoidoscope or colonoscope or by laparotomy. Surgical treatment of colorectal cancer may involve a wide resection of the lesion, the surrounding colon, and the attached tissues. Tumors of the rectum may require removal of the entire rectum by abdominoperineal resection and the creation of a permanent colostomy. Chemotherapy and irradiation may be administered as palliative therapy or adjuvant treatment. Nursing care of the patient after a diagnosis of colorectal cancer focuses on coping with a possible loss of or alteration in body function.



Colorectal cancer *(Kumar et al, 2007)*

colorectitis. See **coloproctitis.**

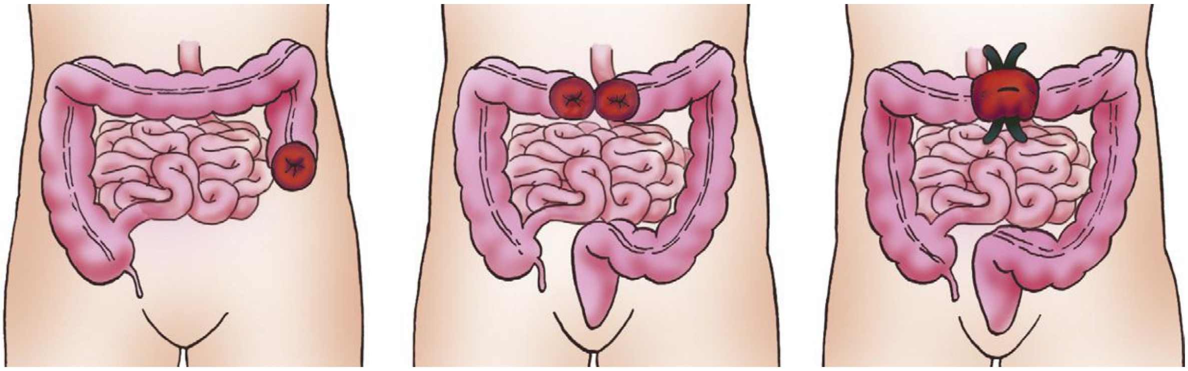
colorimetry /kol′ərim′ətrē/, measurement of the intensity of color in a fluid or substance as compared with that in a standard solution. See also **spectrophotometry.**

color therapy, the therapeutic use of light of specific colors. It encompasses a number of methods used in complementary medicine, including the direction of light of specific colors at the chakras associated with the colors, the stimulation of acupoints, and the use of light of specific wavelengths to facilitate healing. Color therapy is often employed as a complementary treatment for seasonal affective disorder, depression, and stress.

color vision, a recognition of color as the result of changes in the pigments of the cones in the retina that react to varying intensities of red, green, and blue light. The exact mechanisms of color vision are not completely understood, but some experts believe they depend on three specialized types of cones, each type responding to red, green, or blue light. Some retinal cones respond to the entire visual spectrum. See also **color blindness.**

colosigmoidoscopy /kō′ləsig′moidos′kəpē/ [Gk, *kolon* + *sigma*, S-shaped, *eidos*, form, *skopein*, to look], the direct examination of the sigmoid portion of the colon with a sigmoidoscope.

colostomate /kəlos′təmāt/ [Gk, *kolon* + *stoma*, mouth; L, *atum*, one acted upon], a person who has undergone a colostomy.



Single-barrel Double-barrel Loop

Types of colostomies *(Black and Hawks, 2009)*

colostomy /kəlos′təmē/ [Gk, *kolon* + *stoma,* mouth], surgical creation of an artificial anus on the abdominal wall by incising the colon and bringing it out to the surface, performed for cancer of the colon, benign obstructive tumors, and severe abdominal wounds. A colostomy may be single-barreled, with one opening, or double-barreled, with distal and proximal loops opening onto the abdomen. The latter is performed for complete blockage of the lower bowel or in paraplegia to simplify daily management. A temporary colostomy may be done to divert feces after surgery, as in the repair of Hirschsprung's disease, or from an inflamed area; it is repaired when the colon has healed or the inflammation subsides. Preoperative nursing care focuses on teaching the patient what to expect after surgery. A high-calorie, clear liquid diet is given. An antibiotic, usually neomycin, is prescribed to reduce the bacterial count in the bowel, and bowel-cleansing methods are used. Immediate postoperative care is the same as for abdominal surgery. The color of the stoma is checked: a dark blue-black (rather than bright red) indicates a circulation block, and the surgeon is notified. If needed, saline irrigations are begun on the fourth or fifth day. A type of colostomy is **loop colostomy.** Compare **enterostomy.**

colostomy irrigation, a procedure used by colostomates to clear the bowel of fecal matter and to help establish an evacuation schedule.

■ METHOD: Daily irrigation may be ordered beginning 7 to 10 days after the surgery, and the patient is involved in assisting in the procedure as soon as possible. In preparation for self-care, the technique is explained in a step-by-step manner, and irrigation is carried out with the equipment the patient will use at home. In the hospital the procedure is performed as the patient sits in bed in a semi- or high-Fowler's position or on a commode, if ambulatory. At home the individual will probably find a toilet more convenient. A flexible catheter, lubricated with water-soluble lubricant, is gently inserted into the stoma to a depth of no more than 3 inches; the catheter tip is advanced only as far as it will go easily and is never forced. A cone tip on the tubing controls the depth of insertion and prevents water from coming out of the stoma. An irrigating bag containing 500 to 1000 mL of warm solution is held 12 to 18 inches above the stoma, and the fluid is allowed to flow slowly into the colon. If the patient complains of cramps, the catheter is clamped for a few minutes before the flow is resumed. The fluid is retained for several minutes and then drained through outlet tubing into a basin or commode. From 30 to 45 minutes is allowed for draining; if the return is slow, the patient is asked to lean forward or move from side to side; the abdomen may be massaged. The character and amount of the return flow are noted. The peristomal skin is cleaned, rinsed, and dried well. A dehydrated patient may retain some fluid.

■ INTERVENTIONS: The nurse performs and teaches colostomy irrigation and ensures that the patient knows how to carry out the procedure correctly and where to purchase the necessary equipment. The person is urged to report any symptoms of obstruction or prolapse of the stoma. A home nurse is available in many areas for home visits if help is needed.

■ OUTCOME CRITERIA: Many colostomates establish a regular schedule of evacuation with irrigation; but the procedure may be unsatisfactory for those who have a liquid or semisoft fecal stream, for patients who before the operation had a tendency to experience diarrhea under stress, or for patients with irregular bowel habits.

colostrum /kəlos′trəm/ [L, first milk after birth], the fluid secreted by the breast during pregnancy and the first days after the delivery before lactation begins. It consists of immunologically active substances (maternal antibodies) and white blood cells, water, protein, fat, minerals, vitamins, and carbohydrate in a thin, yellow serous fluid. Compare **breast milk.**

colotomy /kōlot′əmē/, a surgical incision into the colon, usually performed through the abdominal wall.

colour blindness. See **color blindness.**

***Colour Index* (CI),** a publication of dyers, colorists, and textile chemists that specifies all the standard industrial pigments and stains according to five-digit numbers associated with chemical coloring materials. For example, methylene blue is assigned number 52015.

colovaginal /kō′lōvaj′inəl/ [Gk, *kolon,* colon; L, *vagina,* sheath], pertaining to the colon and vagina, or to a communication between the two structures.

colovesical fistula, a fistula connecting the colon and the urinary bladder. Also called *vesicocolonic fistula*.

colp-. See **colpo-.**

colpalgia /kolpal′jə/, a pain in the vagina.

colpectomy /kolpek′təmē/, the surgical excision of the vagina.

colpitis /kolpī′tis/, an inflammation of the vagina.

colpo-, colp-, kolpo-, kysth-, kystho-, combining form meaning "vagina": *colpocele, colpocystitis, colpodynia*.

colpocystitis /kol′pōsistī′tis/, an inflammation of the vagina and urinary bladder.

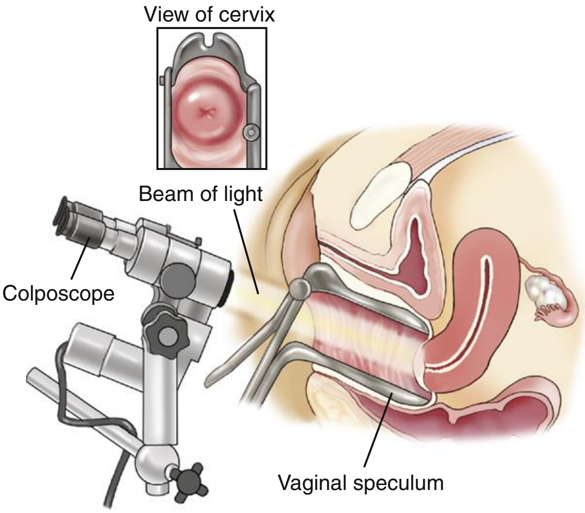
colpocystocele /kol′pəsis′təsēl/, the prolapse of the urinary bladder into the vagina, usually through the anterior vaginal wall.

colpohysterectomy /-his′tərek′təmē/ [Gk, *kolpos*, vagina, *hystera*, womb, *ektomē*, excision], vaginal hysterectomy. See also **hysterectomy.**

colporrhaphy /kolpôr′əfē/ [Gk, *kolpos* + *raphe*, suture], a surgical procedure in which the vagina is sutured to narrow it.

colposcope /kol′pəskōp/, a lighted instrument with lenses for direct examination of the surfaces of the vagina and cervix.

colposcopy /kolpos′kəpē/ [Gk, *kolpos* + *skopein*, to watch], an examination of the vagina and cervix with an optical magnifying instrument (colposcope). It is commonly performed after an abnormal Papanicolaou (Pap) smear to diagnose cervical dysplasia and to obtain biopsy specimens of the cervix.



Colposcopy *(Leonard, 2009)*

colposuspension /kol′posuspen′shun/, bladder neck suspension.

colpotomy /kolpot′əmē/ [Gk, *kolpos* + *temnein*, to cut], any surgical incision into the wall of the vagina.

columbium. See **niobium.**

columella, **1.** a small column. **2.** the fleshy terminal portion of the nasal septum.

column, any elongated, cylindrical anatomical structure. It is usually oriented vertically and may provide structural support.

columna posterior. See **posterior horn.**

columnar cell /kəlum′nər/ [L, *columna*, column, *cella*, storeroom], an epithelial cell that appears long and narrow when sectioned along its long axis.

columnar epithelium [L, *columna*, column; Gk, *epi*, upon, *thele*, nipple], a type of epithelial cell that resembles a hexagonal prism.

column chromatography [L, *columna* + Gk, *chroma*, color, *graphein* to record], the process of separating and analyzing a group of substances according to the differences in their absorption affinities for a given absorbent as evidenced by pigments deposited during filtration through the same absorbent contained in a glass cylinder or tube. The substances are dissolved in a liquid that is passed through the absorbent. The absorbates move down the column at different rates and leave behind a band of pigments that is subsequently washed with a pure solvent to develop discrete pigmented bands that constitute a chromatograph. The cylinder of absorbent is then pushed from the tube, and the individual bands are either separated with a knife or further diluted with the pure solvent and collected in the bottom of the tube for analysis. Effective column chromatography depends on the selection of the appropriate absorbent and solvent and a flow rate that is slow enough to allow complete diffusion of the absorbates from the solvent to the absorbent and the retardation of the absorbates according to their different affinities for the absorbent. Compare **gas chromatography, ion exchange chromatography.**

Coly-Mycin M, a trademark for a parenteral antibacterial **(colistimethate sodium).**

Coly-Mycin S, a trademark for an otic steroid and antibiotic combination containing hydrocortisone, neomycin, and colistin.

com-. See **co-.**

coma /kō′mə/ [Gk, *koma*, deep sleep], a state of profound unconsciousness, characterized by the absence of spontaneous eye openings, response to painful stimuli, and vocalization. The person cannot be aroused. Coma may be the result of trauma, space-occupying brain tumor, hematoma, cerebral edema, toxic metabolic condition, acute infectious disease with encephalitis, vascular disease, or brain ischemia. See also **Glasgow Coma Scale, unconscious.**

-coma, **1.** suffix meaning “(condition of) profound unconsciousness”: *narcoma, semicoma*. **2.** suffix meaning “(condition of) torpor”: *agrypnocoma*.

comatose /kō′mətōs/, pertaining to a state of coma, or abnormally deep sleep, caused by illness or injury.

combat fatigue [L, *com*, together, *batture*, to beat, *fatigare*, to tire], any of a variety of psychological disorders, usually temporary but sometimes permanent, resulting from exhaustion, the stress of combat, or the cumulative emotions and psychological strain of warfare or other traumatic situations. It is characterized by anxiety, depression, irritability, memory and sleep disorders, and various related symptoms. Also called *combat neurosis;* **war neurosis.** See also **posttraumatic stress disorder, shell shock.**

combination chemotherapy /kom′binā′shən/, the simultaneous use of two or more anticancer drugs.

combined anesthesia. See **balanced anesthesia.**

combined carbon dioxide [L, *com*, together, *bini*, twofold], the portion of the total carbon dioxide that is contained in blood carbonate, calculated as the difference between the total and dissolved carbon dioxide.

combined cycling ventilator, a mechanical ventilator that has more than one mechanism to recycle gases, such as equipment that may have time cycling or pressure cycling as a backup to a volume cycling control device.

combined oral contraceptive, an oral contraceptive that includes both an estrogen and a progestogen, which may be administered in either two or three different phases during each menstrual cycle.

combined oxygen, the oxygen that is physically bound to hemoglobin as oxyhemoglobin (HbO_2). One gram-molecular weight of oxygen can combine with 16,700 g of hemoglobin, and each gram of hemoglobin can bind with and carry 1.34 mL of oxygen.

combined patterns, a method of evaluating a patient’s neuromuscular functions through tests that reveal the degree of coordination between movement patterns of the trunk and the extremities.

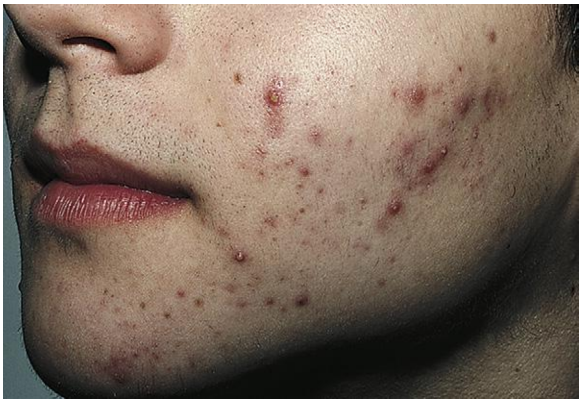
combined system disease, a disorder of the nervous system caused by a deficiency of vitamin B_{12} that results in pernicious anemia and degeneration of the spinal cord and peripheral nerves, marked by increased difficulty in walking, spasticity in lower extremities, a feeling of vibration in the legs, and a loss of sense of position. Also called **subacute combined degeneration of the spinal cord.** See also **cyanocobalamin, pernicious anemia.**

Combitube /kom′bit(y)o͞ob/, a trademark for a double-lumen tube with inflatable balloon cuffs that seal off the hypopharynx from the oropharynx and esophagus, used for airway management. It is inserted blindly, entering either the esophagus or trachea. If it enters the esophagus, one lumen, which has a blind distal end and side holes, functions as an esophageal obturator airway. If it enters the trachea, the other lumen, which has an open distal end, functions as a standard cuffed endotracheal tube.

Combivir /kom′bivir/, a trademark for a combination preparation of the nucleoside analogs **zidovudine** and **lamivudine,** used in treatment of HIV infection and AIDS.

combustion /kəmbus′chen/, the process of burning or oxidation, which may be accompanied by light and heat. Oxygen itself does not burn, but it supports combustion. The rate of combustion is influenced by both oxygen concentration and its partial pressure.

comedo /kom′idō/ *pl.* **comedones** [L, *comedere,* to consume], blackhead (open comedo) or whitehead (closed comedo), the basic lesion of acne vulgaris, caused by an accumulation of keratin and sebum within the opening of a hair follicle. Compare **milium.**



Comedo *(Callen et al, 2000)*

comedocarcinoma /kom′idōkär′sinō′mə/ *pl. comedocarcinomas, comedocarcinomata* [L, *comedere,* to consume; Gk, *karkinos,* crab, *oma,* tumor], a malignant intraductal neoplasm of the breast, in which the central cells degenerate and may be easily expressed from the cut surface of the tumor. Growth confined to the mammary ducts carries a better prognosis than do invasive breast lesions.

comedogenicity /kom′idōjənis′itē/, the ability of certain drugs or agents, such as anabolic steroids, to produce acne comedones.

comedomastitis, mammary duct ectasia.

comedones. See **comedo.**

comet assay. See **single-cell gel electrophoresis.**

comfortable death, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as physical, psychospiritual, sociocultural, and environmental ease with the impending end of life. See also **Nursing Outcomes Classification.**

comfort measure [L, *com,* together, *fortis,* strong], any action taken to promote the soothing of a patient, such as a back rub, a change in position, the prewarming of a stethoscope or bedpan, or administration of selected medications or treatments.

comfort status, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the overall physical, psychospiritual, sociocultural, and environmental ease and safety of an individual. See also **Nursing Outcomes Classification.**

comfort status: environment, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the environmental ease, comfort, and safety of surroundings. See also **Nursing Outcomes Classification.**

comfort status: physical, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the physical ease related to bodily sensations and homeostatic mechanisms. See also **Nursing Outcomes Classification.**

comfort status: psychospiritual, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the psychospiritual ease related to self-concept, emotional well-being, source of inspiration, and meaning and purpose in one's life. See also **Nursing Outcomes Classification.**

comfort status: sociocultural, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the social ease related to interpersonal, family, and societal relationships within a cultural context. See also **Nursing Outcomes Classification.**

comfort zone [ME, *comforten* + Gk, *zone,* belt], the boundaries of temperature, humidity, wind velocity, and solar radiation within which a person dressed in a specified manner can perform certain tasks without discomfort; the psychological feeling of belonging or being comfortable in a specific area and/or role.

comfrey, a perennial herb found in the United States, Australia, and parts of Asia, also cultivated in Japan.

■ USES: It is used for bruises, sprains, broken bones, acne, and boils. It is considered safe and possibly effective when used topically.

■ CONTRAINDICATIONS: Medicinal teas of comfrey are considered unsafe. Use of topical comfrey is not recommended during pregnancy and lactation, in children, and in those who are hypersensitive to this product. Internal use may cause fatal hepatotoxicity. It should not be used for more than 6 weeks or topically on broken skin.

Comfrey leaf *(Auerbach, 2012)*

comitant strabismus. See **concomitant strabismus.**

Comité International des Poids et Mesures (CIPM) /kômitā′aNternäsyōnäl′dāpô·ä′āmesYr′/, a group of scientists who meet periodically to define the international (SI) units of physical quantities, such as the volume of a liter, the length of a meter, or the precise amount of time in a minute. See also **SI units.**

-comma, suffix meaning a "piece of a structure or to cut off a piece": *inocomma, myocomma, osteocomma.*

command [L, *commendare,* to protect], an order given to the computer to execute a specific instruction, such as a code that evokes a particular program or performs a particular function.

command automatism, a condition characterized by an abnormal mechanical responsiveness to commands, usually followed without critical judgment, such as may be seen in hypnosis and certain psychotic states.

command hallucination, a condition in which individuals hear and sometimes obey voices that command them to perform certain acts. The hallucinations may influence them to engage in behavior that is dangerous to themselves or to others.

commensal /kəmen′səl/ [L, *com,* together, *imensa,* table], (two different species) living together in an arrangement that is not harmful to either and that may be beneficial to both. Some bacteria in the digestive tract of humans aid in the processing of food and produce B vitamins needed for normal health while causing no harm (normal flora). Compare **parasite, synergist.**

commensalism /kəmen′səliz′əm/, a symbiosis in which one species benefits but the other species is neither helped nor harmed.

comminuted /kom′inyo͞o′tid/ [L, *comminuere,* to break into pieces], crushed or broken into a number of pieces.

comminuted fracture, a fracture in which the bone is broken in several places or is shattered, creating numerous fragments. Also called **comminution, fragmented fracture.**

Commission E, a German interdisciplinary regulatory committee, whose function is to review herbal drugs and preparations from medicinal plants and evaluate and approve their safety and efficacy.

Commission on Collegiate Nursing Education (CCNE), an autonomous accrediting agency whose mission includes the assessment and identification of nursing programs that engage in effective educational practices, having a scope of the institutions of higher education in the United States offering nursing programs at the bachelor's, master's and doctor of nursing practice level.

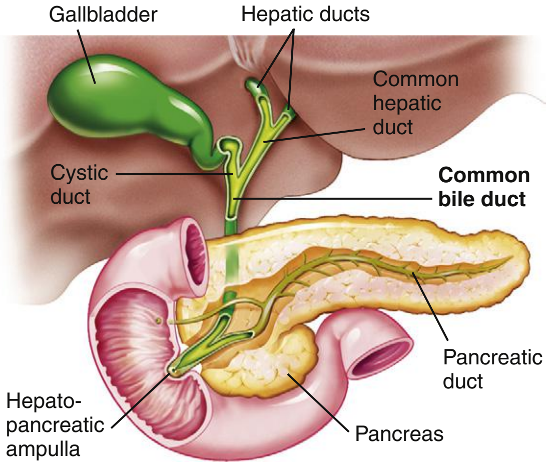
commissure /kom′iso͝or, -syo͝or/, **1.** a band of nerve fiber or other tissue that crosses from one side of the body to the other, usually connecting two structures or masses of tissue. **2.** a site of union of two anatomical parts, as the corner of the eye, lips, or labia.

commissurotomy /kom′isho͝orot′əmē/ [L, *commissura,* a connection; Gk, *temnein,* to cut], the surgical division of a fibrous band or ring connecting corresponding parts of a body structure. A commissurotomy is commonly performed to separate the thickened, adherent leaves of a stenosed mitral valve.

commitment [L, *committere,* to entrust], **1.** the placement or confinement of an individual in a specialized hospital or other institutional facility. See also **institutionalize.** **2.** the legal procedure of admitting a mentally ill person to an institution for psychiatric treatment. The process varies from state to state but usually involves judicial or court action based on medical evidence certifying that the person is mentally ill. See also **certification.** **3.** a pledge or contract to fulfill some obligation or agreement, used especially in some forms of psychotherapy or marriage counseling.

common baldness, androgenetic alopecia, in men called *common male baldness* and in women called *common female baldness.* Hair loss in women may be age-related or hormonal, or it may be associated with genetic predisposition; the hair thins all over the scalp, usually permanently, but the frontal hairline is maintained.

common bile duct [L, *communis,* common, *bilis,* bile, *ducere,* to lead], the duct formed by the juncture of the cystic and hepatic ducts.



Common bile duct

common carotid artery [L, *communis* + Gk, *karos,* heavy sleep, *arteria,* airpipe], one of the major arteries supplying blood to the head and neck. Each divides into an external carotid and an internal carotid. Branches of the external carotid supply the face, scalp, and most of the neck and throat tissues. The internal carotids supply the brain and other tissues generally accessible from within the skull, as the eyes.

common carotid plexus, a network of nerves on the common carotid artery, supplying sympathetic fibers to the head and the neck, with branches that accompany the cranial blood vessels. The common carotid plexus is formed by the internal and external carotid plexuses and by the cervical ganglia of the sympathetic system.

common cold. See **cold.**

common fibular nerve, a nerve originating from the sciatic nerve that gives origin to two cutaneous branches, the sural communicating nerve, which contributes to the innervation of the skin over the lower posterolateral side of the leg, and the lateral sural cutaneous nerve, which innervates the skin over the upper lateral leg. It then continues around the neck of the fibula and enters the lateral compartment, where it divides into the superficial fibular nerve and the deep fibular nerve. The superficial fibular nerve innervates the fibularis longus and brevis and some of the dorsal areas of the foot and toes. The deep fibular nerve innervates the anterior compartment of the leg.

common hepatic artery, the visceral branch of the celiac trunk of the abdominal aorta, passing posterior to the pylorus and dividing into five branches: the gastroduodenal, right gastric, right hepatic, left hepatic, and middle hepatic.

common iliac artery, a division of the abdominal aorta, starting in front of the fourth lumbar vertebra, passing caudally about 5 cm, and dividing into external and internal iliac arteries. The right common iliac artery is somewhat longer than the left.

common iliac node, a node in one of the seven groups of parietal lymph nodes serving the abdomen and the pelvis. They drain the internal and external iliac nodes and pass their materials to the lateral aortic nodes. Compare **external iliac node, iliac circumflex node, internal iliac node.** See also **lymph, lymphatic system, lymph node.**

common iliac vein, one of the two veins that are the sources of the inferior vena cava, formed by the union of the internal and external iliac veins, ventral to the sacroiliac articulation. Each common iliac vein receives the iliolumbar and, in some individuals, the lateral sacral veins. The left common iliac vein also receives the middle sacral vein. Neither of the common iliacs contains valves. Compare **external iliac vein, internal iliac vein.**

common pathway of coagulation, the pathway common to both intrinsic and extrinsic coagulation pathways. Once activated, factor X forms a complex with its cofactor, factor V, to convert prothrombin to thrombin. Thrombin splits peptides from fibrinogen to produce a fibrin clot. See also **extrinsic pathway of coagulation, intrinsic pathway of coagulation.**

common tendinous ring, the thickening of the periorbita around the optic canal and the central part of the superior orbital fissure in the posterior part of the bony orbit. It is the point of origin of the four rectus muscles.

common variable immunodeficiency (CVID), a heterogeneous group of disorders characterized by hypogammaglobulinemia, decreased antibody production in response to antigenic challenge, and recurrent pyogenic infections, and often associated with hematologic and autoimmune disorders. Most patients have normal numbers of circulating B cells that can identify antigens and proliferate, but they lack plasma cells and may have an intrinsic defect of B cell differentiation. Two less common forms are also recognized, one caused by a disorder of T lymphocyte regulation and one caused by production of autoantibodies against T and B lymphocytes.

commotio cordis, damage to the heart, frequently fatal, resulting from a sharp nonpenetrating blow to the adjacent body surface.

commune /kom′yo͞on/, a small community of people who share certain social and economic objectives. Members may also share property ownership and control local political leadership and are committed to the concept of holistic medicine.

communicability period /kəmyo͞o′nəkəbil′itē/, the time during which an infectious agent may be transferred directly or indirectly from an infected person to another person, from an infected animal to humans, or from an infected person to animals, including arthropods. For measles the communicability period ranges from 4 days before the appearance of a rash until 5 days after the onset of symptoms.

communicable /kəmyo͞o′nəkəbəl/ [L, *communis,* common], transmissible by direct or indirect means, as a communicable disease. See also **contagious.**

communicable disease, any disease transmitted from one person or animal to another directly, by contact with excreta or other discharges from the body; indirectly, by means of substances or inanimate objects, such as contaminated drinking glasses, toys, or water; or by means of vectors, such as flies, mosquitoes, ticks, or other insects. Communicable diseases may be caused by bacteria, chlamydia, fungi, parasites, rickettsiae, and viruses. To control a communicable disease, it is important to identify the organism, prevent its spread to the environment, protect others against contamination, and treat the infected person. Many communicable diseases, by law, must be reported to the local health department. Also called **contagious disease.**

Communicable Disease Center, former name of the **Centers for Disease Control and Prevention.**

communicable disease management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as working with a community to decrease and manage the incidence and prevalence of contagious diseases in a specific population. See also **Nursing Interventions Classification.**

communicating hydrocephalus /kəmyo͞o′nikā′ting/ [L, *communicans* + Gk, *hydor,* water, *kephale,* head], a form of hydrocephalus in which there is an increase in cerebrospinal fluid that involves the entire ventricular system and the subarachnoid space. It is caused by an abnormality in the ability to absorb fluid in the subarachnoid space. No obstruction exists in the ventricular pathways.

communication[1] /kəmyo͞o′nikā′shən/ [L, *communis,* common], any process in which a message containing information is transferred, especially from one person to another, by any of a number of media. Communication may be verbal or nonverbal; it may occur directly, such as in a face-to-face conversation or with the observation of a gesture; or it may occur remotely, spanning space and time, such as in writing and reading or in making or playing back of a recording. Communication is basic to all nursing and other health care professions and contributes to the development of all therapeutic relationships. See also **kinesics, therapeutic communication.**

communication[2]**,** a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the reception, interpretation, and expression of spoken, written, and nonverbal messages. See also **Nursing Outcomes Classification.**

communication channels, (in communication theory) any gesture, action, sound, written word, or visual image used in transmitting messages.

communication disorders, a *DSM-IV* classification defined as mental disorders involving difficulties in speech or language, severe enough to be a problem academically, occupationally, or socially. Kinds of disorders include are **expressive language disorder, mixed receptive-expressive language disorder, phonological disorder,** and **stuttering.**

communication enhancement: hearing deficit, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assistance in accepting and learning alternate methods for living with diminished hearing. See also **Nursing Interventions Classification.**

communication enhancement: speech deficit, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assistance in accepting and learning alternate methods for living with impaired speech. See also **Nursing Interventions Classification.**

communication enhancement: visual deficit, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assistance in accepting and learning alternate methods for living with diminished vision. See also **Nursing Interventions Classification.**

communication: expressive, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the expression of meaningful verbal and/or nonverbal messages. See also **Nursing Outcomes Classification.**

communication: receptive, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the

Communicating with patients who have special needs

Patients with difficulty hearing

- Avoid shouting.
- Use simple sentences.
- Punctuate speech with facial expression and gestures.

Patients with difficulty seeing

- Communicate verbally before touching the patient.
- Orient the patient to sounds in the environment.
- Inform the patient when the conversation is over and when you are leaving the room.

Patients who are mute or cannot speak clearly

- Place sign by unit call system to answer call light in person.
- Listen attentively, be patient, and do not interrupt.
- Do not finish patients' sentences for them.

- Ask simple questions that require "yes" or "no" answers.
- Allow time for understanding and responses.
- Use visual cues (e.g., words, pictures, objects) when possible.
- Allow only one person to speak at a time.
- Do not shout or speak too loudly.
- Encourage the client to converse.
- Let the patient know if you do not understand.
- Use communication aids as needed:
  - Pad and felt-tipped pen or Magic Slate
  - Flash cards
  - Communication board with words, letters, or pictures denoting basic needs
  - Computer toy ("speak and spell" type)
  - Call bells or alarms
  - Sign language
  - Use of eye blinks or movement of fingers for simple responses ("yes" or "no")

Patients who are cognitively impaired

- Reduce environmental distractions while conversing.
- Get the patient's attention before speaking.
- Use simple sentences and avoid long explanations.
- Avoid shifting from subject to subject.
- Ask one question at a time.

- Allow time for the client to respond.
- Include family and friends in conversations, especially about subjects known to the patient.

Patients who are unresponsive

- Call the patient by name during interactions.
- Communicate both verbally and by touch.
- Speak to the patient as though he or she could hear.
- Explain all procedures and sensations.

Patients who do not speak English

- Speak to the patient in a normal tone of voice (shouting may be interpreted as anger).
- Establish a method for the client to signal the desire to communicate (call light or bell).
- Provide a professional interpreter/translator as needed:
  - Use a person familiar with the patient's culture and with biomedicine if possible.
  - Allow plenty of time for the interpreter to transmit messages.
  - Communicate directly to the patient and family rather than the interpreter.
  - Ask one question at a time.
  - Avoid making comments to the interpreter about the patient or family (they may understand some English).
- Develop a communication board, pictures, or cards using words translated into English for the patient to make basic requests (e.g., pain medication, water, elimination).
- Have a dictionary (English/Spanish or appropriate) available if the patient can read.

From Potter PA et al: *Basic nursing: essentials for practice,* ed 7, St Louis, 2009, Mosby.

reception and interpretation of verbal and/or nonverbal messages. See also **Nursing Outcomes Classification.**

communication theme, (in psychiatry) a recurrent concept or idea that ties together components of communication. Kinds of communication themes include **content theme,** in which a single concept links varied topics of discussion; **mood theme,** in which the underlying idea is the emotion communicated by the individual; and **interaction theme,** in which a particular idea best describes the dynamics between communicating participants.

communication theory, a hypothesis that describes a model for information transfer consisting of a source of information (the sender), a transmitter, a communication channel, a source of noise (interference), a receiver, and a purpose for the message.

community /kəmyo͞o′nitē/ [L, *communis,* common], **1.** a group of species who reside in a designated geographic area and who share common interests or bonds. **2.** a person's natural environment, that is where the person works, plays, and performs other daily activities.

community-acquired infection, an infection contracted outside of a health care setting or an infection present on admission. Community-acquired infections are often distinguished from nosocomial, or hospital-acquired, diseases by the types of organisms that affect patients who are recovering from a disease or injury. Community-acquired respiratory infections commonly involve strains of ***Haemophilus influenzae*** or ***Streptococcus pneumoniae*** and are usually more antibiotic sensitive.

community competence, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the capacity of a community to collectively problem solve to achieve community goals. See also **Nursing Outcomes Classification.**

Community dental health coordinator, a person designed to assist dentists in improving dental care for patients with limited and no care. A CDHC works with other dental team members under the remote supervision of a dentist, CDHCs will increase access for underserved people by coordinating their dental needs, triaging care based on emergent or urgent needs, and organizing transportation and other logistical or social support as needed. A CDHC is not intended to substitute for dentists in providing clinical care; performs no irreversible procedures; does not diagnose; is part of the dental team; screens patients for emergent, urgent or routine dental care; places temporary restorations after consulting with the supervising dentist.

community disaster preparedness, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparing for an effective response to a large-scale disaster. See also **Nursing Interventions Classification.**

community disaster readiness, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as community preparedness to respond to a natural or man-made calamitous event. See also **Nursing Outcomes Classification.**

community disaster response, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the community response following a natural or man-made calamitous event. See also **Nursing Outcomes Classification.**

community health development, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting members of a community to identify a community's health concerns, mobilize resources, and implement solutions. See also **Nursing Interventions Classification.**

community health nursing, a field of nursing that is a blend of primary health care and nursing practice with public health nursing. The community health nurse conducts a continuing and comprehensive practice that is preventive, curative, and rehabilitative. The philosophy of care is based on the belief that care directed to the individual, the family, and the group contributes to the health care of the population as a whole. The community health nurse is not restricted to the care of a particular age or diagnostic group. Participation of all consumers of health care is encouraged in the development of community activities that contribute to the promotion of, education about, and maintenance of good health. These activities require comprehensive health programs that pay special attention to social and ecological influences and specific populations at risk.

community health status, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the general state of well-being of a community or population. See also **Nursing Outcomes Classification.**

community health status: immunity, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the resistance of community members to the invasion and spread of an infectious agent that could threaten public health. See also **Nursing Outcomes Classification.**

community medicine, a branch of medicine that is concerned with the health of the members of a community, municipality, or region. The emphasis in community medicine is on the early diagnosis of disease, the recognition of environmental and occupational hazards to good health, and the prevention of disease in the community.

community mental health, a treatment philosophy based on the social model of psychiatric care that advocates that a comprehensive range of mental health services be readily accessible to all members of the community.

community mental health center (CMHC), a community-based center that provides comprehensive mental health services, including ambulatory and inpatient care. The specific services to be provided are defined in an act of the U.S. Congress, the Community Mental Health Centers Act; these requirements have been updated periodically. The costs of consultation and educational services, instruction, development, and initial operation of the facility are paid for by the federal government. The organization, management, and operation of CMHCs are also specified by the act. Consumer representation in each of these areas is required.

community mobility, the ability to successfully navigate the geographic, social, and physical environments outside the home environment.

community nurse practitioner (CNP), a nurse who has completed a postbaccalaureate program in community nursing.

community psychiatry, the branch of psychiatry concerned with the development of an adequate and coordinated program of mental health care for residents of specified catchment areas. See also **community mental health center.**

community rating system, a program of health maintenance organizations (HMOs) that uses revenues and membership targets to determine health insurance premium rates. The HMO uses its own history in the calculation of rates, rather than any single employer's risk history. See also **health maintenance organization.**

community reintegration, the return and acceptance of a disabled person as a participating member of the community.

community risk control: chronic disease, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as community actions to reduce the risk of chronic diseases and related complications. See also **Nursing Outcomes Classification.**

community risk control: communicable disease, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as community actions to eliminate or reduce the spread of infectious agents that threaten public health. See also **Nursing Outcomes Classification.**

community risk control: lead exposure, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as community actions to reduce lead exposure and poisoning. See also **Nursing Outcomes Classification.**

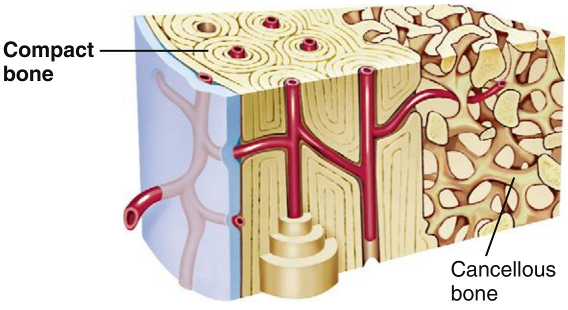
community risk control: violence, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as community actions to eliminate or reduce intentional violent acts resulting in serious physical or psychological harm. See also **Nursing Outcomes Classification.**

community violence level, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the incidence of violent acts compared with local, state, or national values. See also **Nursing Outcomes Classification.**

Comolli's sign /kōmō′lēs/ [Antonio Comolli, Italian pathologist, b. 1879], a triangular swelling corresponding to the shape of the scapula after a fracture of that bone.

comorbidity, two or more coexisting medical conditions or disease processes that are additional to an initial diagnosis.

compact bone /kom′pakt, kompakt′/ [L, *compingere,* to put together], hard, dense bone that is usually found at the periphery of skeletal structures, as distinguished from spongy cancellous bone.



Compact bone

compact disk (CD), an optical disk on which computer data are encoded or on which sound is recorded in a digital format. A CD has a capacity of 650 megabytes of data or 75 minutes of recorded music. Also spelled contact disk.

compact disc/read only memory. See **CD-ROM.**

companion animal, a dog, cat, or other pet that provides health benefits to a person. Companion animals may help relieve stress or serve a more active role, as do guide dogs for blind persons and dogs trained to detect telephone or doorbell sounds for deaf persons or seizures in epileptic persons and signal for help.

companionship /kəmpan′yənship′/ [L, *com,* together, *panis,* food], (in psychiatric nursing) the assignment of a staff member to stay with a disturbed patient to provide support and to protect the patient from self-harm or harm to others. In constant companionship the disturbed patient is accompanied in all activities until the staff member is convinced the patient has regained control.

comparative anatomy /kəmper′ətiv/ [L, *com* + *par,* equal], the study of the morphological characteristics of all living animals. A comparison of the forms indicates a progression on a scale from the simplest to the most highly specialized animals. The adult stage of animals that are lower in the scale resembles the immature stages of many higher-level animals. Compare **applied anatomy.** See also **ontogeny, phylogeny.**

comparative embryology, the study of the similarities and differences among various organisms during the embryological period of development.

comparative genomic hybridization, a cytogenetic technique in which reference DNA and the DNA to be studied, as from a tumor or an embryo, are labeled with green- and red-fluorescing fluorochromes, respectively. Genetic abnormalities are detected by changes in the green-to-red ratio.

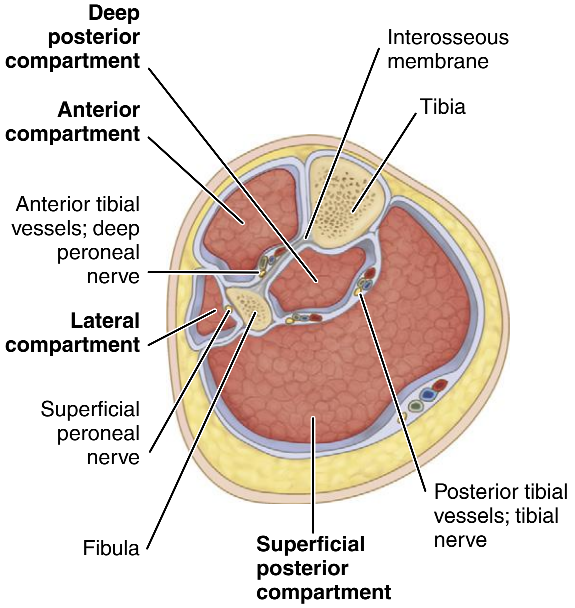
comparative method, the analytic method to which the test method is compared in the comparison-of-methods experiment. This term implies nothing about the quality of the comparative method.

comparative physiology, the study of the similarities and differences of the vital processes found in various species of living organisms to determine fundamental physiological relationships between members of the animal and plant kingdoms.

comparative psychology, **1.** the study of human behavior as it relates to, or differs from, animal behavior. **2.** the study of the psychological and behavioral differences among various peoples.

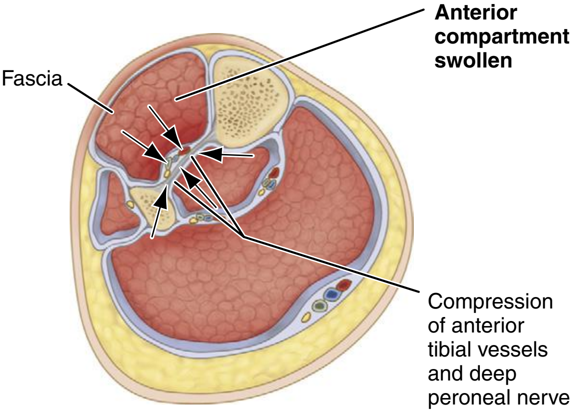
compartment model /kəmpärt′mənt/, a mathematic representation of the body or an area of the body created to study physiological or pharmacological kinetic characteristics. A compartment model can simulate all of the biological processes involved in the kinetic behavior of a drug after it has been introduced into the body, leading to a better understanding of its pharmacodynamic effects. Studies most frequently use one- or two-compartment models. In a one-compartment model the body assumes the characteristics of a homogeneous unit in which an administered drug diffuses instantaneously in the volume of body fluid. In a two-compartment model the body is represented as two distinct compartments, a central and a peripheral compartment, with two separate fluid volumes.

compartment syndrome [L, *com* + *partiri,* to share], **1.** Acute: a pathological condition caused by elevation of tissue pressure within a closed space, resulting in the progressive development of compression and consequent reduction of blood supply. The compression may result from swelling within an overly restrictive dressing or cast or from nonexpansive muscle fascia. Clinical manifestations include swelling, restriction of movement, brown urine, myoglobinuria, vascular compromise, and severe pain or lack of sensation. Severe pain may appear out of proportion to the injury and is one of the earliest manifestations of this emergency situation. It can result in a permanent contracture deformity of the hand or foot, with or without a fracture. In severe cases, it can lead to necrosis and necessitate the amputation of an extremity. Treatment includes elevation, removal of restrictive dressings or casts, and potentially a surgical decompression or open fasciotomy. See also **Volkmann's contracture.** **2.** Chronic: A pathological condition caused by elevation of tissue pressure within a closed space (compartment) during exercise. Clinical manifestations are pain in the affected extremity (usually the lower legs) and occasional numbness. Symptoms are relieved by rest and will recur with renewed exercising. This condition is not a medical emergency and is treated by eliminating the aggravating activities or limited fasciotomy.



Deep posterior compartment
Interosseous membrane
Tibia
Anterior compartment
Anterior tibial vessels; deep peroneal nerve
Lateral compartment
Superficial peroneal nerve
Posterior tibial vessels; tibial nerve
Fibula
Superficial posterior compartment

NORMAL ANATOMY



Anterior compartment swollen
Fascia
Compression of anterior tibial vessels and deep peroneal nerve

ANTERIOR COMPARTMENT SYNDROME

Anterior compartment syndrome *(Black and Hawks, 2009)*

compatibility /kəmpat′əbil′itē/ [L, *compatibilis,* agreeable], **1.** the quality or state of existing together in harmony; congruity. **2.** the orderly, efficient integration of the elements of one system with those of another. **3.** the formation of a stable chemical or biochemical system, specifically in medication, so that two or more drugs can be administered at the same time without producing undesired side effects or without canceling or affecting the therapeutic effects of the others. **4.** (in immunology) the degree to which the body's defense system tolerates the presence of foreign material, such as transfused blood, grafted tissue, or transplanted organs, without an immune reaction. Usually identical twins are completely compatible. **5.** (in blood grouping or cross-matching) the lack of reaction between blood groups so that there is no agglutination when the red blood cells of one sample are mixed with the serum of another sample; no reaction from transfused blood. **—compatible,** *adj.*

compatible, **1.** capable of harmonious coexistence, said of two or more medications that are suitable for simultaneous administration without nullification or aggravation of their effects. **2.** denoting a donor and recipient of a blood transfusion in which there is no transfusion reaction. **3.** histocompatible.

Compazine, a trademark for a phenothiazine **(prochlorperazine).**

compendium /kəmpen′dē·əm/ *pl.* **compendia** [L, *compendere,* to weigh], a collected body of information on the standards of strength, purity, and quality of drugs. The official compendia in the United States are the **United States Pharmacopoeia,** the **Homeopathic Pharmacopoeia of the United States,** and their supplements. See also **formulary.**

compensated acidosis /kom′pənsā′tid/ [L, *compensare,* to balance, *acidus,* sour; Gk, *osis,* condition], a condition in which the pH of the blood is maintained within normal limits (adult/child: 7.35 to 7.45) although the blood bicarbonate level is below normal or the PCO_2 is above normal. This compensation is accomplished by the lungs and/or kidneys altering their functions.

compensated alkalosis, a condition in which the blood bicarbonate is increased or the PCO_2 is decreased but compensation by the lung and kidneys keeps the blood pH within the normal range.

compensated flowmeter [L, *compensare,* to balance], a gas therapy device with a scale that is calibrated against a constant pressure of 50 psi instead of the atmosphere. It is equipped with a valve distal to the gauge to record the output to the patient accurately.

compensated gluteal gait, one of the more common abnormal gaits associated with a weakness of the gluteus medius. It is a variation of the Trendelenburg gait. It involves the dropping of the pelvis on the unaffected side of the body during the walking cycle between the moment of heel strike on the affected side and before the moment of heel strike on the unaffected side. The compensated gluteal gait is also characterized by the dropping of the entire trunk downward and sideways over the affected hip and a short step on the unaffected side. In a compensated gait the trunk is forcibly thrown laterally during the weight-bearing or stance phase in the movement of the affected lower limb. This lateral movement is the result of an attempt to shift a significant portion of body weight above and outside the center of rotation of the affected hip. During this movement the erector spinae and the quadratus lumborum of the involved side function to lift the whole weight of the pelvis and the opposite lower extremity off the ground to allow the uninvolved leg to clear during its swing phase. Also called **gluteal gait.**

compensated heart failure, an abnormal cardiac condition in which heart failure is compensated for by such mechanisms as increased sympathetic stimulation of the heart, fluid retention with increased venous return, increased end-diastolic ventricular volume and fiber length, and ventricular hypertrophy. Progressive decline in cardiac function may be minimized by the administration of beta-blockers, digitalis glycosides, and angiotensin-converting enzyme inhibitors, to improve myocardial function and diuretics to relieve pulmonary and peripheral congestion. See also **heart failure.**

compensating current /kom′pənsā′ting/, an electric current that neutralizes the intensity of a muscle current.

compensating curve, the curvature of alignment of the occlusal surfaces of the teeth, developed to compensate for the paths of the condyles as the mandible moves from centric to eccentric positions. It is used to maintain posterior tooth contacts on the molar teeth and to provide balancing contacts on dentures associated with a protruding mandible. The compensating curve corresponds to the Spee's curve in natural teeth.

compensating filter, a device, such as a wedge of aluminum, clay, or plastic, that is placed over a body area during radiography to compensate for differences in radiopacity. For example, a wedge may be placed over a foot with the thick portion over the toes and the thin edge toward the heel to compensate for the range of thickness of the foot. See also **bowtie filter.**

compensation /kom′pənsā′shən/ [L, *compensare,* to balance], **1.** the process of counterbalancing any defect in body structure or function. **2.** the process of maintaining an adequate blood flow through such cardiac and circulatory mechanisms as tachycardia, fluid retention with increased venous return, and ventricular hypertrophy. Lack of compensation indicates a diseased heart muscle. See also **compensated heart failure.** **3.** a complex defense mechanism that allows one to avoid the unpleasant or painful emotional stimuli that result from a feeling of inferiority or inadequacy. Examples include making an extraordinary effort to overcome a disability, scorning a quality that one lacks ("sour grapes"), and substituting hard work and excellent performance in one field for a lack of ability in another. **4.** changes in structural relationships that accommodate foundation disturbances and maintain balance. See also **overcompensation.**

compensator /kom′pənsā′tər/, a device used in radiotherapy to correct for irregularities in body surfaces by providing a differential attenuation of the x-ray beam before it reaches the patient. The result is a more uniform distribution of radiation dose in the tumor. Compensators are generally mounted on the collimator system of a teletherapy unit.

compensatory hypertrophy /kəmpen′sətôr′ē/ [L, *compensare,* to balance], an increase in the size or the function of an organ or part to counteract a structural or functional defect. See also **compensated heart failure.**

compensatory movement patterns, patterns of movement used because of reduced control of voluntary muscle.

compensatory pause, a pause noted on an electrocardiogram after a premature complex. It precedes the next normal complex.

competence /kom′pətəns/ [L, *competentia,* capable], **1.** (in embryology) the total capacity of an embryonic cell to react to determinative stimuli in various ways of differentiation. **2.** the ability of bacteria to take up donor deoxyribonucleic acid molecules.

competent community /kom′pətənt/, a population that is aware of resources and alternatives, can make reasoned decisions about issues facing the group, and can cope adaptively with problems. It parallels the concept of positive mental health.

competitive antagonist, a substance that interferes with usual metabolic activity by competing for binding sites on a substrate (the substance on which an enzyme acts in a chemical reaction) or on an enzyme that ordinarily attacks the substrate. The antagonist is usually an analog of the substrate. See also **antimetabolite.**

competitive-binding assay /kompet′itiv/ [L, *competere,* to come together], an analytic procedure based on the reversible binding of a ligand to a binding protein. In proportion to its concentration, the ligand competes with a labeled derivative for binding to the limited number of available binding sites.

competitive displacement, the tendency of one drug to displace another at nonspecific protein-binding sites (e.g., plasma albumin) when both drugs are taken at the same time. Only free drug is able to bind to its specific target proteins. An example is phenylbutazone, which has a greater affinity for binding sites on plasma proteins than warfarin. As a result, if both drugs are taken at the same time, fewer binding sites are available for warfarin, thereby increasing its free concentration in the plasma and increasing its anticoagulant action in the liver to potentially undesirable levels.

competitive identification, the unconscious modeling of one's personality on that of another as a means of outdoing or bettering the other person. See also **identification.**

competitive inhibitor, an inhibitor of an enzyme reaction that competes with the substrate by binding at the active site.

complaint [L, *complangere,* to beat the breast], **1.** (in law) a pleading by a plaintiff made under oath to initiate a suit. It is a statement of the formal charge and the cause for action against the defendant. For a minor offense the defendant is tried on the basis of the complaint. A more serious felony prosecution requires an indictment with evidence presented by a state's attorney. **2.** *(informal)* any ailment, problem, or symptom identified by the client, patient, member of the person's family, or other knowledgeable person. The chief complaint often causes the person to seek health care.

complement (C) /kom′pləmənt/ [L, *complementum,* that which completes], a system of at least 20 complex enzymatic serum proteins. In an antigen-antibody reaction, activation of complement causes cell lysis. Complement is also involved in other physiological reactions, including inflammation, anaphylaxis, and phagocytosis. See also **antibody, antigen, antigen-antibody reaction, immune gamma globulin.**

complement abnormality, an unusual condition characterized by deficiencies or dysfunctions of any of the 11 serum proteins known as complement and designated C1-C11. The most common abnormalities are C2 and C3 deficiencies and C5 familial dysfunction. Patients with complement abnormalities may be more susceptible to infections and to collagen vascular diseases. Primary complement abnormalities may be inherited whereas secondary complement abnormalities may stem from immunological reactions, such as drug-induced serum disease, which depletes complement. Complement deficiencies may be associated with other illnesses, such as acute streptococcal glomerulonephritis, acute systemic lupus erythematosus, and dermatomyositis.

■ OBSERVATIONS: Increased susceptibility to systemic bacterial infection is associated with C2 and C3 deficiencies and with C5 familial dysfunction. Chronic renal failure and lupus erythematosus may also be associated with C2 deficiency. Signs of C5 dysfunction are malaise, diarrhea, and seborrheic dermatitis. Diagnosis of complement abnormalities is difficult and often expensive. Some indications are electrocardiographic conduction abnormalities; detection of complement and immunoglobulins in the walls of blood vessels in glomerulonephritis; cerebrospinal fluid pleocytosis; increased erythrocyte sedimentation rate; and presence in the urine of red blood cells (RBCs), RBC casts, and protein.

■ INTERVENTIONS: Replacement of complement-fixing antibodies and control of infection and associated illnesses are part of standard treatment for complement abnormalities. The patient commonly receives transfusion of fresh plasma to replace antibodies. Bone marrow transplantations and injection of gamma globulin may also be used, but the former carries the risk of a fatal graft-versus-host reaction. Complement abnormalities are usually corrected temporarily by replacement therapy, but no permanent cure is available.

■ NURSING CONSIDERATIONS: Patients should be carefully monitored, especially if they are receiving gamma globulin injections. Gamma globulin is injected into a large muscle mass, which is massaged well after each injection. More than one site is usually selected if the dosage is more than 1.5 mL. If frequent doses are ordered, the injection sites are rotated. With plasma infusions, careful matching of leukocytes for human leukocyte antigen cell types is important to prevent a graft-versus-host reaction and other undesirable responses. Bone marrow transplantation requires close monitoring for transfusion reactions and is usually followed by instructions to the patient for scrupulous hygiene, prompt treatment of even the smallest wounds, and avoidance of crowds or persons with active infections. The nurse should be alert for early signs of ataxia or slight changes in mental activity that may signal neurological damage caused by infection.

complemental inheritance /kom′pləmen′təl/, the expression of a trait as a result of the presence of two independent pairs of nonallelic genes. Both of the genes must be present for the trait to appear in the phenotype.

complementary and alternative medicine (CAM), a large and diverse set of systems of diagnosis, treatment, and prevention based on philosophies and techniques other than those used in conventional Western medicine, often derived from traditions of medical practice used in other (non-Western) cultures. Such practices may be described as alternative, that is, existing as a body separate from and as a replacement for conventional Western medicine, or complementary, that is, used in addition to conventional Western practice. CAM is characterized by its focus on the whole person as a unique individual, on the energy of the body and its influence on health and disease, on the healing power of nature and the mobilization of the body's own resources to heal itself, and on the treatment of the underlying causes, rather than symptoms, of disease. Many of the techniques used are the subject of controversy and have not been validated by controlled studies.

complementary feeding /kom′pləmen′tərē/ [L, *complementum,* that which completes], a supplemental feeding given to an infant who is still hungry after breastfeeding.

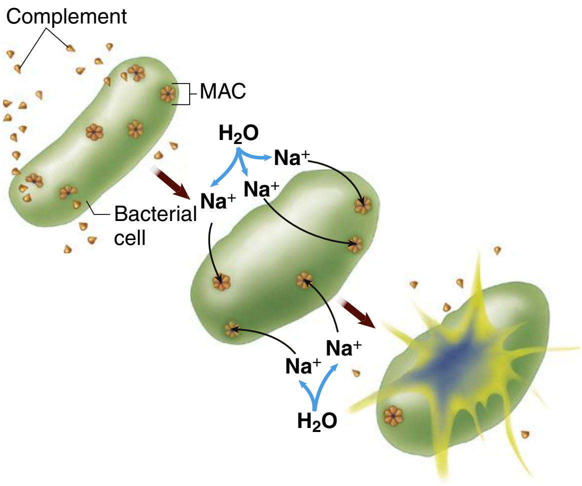
complementary gene, either member of two or more nonallelic gene pairs that interact to produce an effect not expressed in the absence of any of the pairs. Also called **reciprocal gene.**

complement assay, a blood test used primarily to measure serum complement in an effort to diagnose angioedema and to monitor the activity of disease in patients with systemic lupus erythematosus nephritis, membranoproliferative nephritis, or poststreptococcal nephritis.

complement cascade, a biochemical process involving the C1 to C9 complement proteins in which one protein interacts with another in a specific sequence called a complement pathway. C5b with C6, C7, C8, and C9 form the membrane attack complex that initiates cell lysis. Other molecules, such as C3a and C5a, act as cytokines, leading to inflammation.

complement control protein (CCP), any of a large family of proteins involved in complement regulation, encoded in a closely linked gene cluster, and having one or more stretches of a common short repeated sequence. See also **complement.**

complement fixation, an immunological reaction in which an antigen combines with an antibody and its complement, causing the complement factor to become inactive or fixed. The complement-fixation reaction can be tested in the laboratory by exposing the patient's serum to antigen, complement, and specially sensitized red blood cells. Complement-fixation tests can be used to detect antibodies for infectious diseases, especially syphilis and viral illnesses. They are rarely used in clinical practice today. See also **anticomplement, complement, immune system, immunity, Wassermann blood test.**



Complement fixation *(Patton and Thibodeau, 2010)*

complement-fixation test, any serological test in which complement fixation is detected, indicating the presence of a particular antigen. Specific C-F tests are used to aid in the diagnosis of amebiasis, Rocky Mountain spotted fever, trypanosomiasis, and typhus. They are rarely used in clinical practice today.

complement inactivation [L, *in* + *activus, complere,* to complete], the loss of activity of complement proteins in blood, achieved by heating the serum to about 133° F (56° C).

complement protein molecule [L, *complementum* + *proteios,* first rank], any of the protein molecules that are chief humoral mediators of antigen-antibody reactions in the immune system. Complement proteins stimulate phagocytosis and inflammation. Nine are involved in the "classical pathway" cascade that results in the lysis of antibody-coated bacteria. They are designated C_1 to C_9.

complete abortion [L, *complere,*to fill up], termination of pregnancy in which the conceptus is expelled or removed in its entirety. Because no products of conception remain in the uterus, surgical evacuation is not necessary. Compare **incomplete abortion.**

complete bed bath, a bath in which the entire body of a patient is washed while he or she is in bed. See also **blanket bath.**

complete blood count (CBC), a determination of the number of red and white blood cells per cubic millimeter of blood. A CBC is one of the most routinely performed tests in a clinical laboratory and one of the most valuable screening and diagnostic techniques. Most laboratories use an electronic counter for reporting numbers of red and white blood cells and platelets. Examining a stained slide of blood yields useful information about red cell morphological characteristics and types of white blood cells (WBCs). The normal red blood cell (RBC) count in adult males is 4.7 to 6.1 million/mm^3. In adult females the normal RBC is 4.2 to 5.4 million/mm^3. Each type of white blood cell can be represented as a percentage of the total number of white cells observed. This is called a differential count. The normal adult WBC count is 5000 to 10,000/cm^3. Electronic blood counters also automatically determine hemoglobin or hematocrit and include this value in the CBC. See also **differential white blood cell count, erythrocyte, hematocrit, hemoglobin, leukocyte.**

complete breech, a fetal presentation in which the buttocks present with the legs folded on the thighs and the thighs on the abdomen. The position of the fetus is the same as in a normal vertex presentation but upside down. Compare **frank breech.** See also **breech birth.**

complete color blindness, monochromatic vision.

complete denture. See **full denture.**

complete dislocation [L, *complere,* to fill up, *dis,* apart, *locare,* to place], a dislocation in which the articular surfaces of the joint are completely separated.

complete fistula, an abnormal passage from an internal organ or structure to the surface of the body or to another internal organ or structure.

complete fracture, a bone break that completely disrupts the continuity of a bone across its entire width.

complete health history, a health history that includes a history of the chief complaint, present illness, past and present health history, social history, occupational history, sexual history, and family health history. See also **functional health history, health history.**

complete heart block (CHB) [L, *complere,* to fill up; Gk, *kardia,* heart; OFr, *bloc*], total failure of impulses to be conducted from the atria to the ventricles. It causes the atria and ventricles to beat independently. It requires the use of a pacemaker to maintain a normal heart rate. Also called **third-degree AV heart block.**

complete hernia [L, *complere,* to fill up, *hernia,* rupture], a hernia characterized by protrusion of the hernial sac and abdominal contents through the abdominal wall.

complete paralysis [L, *complere,* to fill up; Gk, *paralyein,* to be palsied], paralysis characterized by a complete loss of motor function. Compare **paresis**.

complete previa. See **central placenta previa.**

complete protein, a protein that contains all the essential amino acids in appropriate amounts to allow normal growth and tissue maintenance when adequate energy is provided in the diet. Examples are casein (milk protein), eggs, fish, poultry, cheese, meat and some whole grains, such as quinoa.

complete rachischisis, a rare congenital fissure of the entire vertebral column and spinal cord, resulting from failure of the embryonic neural tube to close. The condition is characterized by flaccid paralysis and impaired sensations. It is often accompanied by other birth defects, such as cleft palate, cleft lip, and hydrocephalus, and is frequently fatal. Also called **holorachischisis, rachischisis totalis.** See also **spina bifida.**

complete response (CR), (in oncology) the total disappearance of a tumor.

complex /kom′pleks, kəmpleks′/ [L, *complexus,* an embrace], **1.** a group of items, such as chemical molecules, that are related in structure or function as are the iron and protein portions of hemoglobin or the cobalt and protein portions of vitamin B_{12}. **2.** a combination of signs and symptoms of disease that forms a syndrome. **3.** (in psychology) a group of associated ideas with strong emotional overtones that affect a person's attitudes toward a specific subject.

complex carbohydrate, a polysaccharide, such as a carbohydrate, that is composed of a large number of glucose molecules, so called to distinguish it from a simple sugar.

complex cavity, a cavity that involves more than one surface of a tooth. Compare **gingival cavity.**

complex fracture, a closed fracture in which the soft tissue surrounding the bone is severely damaged.

complex odontoma. See **composite odontoma.**

complex protein, a protein that contains a simple protein and at least one molecule of another substance, as a glycoprotein, lipoprotein, nucleoprotein, or hemoglobin.

complex regional pain syndrome, a neuromuscular condition characterized by pain and stiffness in the shoulder and arm, limited joint motion, swelling of the hand, muscle atrophy, and decalcification of the underlying bones. It is thought that a disturbance to the sympathetic nervous system is responsible for this condition. The condition occurs most commonly after myocardial infarction. Also known as RSD (reflex sympathetic dystrophy syndrome), causalgia, shoulder-hand syndrome. See **reflex sympathetic dystrophy.**

complex relationship building, a nursing intervention from the Nursing Interventions Classification (NIC) defined as establishing a therapeutic relationship with a patient to promote insight and behavioral change. See also **Nursing Interventions Classification.**

complex spatial relations, the perceptual relationship of one figure or part of a figure to another.

complex sugars, sugar molecules that can be hydrolyzed or digested to yield two molecules of the same or different simple sugars, such as sucrose, lactose, and maltose. Also called **disaccharide, polysaccharide.**

compliance (C) /kəmplī′əns/ [L, *complere,* to complete], **1.** fulfillment by a patient of a caregiver's prescribed course of treatment. **2.** also called **pulmonary compliance.** (in respiratory physiology) a measure of distensibility of the lung volume produced by a unit pressure change.

compliance behavior, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to promote wellness, recovery, and rehabilitation recommended by a health professional. See also **Nursing Outcomes Classification.**

compliance behavior: prescribed diet, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to follow food and fluid intake recommended by a health professional for a specific health condition. See also **Nursing Outcomes Classification.**

compliance behavior: prescribed medication, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to administer medication safely to meet therapeutic goals as recommended by a health professional. See also **Nursing Outcomes Classification.**

compliance factor, a measure of the expansion of the flexible tubing in a mechanical ventilating system when pressure is applied.

complicated dislocation [L, *complicare,* to fold together, *dis,* apart, *locare,* place], a joint dislocation accompanied by damage to other tissues.

complicated fracture, a fracture accompanied by injury to neighboring soft tissues, such as nerves and blood vessels.

complicated labor [L, *complicare,* to fold together, *labor,* work], any labor that is made more difficult or complex by a deviation from the normal procedure.

complication [L, *complicare,* to fold together], **1.** a disease or injury that develops during the treatment of a preexisting disorder. An example is a bacterial infection that is acquired by a person weakened by a viral infection. The complication frequently alters the prognosis. **2.** a problem that arises during labor that puts the neonate, mother, or both at risk.

component /kəmpō′nənt/ [L, *componere,* to assemble], a significant part of a larger unit.

component drip set, a device used for delivering IV fluids, especially whole blood. It includes plastic tubing and a combination drip-chamber and filter. Compare **component syringe set, microaggregate recipient set, straight line blood set, Y-set.**

component syringe set, a device used for delivering IV fluids. It includes plastic tubing, two slide clamps, a Y-connector, and a syringe. The component syringe set may be used in various procedures, such as the transfusion of platelets and cryoprecipitates. In such transfusions the component syringe set is used primarily to prevent clogging the IV line. Compare **component drip set, microaggregate recipient set, straight line blood set, Y-set.**

component therapy, transfusion of an individual blood component rather than whole blood, to treat a specific deficiency, avoid volume overload, and prevent reactions to unneeded blood products. Compare **plasmapheresis.** See also **packed cells, pooled plasma.**

composite core /kəmpos′it/ [L, *componere,* to assemble], a buildup of composite resin designed and placed in the pulp chamber and root canal of an endodontically treated tooth to allow the tooth to be used as a foundation for a crown or bridge. Compare **amalgam core, cast core.** See also **core.**

composite graft, a transplantation that involves more than one type of tissue, such as skin and cartilage. The term may also refer to an artificial vessel graft, an aortic valve prosthesis used to replace the ascending aorta valve.

composite odontoma, a tumor arising in the tooth or tooth tissue consisting of both enamel and dentin.

compos mentis /kom′pōs men′tis/, having a sound mind. Compare **non compos mentis.**

compound [L, *componere,* to assemble], /kom′pound/, **1.** *n,* (in chemistry) a substance composed of two or more different elements, chemically combined in definite proportions, that cannot be separated by physical means. **2.** *n,* any substance composed of two or more different ingredients. **3.** *adj,* denoting an injury characterized by multiple factors, such as a compound fracture. **4.** /kəmpound′/, *v,* to make a substance by combining ingredients, such as a pharmaceutic.

compound aneurysm, a localized dilation of an arterial wall in which some of the layers of the wall are distended and others are ruptured or dissected.

compound dislocation. See **open dislocation.**

compound fracture, a fracture in which the broken end or ends of the bone have torn through the skin. Also called **open fracture.**

compound joint [L, *componere,* to assemble, *jungere,* to join], a joint that involves more than two bones. The elbow and knee joints are two examples.

compound melanocytoma. See **benign juvenile melanoma.**

compound microscope [L, *componere,* to assemble; Gk, *mikros,* small, *skopein,* to view], a microscope with two or more simple or complex lens systems.

compound odontoma, an odontogenic tumor comprised of calcified dental tissues which consists of dentin, cementum, and enamel in such an arrangement to resemble rudimentary teeth. See composite odontoma and **odontoma.**

compound tubuloalveolar gland /to͞o′byəlō′alvē′ələr/, one of the many multicellular glands with more than one secretory duct that contains both tube-shaped and sac-shaped portions, such as the salivary glands.

comprehensive care. See **holistic health care.**

Comprehensive Health Manpower Training Act of 1971, legislation passed by the U.S. Congress to provide educational funding for nurse-practitioner and physician-assistant programs.

Comprehensive Health Planning (CHP) and Public Health Services Amendments, legislation passed by the U.S. Congress in 1966 that emphasized regional planning and introduced the concept that each person has a "right to health care."

comprehensive medical care, a health care program that provides for preventive medical care and rehabilitative services in addition to traditional chronic and acute illness services.

compress /kom′pres/ [L, *comprimere,* to press together], a soft pad, usually made of cloth, used to apply heat, cold, or medication to the surface of a body area. A compress also may be applied over a wound to help control bleeding. Compare **dressing.**

compressed air hazards. See **decompression sickness.**

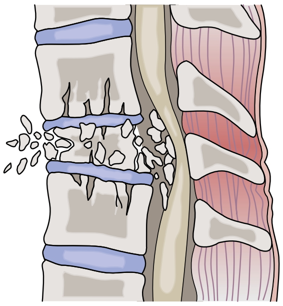
compressibility factor /kəmpres′ibil′itē/, a measure of the amount of tidal volume that may be trapped in a mechanical ventilator system in relation to the water pressure applied. It is expressed in milliliters of gas per centimeter of water pressure.

compressible volume /kəmpres′əbəl/, a part of the tidal volume of gas produced by a mechanical ventilator that is prevented from reaching a patient by compression of the gas and expansion of the flexible tubing in the equipment.

compression /kəmpresh′ən/ [L, *comprimere,* to press together], **1.** the act of pressing, squeezing, or otherwise applying pressure to an organ, tissue, or body area. An intracranial tumor or hemorrhage may cause compression of brain tissue. Kinds of pathological compression include **compression fracture,** in which bone surfaces are forced against each other, causing a break, and **compression paralysis,** marked by paralysis of a body area caused by pressure on a nerve. **2.** the pressing or squeezing of substances together so that they occupy a smaller volume of space (e.g., compressing gas into a pressurized aerosol can).

compression amplification. See **gray scale display.**

compression fracture, a bone break, especially in a short bone, that disrupts osseous tissue and collapses the affected bone. Axial loading is the usual mechanism of injury. The bodies of vertebrae are often sites of compression fractures.



Compression fracture *(Monahan et al, 2007)*

compression neuropathy, any of several disorders involving damage to sensory nerve roots or peripheral nerves, caused by mechanical pressure or localized trauma. Compression neuropathy is characterized by paresthesia, weakness, or paralysis. The carpal, peroneal, radial, and ulnar nerves are most commonly involved. Compare **neuritis.** See also **paresthesia.**

compression paralysis [L, *comprimere,* to press together; Gk, *paralyein,* to be palsied], a paralysis caused by sustained pressure on a peripheral nerve. The condition may be temporary or permanent, depending on the duration and intensity of pressure.

compressions, (in physical science) regions of high molecular density, such as a great amount of ultrasound energy, within a longitudinal wave.

compressive atelectasis /kəmpres′iv/, a condition in which a region of the lung cannot be ventilated as a result of intrathoracic pressures that compress the alveoli in that region. The condition may result from a pulmonary embolism, which releases chemicals that cause vasoconstriction and bronchospasm, leading to alveolar compression.

compressor naris /kompres′ôr när′is/, the transverse part of the nasalis muscle that serves to depress the cartilage of the nose and to draw the ala toward the septum. Compare **dilator naris.**

compromise /kom′prəmīs/ [L, *com,* together, *promittere,* to promise], **1.** an action that may involve a change in a person's behavior, as in substituting goals or delaying satisfaction of needs in one area to reduce stress in another. **2.** an illness or condition that can affect another part of the body.

compromise body image, a new body image acquired by a patient as part of his or her adjustment to a physical dysfunction. It may harbor important emotional factors for the individual. A compromise body image incorporates and modifies unacceptable features of the condition through psychological defense mechanisms such as denial, sublimation, repression, and overcompensation.

compromised host, a person who is less than normally able to resist infection because of immunosuppressive therapy, immunological defect, severe anemia, or concurrent disease or condition, including human immunodeficiency virus infection, metastatic malignancy, cachexia, or severe malnutrition.

Compton scatter [Arthur H. Compton, American physicist, 1892–1962], the principal interaction process of photons with tissue in the diagnostic and therapeutic radiology energy range. In this process, the incoming photon transfers energy to an electron in the material and is deflected, with reduced energy, into a path that generally leads to additional interactions.

compulsion [L, *compellere,* to urge], an irresistible, repetitive irrational impulse to perform an act that is usually contrary to one's ordinary judgments or standards, yet results in overt anxiety if it is not completed. The compulsion also acts to decrease anxiety. The impulse is usually the result of an obsession. Compulsions are characteristic of an obsessive-compulsive disorder. Compare **phobia.** See also **compulsive ritual, obsession, obsessive-compulsive disorder.**

compulsion need [L, *compellere,* to urge; Gk, *neuron,* nerve, *osis,* condition], an irresistible, irrational urge to perform certain acts repeatedly in spite of conscious recognition that doing so is abnormal behavior.

compulsive /kəmpul′siv/ [L, *compellere,* to urge], pertaining to an act repeatedly performed under the stress of pathological, intense need.

compulsive eating, an eating disorder characterized by continuous or frequent excessive eating over which an individual does not feel he or she has control, and which usually leads to weight gain and obesity. Eating is not connected to hunger, and food intake may be rapid or secret. Compensatory behaviors like purging, laxative use, or excessive exercise do not occur. Generally the amount eaten at any one time is not large; when it is, the disorder is usually called binge eating.

compulsive idea [L, *compellere,* to urge], a recurring irrational idea that persists in the mind, usually generating an irresistible urge to perform an inappropriate act. Also called **imperative idea.**

compulsive personality, a type of character structure with a pattern of chronic and obsessive adherence to rigid standards of conduct. The person is usually excessively conscientious and inhibited, is extremely inflexible, has an extraordinary capacity for work, and lacks a normal ability to relax and to relate to other people. The compulsive person is likely to follow repetitive patterns of behavior, such as snapping the fingers, crossing the legs, tapping the foot, or refusing to walk on cracks in the sidewalk, and often leads an impoverished emotional life, being dominated by a need for order, cleanliness, punctuality, rules, and systems. See also **compulsive personality disorder.**

compulsive personality disorder, a condition in which an irrational preoccupation with order, rules, ritual, and detail interferes with everyday functioning and normal behavior. The disorder is characterized by an excessive devotion to work, a pathological adherence to a definite set of rules or system of behavior, and a persistent, compulsive following of specific rituals. The person cannot make decisions when faced with unexpected situations and cannot take pleasure in the normal activities of daily life. Psychotherapy is the usual treatment and may include behavior therapy with desensitization and flooding to reduce maladaptive anxiety. See also **compulsive personality.**

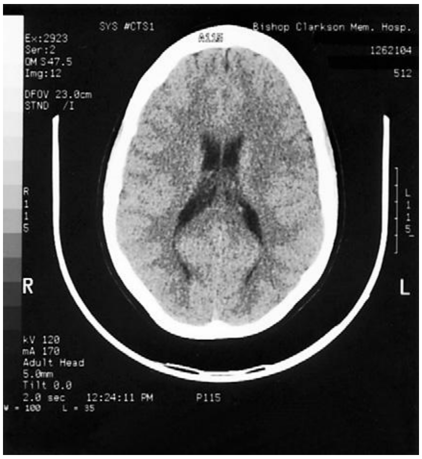
compulsive polydipsia, a compelling urge to drink excessive amounts of liquid. The condition is psychogenic; it is not caused by any organic dysfunction or physical deprivation. Extreme cases can result in death from water intoxication and electrolyte imbalance. Also called **psychogenic polydipsia.** Compare **diabetes insipidus.** See also **polydipsia.**

compulsive ritual, a series of acts a person feels must be carried out even though he or she recognizes that the behavior is useless and inappropriate, commonly seen in obsessive-compulsive disorder. Failure to complete the acts causes extreme tension or anxiety.

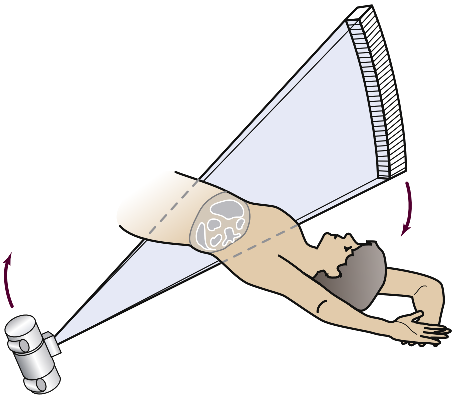
computed dental radiography (CDR), a computer-assisted method for projecting digital radiographic images of the teeth and jaws on a video monitor. CDR may expose a patient to less radiation than conventional dental radiography.

computed radiography (CR), digital radiography that records radiographic images on photostimulable phosphor plates instead of film/screen image receptors. The acquired image data are converted to electronic signals and digitized so they can be stored and manipulated by a computer and displayed on a high-resolution monitor or recorded on film by using a laser printer. See also **digital radiography.**

computed tomography (CT) /kəmpyo͞o′tid/, **1.** a radiographic technique that produces an image of a detailed cross section of tissue. The procedure, first used in 1972, is painless and noninvasive and requires no special preparation. It is 100 times more sensitive than conventional radiography. CT uses a narrowly collimated beam of x-rays that rotates in a full arc around the patient to image the body in cross-sectional slices. An array of detectors, positioned at several angles, records those x-rays that pass through the body. The image is created by a computer that uses multiple attenuation readings taken around the periphery of the body part. The computer calculates tissue absorption and produces a representation of the tissues that demonstrates the densities of the various structures. Tumor masses, infractions, bone displacement, and accumulations of fluid may be detected. For cardiological examination, ultrafast CT is electrocardiogram-triggered and allows visualization of cardiac function and blood flow. Because modern CT equipment does not involve motion of the x-ray tube, heat loading is not a problem and multilevel images can be acquired in a very short time, sometimes during a single held breath. During a period of two held breaths, as many as 50 continuous tomographic images can be produced in a single-slice mode. Formerly called **computerized axial tomography. 2.** in dentistry, also called cone-beam imaging or cone-beam computed tomography (CBCT). Often used to view the temporomandibular joint area or a presurgical dental implant site.



Computed tomography scan *(Black and Hawks, 2005)*



Computed tomography *(Frank, Long, and Smith, 2012)*

computed tomography angiography, the use of computed tomography to visualize the blood vessels of the heart.

computed tomography of the abdomen, a noninvasive radiographic procedure performed with contrast dye to diagnose pathological conditions of the abdominal and retroperitoneal organs. See also **computed tomography.**

computed tomography of the brain, a radiographic procedure performed with contrast dye to diagnose pathological conditions of the brain. It can also identify multiple sclerosis and other degenerative abnormalities. See also **computed tomography.**

computed tomography of the chest, a noninvasive radiographic procedure performed with contrast dye to diagnose and evaluate pathological conditions of the chest. Fractures can also be seen. See also **computed tomography.**

computed tomography portogram, an x-ray test with contrast dye used to identify tumors of the liver smaller than 2 cm. The contrast medium is injected through a catheter in the splenic artery, rather than through a peripheral vein as in a routine CT scan.

computed tomography scanogram, a CT technique used especially to measure discrepancies in limb length. CT scout images of the joints of the upper or lower extremity are taken, followed by placement of the CT cursors over the joints to obtain measurements. The CT scanogram is more consistently reproduced and radiation doses are lower than in the conventional imaging technique (orthoroentgenography). See also **orthoroentgenography, scanography.**

computer [L *computare* to calculate], an electronic device that processes and stores large amounts of information very quickly. See also **analog computer, mainframe computer, microcomputer, minicomputer.**

computer-aided semen analysis (CASA), any of various methods of automated, objective, standardized evaluation of sperm concentration and movement in a semen sample, to assess the individual's potential fertility or infertility. Most techniques use video recordings showing movements of multiple spermatozoa.

computer-assisted instruction (CAI), a teaching process that uses a computer in the presentation of instructional materials, often in a way that requires the student to interact with it. Also called **computer-assisted learning.**

computerized axial tomography (CAT). See **computed tomography.**

computer-managed instruction (CMI), a system in which a computer is used to manage several aspects of instruction, including learning assessment through administration of pretests and posttests; design and preparation of learning prescriptions; and calculation, analysis, and storage of student scores.

COMT, abbreviation for **catechol-o-methyl transferase.**

CON, abbreviation for **certificate-of-need.**

con-. See **co-.**

CONA, abbreviation for **Canadian Orthopedic Nurses Association.**

conation /kōnā′shən/ [L, *conari,* to attempt], the mental process characterized by desire, impulse, volition, and striving. Compare **cognition.** —*conative, adj.*

-conazole, suffix designating a miconazole-type systemic antifungal agent.

concanavalin A /kon′kənav′əlin/, a protein isolated from the jack bean that reacts with polyglucosans in the blood of mammals and causes blood cells to agglutinate. It has been used in immunology to stimulate T cell production.

concatenates /kənkat′ənāts/, long molecules formed by continuous repeating of the same molecular subunit.

concave [L, *concavare,* to make hollow], curved like the interior of an arched circle. Compare **convex.**

concave-convex joint relationship /kon′kāv, konkāv′/, a relationship in which one of a joint's articulating surfaces is concave and the other is convex.

concave spherical lens [L, *concavare,* to make hollow; Gk, *sphaira,* ball; L, *lentil*], a lens with curved, depressed surfaces that cause light rays to diverge. It is used for the management of myopia (nearsightedness).

concavity /kən′kav′itē/, a deep depression or inward curving surface of an organ or body structure.

concealed accessory pathway /kənsēld/ [L, *con,* together, *celare,* to hide], a connection between the atria and ventricles that is capable of retrograde conduction only. The electrocardiogram is normal (no delta wave) during sinus rhythm and is not associated with preexcitation, but the patient is prone to paroxysmal supraventricular tachycardia caused by orthodromic circus movement tachycardia. Conduction into the ventricles is normal during atrial fibrillation because the accessory pathway does not conduct in that direction.

concealed hemorrhage, the escape of blood from a ruptured vessel into internal organs or cavities.

concealed junctional extrasystole, an impulse that arises in and discharges the atrioventricular (AV) node or the AV bundle but fails to reach either the atria or the ventricles. It is identified by its blocking or delaying effect on subsequent AV conduction.

concealed penis, a small penis concealed beneath a fat pad or the skin of the scrotum, abdomen, or thigh. Also called **buried penis.**

conceive /kənsēv′/ [L, *concipere,* to take together], to become pregnant.

concentrate /kon′səntrāt/ [L, *con* + *centrum,* center], **1.** *v,* to decrease the bulk of a liquid mixture and increase the quantity of dissolved substances per unit of volume by the removal of solvent through evaporation or other means. **2.** *n,* a substance, particularly a liquid, that has been strengthened and reduced in volume through such means.

concentration^1 /kon′səntrā′shən/ [L, *concentratio*], **1.** increase in strength by evaporation. **2.** the ratio of the mass or volume of a solute to the mass or volume of the solution or solvent. See also **molality, molarity. 3.** to focus or direct one's thoughts or attention. **4.** a means of expressing the amount of herb and solvent used in formulating an herbal preparation. For example, a tincture with a 1:5 concentration contains 1 part of the herb in grams to 5 parts of the solvent in milliliters. Concentration is not the same thing as **potency.**

concentration^2, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as ability to focus on a specific stimulus. See also **Nursing Outcomes Classification.**

concentration gradient, a difference in the concentration of a substance on two sides of a permeable barrier.

concentric /kənsen′trik/ [L, *con* + *centrum,* center], describing two or more circles that have a common center.

concentric contraction, a common form of muscle contraction that occurs in rhythmic activities when the muscle fibers shorten as tension develops. Compare **eccentric contraction.** See also **isotonic exercise.**

concentric fibroma, a fibrous tumor surrounding the uterine cavity.

concentric hypertrophy [L, *con* + *centrum,* center; Gk, *hyper,* excessive, *trophe,* nourishment], a type of tissue overgrowth in which the walls of an organ continue to increase but the exterior size remains the same and the internal size diminishes.

concept [L, *concipere,* to take together], a construct or abstract idea or thought that originates and remains within the mind. —**conceptual,** *adj.*

concept analysis, examination of the attributes of a concept as it occurs in ordinary usage in order to identify the meanings attached to the concept.

conception /kənsep′shən/ [L, *concipere,* to take together], **1.** the beginning of pregnancy, usually taken to be the instant that a spermatozoon enters an ovum and forms a viable zygote. **2.** the act or process of fertilization. **3.** the act or process of creating an idea or notion. **4.** the idea or notion created; a general impression resulting from the interpretation of a symbol or set of symbols.

conceptional age, in fetal development the number of weeks since conception. Because the exact time of conception is difficult to determine, conceptional age is assumed to be 2 weeks less than gestational age.

conception control. See **contraception.**

conceptive /kənsep′tiv/ [L, *concipere,* to take together], **1.** able to become pregnant. **2.** pertaining to or characteristic of the mental process of forming ideas or impressions.

concept mapping, a method of visualizing relationships among various concepts. A branching, hierarchical diagram of concepts shows how they are connected using arrows and labels that identify interrelationships.

conceptual. See **concept.**

conceptual disorder /kənsep′cho͞o·əl/ [L, *concipere,* to take together], a disturbance in thought processes, cognitive activities, or ability to formulate concepts.

conceptual framework, a group of concepts that are broadly defined and systematically organized to provide a focus, a rationale, and a tool for the integration and interpretation of information. Usually expressed abstractly through word models, a conceptual framework is the conceptual basis for many theories, such as communication theory and general systems theory. Conceptual frameworks also provide a foundation and organization for the educational plan in schools of nursing.

conceptus /kənsep′təs/ [L, *concipere,* to take together], the product of conception; the fertilized ovum and its enclosing membranes at all stages of intrauterine development, from implantation to birth. See also **embryo, fetus.**

concha /kong′kə/, a body structure that is shell-shaped, as the cavity in the external ear that surrounds the external auditory canal meatus or patella or vulva.

conchitis /kongkī′tis/, an inflammation of a concha of the ear or nose.

concoction /kənkok′shən/ [L, *con* + *coquere,* to cook], a remedy prepared from a mixture of two or more drugs or substances that have been heated.

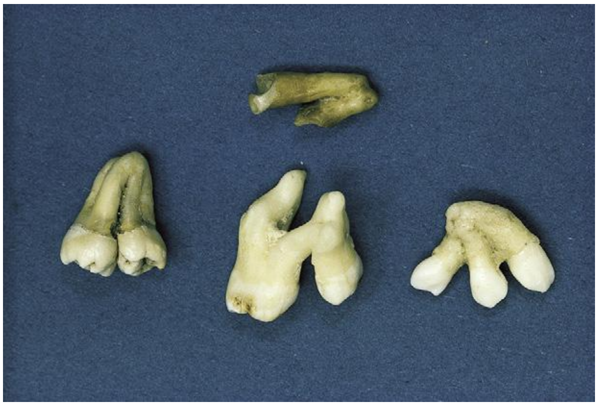
concomitant /konkom′itənt/ [L, *con* + *comitari,* to accompany], designating one or more of two or more things, occurring simultaneously, that may or may not be interrelated or produced as a result of the others; accompanying.

concomitant strabismus, a condition of crossed eyes in which the angle of squint is the same in all directions of gaze for a given testing distance. Also called **comitant strabismus.**

concomitant symptom, any symptom that accompanies a primary symptom.

concordance /kənkôr′dəns/ [L, *concordare,* to agree], the expression of one or more specific traits in both members of a pair of twins. Compare **discordance.** —*concordant, adj.*

concrescence /kənkres′əns/ [L, *concrescere* to be formed], **1.** a growing together; a union of parts originally separate. **2.** (in embryology) the flowing together and piling up of cells. **3.** (in dentistry) the union of the roots of two adjacent teeth by a deposit of excess cementum.



Concrescence *(Regezi, Sciubba, and Jordan, 2008)*

concreteness /kənkrēt′nes/ [L, *concrescere,* to be formed], communication in the here and now; simplicity; lack of abstraction.

concrete operation /kon′krēt, konkrēt′/, a thought process based on tangible rather than abstract points of reference.

concrete thinking, a stage in the development of the cognitive thought processes in the child. During this phase thought becomes increasingly logical and coherent so that the child is able to classify, sort, order, and organize facts while still being incapable of generalizing or dealing in abstractions. Problem solving is accomplished in a concrete, systematic fashion based on what is perceived, keeping to the literal meaning of words, as in applying the word *horse* to a particular animal and not to horses in general. In Piaget's classification this stage occurs between 7 and 11 years of age, is preceded by syncretic thinking, and is followed by abstract thinking. Compare **abstract thinking, syncretic thinking.**

concretion. See **calculus.**

concurrent infection [L, *concurrere,* to run together, *inficere,* to stain], a condition during which a person has two or more simultaneous infections.

concurrent nursing audit. See **nursing audit.**

concurrent review, part of a utilization management program in which health care is reviewed as it is provided. Reviewers, usually nurses, monitor appropriateness of the care, the setting, and the progress of discharge plans. The ongoing review is directed at keeping costs as low as possible and maintaining effectiveness of care.

concurrent sterilization, a method of preparing an infant-feeding formula in which all ingredients and equipment are sterilized before mixing.

concurrent validity, validity of a test or a measurement tool that is established by simultaneously applying a previously validated tool or test to the same phenomenon, or data base, and comparing the results. Concurrent validity is achieved if the results are highly correlated (the same or similar) at a statistically significant level. See also **validity.**

concussion /konkush′ən/ [L, *concutere,* to shake violently], **1.** damage to the brain caused by a violent jarring or shaking, such as a blow or an explosion. **2.** *(informal)* See **brain concussion.**

condensation /kon′dənsā′shən/ [L, *condensare,* to make thick], **1.** a reduction to a denser form, such as from water vapor to a liquid. **2.** (in psychology) a process, often present in dreams, in which two or more concepts are fused so that a single symbol represents the multiple components. In some cases of schizophrenia condensation, several thoughts and feelings fuse into a single verbal or nonverbal message and may be expressed in repetitive statements or gestures that can have a variety of meanings.

condensation nuclei, neutral particles, such as dust, in the atmosphere that are able to absorb or adsorb water and grow. At relatively high humidities they form fogs or hazes. Condensation nuclei consisting of sulfuric or nitric acid vapors or nitrogen oxides may be a source of respiratory irritants.

condensed milk, a thick liquid prepared by the evaporation of half of the water content of cow's milk.

condenser, an instrument for compacting dental restorative material into a prepared tooth cavity. It has a working end, or nib, with a flat or serrated face.

condition /kəndish′ən/ [L, *condicere,* to make arrangements], **1.** *n,* a state of being, specifically in reference to physical and mental health or well-being. **2.** *n,* anything that is essential to or restricts or modifies the appearance or occurrence of something else. **3.** *v,* to train a person or an animal, usually through specific exercises and repeated exposure to a particular state or thing. **4.** *v,* (in psychology) to subject a person or animal to conditioning or associative learning so that a specific stimulus always elicits a particular response. See also **classical conditioning.**

conditional discharge /kəndish′ənəl/, a specified leave of absence or liberty from a psychiatric hospital in which certain behaviors are expected from the patient and the original commitment order remains in effect. It may be referred to as a **pass** or **temporary absence.**

conditionally essential nutrients, nutrients that must be supplied to the body only under special conditions, such as stress, illness, or aging.

conditioned avoidance response, a learned reaction that is performed either consciously or unconsciously to avoid an unpleasant or painful stimulus.

conditioned escape response, a learned reaction that is performed either consciously or unconsciously to stop or to escape from an aversive stimulus.

conditioned orientation response (COR), the response, in a child under the age of 2 years, of turning his or her head toward the source of a sound. When the child responds appropriately by turning toward the sound, he or she is rewarded by seeing a toy move or light up. See also **visual response audiometry.**

conditioned reflex, a reflex developed gradually by training in association with a specific repeated external stimulus. An example of a conditioned reflex is that in Pavlov's experiment in which a dog salivates at the ringing of a bell if, over a period of time, every feeding is preceded by the bell-ringing stimulus. Also called **acquired reflex.**

conditioned response, an automatic reaction learned through training to a stimulus that does not normally elicit such response. Such responses can be physical or psychological and are produced by repeated association of some physiological function or behavioral pattern with an unrelated stimulus or event. In Pavlov's classic experiments, dogs learned to associate the sound of a ringing bell with feeding time so that they salivated at the sound of the bell, regardless of whether or not food was given to them. Also called **acquired reflex, behavior reflex, conditioned reflex, trained reflex.** Compare **unconditioned response.** See also **classical conditioning, operant conditioning.**

conditioned stimulus [L, *conditio* + *stimulus,* goad], any stimulus to which a reflex response has been conditioned by previous training or experience.

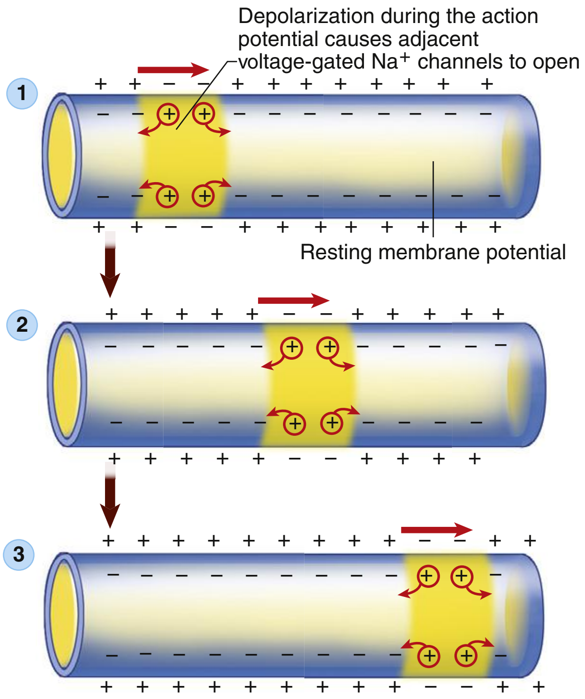
conditioning /kəndish′əning/ [L, *condicere,* to make arrangements], a form of learning based on the development of a response or set of responses to a stimulus or series of stimuli. Kinds of conditioning are **classical conditioning** and **operant conditioning.**

condom /kon′dəm/, a soft, flexible sheath made of plastic, rubber, or skin that covers the penis. Condoms prevent the exchange of body fluids during sexual activity, thereby preventing infection and conception. Also called **prophylactic,** *(informal)* **rubber.**

condom catheter, an external urinary collection device that fits over the penis like a condom, used in the management of urinary incontinence. Also called **Texas catheter.**

conduct disorder /kon′dukt/, (in psychiatry) an enduring set of behaviors that evolves over time, characterized by aggression and violations of the rights of others.

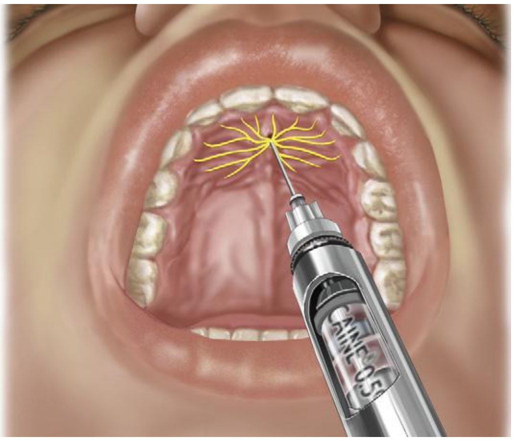
conduction /kənduk′shən/ [L, *conducere,* to lead], **1.** (in physics) a process in which heat is transferred from one substance to another because of a difference in temperature; a process (often electrical) in which energy is transmitted through a conductor. **2.** (in physiology) the process by which a nerve impulse is transmitted. **—***conductive, adj.*



Depolarization during the action potential causes adjacent voltage-gated Na$^+$ channels to open
1
Resting membrane potential
2
3

Conduction of an action potential
(Patton and Thibodeau, 2010)

conduction anesthesia, a loss of sensation, especially pain, in a region of the body, produced by injecting a local anesthetic along the course of a nerve or nerves to inhibit the conduction of impulses to and from the area supplied by that nerve or nerves. Also called **block anesthesia, nerve block anesthesia.** See also **anesthesia, regional anesthesia.**



Conduction anesthesia *(Custalow, 2005)*

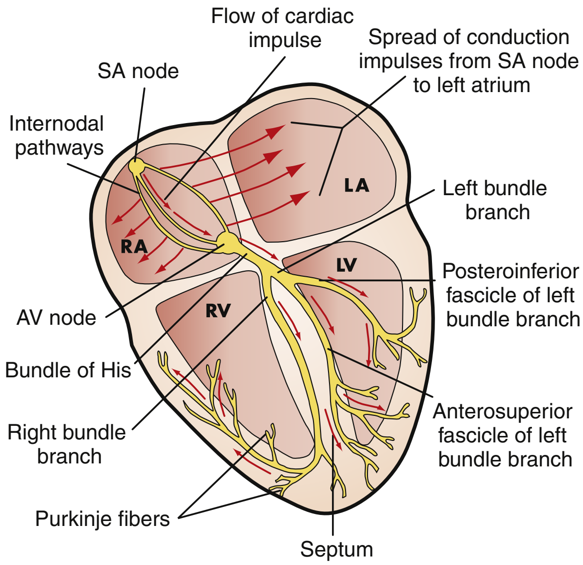
conduction aphasia, a dissociative speech phenomenon in which a patient has no difficulty in comprehending words seen or heard and no dysarthria, yet has problems in self-expression. The patient may substitute words similar in sound or meaning for the correct ones but is unable to repeat from dictation, to spell, or to read aloud. The patient is alert and aware of the deficit. A common cause is an embolus in a branch of the middle cerebral artery. The nurse should try to reduce tension and frustration in the patient, encourage socialization, find alternate means of communication for the patient, use simple language and direct questions requiring simple answers, and help the family to understand the problem and deal with it. See also **aphasia.**

conduction deafness. See **conductive hearing loss.**

conduction pathway, the route followed by nerve impulses propagated along synaptically connected neurons.

conduction system, specialized tissue that carries electrical impulses, such as bundle branches and Purkinje fibers in the heart.

conduction system of the heart, the network of highly specialized muscle tissue that transmits the electrical impulses needed for a heartbeat. It includes the sinus and atrioventricular (AV) nodes, the conducting fibers between the nodes, the AV bundle (bundle of His), the left and right bundle branches, and the Purkinje fibers. See also **cardiac cycle.**



Flow of cardiac impulse
Spread of conduction impulses from SA node to left atrium
SA node
Internodal pathways
LA
Left bundle branch
RA
LV
Posteroinferior fascicle of left bundle branch
AV node
RV
Bundle of His
Anterosuperior fascicle of left bundle branch
Right bundle branch
Purkinje fibers
Septum

Conduction system of the heart *(Kinney, 1996)*

conduction velocity, the speed with which an electrical impulse can be transmitted through excitable tissue, as in the movement of an action potential through His-Purkinje fibers of the heart.

conductive hearing loss /kənduk′tiv/ [L, *conducere,* to lead], a form of hearing loss in which sound is inadequately conducted through the external or middle ear to the sensorineural apparatus of the inner ear. Sensitivity to sound is diminished, but clarity (interpretation of the sound) is not changed as long as the sound is sufficiently loud. Also called **conduction deafness.** Compare **sensorineural hearing loss.**

conductivity, the ability of an electric or other system to transmit sound, heat, light, or electromagnetic energy.

conductor, **1.** any substance through which electrons flow readily. **2.** (in psychiatry) a family therapist who uses his or her own personality to give direction to patients in therapy.

conduit /kon′dit, kon′do͞o·it/, **1.** an artificial channel or passage that connects two organs or different parts of the same organ. **2.** a tube or other device for conveying water or other fluids from one region to another.

condylar fracture /kon′dilər/ [Gk, *kondylos,* knuckle], any break in a condyle, a rounded projection on a bone at a hinge joint. Such fractures usually occur at the distal end of the humerus or the femur and frequently detach a bone fragment that includes the condyle.

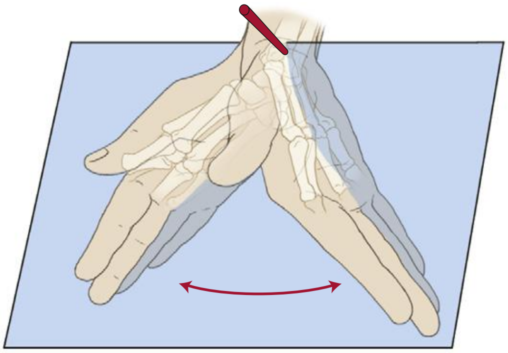
condylar guide, a mechanical device on a dental articulator, designed to guide articular movement similar to that produced by the condyles within the mandibular fossae of the temporomandibular joints. Compare **anterior guide.**

condyle /kon′dīl/ [Gk, *kondylos,* knuckle], a rounded projection at the end of a bone that anchors muscle ligaments and articulates with adjacent bones. —*condylar, adj.*

-condyle, -condylus, suffix meaning a "knucklelike projection on a bone": *entepicondyle, entocondyle, epicondyle.*

condyloid /kon′diloid/ [Gk, *kondylos,* knuckle], resembling a knuckle.

condyloid joint [L, *kondylos + eidos,* form]. See **ellipsoid joint.**

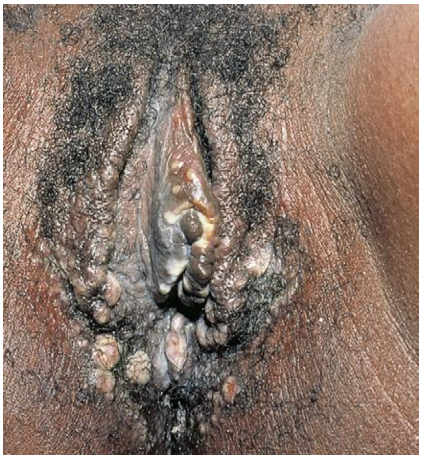


Condyloid joint *(Muscolino, 2011)*

condyloma /kon′dilō′mə/ *pl.* **condylomas, condylomata** [Gk, *kondyloma,* a knob]. See **genital wart.**

condyloma acuminatum. See **genital wart.**

condyloma latum, *pl. condylomata lata,* a flat, moist papular growth that appears in secondary syphilis in the coronal sulcus of the perineum or on the glans penis. See also **syphilis.**

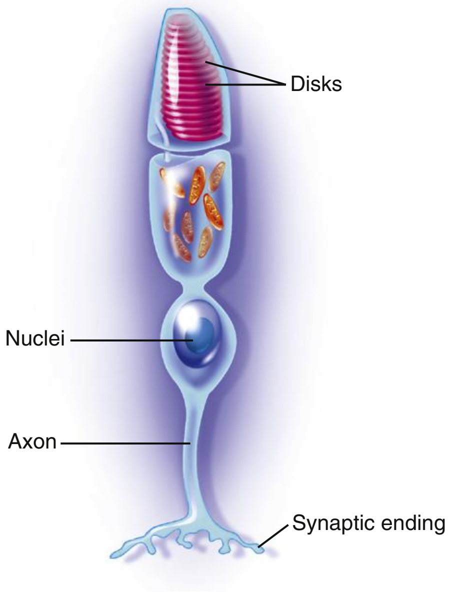


Condyloma latum
(White and Cox, 2006/Courtesy Dr. Michael O. Murphy)

condylomatum acuminatum, a warty growth in the uterine cervix as a result of a human papillomavirus infection.

-condylus. See **-condyle.**

cone /kōn/ [Gk, *konos,* cone], **1.** a photoreceptor cell in the retina of the eye that enables a person to visualize colors. There are three kinds of retinal cones, one each for the colors blue, green, and red; other colors are seen by stimulation of more than one type of cone. **2.** a cone-shaped device attached to radiological equipment to focus x-rays on a small target of tissue. See also **cone biopsy. —conic** /kon′ik/, *conical, adj.*



Cone cell of the retina

cone biopsy, surgical removal of a cone-shaped segment of the cervix, including both epithelial and endocervical tissue. The cone of tissue is excised and examined microscopically to establish a precise diagnosis, usually to confirm or evaluate a positive Papanicolaou's test result. After surgery, hemorrhage sometimes occurs. If bleeding occurs 7 to 10 days later, suturing may be required. See also **biopsy, cone.**

cone cutting, interference with an x-ray beam by a radiographic cone caused by misalignment of the tube, cone, and image receptor. It may result in the loss of one portion of the radiographic image.

confabulation /kənfab′yəlā′shən/ [L, *con* + *fabulari,* to speak], the fabrication of experiences or situations, often recounted in a detailed and plausible way to fill in and cover up cognitive impairment or memory loss, which may be caused by alcoholism, especially in people with Korsakoff's psychosis; head injuries; dementia; or lead poisoning. Also called **fabrication.**

confession /kənfesh′ən/, an act of seeking expiation through another from guilt for a real or imagined transgression.

confidence coefficient [L, *confidere,* to rely on; L, *coefficiens*], the probability that a confidence interval will contain the true value of the population parameter. For example, if the confidence coefficient is .95, 95% of the confidence intervals so calculated for each of a large number of random samples would contain the parameter.

confidence interval [L, *confidere,* to rely on; L, *intervallum,* area within ramparts], a type of statistical interval estimate for an unknown parameter: a range of values believed to contain the parameter, with a predetermined degree of confidence. Its endpoints are the **confidence limits,** and it has a stated probability **(confidence coefficient)** of containing the parameter.

confidence limits [L, *confidere,* to rely on; L, *limes,* limit], the endpoints or boundaries of a confidence interval, delineating the minimum and maximum values of the range expected to contain the parameter.

confidentiality /kon′fiden′shē·al′itē/, **1.** the nondisclosure of information except to another authorized person. **2.** (in research) protection of study participants such that an individual participant's identity cannot be linked to the information provided to the researcher and is never publicly divulged.

configuration /kənfig′yərā′shən/ [L, *configuare,* to form from], the hardware, software, and peripherals assembled to work as a computer unit for a specific situation or purpose.

configurationism. See **Gestalt psychology.**

confinement /kənfīn′mənt/ [L, *confinis,* common boundary], **1.** a state of being held or restrained within a specific place in order to hinder or minimize activity. **2.** the final phase of pregnancy, during which labor and childbirth occur. See also **puerperium.**

confinement deprivation, an emotional disorder that may result when an individual is separated from familiar surroundings or denied contact with familiar persons or objects. It may occur when one is confined to a single room.

conflict /kon′flikt/ [L, *conflictere,* to strike together], **1.** a mental struggle, either conscious or unconscious, resulting from the simultaneous presence of opposing or incompatible thoughts, ideas, goals, or emotional forces, such as impulses, desires, or drives. **2.** a painful state of consciousness caused by the arousal of such opposing forces and the inability to resolve them; a kind of stress found to a certain degree in every person. **3.** (in psychoanalysis) the unconscious emotional struggle between the demands of the id and those of the ego and superego or between the demands of the ego and the restrictions imposed by society. Kinds of conflict include **approach-approach conflict, approach-avoidance conflict, avoidance-avoidance conflict, extrapsychic conflict,** and **intrapsychic conflict.**

conflict mediation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitation of constructive dialogue between opposing parties with a goal of resolving disputes in a mutually acceptable manner. See also **Nursing Interventions Classification.**

confluence of the sinuses /kon′flo͞o·əns/ [L, *confluere,* to flow together], the wide union of the superior sagittal, the straight, and the occipital sinuses with the two large transverse sinuses of the dura mater. The right transverse sinus usually receives most of the blood from the superior sagittal sinus; the left transverse sinus receives the blood from the straight sinus. The confluence is one of six posterior superior sinuses of the dura matter, draining blood from the section and an inner bulging granular section.

confluent /kon′flo͞o·ənt/ [L, *confluere,* to flow together], running together, such as the sinuses of the dura mater, or some skin eruptions.

conformational disease, a general term for a number of disorders, such as Alzheimer's disease and Pick's disease, caused by mutations in the structure of specific proteins, leading to the aggregation and deposition of abnormal proteins.

confounding /konfoun′ding/, **1.** interference by a third variable so as to distort the association being studied between two other variables, because of a strong relationship with both of the other variables. **2.** a relationship between two causal factors such that their individual contributions cannot be separated.

confrontational visual field testing /kon′frəntā′shənəl/ [L, *con* + *frons,* forehead], a method of assessing a patient's visual field by moving an object into the periphery of each of the visual quadrants. The test is conducted while one eye is covered and the vision of the other is fixed on a point straight ahead. The patient reports when the moving object, which may be the examiner's finger, is first detected at the edge of the visual field.

confusion /kənfyo͞o′shən/ [L, *confundere,* to mingle], a mental state characterized by disorientation regarding time, place, person, or situation. It causes bewilderment, perplexity, lack of orderly thought, and inability to choose or act decisively and perform the activities of daily living. It is usually symptomatic of an organic mental disorder, but it may accompany severe emotional stress and various psychological disorders. —*confusional, adj.*

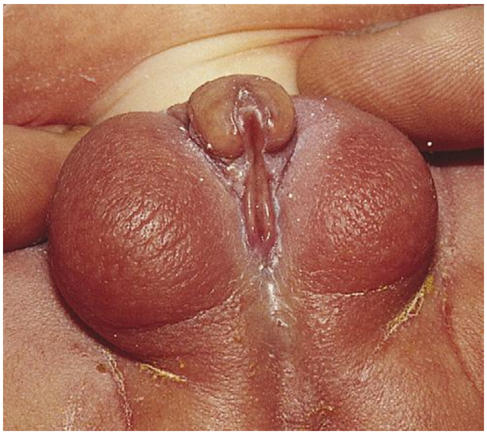
confusional state, a mild form of delirium. It may occur in any age group or may accompany preexisting brain disease. It may be triggered by a sudden or unexpected change in the person's environment. The confusion may be characterized by failure to perform activities of daily living, memory deficits, disruptive behavior, and inappropriate speech.

congener /kon′jənər/ [L, *con* + *genus,* origin], one of two or more things that are similar or closely related in structure, function, or origin. Examples of congeners are muscles that function identically, chemical compounds similar in composition and effect, and species of the same genus of plants or animals. —*congenerous* /kənjen′ərəs/, *adj.*

congenital /kənjen′itəl/ [L, *congenitus,* born with], present at birth, as a congenital anomaly or defect. Compare **acquired, familial, hereditary.**

congenital absence of sacrum and lumbar vertebrae, an abnormal condition present at birth and characterized by varying degrees of deformity, ranging from the absence of the lower segment of the coccyx to the absence of the entire sacrum and all lumbar vertebrae. Congenital absence of the sacrum and the lumbar vertebrae is relatively rare. Lesser degrees of this anomaly may present so few signs that marked deformities are not present, and the condition may not be diagnosed unless accidentally found on radiographic examination. More severe forms display gross deformities and neurological deficits. Signs and symptoms of the more severe kinds include short stature, flattened buttocks, muscle paralysis to varying degrees, muscle atrophy in the lower extremities, foot deformities, contractures of the hips and knees, and varying degrees of loss of sensation, especially sensation distal to the knees. The treatment varies greatly for the congenital absence of the sacrum and lumbar vertebrae and depends on severity. Surgical intervention may be reconstructive or may involve disarticulation procedures at various spinal levels and subsequent fusion of the remaining vertebrae. Depending on the severity, many patients with this anomaly gain enough stability to sit and to walk with assistance through surgery. The most severe forms are usually fatal.

congenital adrenal hyperplasia (CAH), a group of disorders that have in common an enzyme defect resulting in low levels of cortisol and increased secretion of adrenocorticotropic hormone. The net effects are adrenal gland hyperplasia and increased production of cortisol precursors and androgens. During intrauterine life the disorder leads to pseudohermaphroditism in female infants and macrogenitosomia in male infants. Treatment involves hydrocortisone therapy and reconstructive surgery. See also **adrenal virilism, macrogenitosomia, pseudohermaphroditism.**



Congenital adrenal hyperplasia *(Zitelli and Davis, 2007)*

congenital amputation, the absence of a fetal limb or part at birth. The condition previously was attributed to amputation by constricting bands in utero but now is regarded as a developmental defect.

congenital anomaly, any abnormality present at birth, particularly a structural one, which may be inherited genetically, acquired during gestation, or inflicted during parturition. Also called **birth defect.**

congenital cardiac anomaly, any structural or functional abnormality or defect of the heart or great vessels present at birth. Congenital heart anomalies are a major cause of neonatal distress and the most common cause of death in the newborn other than problems related to prematurity. Approximately 90% of all deaths from congenital heart anomalies occur during the first year of life. Congenital heart defects may be inherited or result from environmental factors, such as maternal infection or exposure to radiation or noxious substances during pregnancy. Most defects are probably caused by an interaction between inherited and environmental factors that results in arrested embryonic development. Congenital heart anomalies are classified as broadly cyanotic, in which unoxygenated blood mixes with oxygenated blood in the systemic circulation, and acyanotic, in which such mixing does not occur. The general effects of cardiac malformations on cardiovascular functioning are increased cardiac workload, increased pulmonary vascular resistance, inadequate cardiac output, and, in the case of cyanotic anomalies, decreased oxygen saturation. The general physical symptoms of these pathophysiological alterations are growth retardation, decreased exercise tolerance, recurrent respiratory infections, dyspnea, tachypnea, tachycardia, cyanosis, tissue hypoxia, and murmurs, all of which vary in severity, depending on the type and degree of the defect. Kinds of congenital cardiac anomalies include **atrial septal defect, coarctation of the aorta, tetralogy of Fallot, transposition of the great vessels, tricuspid atresia,** and **ventricular septal defect.** Also called **congenital heart disease.** See also **aortic stenosis, patent ductus arteriosus,pulmonary stenosis, valvular stenosis.**

congenital cataracts. See **cataract.**

congenital cerebral diplegia. See **cerebral palsy.**

congenital cloaca. See **persistent cloaca.**

congenital cyanosis [L, *congenitus,* born with; Gk, *kyanos,* blue, *osis,* condition], cyanosis present at birth caused by a congenital heart disease or atelectasis of the lungs. See also **blue baby.**

congenital cyst [L, *congenitus,* born with; Gk, *kystis,* bag], a cyst present at birth, such as a dermoid cyst resulting from an embryonic defect in the skin or midline structures.

congenital cytomegalovirus disease. See **cytomegalic inclusion disease.**

congenital dermal sinus, a channel present at birth, extending from the surface of the body and passing between the bodies of two adjacent lumbar vertebrae to the spinal canal.

congenital dislocation of the hip (CDH), an orthopedic defect, present at birth, in which the head of the femur does not articulate with the acetabulum as a result of an abnormal shallowness of the acetabulum. Treatment consists of maintaining continuous abduction of the thigh so that the head of the femur presses into the center of the shallow cavity, causing it to deepen. Also called **congenital dysplasia of the hip, congenital subluxation of the hip.** See also **Frejka splint.**

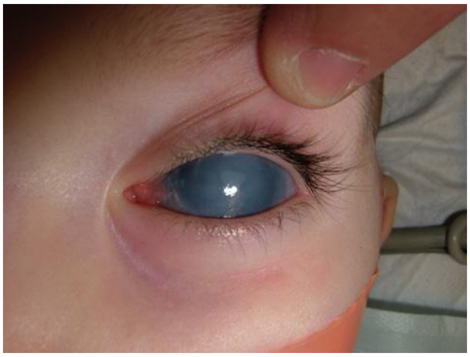
congenital ectodermal defect. See **anhidrotic ectodermal dysplasia.**

congenital erythropoietic porphyria (CEP) [L, *congenitus,* born with; Gk, *erythros,* red, *poein,* to make, *porphyros,* purple], a rare autosomal-recessive trait caused by a defect in hemoglobin synthesis in erythrocytes and release of porphyrin from normoblasts in the bone marrow. Symptoms may include mutilating lesions, hemolytic anemia, splenomegaly, excessive urinary excretion of uroporphyrin and coproporphyrin, and invariably erythrodontia and hypertrichosis.

congenital facial diplegia. See **Möbius' syndrome.**

congenital generalized fibromatosis, the presence of small, hard, round fibromas of the subcutaneous and muscle tissues, the viscera, and the osseous systems, usually at birth. Visceral involvement may cause symptoms such as intestinal obstruction, diarrhea, and respiratory disturbances. Death is usually during the first few months of life. Also called **infantile fibromatosis.**

congenital glaucoma, a rare form of glaucoma affecting infants and young children, which results from a congenital closure of the iridocorneal angle by a membrane that obstructs the outflow of aqueous humor and increases the intraorbital pressure. The condition is progressive, is usually bilateral, and may damage the optic nerve. It may be corrected surgically. Symptoms include tearing, photophobia, and enlargement of the eye, known as **buphthalmos** or **hydrophthalmos.**



Congenital glaucoma *(Brightbill, 2009)*

congenital goiter, an enlargement of the thyroid gland at birth. It may be caused by a deficiency of enzymes or iodine required for the production of thyroxine.

congenital heart disease (CHD). See **congenital cardiac anomaly.**

congenital hernia [L, *congenitus,* born with, *hernia,* rupture], a hernia caused by a defect present at birth, as an umbilical hernia.

congenital hypogammaglobulinemia [L, *congenitus,* born with; Gk, *hypo,* deficiency, *gamma,* third letter of Greek alphabet; L, *globus,* small globe, *haima,* blood], a genetic disease characterized by a deficiency of gamma globulin and antibody in the serum. The cause may be a genetic defect leading to a failure of development of a normal beta-lymphocyte system and immune responses.

congenital hypoplastic anemia. See **Diamond-Blackfan syndrome.**

congenital immunity [L, *congenitus,* born with, *immunis,* free from], the immunity one has at birth that is acquired from the mother's antibodies as they pass through the placenta.

congenital jaundice [L, *congenitus,* born with; Fr, *jaune,* yellow], jaundice present at birth or during the first 24 hours of life. It is usually caused by poorly developed bile ducts.

congenital laryngeal stridor [L, *congenitus,* born with; Gk, *larynx* + L, *stridens,* a grating noise], a harsh respiratory sound that some infants make the first weeks after birth.

congenital leukemoid reaction. See **transient myeloproliferative disorder.**

congenital lobar emphysema [L, *congenitus,* born with; Gk, *lobos,* lobe; Gk, *en,* in + *physema,* a blowing], a condition characterized by overinflation, commonly affecting one of the upper lobes and causing respiratory distress in early life. Also called **congenital lobar overinflation.**

congenital lymphedema. See **Milroy's disease.**

congenital megacolon. See **Hirschsprung's disease.**

congenital nonspherocytic hemolytic anemia, a group of blood disorders made up of a number of similar inherited diseases, each with a deficiency of one of the enzymes of red cell glycolysis. Most are associated with varying degrees of hemolysis, but all are less severe than, and are to be differentiated from, the more serious disorder associated with spherocytosis. Compare **hemolytic anemia, spherocytic anemia.** See also **elliptocytosis, glucose-6-phosphate dehydrogenase (G6PD) deficiency heme, sickle cell anemia.**

congenital oculofacial paralysis. See **Möbius' syndrome.**

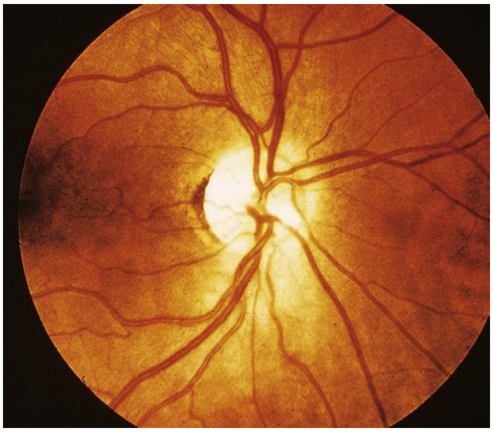
congenital pancytopenia. See **Fanconi's anemia.**

congenital polycystic disease. See **polycystic kidney disease.**

congenital pouch colon, a developmental anomaly of the colon in which part or all of it is replaced by a dilated pouch, accompanied by anorectal malformation and a fistula between the colon and the genitourinary tract.

congenital pulmonary arteriovenous fistula, a direct connection between the arterial and venous systems of the lung present at birth that results in a right-to-left shunt and permits unoxygenated blood to enter the systemic circulation. The anomaly is probably caused by faulty development of the network of vessels covering the embryonic lungs. It is often accompanied by hereditary hemorrhagic telangiectasis (Rendu-Osler-Weber disease). The fistula may be single or multiple and may occur in any part of the lung. If it is in an accessible site, surgical correction is the method of treatment.

congenital rubella syndrome, a collection of birth defects caused by transmission of the rubella virus from an infected mother to a fetus during the first trimester of pregnancy. Anomalies include cataracts, congenital heart disease, and sensorineural hearing loss. The infant may be small for gestational age and exhibit hyperbilirubinemia, thrombocytopenia, and hepatomegaly.



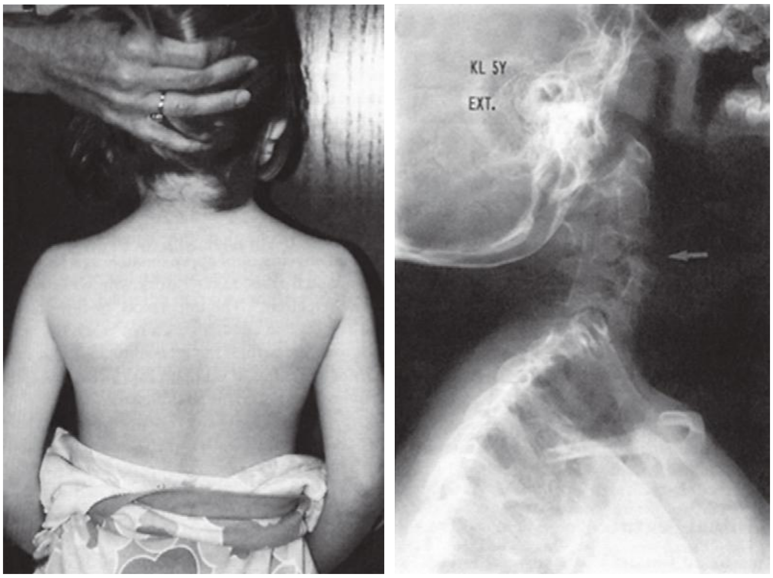
Congenital rubella syndrome: hyperpigmentation and hypopigmentation of the retina
(Stone and Gorbach, 2000)

congenital scoliosis, an abnormal condition present at birth, characterized by a lateral curvature of the spine. It results from specific congenital rib and vertebral anomalies. The causative and pathological characteristics of congenital scoliosis are divided into six categories. Category I is associated with partial unilateral failure of the formation of a vertebra. Category II is associated with complete unilateral failure of the formation of a vertebra. Category III is associated with bilateral failure of segmentation with the absence of disk space. Category IV is associated with the unilateral failure of segmentation with the unsegmented bar. Category V is associated with the fusion of ribs. Category VI is associated with any condition not covered in the other categories. Category IV scoliosis seems to progress more rapidly and cause the greatest degree of deformity. The degree of obvious deformity caused by congenital scoliosis depends on the cause of the disease. The deformity increases with growth and age, usually progressing slowly during periods of slow growth of the trunk of the body. Treatment of congenital scoliosis may be surgical or nonsurgical. Some kinds of nonsurgical treatment techniques are exercise programs and use of orthotic devices, such as scoliosis splints or a Milwaukee brace. Surgical intervention in this disease may involve an anterior or a posterior spinal fusion. In a few individuals, additional procedures, such as spinal osteotomy, use of the Harrington rod, or halo traction, may be required. See also **scoliosis.**

congenital short neck syndrome, a rare congenital malformation of the cervical spine in which the cervical vertebrae are fused, usually in pairs, into one mass of bone, causing decreased neck motion and decreased cervical length, sometimes with neurological involvement. The posterior portion of the laminar arches in the cervical area is not fully developed; the result is spina bifida in the cervical region, usually involving the lower cervical vertebrae and, in some cases, one or more of the upper thoracic vertebrae. Congenital short neck syndrome is often associated with a cervical rib or with hemivertebrae. Neurological complications, such as nerve-root compression and peripheral nerve symptoms, are secondary to deformities of the vertebral bodies. The extreme shortness of the neck is the most common sign of this deformity, which allows only limited motion, lateral bending, and rotation. When the deformity involves nerve-root compression, symptoms of peripheral nerve involvement, such as pain or a burning sensation, may be evident, accompanied by paralysis, hyperesthesia, or paresthesia. Involvement of the spinal cord may present signs of abnormalities of lower extremities with associated signs of an upper motor lesion. Congenital short neck syndrome may require no treatment. Mild associated symptoms may be alleviated with traction, cast application, or cervical collars. Surgery may be required to relieve neurological manifestations. Also called **Klippel-Feil syndrome.**

congenital subluxation of the hip. See **congenital dislocation of the hip.**

congenital syphilis [L, *congenitus,* born with; Gk, *syn,* together, *philein,* to love], a form of syphilis acquired in utero, caused by the spirochete ***Treponema pallidum.*** Nearly



Child with short neck and low hairline associated with congenital short neck syndrome. The radiograph of the cervical spine in extension demonstrates congenital fusion and evidence of spinal instability *(arrow).*
(Weisel, Boden, and Wisnecki, 1996)

50% of infected infants die shortly before or after birth. It is generally characterized by osteitis, rashes, coryza, and wasting in the first months of life. Later childhood signs of the infection include interstitial keratitis, deafness, and notches in the incisor teeth (called **Hutchinson's teeth**). Some infected infants may appear disease-free at birth, but typical signs of the disease develop in adolescence. Infants are treated with penicillin; all infected infants require an ophthalmic examination. If untreated, the infection may cause deafness, blindness, crippling, or death.

congested /kənjes′tid/, having an excessive accumulation of a substance such as blood. The condition may be the result of increased production of the substance and/or outflow of the substance. It also can result from a decreased ability of the heart to pump, leading to lung congestion.

congestion /kənjes′chən/ [L, *congerere,* to accumulate], an abnormal accumulation of fluid in an organ or body area. The fluid is often mucus, but it may be bile or blood.

congestive /kənjes′tiv/, pertaining to congestion.

congestive atelectasis. See **adult respiratory distress syndrome.**

congestive cardiomyopathy [L, *congerere,* to accumulate; Gk, *kardia,* heart, *mys,* muscle, *pathos,* disease], a heart muscle disease characterized by heart failure and enlargement.

congestive dysmenorrhea [L, *congerere,* to accumulate; Gk, *dys,* difficult, *men,* month, *rhein,* to flow], a form of secondary dysmenorrhea caused by pelvic congestion, which arises from an increased blood supply in the area caused by pelvic disease.

congestive heart failure (CHF), an abnormal condition that reflects impaired cardiac pumping and the inability to maintain the metabolic needs of the body. Its causes include myocardial infarction, ischemic heart disease, and cardiomyopathy. Failure of the ventricles to eject blood efficiently results in volume overload, ventricular dilation, and elevated intracardiac pressure. Increased pressure in the left side of the heart causes pulmonary congestion. Increased pressure in the right side causes systemic venous congestion and peripheral edema. See also **heart failure.**

congestive splenomegalia [L, *congerere,* to accumulate; Gk, *splen* + *megas,* large], an enlarged spleen associated with gastric hemorrhage, anemia, portal hypertension, and cirrhosis of the liver. Also called **Banti's syndrome, congestive splenomegaly, hepatolienal fibrosis.**

conglomerate silicosis /kənglom′ərit/ [L, *con* + *glomerare,* to wind into a ball], a severe form of silicosis marked by conglomerate masses of mineral dust in the lungs, causing acute shortness of breath, coughing, and production of sputum. The conglomerates may encroach on the pulmonary circulation, causing pulmonary hypertension, right ventricular hypertrophy, pulmonary fibrosis, and complete disability. Cor pulmonale usually develops.

Congolese red fever. See **murine typhus.**

congruent communication /kong′gro͞o·ənt/, a communication pattern in which the person sends the same message on both verbal and nonverbal levels.

-conia, suffix meaning "small particles in the (specified) fluid or part of the body": *chondroconia, otoconia, statoconia.*

conic, conical. See **cone.**

conic papilla. See **papilla.**

Conidiobolus /konid′e·ob′olus/, a genus of perfect fungi. *C. coronatus* is usually a saprobe, but sometimes causes entomophthoromycosis (a chronic granulomatous disease) in humans and horses.

coning, the squeezing of the brain and brainstem through the foramen magnum as a result of swelling. It may lead to a loss of basic cardiorespiratory function.

conium. See **hemlock.**

conivaptan, a vasopressin receptor antagonist.

■ INDICATIONS: This drug is used to treat euvolemia hyponatremia in those hospitalized.

■ CONTRAINDICATIONS: Hypovolemia and known hypersensitivity to this drug prohibit its use.

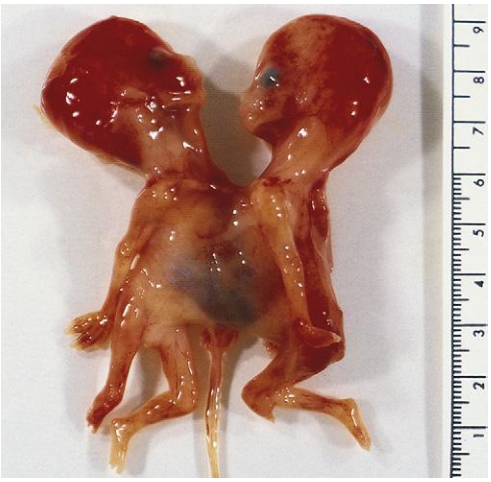
■ ADVERSE EFFECTS: Adverse effects of this drug include headache, confusion, insomnia, hypotension, hypertension, orthostatic hypotension, phlebitis, nausea, vomiting, constipation, dry mouth, hematuria, polyuria, urinary tract infection, pollakiuria, anemia, erythema, injection site reaction, dehydration, hyperglycemia, hypoglycemia, hypokalemia, hypomagnesia, hyponatremia, oral candidiasis, pain, peripheral edema, and pneumonia. Atrial fibrillation is a life-threatening side effect.

conization /kon′īzā′shən/, the removal of a cone-shaped sample of tissue. See also **cone biopsy.**

conjoined manipulation /kənjoind′/ [L, *con* + *jungere,* to yoke together], the use of both hands in obstetric and gynecological procedures, with one positioned in the vagina and the other on the abdomen.

conjoined tendon. See **inguinal falx.**

conjoined twins, two fetuses developed from the same ovum who are physically united at birth. The defect ranges from a superficial anatomical union of varying extent between equally or nearly equally formed fetuses to one in which only a part of the body is duplicated or in which a small, incompletely developed fetus, or parasite, is attached to a more fully formed one, the autosite. Conjoined twins result when separation of the blastomeres in early embryonic development does not occur until a late cleavage phase and is incomplete, causing the fused condition. Viability depends on the extent of the fusion and the degree of development of the fetuses. See also **Siamese twins.**



Conjoined twins at 12 weeks of development *(Moore, Persaud, and Shiota, 2000/Courtesy Dr. D.K. Kalousek, Department of Pathology, University of British Columbia, Children's Hospital)*

conjoint family therapy /kənjoint′/, a form of psychotherapy in which a therapist sees a single nuclear family and addresses the issues and problems raised by family members.

conjugata /kon′jəgā′tə/ [L, *conjugere,* to yoke together], pertaining to the combined diameters of the pelvis, measured from the center of the promontory of sacrum to the back of the symphysis pubis.

conjugate /kon′jəgit/ [L, *con* + *jungere,* to yoke together], (in pelvimetry) the measurement of the female pelvis to determine whether the presenting part of a fetus can enter the birth canal. See also **diagonal conjugate, true conjugate.**

conjugated bilirubin. See **bilirubin.**

conjugated estrogen /kon′jəgā′tid/, a mixture of sodium salts of estrogen sulfates, chiefly those of estrone, equilin, and 17-alpha-dihydroequilin. Conjugated estrogens may be prescribed to relieve postmenopausal vasomotor symptoms, such as hot flashes; to treat atrophic vaginitis, female hypogonadism, or primary ovarian failure; and to provide palliation in advanced prostatic carcinoma and metastatic breast cancer in selected patients. The drug is also used to treat and prevent osteoporosis. Continued use of estrogens can increase the risk of endometrial carcinoma, gallbladder disease, and thromboembolic disorders. Because of the danger of damage to the fetus, all female sex hormones are contraindicated during pregnancy. Among the adverse effects of conjugated estrogens are breakthrough bleeding, breast tenderness, nausea, headache, water retention, and skin eruptions. Current preliminary evidence suggests that there are no cardiovascular benefits to estrogen use during menopause, evidence that led to early discontinuation of the clinical study and changes in the product labeling. Coronary heart disease, the focus of the study, was actually increased in the treatment group, along with breast cancer, stroke, and thromboembolism. Topical agents rather than systemic estrogen should be used for treating vulvar or vaginal atrophy. Nonestrogen agents are recommended for the treatment and prevention of osteoporosis.

conjugate deviation [L, *conjugere,* to yoke together, *deviare,* to turn aside], pertaining to movements of the two eyes in which their visual axes function in parallel. The cause is a dysfunction of the ocular muscles, which allows the eyes to diverge to the same side when at rest.

conjugated hyperbilirubinemia, hyperbilirubinemia caused by defective excretion of conjugated bilirubin by the liver cells or by anatomical obstruction to bile flow within the liver or in the extrahepatic bile duct system; kinds of conjugated hyperbilirubinemia include **Dubin-Johnson syndrome** and **Rotor’s syndrome.**

conjugated protein, a compound that contains a protein molecule united to a nonprotein substance, such as a carbohydrate or lipid.

conjugate paralysis [L, *conjugere,* to yoke together; Gk, *paralyein,* to be palsied], a condition of paralysis of the conjugate movements of the two eyes, up or down, or to the right or left. There is no diplopia. The cause is a cranial nerve lesion.

conjugation /kon′jəgā′shən/, **1.** (in biology) an exchange or transfer of genetic information between two individuals in certain types of unicellular organisms, including bacteria and some protozoa. In *Paramecium,* for example, both partners swap micronuclear material. The exchanged material is incorporated and passed on to progeny after replication. **2.** (in chemistry) a network of atoms connected together by alternating single and double bonds.

conjugon /kon′jo͝ogon/, an extrachromosomal segment of DNA that induces bacterial conjugation.

conjunctiva /kon′jungktī′və/ [L, *conjunctivus,* connecting], the mucous membrane lining the inner surfaces of the eyelids and anterior part of the sclera. The **palpebral conjunctiva** lines the inner surface of the eyelids and is thick, opaque, and highly vascular. The **bulbar conjunctiva** is loosely connected, thin, and transparent, covering the sclera of the anterior third of the eye. **—***conjunctival, adj.*

conjunctival burn /-ī′vəl/, a chemical burn of the conjunctiva. Emergency treatment involves irrigating the eye with copious amounts of water until the chemical has been neutralized, as indicated by paper pH indicators. A topical ophthalmic anesthetic may be instilled to relieve pain. Emergency medical care should be sought.

conjunctival edema. See **chemosis.**

conjunctival fornix. See **inferior conjunctival fornix, superior conjunctival fornix.**

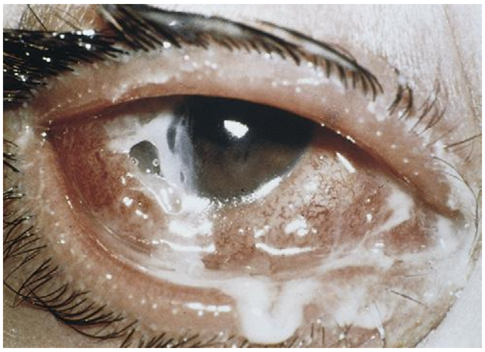
conjunctival reflex, a protective mechanism of the eye in which the eyelids close whenever the conjunctiva is touched. Compare **corneal reflex.**

conjunctival ring, a narrow ring at the junction of the conjunctiva and the periphery of the cornea. Also called **annulus conjunctivae, limbus.**

conjunctival sac [L, *conjunctivus,* connecting; Gk, *sakkos*], the potential space enclosed by the conjunctiva and the eyelids.

conjunctival test, a procedure used to identify offending allergens by instilling the eye with a dilute solution of the allergenic extract. A positive reaction in the allergic patient causes tearing and redness of the conjunctiva within 5 to 15 minutes. See also **allergy testing.**

conjunctivitis /kənjungk′tivī′tis/, inflammation of the conjunctiva, caused by bacterial or viral infection, allergy, or environmental factors. Red eyes, thick discharge, sticky eyelids in the morning, and inflammation without pain are characteristic results of the most common cause, bacteria. The cause may be found by microscopic examination or bacteriological culture of the discharge. Choice of treatment depends on the causative agent and may include antibacterial agents, antibiotics, or corticosteroids. Also called **pinkeye.** See also **choroiditis, uveitis.**



Conjunctivitis
(Courtesy American Academy of Ophthalmology)

conjunctivitis of newborn [L, *conjunctivus,* connecting, *itis,* inflammation; ME, *newe* + *borne*], a condition characterized by a purulent discharge from the eyes of an infant during the first 3 weeks of life. Frequent causes include gonococcal and chlamydial infections, which may lead to blindness if untreated. Also called **ophthalmia neonatorum.**

connecting fibrocartilage [L, *con* + *nectere,* to bind], a disk of fibrocartilage found between many joints, especially those with limited mobility, such as the spinal vertebrae. Each disk is composed of concentric rings of fibrous tissue separated by cartilaginous laminae. The disk swells outward if it is compressed by the vertebrae above or below. Compare **circumferential fibrocartilage, interarticular fibrocartilage, stratiform fibrocartilage.**

connective /kənek′tiv/ [L, *cum,* together with, *nectere,* to bind], pertaining to a binding or connection.

connective tissue, tissue that supports and binds other body tissue and parts. It derives from the mesoderm of the embryo and is dense, containing large numbers of cells and large amounts of intercellular material. The intercellular material is composed of fibers in a matrix or ground substance that may be liquid, gelatinous, or solid, such as in bone and cartilage. Connective tissue fibers may be collagenous or elastic. The matrix or ground material surrounding fibers and cells is a dynamic substance, susceptible to its own special diseases. Kinds of connective tissue are **bone tissue, cartilage tissue, dense connective tissue, fibrous tissue,** and **loose connective tissue.**

connective tissue disease. See **collagen vascular disease.**

connector /kə·nek′tər/ [L, *con* + *nectere,* to bind], **1.** anything serving as a link between two separate objects or units. **2.** (in dentistry) the part of a fixed partial denture that unites the retainer and the pontic. It may be rigid or nonrigid.

connexin 26, a protein found on the GJB2 gene. Autosomal-recessive mutation of the gene encoding it is the most common cause of congenital sensorineuronal hearing loss.

connexon /kənek′son/ [L, *con* + *nectere,* to bind], the functional unit of a gap junction; the hexagonal array of membrane-spanning proteins around a central channel that connects with its counterpart in an adjacent cell to form the intercellular pore of the gap junction. See also **gap junction.**

Conn's syndrome [Jerome W. Conn, American physician, b. 1907; Gk, *syn,* together, *dromos,* course], primary aldosteronism, characterized by excessive secretion of aldosterone with symptoms of headache, fatigue, nocturia, and polyuria. The patient may also experience hypertension, hypokalemic alkalosis, potassium depletion, and hypervolemia. It may be caused by adrenal hyperplasia or an aldosterone-secreting adenoma.

conoid tubercle, a tubercle on the inferior surface of the lateral third of the clavicle that gives attachment to the coracoclavicular ligament.

Conor's disease. See **Marseilles fever.**

Conradi-Hünermann syndrome /kon·rä′dē· hu′nər·män/ [Erich Conradi, German physician, 20th century; Carl Hünermann, German physician, 20th century], an autosomal-dominant form of chondrodysplasia punctata, characterized by asymmetric shortening of the limbs and scoliosis, with normal intelligence and life expectancy. The syndrome is also associated with maternal use of warfarin sodium during pregnancy.

Conradi's disease. See **chondrodystrophia calcificans congenita.**

consanguinity /kon′sang·gwin′itē/ [L, *con* + *sanguis,* blood], a hereditary or "blood" relationship between persons that results from having a common parent or ancestor.

conscience [L, *conscientia,* to be privy to information], **1.** the moral, self-critical sense of what is right and wrong. **2.** (in psychoanalysis) the part of the superego system that monitors thoughts, feelings, and actions and measures them against internalized values and standards.

conscientiousness /kon′she·en′shusnes/, **1.** a principled commitment to do something, such as to provide health care. **2.** acting in a way that is considered right or proper.

conscious /kon′shəs/ [L, *conscire,* to be aware], **1.** *adj,* (in neurology) capable of responding to sensory stimuli; awake, alert; aware of one's external environment. **2.** *n,* (in psychiatry) that part of the psyche or mental functioning in which thoughts, ideas, emotions, and other mental content are in complete awareness. Compare **preconscious, unconscious.**

consciousness /kon′shəsnes/, a clear state of awareness of self and the environment in which attention is focused on immediate matters, as distinguished from mental activity of an unconscious or subconscious nature.

conscious proprioception, the conscious awareness of body position and movement of body segments. It is regulated by the lemniscal system through pathways that begin in joint receptors and end in the parietal lobe of the cerebral cortex; it enables the cortex to refine voluntary movements.

conscious sedation^1, Now called moderate sedation.

conscious sedation^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as administration of sedatives, monitoring of the patient's response, and provision of necessary physiological support during a diagnostic or therapeutic procedure. See also **Nursing Interventions Classification.**

consensual /konsen′sho͞o·əl/ [L, *con* + *sentire,* to feel], pertaining to a reflex action in which stimulation of one body part results in a response in another.

consensual light reflex, a normally present crossed reflex in which light directed at one eye causes the opposite pupil to contract. In monocular blindness the pupil of the blind eye reacts consensually with stimulation of the seeing eye but does not cause constriction of the pupil of either eye. Also called **consensual reaction to light.** See also **light reflex.** Compare **direct light reflex.**

consensually validated symbols, symbols that are accepted by enough people that they have an agreed-upon meaning.

consensual reaction, contraction of the pupil of one eye when the other retina is stimulated. It is a normal reflex and a test to evaluate the second and third cranial nerves.

consensual reaction to light. See **consensual light reflex.**

consensual reflex /konsen′sho͞o·əl/ [L, *con* + *sentire,* to feel], pertaining to a reflex action in which stimulation of one body part results in a response in another.

consensual validation, **1.** a mutual agreement by two or more persons about a particular meaning that is to be attributed to verbal or nonverbal behavior. **2.** the determination that a measuring tool (e.g., a test) measures what it is supposed to measure.

consensus sequence /kənsen′səs/, a sequence of nucleotides or amino acids similar or identical between regions of homology in different but related DNA, RNA, or protein sequence.

consensus statement, a document developed by an independent panel of experts, usually multidisciplinary, convened to review the research literature for the purpose of advancing the understanding of an issue, procedure, or method.

consent /kənsent′/ [L, *consentire,* to agree], to give approval, assent, or permission. A person must be of sufficient mental capacity and of the age at which he or she is legally recognized as competent to give consent (age of consent). See also **informed consent.**

consenting adult, an adult who willingly agrees to participate in an activity with one or more other adults. The term is usually applied to sexual activity.

consequences /kon′səkwen′səs/, stimulus events following a behavior that strengthen or weaken it. They may be either reinforcers or punishers, positive or negative.

conservation of energy /kon′sərvā′shən/ [L, *conservare,* to preserve], (in physics) a law stating that in any closed system the total amount of energy is constant. It is superseded by the special relativity equation $e = mc^2$, but it is still applicable in the chemical process.

conservation of matter, (in physics) a law stating that matter can be neither created nor destroyed and that the amount of matter in the universe is finite. It is superseded by the special relativity equation $e = mc^2$, but it is still applicable in the chemical process. Also called *conservation of mass*. See also **conservation of energy.**

conservation principles of nursing, a conceptual framework for nursing that is directed at maintaining the wholeness or integrity of the patient when the normal ability to cope is disturbed by stress. Nursing intervention is determined by the patient's need to conserve energy and to maintain structural, personal, and social integrity. The patient is perceived as a person whose wholeness is threatened by stress. Subjective and objective indicators of stress are assessed by the nurse, the stimuli for the stress are identified, and the level of integrity in each area is evaluated. The nurse acts as a "conservationist."

conservative treatment. See **treatment.**

Consolidated Omnibus Budget Reconciliation Act (COBRA), legislation that provides for limited continuation of health coverage for individuals and families at the individual's own expense when the individual terminates employment from an organization that provides health insurance. The law applies only to organizations with a specified minimum number of employees.

consolidation /kənsol′idā′shən/ [L, *consolidare,* to make solid], **1.** the combining of separate parts into a single whole. **2.** a state of solidification. **3.** (in medicine) the process of becoming solid, as when the lungs become firm and inelastic in pneumonia.

consolidation of individuality and emotional constancy, (in psychiatry) the fourth and final subphase in Mahler's system of the separation-individuation phase of preoedipal development. It begins toward the end of the second year and is seen as open ended. A degree of object constancy is accomplished, and separation of self and object representations is established.

constancy /kon′stənsē/, an absence of variation in quality of distinctive features despite location, rotation, size, or color of an object.

constant /kon′stant/, a fact or principle that is not subject to change.

constant positive airway pressure. See **continuous positive airway pressure.**

constant positive pressure ventilation. See **continuous positive pressure ventilation.**

constant pressure generator, a machine that provides or generates a constant gas pressure throughout the inspiratory cycle of breathing. The pressure may range from a low value, such as 12 cm H_2O, to a high value of as much as 3500 cm H_2O, as required.

constant region, the part of an immunoglobulin in which the amino acid sequence is relatively constant in all molecules of that class of immunoglobulin. Compare **variable region.**

constant touch, a technique to diagnose the sensibility of an injured body part, such as a hand, by pressing the eraser end of a pencil or another object in various areas to determine the person's ability to detect the pressure.

constipation /kon′stipā′shən/ [L, *constipare,* to crowd together], difficulty in passing stools or incomplete or infrequent passage of hard stools. There are many causes, both organic and functional. Among the organic causes are intestinal obstruction, diverticulitis, and tumors. Functional impairment of the colon may occur in elderly or bedridden patients who fail to respond to the urge to defecate. For constipation that is not organically caused, the nurse can encourage a liberal diet of fruits, vegetables, and plenty of water. The patient should be encouraged to exercise moderately, if possible, and to develop regular, unhurried bowel habits. See also **atonic constipation.** —*constipated, adj.*

■ OBSERVATIONS: Manifestations of constipation range from vague abdominal discomfort and a feeling of "fullness" to acute abdominal pain and nausea and vomiting. Decreased history of stools; hard, dry stools; small stools; bloody stools; increased flatulence; increased rectal pressure and pain; straining to evacuate; and decreased appetite are also common. A Valsalva maneuver during straining to pass stool can cause serious problems for individuals with cardiac disease or cerebral edema. Complications include fecal impaction and perforation of the colon. Chronic constipation can lead to diverticulosis and mucosal ulcers of the rectum, particularly in older adults. Most constipation is diagnosed on clinical exam, although abdominal x-rays or sigmoidoscopy may be helpful.

■ INTERVENTIONS: Most cases of constipation are managed with diet therapy, stool softeners, bulk forming agents, laxatives, and enemas. Constipation from slowed or absent GI motility requires a long-term bowel program and possible colectomy for chronic constipation resistant to treatment.

■ NURSING CONSIDERATIONS: The overall goals of nursing care are to relieve the constipated state, produce regular soft, well-formed stools, and prevent complications, such as mucosal tears or bleeding hemorrhoids. Laxatives and/or enemas may be used for immediate relief. Assessment of elimination, nutrition, and activity patterns will assist the nurse in tailoring an educational approach aimed at preventing a pattern of chronic constipation. Emphasis on a high fiber diet, adequate fluid intake, and regular exercise is the cornerstone. Specific exercises to improve abdominal tone may be needed. The nurse should discourage regular use of laxatives and enemas for fecal elimination because it may lead to constipation, electrolyte imbalances, and enlarged colon with chronic use.

constipation/impaction management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as prevention and alleviation of constipation/impaction. See also **Nursing Interventions Classification.**

constitution, the general bodily health of an individual, expressed by the person's physical and mental ability to function adequately in adverse circumstances.

constitutional delay /kon′stityo͞o′shənəl/ [L, *constituere,* to establish], a period in a child's development during which growth may be interrupted. In some cases constitutional delay may be associated with an illness or stressful event, and growth resumes later. The lost growth may or may not be regained. A form of constitutional delay is associated with some types of dwarfism.

constitutional disease [L, *constituere,* to set up; Gk, *dis,* without; Fr, *aise,* ease], any disease associated with the inborn physical condition of the client, such as a hereditary susceptibility.

constitutional psychology, the study of the relationship of individual psychological makeup to body morphological characteristics and organic functioning.

constitutional symptom, a symptom that affects the general well-being or general status of a patient. Examples include weight loss, shaking, chills, fever, and vomiting.

constitutive resistance /kənstich′o͞otiv/, the bacterial resistance to antibiotics that is contained in the deoxyribonucleic acid molecules of the organism. The trait can be passed on to daughter cells through cell division, but it cannot be transmitted to other species of bacteria.

constriction /kənstrik′shən/ [L, *constringere,* to draw tight], an abnormal closing or reduction in the size of an opening or passage of the body, as in vasoconstriction of a blood vessel. See also **stenosis.**

constriction ring, a band of contracted uterine muscle that forms a stricture around part of the fetus during labor, usually after premature rupture of the membranes and sometimes impeding labor. The uterine wall is thickened in the zone of the ring and is not prone to rupture. Compare **pathological retraction ring.**

constrictive cardiomyopathy /kənstrik′tiv kär′dē·omī·op′əthe/ [L, *constringere,* to draw tight; Gk, *kardia,* heart, *mys,* muscle, *pathos,* disease], a heart disorder characterized by decreased diastolic compliance of the ventricles, imitating constrictive pericarditis. Also called **restrictive cardiomyopathy.**

constrictive pericarditis, a fibrous thickening of the pericardium caused by gradual scarring or fibrosis. The pericardium may undergo calcification and gradually becomes rigid, resisting the normal dilation of the heart chambers during the blood-filling phases of the cardiac cycle.

constrictor /kənstrik′tər/, a muscle that binds or restricts an opening, such as the ciliary body fibers that control the size of the pupil.

constructional apraxia /kənstruk′shənəl/ [L, *construere,* to build], a form of apraxia characterized by the inability to copy drawings or to manipulate objects to form patterns or designs. It is caused by a right hemisphere lesion. The deficit is tested by asking the patient to copy two-dimensional geometric patterns, such as circles, squares, diamonds, and hexagons, and to copy three-dimensional structures constructed of 1-inch building blocks.

constructive aggression /kənstruk′tiv/, an act of self-assertiveness in response to a threatening action for purposes of self-protection and preservation. See also **aggression.**

constructive interference, (in ultrasonography) an increase in amplitude of sound waves that results when multiple waves of equal frequency are transmitted precisely in phase.

construct validity /kon′strəkt/, validity of a test or a measurement tool that is established by demonstrating its ability to identify or measure the variables or constructs that it proposes to identify or measure. The judgment is based on the accumulation of correlations from numerous studies using the instrument being evaluated. See also **validity.**

consultant /kənsul′tənt/ [L, *consultare,* to deliberate], a person who by training and experience has acquired a special knowledge in a subject area that has been recognized by a peer group.

consultation^1 /kon′səltā′shən/ [L, *consultare,* to deliberate], a process in which the help of a specialist is sought to identify ways to correct problems in patient management or in planning and implementation of health care programs.

consultation^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as using expert knowledge to work with those who seek help in problem solving to enable individuals, families, groups, or agencies to achieve identified goals. See also **Nursing Interventions Classification.**

consultee-centered communication /kon′sultē′/, expert advice or guidance that is given a consultee (health care provider) to improve the consultee's capacity to function more effectively in working with patients.

consumption coagulopathy. See **disseminated intravascular coagulation.**

contact [L, *contingere,* to touch], **1.** the touching or drawing together of two surfaces, as those of upper and lower teeth. The term is often used attributively, as in contact dermatitis and contact lens. **2.** the moving together, either directly or indirectly, of two individuals so as to allow the transmission of an infectious organism from one to the other. **3.** a person who has been exposed to an infectious disease.

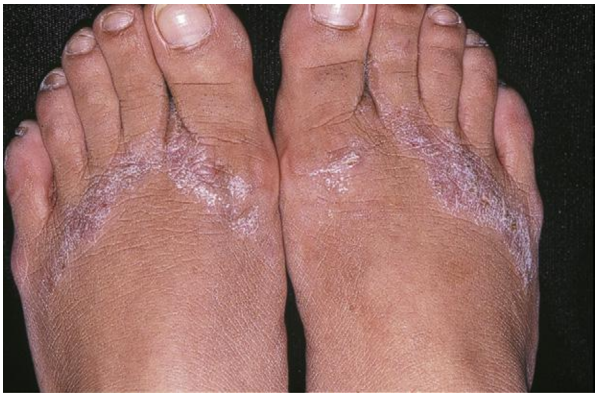
contact allergy, hypersensitivity to a substance that produced a reaction in a previous contact or that is structurally similar to another substance that produced such a reaction. Substances that can cause a contact allergy include poison ivy, metals, detergents, cosmetics, foods, and topical medicines.

contact dermatitis, a skin rash resulting from exposure to a primary irritant or to a sensitizing antigen. In the first, or nonallergic, type, a primary irritant, such as an alkaline detergent or an acid, causes a lesion similar to a thermal burn. Emergency treatment is to drench liberally and immediately with water. In the second, or allergic, type, sensitizing antigens cause an immunological change in certain lymphocytes. Subsequent exposure to the antigen causes the lymphocytes to release irritating chemicals, leading to inflammation, edema, and vesiculation. Poison ivy and nickel dermatitis are common examples of this type of delayed hypersensitivity reaction. The diagnosis can be aided by patch testing with suspected antigens. Treatment includes avoidance of the irritant or sensitizer, administration of topical corticosteroid preparations, and use of soothing or drying lotions. In severe cases, systemic corticosteroids may be used. Also called **dermatitis venenata.** Compare **atopic dermatitis.** See also **hypersensitivity reaction.**

■ OBSERVATIONS: Contact dermatitis is caused by contact with irritants and manifests as skin irritation at the site of contact. This irritation can vary from transient redness to bulla formation. Itching is common, and weeping and crusting may be present. Diagnosis is made through clinical evaluation, detailed history to locate possible source of contact rash, and patch testing to isolate allergens.

■ INTERVENTIONS: Removal of irritant from the skin with soap and water is the first line of treatment. Treatment then focuses on alleviating the itching and rash. Cool, wet cloths are effective for treating blistering. Oral antihistamines and colloidal oatmeal baths are used to control itching. Erythema may be treated with topical steroids. Oral corticosteroids are reserved for severe or widespread dermatitis.

■ NURSING CONSIDERATIONS: Instruction is needed about avoidance of contact with known irritants.



Allergic contact dermatitis to sandals
(White and Cox, 2006)

contact factor. See **factor XII, high-molecular-weight kininogen** (HMWK, **Fitzgerald factor),** and **prekallekrein** (PK).

contact hour, a 50-minute "hour" used to measure time for continuing education programs.

contact lens, a small, curved lens, primarily plastic in composition, shaped to fit the person's eye either to correct refractive error or to enhance appearance. The two primary forms of contact lenses are (1) rigid gas-permeable lenses, which are small, are durable, and have little to no water absorption; and (2) soft lenses, which are larger, are more fragile, and have a 30% to 70% water content. Contact lenses float on the precorneal tear film and must be inserted, removed, cleaned, and stored to prevent damage or infection to the eyes. Patients should not sleep with their lenses in their eyes.

contact lens care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the prevention of eye injury and lens damage by proper use of contact lenses. See also **Nursing Interventions Classification.**

contactor /kəntak′tər/, a switching device that is part of the timer for the control of voltage across an x-ray tube.

contact precautions, guidelines recommended by the Centers for Disease Control and Prevention for reducing the risk of transmission of epidemiologically important microorganisms by direct or indirect contact. Direct-contact transmission involves skin-to-skin contact and physical transfer of microorganisms to a susceptible host from an infected or colonized person. This can occur when health care personnel perform patient-care activities that require physical contact, such as turning or bathing the patient. Direct-contact transmission can also occur between two patients, such as by hand contact, with one patient serving as the source of infectious microorganisms and the other as a susceptible host. Indirect-contact transmission involves contact of a susceptible host with a contaminated intermediate object, usually inanimate, in the patient's environment. Contact Precautions apply to specified patients known or suspected to be infected or colonized with epidemiologically important microorganisms that can be transmitted by direct or indirect contact. See also **standard precautions, transmission-based precautions.** Compare **Airborne Precautions, Droplet Precautions.**

contact shield, a protective device constructed of lead or other material that is positioned directly over the eyes or gonads of a patient to be exposed to an x-ray beam.

contagion /kəntā′jən/ [L, *contingere,* to touch], the transmission of an infection by direct contact, droplet spread, or contact with contaminated fomites, such as clothing, bedding, dishes, or other objects the infected person has used.

contagious /kəntā′jəs/ [L, *contingere,* to touch], infectious; transmitted from person to person by direct or indirect contact. See also **communicable. —contagion,** *n.*

contagious disease. See **communicable disease.**

contagious pustular dermatitis [L, *contingere,* to touch, *pustula,* pustules; Gk, *derma,* skin, *itis,* inflammation], a skin disease normally affecting sheep and goats but transmitted to humans who handle infected animals. It is caused by a pox virus and results in lesions on the hands, and occasionally on the face. The lesions resolve spontaneously, but slowly. Also called **ecthyma contagiosum, orf.**

containment, the keeping of something within limits.

contaminant /kəntam′inənt/ [L, *contaminare,* to bring in contact], an agent that causes contamination, pollution, or spoilage, such as a mold spore that makes food unsafe to eat.

contaminated culture /kəntam′inātid/, a bacterial culture that has acquired unwanted foreign microorganisms.

contamination^1 /-ā′shən/ [L, *contaminare,* to pollute], a condition of being soiled, stained, touched, or otherwise exposed to harmful agents, making an object potentially unsafe for use as intended or without barrier techniques. An example is entry of infectious or toxic materials into a previously clean or sterile environment.

content analysis, a systematic procedure for the quantification and objective examination of qualitative data, such as observations and written or oral messages, by the classification and evaluation of terms, themes, or ideas; for example, the measurement of frequency, order, or intensity of occurrences in a communication to determine their meaning or effect.

content theme. See **communication theme.**

content validity, **1.** validity of a test or a measurement as a result of the use of previously tested items or concepts within the tool. See also **validity.** **2.** the degree to which the items within a research instrument or measurement tool represent the universe of content for the concept being measured or the domain of a given behavior.

context [L, *contextus,* to weave together], (in communications theory) the setting, meaning, and language of a message. If a message is interpreted without strict regard for these limits, it is taken out of context.

continence /kon′tinəns/ [L, *continere,* to contain], **1.** the ability to control bladder or bowel function. **2.** the use of self-restraint, particularly in regard to sexual intercourse.

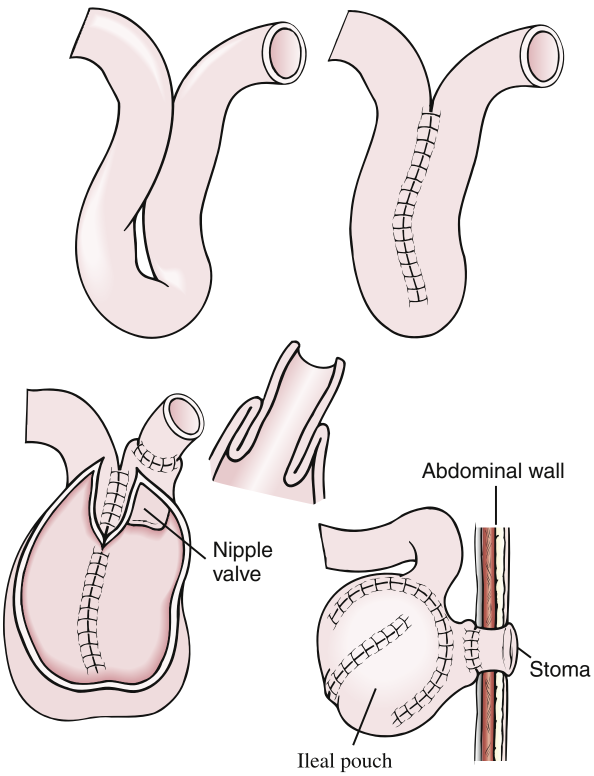
continent ileal reservoir, an intraabdominal pouch having a volume of at least 500 mL and a valve created from a portion of the ileum, pulled through the stoma, and lying flat against the abdominal wall. It maintains continence of feces and is emptied by a catheter when full. See also **continent ileostomy**.

continent ileostomy /kon′tinənt/, an ileostomy that drains into a surgically created pouch or reservoir in the abdomen. Involuntary discharge of intestinal contents is prevented by a nipple valve created from the ileum. This method eliminates the need for the patient to wear an external pouch over the stoma. Also called **Kock's pouch.**

■ METHOD: After surgery the pouch is kept relatively empty by means of a catheter placed in it at surgery. The catheter is removed a week or two afterward, depending on the status of intestinal function and wound healing. Once the indwelling catheter is removed, the pouch is drained by periodically inserting a catheter through the stoma into the pouch through the valve. The time allowed to elapse between catheterizations is gradually lengthened as the capacity of the pouch increases to between 500 and 1000 mL. Six months after surgery drainage may be necessary only three or four times a day. The patient learns to recognize a feeling of fullness that indicates the need for drainage. When the patient is seated on the toilet, the dressing over the stoma is removed, and the tip of a French size 28 to 32 catheter is lubricated and inserted into the stoma. The distal end of the catheter is in a receptacle or in the toilet, at least 30 cm below the stoma. The lubricated tip of the catheter is advanced carefully through the stoma. Resistance is usually felt at a depth of about 5 cm where the valve covers the opening to the pouch. Flow usually begins when the tip of the catheter has passed the valve, at a distance of approximately 7.5 cm from the stoma. Complete drainage may require up to 15 minutes.

■ INTERVENTIONS: After surgery the patient is usually instructed to add foods one at a time. High-fiber foods and those that cause gas formation are particularly likely to be problematic. Thick secretions may be thinned by the injection of a little water into the pouch through the catheter. The stoma may be covered with a stoma cap or dressing. It is important to teach the patient to prevent irritation of the skin around the stoma. Nonallergenic tape may be used to hold the pad in place. After healing, if there is no danger of a blow to the abdomen, a pad is often not necessary. After surgery activity is resumed as the patient is able to tolerate it. There is no reason for activity to be curtailed once healing is complete and the person feels well.

■ OUTCOME CRITERIA: The patient may expect to be able to care for the stoma and to manage the drainage of the pouch. A continent ileostomy has several advantages, including the prevention of unpleasant odors and the convenience of eliminating the need for a colostomy or ileostomy bag.



Surgical formation of a continent ileostomy
(Lewis et al, 2007)

continent urostomy. See **Indiana pouch.**

contingency contracting /kəntin′jənsē/ [L, *contingere,* to touch], a formal agreement between a psychotherapist and a patient undergoing behavior therapy regarding the consequences of certain actions by both parties.

contingency management, any of a group of techniques used in behavior therapy that attempts to modify a behavioral response by controlling the consequences of that response. Kinds of contingency management include **contingency contracting, shaping,** and **token economy.**

contingent nurse. See **float nurse.**

continua. See **continuum.**

continuing care nurse /kəntin′yo͞o·ing/ [L, *continuare,* to unite], a nurse who specializes in coordination of the overall needs of the patient with the potential health care resources of the community. Much of the emphasis is on discharge planning and assessment of the availability of participation in the patient's care after discharge by members of the family or other parties. Continuing care nursing responsibilities and discharge planning ideally begin at the time a patient is admitted to a hospital.

continuing education, formal educational programs designed to promote knowledge, skills, and professional attitudes. The programs are usually short-term and specific. A certificate may be awarded for completion of a course, and a number of continuing education units or contact hours may be conferred. Continuing education is required for relicensure in many states. It is not to be confused with academic degree-granting programs, such as advanced education or graduate education. See also **contact hour.**

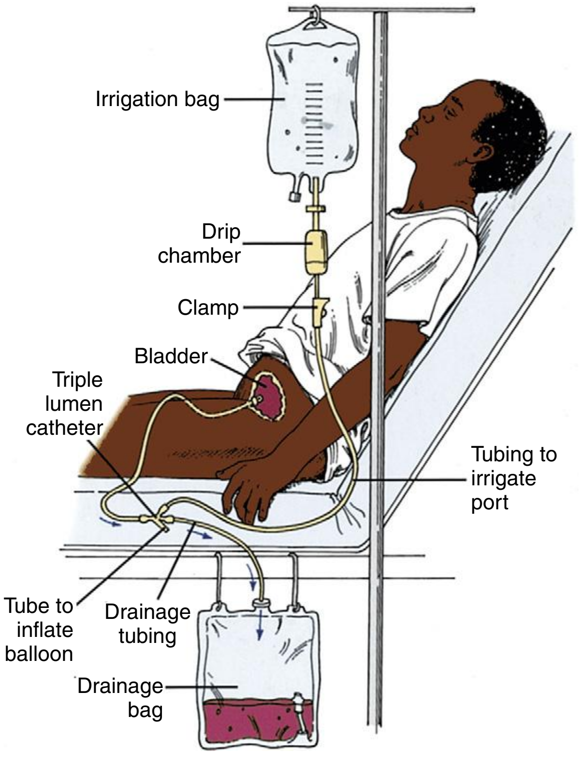
continuing education unit (CEU), a point awarded to a professional person by a professional organization for having attended an educational program relevant to the goals of the organization. A value is established for the course, and that number of points is given. Many states require professionals in the various fields of medicine and nursing to obtain a specific number of CEUs annually for relicensure. See also **contact hour.**

continuity theory /kon′tinyo͞o′itē/, a concept that an individual's personality does not change as the person ages, with the result that his or her behavior becomes more predictable.

continuous ambulatory peritoneal dialysis (CAPD) /kəntin′yo͞o·əs/ [L, *continuare,* to unite, *ambulare,* to walk about; Gk, *peri,* near, *tenein,* to stretch, *dia,* through, *lysis,* loosening], a maintenance system of peritoneal dialysis in which an indwelling catheter permits fluid to drain into and out of the peritoneal cavity by gravity.

continuous bath. See **continuous tub bath.**

continuous bladder irrigation (CBI), a continuous infusion of a sterile solution into the bladder, usually by using a three-way irrigation closed system with a triple-lumen catheter. One lumen is used to drain urine; another is used to inflate the catheter balloon, and the final lumen carries the irrigation solution. CBI is primarily used following genitourinary surgery to keep the bladder clear and free of blood clots or sediment. See also **drainage.**



Continuous bladder irrigation *(Perry, Potter, and Elkin, 2012)*

continuous cycling peritoneal dialysis (CCPD), a type of dialysis in which the patient is attached to an automatic cycler for short exchanges while sleeping at night. Mobility is not feasible because of the cumbersome equipment. During waking hours the patient receives long dialysis exchanges but has ambulatory freedom.

continuous fever, a fever that persists steadily for a prolonged period. Compare **intermittent fever.**

continuous mandatory ventilation. See **assist-control mode.**

continuous murmur [L, *continuare,* to unite, *murmur,* humming], an uninterrupted heart murmur or cervical venous hum that characteristically begins in systole and persists through diastole. Cervical venous hum is a normal finding in children; other continuous murmurs are always pathological.

continuous negative chest wall pressure, a pressure below ambient pressure that is applied to the chest wall during the entire respiratory cycle, thus increasing transpulmonary pressure.

continuous passive motion (CPM), a technique for maintaining or increasing the amount of movement in a joint, using a mechanical device that applies force to produce joint motion without normal muscle function.

Continuous passive motion

(Courtesy DJO Global, Vista, California)

Continuous positive airway pressure

(Perry, Potter, and Elkin, 2012)

continuous phase [L, *continuare,* to unite; Gk, *phasis,* appearance], the phase of a colloidal solution corresponding to that of the solvent of a true solution. Also called **dispersion medium, external phase.**

continuous positive airway pressure (CPAP), a method of noninvasive or invasive ventilation assisted by a flow of air delivered at a constant pressure throughout the respiratory cycle. It is performed for patients who can initiate their own respirations but who are not able to maintain adequate arterial oxygen levels without assistance. CPAP may be given through a ventilator and endotracheal tube, through a nasal cannula, or into a hood over the patient's head. Respiratory distress syndrome in the newborn and sleep apnea are often treated with CPAP. Also called **constant positive airway pressure,** *continuous positive pressure breathing.* Compare **positive end-expiratory pressure.**

continuous positive pressure ventilation (CPPV), a pressure above ambient pressure maintained in the upper airway throughout the breathing cycle. The term is usually applied to positive end-expiratory pressure and mechanical ventilation. Also called **constant positive pressure ventilation, continuous positive pressure breathing.** See also **continuous positive airway pressure.**

continuous quality improvement (CQI), a system that seeks to improve the provision of services with an emphasis on future results. Like total quality management, CQI uses a set of statistical tools to understand subsystems and uncover problems, but its emphasis is on maintaining quality in the future, not just controlling a process. Once a process that needs improvement is identified, a team of knowledgeable individuals is gathered to research and document each step of that process. Once specific expectations and the means to measure them have been established, implementation aims at preventing future failures and involves the setting of goals, education, and the measurement of results. If necessary, the plan may be revised on the basis of the results, so that the improvement is ongoing.

continuous regional anesthesia [L, *continuare,* to unite], a method for maintaining regional nerve block. A local anesthetic solution is infused at intervals or at a slow rate to infiltrate epidural or spinal spaces, usually via an indwelling catheter.

continuous reinforcement, a schedule of strengthening or rewarding behavior in which omission of a response is followed by a reinforcing event or behavior.

continuous tremor, fine, rhythmic, purposeless movements that persist during rest but sometimes disappear briefly during voluntary movements. The pill-rolling movements and trembling of Parkinson's disease are typical of continuous tremors. Also called **resting tremor.** Compare **intention tremor.** See also **tremor.**

continuous tub bath, a therapeutic bath, usually prescribed in the treatment of some dermatological conditions, in which the patient lies supported in a medicated solution of tepid water.

■ METHOD: The bath is prepared as for a medicated tub bath. The patient is immersed in the water, and a towel saturated with the solution is placed over the torso. The patient may wear a loin cloth, and a harness is fitted comfortably around the chest and under the shoulders and head to hold the head safely out of the water as the patient sleeps or dozes. A pillow or folded towel is placed over the wide supporting straps under the head and neck to add to the patient's comfort. A board is placed on top of the tub from the patient's shoulders to the end of the tub, and a sheet is draped over it. A bell for calling for assistance, a container of drinking water with a flexible straw, and any other materials that may be needed are placed on the board.

■ INTERVENTIONS: The method and the reason for the treatment are explained to the patient. Privacy is maintained; close supervision by a nurse is available throughout the treatment. The procedure is psychologically trying and may be physically unpleasant for the patient. Psychosocial support and attention to maximization of patient comfort improve the patient's tolerance for the procedure.

■ OUTCOME CRITERIA: The patient is observed for any febrile reaction, rapid or weak pulse, faintness, or increased severity of symptoms, such as itching, burning, or pain. The solution is changed completely every 4 hours, the linen is changed twice a day, and the harness is changed once a day.

continuous wave (CW), **1.** an uninterrupted flow of energy, such as a beam of laser light. **2.** sound intensity that remains constant while ultrasound is being produced.

continuum /kəntin′yo͞o·əm/, *pl.* **continua** **1.** a continuous series or whole. **2.** (in mathematics) a system of real numbers.

contour /kon′to͞or/ [Fr], **1.** *n*, the normal outline or configuration of the body or of a part. **2.** *v*, to shape a solid along certain desired lines.

contoured adducted trochanteric controlled alignment method (CAT-CAM) /kon′to͝ord/, a design for an artificial lower limb for persons who have undergone above-the-knee amputations.

contouring /kon′to͞oring/, the process of forming a contour.

contra-, prefix meaning "against": *contraception, contralateral, contraparetic*.

contra-angle /kon′trə·ang′gəl/ [L, *contra,* against + *angulus*, angle], an angulation by which the working point of a surgical instrument is brought close to the long axis of its shaft. It may involve two, three, or four bends, or angles, in its shank.

contra-angle handpiece, a handpiece (dental drill) in which two or more angles or bends are used to set the shaft at a desired angle to access hard-to-reach areas of the oral cavity.

contra bevel [L, *contra,* against; OFr, *baif,* open mouth], **1.** also called **reverse bevel.** the angle between a dental cutting blade and the base of the periodontal pocket when the blade is held so that it separates the sulcular epithelium from the external epithelium of the gingiva. **2.** an external bevel of a tooth preparation extending onto a buccal or lingual cusp from an intracoronal restoration.

contraception /kon′trəsep′shən/ [L, *contra* + *concipere,* to take in], a process or technique for preventing pregnancy by means of a medication, device, or method that blocks or alters one or more of the processes of reproduction in such a way that sexual union can occur without impregnation. Kinds of contraception include **cervical cap, condom, contraceptive diaphragm, injectable contraceptive, intrauterine device, natural family planning method, oral contraceptive, spermatocide, sterilization,** and *subdermal contraceptive implants*. Also called **birth control, conception control.** See also **basal body temperature method of family planning, planned parenthood.**

contraceptive /kon′trəsep′tiv/ [L, *contra* + *concipere,* to take in], any device or technique that prevents conception. See also **contraception.**

contraceptive diaphragm, a contraceptive device consisting of a hemisphere of thin rubber bonded to a flexible ring, inserted into the vagina together with spermicidal jelly

Advantages and disadvantages of contraceptive methods

Method	*Advantages*	*Disadvantages*
Abstinence		
	100% effective in preventing sexually transmitted diseases (STDs) and pregnancy	Peer pressure to conform Relatively high failure rate from noncompliance
Withdrawal (coitus interruptus)		
Withdrawal of penis before ejaculation	No medical visit necessary	High failure rate Some seminal fluid often released before ejaculation Ejaculate at vaginal orifice may enter vagina No STD protection
Calendar method		
Refrain from intercourse during fertile period (time of ovulation)	Teaches girls about their menstrual cycle Encourages couple participation	High failure rate Requires a regular, predictable menstrual cycle (irregular menses are common for first 2 yr after menarche) No STD protection
Barrier methods		
Condom	Minimal side effects Easy to use Available without prescription Portable Provides protection against STDs Spermicidal condoms increase effectiveness for pregnancy and STD prevention Inexpensive in comparison to female condom Female participation Made of polyurethane; no latex sensitivities and can be used with oil-based lubricants Provides protection from STDs	Requires consistent use Requires premeditated intent for sexual union May decrease sensation

Continued

Advantages and disadvantages of contraceptive methods—cont'd

Method	*Advantages*	*Disadvantages*
Male—Penile covering to trap sperm	Provides protection against STDs	Misuse results in failure Small percentage of people have latex sensitivity or allergies Decreased spontaneity
Female—Inserted into vagina with base covering part of perineum; may be inserted 8 hours before intercourse	Female participation Made of polyurethane; no latex sensitivities	Improper use may lead to pregnancy or development of STD May be difficult to insert Coital dependent Noisy
Diaphragm Cervical covering to prevent sperm from reaching egg Must be used in conjunction with spermicidal jelly May be inserted 4-6 hr before intercourse If inserted early, should be checked for placement before coitus	Can be fitted in virgins Low failure rate when used correctly Few contraindications May be reused	High failure rate in adolescents because of inconvenience of use Requires consistent use Requires fitting and instruction by medical personnel Requires premeditated intent for sexual union Requires body awareness and comfort with touching oneself for insertion Little STD protection May increase incidence of UTI
Lea's Shield Reusable vaginal contraceptive made of silicone; elliptical bowl placed in vagina up to 48 hr before sexual intercourse; removed 8 hr after intercourse	No latex allergies Reusable Very effective in nulliparous women Simple fitting	Less effective in women who have delivered a baby Requires prescription No STD protection More effective if spermicidal cream is used May increase incidence of urinary tract infection
Cervical Cap Soft rubber dome with a firm but pliable rim; fits over base of the cervix close to the junction of the cervix and vaginal fornices	May be inserted hours before intercourse Insertion and removal similar to diaphragm	Available in only 4 sizes Must remain in place at least 6 hours after intercourse, but no more than 48 hours Not recommended for women with abnormal Pap test, history of toxic shock syndrome, or who have difficulty with proper fitting No STD protection
Chemicals Spermicidal foam, jelly, cream, and suppositories Substance inserted into vagina to kill sperm	Available without prescription Inexpensive Easy to use No major health concerns	High failure rate unless combined with condom Possible for sperm to be ejaculated directly into uterine os, bypassing spermicide in vagina Must be used shortly before coitus; therefore requires interruption of sexual experience Repeated sexual union requires repeated application Requires premeditated intent for sexual union Messy Nonoxynol-9 associated with increased transmission of human immunodeficiency virus to females; should not be used with anal sex in male partner sex for same reason No STD protection.
Oral contraceptives		
Estrogen and progesterone-like compounds Inhibit ovulation by blocking release of gonadotropins from anterior pituitary gland	99% effective if used correctly Safe for adolescents Method of choice for most adolescents Administered by mouth Becomes a ritual not associated with sexual activity Regulates menses, decreases dysmenorrhea and acne, decreases menstrual flow Prevents ovarian and endometrial cancers Prevents functional ovarian cysts	Higher failure rate in adolescents than in older women Need to follow precise instructions; requires continued motivation, consistent use Requires prescription Price substantial for teenager No STD protection Possible side effects include headaches, missed or scanty periods, breakthrough bleeding, blood clots Increased rates of chlamydia

Continued

Advantages and disadvantages of contraceptive methods—cont'd

Method	*Advantages*	*Disadvantages*
Medroxyprogesterone acetate (Depo-Provera)		
Progestin that suppresses hormonal cycle and prevents ovulation Injection given every 3 mo	No interruption of sex Invisible method	No STD protection Possible side effects include significant weight gain, decreased high-density lipoproteins, irregular menses or amenorrhea, decreased libido, depression Fertility may be delayed after discontinuation Must return to care provider every 3 mo for injection Food and Drug Administration recommends discontinuation after 2 yr because of decreased bone density
Ortho Evra transdermal system		
4.5-cm (1.75 in) square patch with norelgestromin and ethinyl estradiol Hormonal patch applied to skin weekly for 3 consecutive weeks (21 days) Suppresses ovulation, thickens cervical mucus, and thins endometrium	88.2% effective in perfect users Simple to use Regular menstrual cycles Not associated with sexual activity Avoids first-pass metabolism, resulting in more constant levels	Not recommended for women >90 kg (198 lb) Possible side effects include skin reaction at site, nausea, headache, dysmenorrhea, breast tenderness Slight increase risk of blood clot formation over combination oral contraceptive pill Patch may be visible No STD protection
NuvaRing		
Etonogestrel plus ethinyl estradiol Soft, flexible, transparent ring placed in vagina for 3 wk Suppresses ovulation	99.3% effective Immediate return to ovulation at discontinuation May leave in place during sexual intercourse Avoids first-pass metabolism, resulting in more constant levels No spermicide needed No vaginal erosion No weight gain	Device may be felt by female or partner during sexual intercourse Device may fall out Possible side effects include headache, vaginitis, leukorrhea, nausea, breakthrough bleeding May have late withdrawal bleeding requiring placement of ring during menses No STD protection
Levonorgestrel intrauterine system (Mirena)		
T-shape intrauterine device that releases 20 mcg/day of levonorgestrel Inserted within 7 days of menses and remains in place for 5 yr Thickens cervical mucus, inhibits sperm mobility and function	>99% effective Effectively prevents fertilization, resulting in low rates of ectopic pregnancy Reduced length and quantity of menstrual bleeding Reduced dysmenorrhea No weight gain	Risk of perforation at time of insertion 2%-12% expulsion rate Not recommended in nulliparous women or women not in monogamous relationships Possible side effects include abdominal pain, headache, vaginal discharge, and breast pain No STD protection
Emergency or postcoital contraceptions		
Emergency contraception works in one of three ways: by suppressing or delaying ovulation, by preventing the meeting of sperm and egg, or by preventing implantation Progestin-only pill given within 72 hours of intercourse *or* Insertion of a copper-releasing intrauterine device up to 7 days after unprotected intercourse	Useful in unplanned sexual intercourse or contraceptive failure May be given to adolescent in advance in case of an emergency Available without prescription for adults	No STD protection May cause nausea if combination method used May change timing of next menstrual cycle

Modified from Hockenberry MJ, Wilson D: *Wong's nursing care of infants and children,* ed 9, St Louis, 2011, Mosby.

or cream up to 2 hours before coitus. Fitted between the pubic symphysis and the posterior fornix of the vagina, the diaphragm cups the cervix in a pool of spermicide so that spermatozoa cannot enter the uterus, thus preventing conception. The rate of failure of the diaphragm method of contraception is approximately 2 unplanned pregnancies in 100 women using the method properly for 1 year. The principal advantage of the diaphragm is that it has no systemic effects. Diaphragms are manufactured in seven standard sizes from 55 to 100 mm in diameter. Kinds of diaphragms are **arcing spring, coil spring,** and **flat spring.** Also called *(informal)* **diaphragm.**

contraceptive diaphragm fitting, a procedure, performed in an office or clinic, in which a contraceptive diaphragm is selected according to the clinical assessment of anatomical factors specific to the woman being fitted, including size of the vagina, position of the uterus, depth of the arch behind the symphysis pubis, and degree of support afforded by the muscles surrounding the vagina. See also **arcing spring contraceptive diaphragm, coil spring contraceptive diaphragm, flat spring contraceptive diaphragm.**

contraceptive effectiveness, the effectiveness of a method of contraception in preventing pregnancy. For clinical purposes it combines the theoretic effectiveness of the device, medication, or method and the use effectiveness. It is sometimes represented as a percentage but more accurately as the number of pregnancies per 100 woman-years. The average pregnancy rate for a couple who are sexually active and do not use contraceptives is equivalent to 85 pregnancies per 100 woman-years. A contraceptive method that results in a pregnancy rate of fewer than 10 pregnancies per 100 woman-years is considered highly effective. See also **pregnancy rate, woman-year.**

contraceptive jelly [L, *contra,* opposed, *concipere,* to take in, *gelare,* to congeal], a gelatinous preparation containing a spermicide to be introduced into the vagina to prevent conception.

contraceptive method, any act, device, or medication for avoiding conception or a viable pregnancy. See also **cervical cap, condom, diaphragm, intrauterine device, natural family planning method, oral contraceptive, spermatocide, sterilization.**

contract [L, *con* + *trahere,* to draw], **1.** *n,* /kon′trakt/, an agreement or a promise that meets certain legal requirements, including competence of both or all parties to make the contract, proper lawful subject matter, mutuality of agreement, mutuality of obligation, and consideration (the exchange of something of value in payment for the obligation undertaken). **2.** *v,* /kəntrakt′/, to make such an agreement or promise. **—contractual,** *adj.*

contracted kidney, a kidney that is greatly reduced in size and function as a result of an overgrowth of fibrous tissue and a diminished blood supply. The condition occurs in arteriolar nephrosclerosis and glomerulonephritis.

contractile /kəntrak′tīl/ [L, *con,* with, *trahere,* to draw], capable of becoming reduced in size or length or of being drawn together in response to some stimulus.

contractile ring dysphagia [L, *con* + *trahere,* to draw; AS, *hring*], an abnormal condition characterized by difficulty in swallowing caused by an overreactive interior esophageal sphincteric mechanism that induces painful sticking sensations under the lower sternum. Compare **dysphagia lusoria, vallecular dysphagia.**

contractility /kon′traktil′itē/, the ability of muscle tissue to contract when its thick (myosin) and thin (actin) filaments slide past each other.

contraction /kəntrak′shən/ [L, *con* + *trahere,* to draw], **1.** a reduction in size, especially of muscle fibers. **2.** an abnormal shrinkage. **3.** (in labor) a rhythmic tightening of the musculature of the upper uterine segment that begins as mild tightening and becomes very strong late in labor, occurring as frequently as every 2 minutes and lasting over 1 minute. Contractions decrease the size of the uterus and squeeze the fetus through the birth canal. **4.** abnormal smallness of the birth canal or part of it, a cause of dystocia. **Inlet contraction** exists if the anteroposterior diameter is 10 cm or less or if the transverse diameter is 11.5 cm or less. **Midpelvic contraction** exists if the sum of the measurements in centimeters of the interspinous diameter (normally 10.5 cm) and the posterior sagittal diameter (normally 5 cm) is 13.5 cm or less. **Outlet contraction** exists if the intertuberous diameter is 8 cm or less. See also **clinical pelvimetry, concentric contraction, dystocia, eccentric contraction, x-ray pelvimetry.**

contractions stress test (CST), ultrasound monitoring of the fetal heart rate during uterine contractions induced by oxytocin administration or nipple stimulation.

contract-model HMO, a model in which the health maintenance organization (HMO) contracts with individual physicians rather than groups of providers for services not provided directly by the HMO.

contract suicide, assisted suicide for remuneration.

contractual. See **contract.**

contracture /kəntrak′chər/ [L, *contractura,* a pulling together], an abnormal, usually permanent condition of a joint, characterized by flexion and fixation. It may be caused by atrophy and shortening of muscle fibers resulting from immobilization or by loss of the normal elasticity of connective tissues or the skin, as from the formation of extensive scar tissue over a joint. See also **Volkmann's contracture.**

contraindicate /kon′trə·in′dikāt/ [L, *contra,* against, *indicare,* to make known], to report the presence of a disease or physical condition that makes it impossible or undesirable to treat a particular client in the usual manner or to prescribe medicines that might otherwise be suitable.

contraindication /-in′dikā′shən/ [L, *contra,* against, *indicare,* to make known], a factor that prohibits the administration of a drug or the performance of an act or procedure in the care of a specific patient. For example, pregnancy is a contraindication for the administration of tetracycline, immunosuppression may be a contraindication for vaccination, and complete placenta previa is a contraindication for vaginal delivery.

contralateral /-lat′ərəl/ [L, *contra* + *lateralis,* side], affecting or originating in the opposite side of a point of reference, such as a point on a body.

contralateral reflexes [L, *contra,* against, *latus,* side, *reflectere,* to bend back], an overflow phenomenon of the nervous system in which a reflex is elicited on one side of the body by a stimulus to the opposite side.

contrast /kon′trast/ [L, *contra,* against, *stare,* to stand], a measure of the difference in optic density, radiation transmission, pixel brightness, or other parameters between two adjacent areas in a radiographic image. Contrast plays an important role in the ability of a radiologist to perceive image detail.

contrast agent. See **contrast medium**.

contrast bath, a bath in which the patient alternately immerses a part of the body, usually the hands or feet, in hot and cold water for a specified period. The procedure is used to increase the blood flow to a particular area.

contrast enema. See **barium enema.**

contrast examination, the use of radiopaque materials to make internal organs visible on x-ray film. Because of their high atomic numbers, substances such as iodine and barium have an x-ray photoelectrical interaction that is nearly 400 times that of soft tissue. As a result, internal organs or cavities outlined by such substances are more visible.

contrast medium, a substance that is injected into the body, introduced via catheter, or swallowed to facilitate radiographic imaging of internal structures that otherwise are difficult to visualize on x-ray films. Contrast media may be either radiopaque or radiolucent. Also called **contrast agent.**

contrast nephropathy, kidney damage by a contrast medium, usually seen in patients already weakened by some other condition, such as diabetes mellitus, proteinuria, hypovolemia, multiple myeloma, or preexisting renal insufficiency. There is usually a sharp decline in the glomerular filtration rate after administration of the agent, sometimes with acute renal failure, followed in a few days by return to the patient's previous level of function. Also called **contrast medium nephrotoxicity.**

contrasuppressor cell /kon′trəsəpres′ər/, one of a group of T cells that inhibit the function of suppressor T cells.

contrecoup. See **coup,** def 4.

contrecoup injury /kôtreko͞o′/ [L, *contra,* against; Fr, *coup,* blow; L, *injuria*], an injury, usually involving the brain, in which the tissue damage is on the side opposite the trauma site, as when a blow to the left side of the head results in brain damage on the right side.

contributory negligence /kəntrib′yətôr′ē/, a legal term describing a situation in which both the plaintiff and the defendant share in the negligence that caused injury to the plaintiff.

control [Fr, *controler,* to register], **1.** *v,* to exercise restraint or maintain influence over a situation, as in self-control, the conscious limitation or suppression of impulses. **2.** *n,* a standard against which conclusions may be measured, as in a "control group."

control cable, a stainless steel wire, usually contained in a flexible stainless steel housing, used to move or lock a prosthesis into place.

control gene, a gene, such as an operator or a regulator, that controls the transcription of a structural gene by either inducing or repressing RNA synthesis.

control group, a set of items or people that serves as a standard or reference for comparison with an experimental group. A control group is similar to the experimental group in number and is identical in specified characteristics, such as sex, age, annual income, parity, or other factors, but does not receive the experimental treatment or intervention.

controlled area, a part of a hospital or other health facility that is occupied primarily by personnel who work with radioactive materials. It is designed with barrier shielding to confine the radiation exposure rate in the area to less than 100 milliroentgen per week.

controlled association. 1. a direct connection of relevant ideas that results from a specific stimulus. **2.** also called **word association.** a process of drawing repressed ideas into the consciousness in response to words spoken by a psychoanalyst.

controlled hypotension. See **deliberate hypotension.**

controlled ovarian hyperstimulation, a method of assisted reproductive technology consisting of carefully monitored administration of agents designed to induce ovulation by a greater number of ovarian follicles and thus increase the probability of an oocyte being fertilized. Also called **controlled ovarian stimulation.**

controlled oxygen therapy, the administration of oxygen to a patient on a dose-response basis in which oxygen is regarded as a drug and only the smallest amount of it is used to obtain a desired therapeutic effect.

controlled substance [Fr, *controle,* to register; L, *substantia,* essence], any drug defined in the five categories of the federal **Controlled Substances Act** of 1970. The categories, or schedules, cover opium and its derivatives, hallucinogens, depressants, and stimulants. Schedule I drugs have a high abuse potential and no approved medical uses. Drugs in Schedules II to V all have approved medical indications, with decreasing abuse and dependence liabilities as the schedule number increases.

controlled substance checking, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promoting appropriate use and maintaining security of controlled substances. See also **Nursing Interventions Classification.**

Controlled Substances Act, a U.S. law enacted in 1970 that regulates the prescribing and dispensing of psychoactive drugs, including stimulants, depressants, and hallucinogens. The act lists five categories of restricted drugs, organized by their medical acceptance, abuse potential, and ability to produce dependence.

United States classification of controlled substances

Schedule	*Dispensing restrictions*	*Examples*
C-I	Only with approved protocol	Heroin, lysergic acid diethylamide (LSD), marijuana, mescaline, peyote, psilocybin, and methaqualone
C-II	• Written prescription only (if telephoned in, written prescription required within 72 hr) • No prescription refills • Container must have warning label	Codeine, cocaine, hydromorphone, meperidine, morphine, methadone, secobarbital, pentobarbital, oxycodone, amphetamine, methylphenidate, and others
C-III	• Written or oral prescription that expires in 6 mo • No more than five refills in 6-mo period • Container must have warning label	Codeine with selected other medications (e.g. acetaminophen), hydrocodone, pentobarbital rectal suppositories, and dihydrocodeine combination products
C-IV	• Written or oral prescription that expires in 6 mo • No more than five refills in 6-mo period • Container must have warning label	Phenobarbital, chloral hydrate, meprobamate, the benzodiazepines (e.g. diazepam, temazepam, lorazepam), dextropropoxyphene, pentazocine, and others
C-V	Written prescription or over the counter (varies with state law)	Medications generally for relief of coughs or diarrhea containing limited quantities of certain opioid controlled substances

From Lilley et al: *Pharmacology and the nursing process*, ed 6, St Louis, 2011, Mosby.

Canadian controlled substance chart

Drugs	*Canada*
LSD, mescaline (peyote), harmaline, psilocin and psilocybin (magic mushrooms)	**Part J of the Food and Drug Regulation (FDR)** • Considered "restricted drugs" • High misuse potential • No recognized medical use • Marihuana exemption from FDR if produced for medical reasons
Sedatives such as barbiturates and derivatives (secobarbital), thiobarbiturates (pentothal sodium); anabolic steroids (androstanolone), weight-reduction drugs (anorexiants)	**Part G of the FDR** • Controlled drugs • Misuse potential • Verbal and written prescriptions under certain conditions • Only prescribed if required for medical condition • Specified number of refills (conditions apply) • Records must be kept • May be administered under emergency situations (conditions apply)
Amphetamines; benzphetamine; methamphetamine; phenmetrazine; phendimetrazine	**Part G of the FDR** • Designated controlled drug • May be used for designated medical conditions outlined in FDR
Benzodiazepine tranquilizers such as diazepam, lorazepam, flunitrazepam, zolpidem	**Benzodiazepines and other targeted substances regulations** • Misuse potential • Verbal and written prescriptions under certain conditions • Only prescribed if required for medical condition • Specified number of refills (conditions apply) • Records must be kept • May be administered under emergency situations (conditions apply)
Opiates: heroin, morphine, codeine >8 mg, Amidone (methadone), coca and derivatives (cocaine), phencyclidine (PCP), benzazocines (analgesics such as pentazocine), fentanyls	**Narcotic control regulation** • High misuse potential • Written prescriptions for specific medical conditions* • Records of opiate prescription file must be kept • No refills (limited amounts in a prescription) • Heroin and methadone are subject to specific controls
Chloral hydrate, chlordiazepoxide	**Schedule F of the FDR** • Low misuse potential

From Skidmore-Roth L: *Mosby's 2008 nursing drug reference*, St Louis, 2008, Mosby.

*Verbal prescriptions are permitted for certain opioid preparations (such as Tylenol No. 2 and No. 3), but not for opiate alone, or opiates with one other active nonopioid ingredient.

controlled ventilation, the use of an intermittent positive pressure breathing unit or other respirator that has an automatic cycling device that replaces spontaneous respiration. Some units measure expired volume, nebulize medication or fluids in the air, exert negative pressure at the end of expiration, or have a variety of alarms.

control of hemorrhage, the limitation or cessation of the flow of blood from a break in the wall of a blood vessel.

■ METHOD: Some of the methods for controlling hemorrhage are direct pressure, use of a tourniquet, and application of pressure on pressure points proximal to the wound. Direct pressure with a thick compress is applied in such a way that the edges of the wound are drawn together. A tourniquet is applied proximal to the site of bleeding only in the most extreme emergency, for the limb may then have to be removed as a result of tissue anoxia stemming from the use of the tourniquet. Firm manual pressure is applied to a pressure point over the main artery supplying the wound. Points used to obtain the pulse may be used as pressure points to stop hemorrhage. See also **tourniquet.**

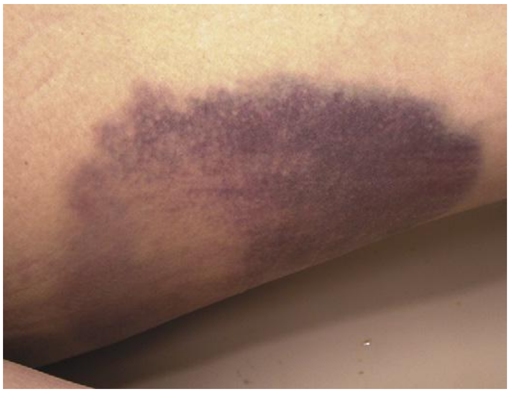
■ INTERVENTIONS: Blood flow to an area is limited by restricting activity, elevating the part, and applying pressure. Specific treatment depends on the cause of the hemorrhage and the patient's condition. In addition to IV infusion equipment and fluids, the nurse may anticipate the need for vasopressor drugs, ventilatory assistance, central venous pressure monitoring equipment, and materials for obtaining and recording the blood pressure and urinary output. If signs of shock are present, the patient may be placed supine at a 45-degree angle to the pelvis, with the knees straight and the pelvis slightly higher than the chest. The head may be supported with a pillow. The person may be given oxygen, and the central venous pressure may be measured to determine the need for replacement of fluid volume. Sudden, severe hemorrhage with signs of shock usually is treated with IV infusion of fluids and transfusion of blood. The application of additional warmth to the skin is not recommended because heat increases the metabolism and the need for oxygen.

■ OUTCOME CRITERIA: Signs of continued bleeding, tachycardia, cold sweat, decreasing blood pressure, and patient anxiety alert the nurse to the probability that bleeding has begun again or that replacement fluids administered after the hemorrhage are not adequate. The person is kept calm and quiet. If the fluid balance is promptly restored, recovery is usual. Excessive loss of blood leads to hypoxia of all the tissues of the body, including the brain and vital organs, and causes death.

control process, a system of establishing standards, objectives, and methods and measuring actual performance, comparing results, reinforcing strengths, and taking necessary corrective action.

contuse /konto͞oz′/, to injure a body part without breaking the skin.

contusion /kənt(y)o͞o′zhən/ [L, *contundere,* to bruise], an injury that does not disrupt the integrity of the skin, caused by a blow to the body and characterized by swelling, discoloration, and pain. The immediate application of cold may limit the development of a contusion. Also called **bruise.** Compare **ecchymosis.**



Contusion *(Finkbeiner, Ursell, and Davis, 2009)*

conus medularis, the terminal end of the spinal cord.

convalescence /kon′vəles′əns/ [L, *convalescere,* to grow strong], the period of recovery after an illness, injury, or surgery.

convalescent carrier, a person who has recovered from the symptoms of an infectious disease but is still capable of transmitting pathogens to others.

convalescent home. See **extended care facility.**

convection /kənvek′shən/ [L, *convehere,* to bring together], (in physics) the transfer of heat through a gas or liquid by the circulation of heated particles.

convergence /kənvur′jəns/ [L, *convergere,* to bend together], the movement of two objects toward a common point, such as the turning of the eyes inward to see an object close to the face. —*convergent, adj.*

convergent evolution, the evolution of nonhomologous organs in distantly related species in response to similar environmental conditions. Although of different origin, the organs appear similar in function, shape, or form.

convergent nystagmus, an intermittent spasmodic movement of the eyes in which they move rhythmically toward each other and slowly return to the original position. It is usually caused by a tumor of the anterior aqueduct of Silvius, third ventricle, or midbrain.

convergent squint, convergent strabismus. See **esotropia.**

conversion /kənvur′zhən/ [L, *convertere,* to turn around], **1.** changing from one form to another; transmutation. **2.** (in obstetrics) the correction of a fetal position during labor. **3.** (in psychiatry) an unconscious defense mechanism by which emotional conflicts that ordinarily cause anxiety are repressed and transformed into symbolic physical symptoms that have no organic basis. Loss of sensation, paralysis, pain, and other dysfunctions of the nervous system are the most common somatic expressions of conversion.

conversion disorder, an abnormality in which repressed emotional conflicts are changed into sensory, motor, or visceral symptoms with no underlying organic cause, such as blindness, anesthesia, hypesthesia, hyperesthesia, paresthesia, involuntary muscular movements (for example, tics or tremors), paralysis, aphonia, mutism, hallucinations, catalepsy, choking sensations, and respiratory difficulties. The person who has a conversion disorder may be indifferent to the symptoms yet firmly believes the condition exists. Causal factors include a conscious or unconscious desire to escape from or avoid some unpleasant situation or responsibility or to obtain sympathy or some other secondary gain. Treatment usually consists of psychotherapy. Also called **conversion hysteria, conversion reaction, somatoform disorder.**

conversion dysphonia, an inability to speak, usually psychogenic in nature. Conversion disorders have been reported to affect aspects of communication other than the voice. Formerly called **hysteric aphonia.**

conversion factor, a dollar value multiplied by a procedure's unit value, from the ***Current Procedural Terminology*** codes or a relative value scale, used to calculate the payment amount for contracted services or to set a price for a service.

conversion hysteria. See **conversion disorder.**

conversion reaction, an ego defense mechanism whereby intrapsychic conflict is expressed symbolically through physical symptoms.

convex [L, *convextus,* vaulted], having a surface that curves outward. Compare **concave.**

convex spherical lens [L, *convehere,* to bring together; Gk, *sphaira,* ball; L, *lentil*], a lens that has sides that curve outward like a section of the exterior of a sphere and that brings light to a focus. It is used in the treatment of hyperopia (farsightedness).

convoluted /kon′vəlo͞o′tid/ [L, *convolutus,* rolled together], twisted, rolled together, with one part over another in a scroll. —*convolute, v.*

convoluted kidney tubules [L, *convolutus,* rolled together; ME, *kidenei;* L, *tubulus*], pertaining to the proximal convoluted tubule of the nephron that leads from the glomerulus to the connecting ducts and between the Bowman's capsule and the loop of Henle. The proximal and distal sections are convoluted, whereas the ascending and descending limbs of Henle's loop are relatively straight.

convoluted seminiferous tubules, the long threadlike tubes in the areolar tissue of the testes. The testes also contain straight segments of seminiferous tubules.

convolution /kon′vəlo͞o′shən/ [L, *convolutus,* rolled together], a tortuous irregularity or elevation caused by a structure being infolded on itself, such as the gyri of the cerebrum. See also **gyrus.**

convulsion. See **seizure.**

convulsive seizure /kənvul′siv/ [L, *convulsio,* cramp; OFr, *seisir*], a sudden onset of a disease, characterized by convulsions, palpitations, and other symptoms. The term is sometimes applied to an attack of an epileptic disorder.

convulsive syncope, a fainting episode. See **vasodepressor syncope.**

convulsive tic, a disorder of the facial nerve, causing involuntary spasmodic contractions of the facial muscles supplied by that nerve. Also called **hemifacial spasm.** See also **Gilles de la Tourette's syndrome.**

Cook catheter, a flexible catheter sometimes used in place of the Tenckhoff catheter in peritoneal dialysis.

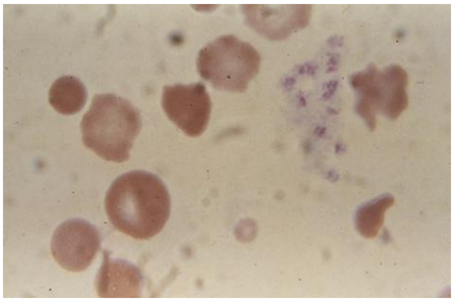
Cooley's anaemia, Cooley's anemia. See **thalassemia.**

Coolidge tube [William D. Coolidge, American physician, 1873–1977], a basic type of hot-cathode x-ray tube that, with modern refinements, has been used by radiologists since it was invented in 1913.

cooling [AS, *colian,* cool], reducing body temperature by the application of a hypothermia blanket, cold moist dressings, ice packs, or an alcohol bath. Subnormal body temperature may be induced to reduce metabolic function before some kinds of surgery. Very high fevers of any origin may be treated in part by reduction of the fever with cooling techniques. See also **alcohol bath, hypothermia, hypothermia blanket.**

cooling rate, the rate at which temperature decreases with time (°C/min) immediately after the completion of hyperthermia treatment.

Coombs' positive hemolytic anemia /ko͞omz/ [Robin R.A. Coombs, British immunologist, b. 1921], a form of anemia that results from premature destruction of circulating red blood cells. See also **antiglobulin test.**



Coombs' positive hemolytic anemia
(Zitelli and Davis, 2007)

Coombs' test. See **antiglobulin test.**

cooperative play /kō·op′ərətiv′/, any organized recreation among a group of children in which activities are planned for the purpose of achieving some goal. It usually occurs among older children. Compare **associative play, parallel play, solitary play.**

Cooper's ligament. See **pectineal ligament.**

coordinated movement, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability of muscles to work together voluntarily for purposeful movement. See also **Nursing Outcomes Classification.**

coordinated reflex /kō·ôr′dinā′tid/ [L, *coordinare,* to arrange], a sequence of muscular actions that occur in a purposeful, orderly progression, such as the act of swallowing.

CO-oximeter, a device that uses spectrophotometry to measure relative blood concentrations of oxyhemoglobin, carboxyhemoglobin, methemoglobin, and reduced hemoglobin.

copayment /kō′pāmənt/, (in the United States) an amount paid by a health insurance plan enrollee for each office or emergency department visit or purchase of prescription drugs in addition to the amount paid by the insurance company. See also **deductible.**

COPD, abbreviation for **chronic obstructive pulmonary disease.**

Cope loop catheter, a type of nephrostomy catheter with a loop at the end to hold it in place.

coping[1] [Gk, *kolaphos,* buffet], a process by which a person deals with stress, solves problems, and makes decisions. The process has two components, cognitive and noncognitive. The cognitive component includes the thought and learning necessary to identify the source of the stress. The noncognitive components are automatic and focus on relieving the discomfort. Many defense mechanisms fall into this category. Although sometimes useful, noncognitive measures may fail to relieve the stress because the response may be inappropriate, may have the wrong effect, and, as it replaces cognitive coping measures, may prevent the person from learning more about the cause and finding a better solution for the problem.

coping[2]**,** a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to manage stressors that tax an individual's resources. See also **Nursing Outcomes Classification.**

coping enhancement, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting a patient to adapt to perceived stressors, changes, or threats which interfere with meeting life demands and roles. See also **Nursing Interventions Classification.**

coping mechanism, any effort directed to stress management, including task-oriented and ego defense mechanisms, the factors that enable an individual to regain emotional equilibrium after a stressful experience. It may be an unconscious process.

coping resources, the characteristics of a person, group, or environment that are helpful in assisting individuals in adapting to stress.

coping style, the cognitive, affective, or behavioral responses of a person to problematic or traumatic life events.

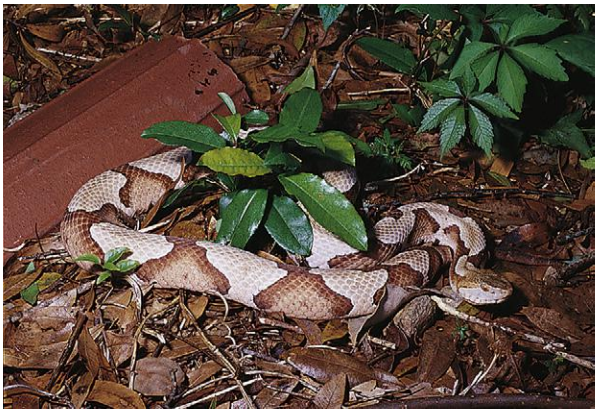
copolymer /kōpol′əmər/ [L, *co-,* together or with + Gk, *polys,* many + *meros,* parts], a polymer containing monomers of more than one kind.

COPP, an anticancer drug combination of cyclophosphamide, procarbazine, prednisone, and vincristine.

copper (Cu) [L, *cuprum*], a malleable, reddish-brown metallic element. Its atomic number is 29; its atomic mass is 63.55. Copper occurs in a pure state in nature and in many ores. It is a component of several important enzymes in the body and is essential to good health. Copper deficiency is rare because only 2 to 5 mg daily, easily obtained from a variety of foods, is sufficient for a proper balance. Copper accumulates in individuals with Wilson's disease, primary biliary cirrhosis, and, occasionally, chronic extrahepatic biliary tract obstruction. It is an excellent conductor of heat and electricity and a valuable component of numerous alloys, and it may be compounded with arsenic to form insecticides. See also **ceruloplasmin, hepatolenticular degeneration.**

copper gluconate, a salt of copper used in the prophylaxis and treatment of copper deficiency.

copperhead /kop′ərhed′/ [L, *cuprum* + ME, *hed*], a poisonous pit viper *(Agkistrodon contortrix)* found mainly in the southeastern United States. The reddish brown, darkly banded snake is responsible for nearly 40% of the snakebites in the United States. Few bites are fatal. Pain, swelling, fang marks, and a bruise are usually present. Immediate treatment includes keeping the victim quiet and immobilizing the bite area at the level of the heart while seeking medical attention. Antivenin is available but is rarely indicated. See also **coral snake, cottonmouth, rattlesnake.**



Copperhead *(Auerbach, 2012/Courtesy Michael Cardwell and Carl Barden Venom Laboratory)*

Copper T, a trademark for a T-shaped plastic intrauterine device.

copro-, copr-, kopr-, kopra-, prefix meaning "feces": *coprolalia, coprolith.*

coprogogue. See **cathartic.**

coprolalia /kop′rōlā′lyə/ [Gk, *kopros,* dung, *lalein,* to babble], the excessive use of obscene language.

coprolith /kop′rōlith/, a hard mass of feces in the intestinal tract, usually caused by excessive absorption of water from the large intestine.

coprology, the study and analysis of fecal material. See **scatology.**

coproporphyria /kop′rōpôrfir′ē·ə/ [Gk, *kopros* + *porphyros,* purple], a rare autosomal-dominant metabolic disorder in which large quantities of nitrogenous substances, called porphyrins, are excreted in the feces. Attacks, with varying GI and neurological symptoms, may be precipitated by certain drugs, including barbiturates, sulfonamides, and steroids. Patients are often helped by a high-carbohydrate diet. Also called **hereditary coproporphyria.** See also **acute intermittent porphyria, coproporphyrin, porphyria.**

coproporphyrin /kop′rōpôr′firin/ [Gk, *kopros* + *porphyros,* purple], **1.** any of the nitrogenous organic substances normally excreted in the feces that are products of the breakdown of bilirubin from hemoglobin decomposition. **2.** a test used to measure red blood cell porphyrin levels.

copula /kop′ū·lə/ [L], **1.** any connecting part or structure. **2.** a median ventral elevation on the embryonic tongue, formed by union of the second pharyngeal arches, that represents the future root of the tongue. Also called *copula linguae*.

copulation, intercourse See **coitus.**

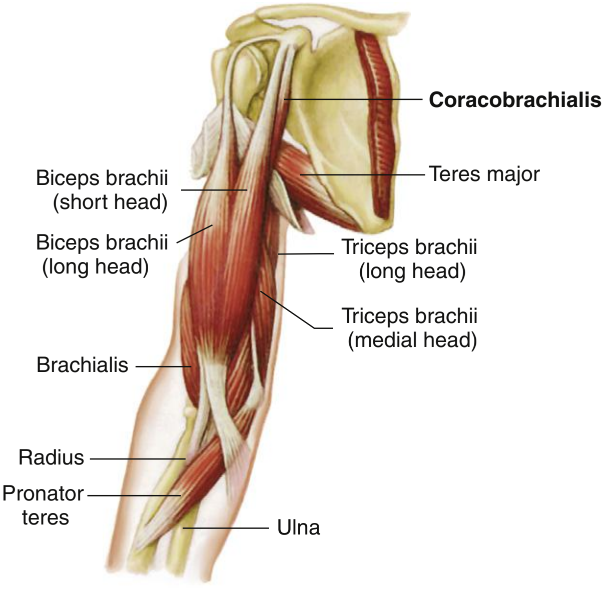
CoQ, abbreviation for **coenzyme Q.**

cor /kôr/, **1.** the heart. **2.** relating to the heart.

cor-. See **co-.**

coracoacromial /kôr′əkō·əkrō′mē·əl/, pertaining to the coracoid process and the acromion of the scapula.

coracobrachialis /kôr′əkōbrā′kē·al′is/, a muscle with its origin on the scapula and its insertion on the inner side of the humerus. It functions to adduct and flex the arm.



Coracobrachialis
Teres major
Biceps brachii (short head)
Biceps brachii (long head)
Triceps brachii (long head)
Triceps brachii (medial head)
Brachialis
Radius
Pronator teres
Ulna

Coracobrachialis muscle *(Patton and Thibodeau, 2010)*

coracoid process /kôr′əkoid/ [Gk, *korax,* crow, *eidos,* form; L, *processus*], the thick, curved extension of the superior border of the scapula, to which the pectoralis minor is attached. Compare **acromion.**

coral calculus. See **dendritic calculus.**

coral snake, a poisonous snake with transverse red, yellow, and black bands that is native to the southern United States. Bites are rare; pain does not always result, but neuromuscular and respiratory effects may be severe. Immediate treatment includes keeping the victim quiet and immobilizing the bite area at the level of the heart. Ventilatory support should be provided. Antivenin is available.

Coral snake *(Courtesy St. Louis Zoo)*

cord [Gk, *chorde,* string], any long, rounded, flexible structure. The body contains many different cords, such as the spermatic, vocal, spinal, neural, umbilical, and hepatic cords. Cords serve many different purposes, depending on location, kind of enclosed cells, and body parts or tissue involved.

cordal, pertaining to a cord, such as the umbilical cord.

Cordarone, a trademark for an oral antiarrhythmic **(amiodarone hydrochloride).**

cord blood, blood taken from the umbilical cord vein or artery of the fetus. Like bone marrow, cord blood is rich in stem cells. It can be frozen and stored for later transfusion, for example, in cord blood transplantation.

cord blood transplantation, the removal of blood from the umbilical cord of a fetus or its placenta for the treatment of blood diseases. Cord blood transplantation has been performed successfully in patients with leukemia, aplastic anemia, Fanconi's anemia, immunodeficiency, and genetic and metabolic disorders.

cordiform /kor′di-form/, heart-shaped.

corditis /kôrdī′tis/ [Gk, *chorde* + *itis,* inflammation], an inflammation of the spermatic cord, accompanied by pain in the testis, often caused by an infection originating in the urethra or by a tumor, hydrocele, or varicocele. Inflammatory conditions of the testis may lead to swelling and tenderness.

cord presentation. See **funic presentation.**

Cordran, a trademark for a topical glucocorticoid **(flurandrenolide).**

core [L, *cor,* heart], **1.** a kind of main computer memory. **2.** Also called **laboratory core. 3.** (in dentistry) a section of a mold, usually of plaster, made over assembled parts of a dental restoration to record and maintain their relationships so that the parts can be reassembled in their original position; the retainer portion to which a dental restoration is attached. See **composite core, cast core, cast post,** and **cast core. 4.** the center of a structure, as in core temperature of the body.

core-, coro-, prefix meaning "pupil of the eye": *coreclisis, corectasis, corectopia*.

core gender identity. See **gender identity.**

core temperature [L, *cor,* heart, *temperatura*], the temperature of deep structures of the body, such as the liver, as compared to that of peripheral tissues.

Corgard, a trademark for a nonselective beta-adrenergic blocking agent **(nadolol).**

-coria, suffix meaning "(condition of the) pupil": *anisocoria, diplocoria, platycoria*.

Cori cycle [Carl F. Cori, American physician, 1896–1984; Gerty T. Cori, American biochemist, 1896–1957; co-Nobel laureates in 1947], a physiological mechanism whereby lactate, produced by glycolysis of glucose in contracting muscle, is converted back to glucose in the liver and returned via the circulation to the muscles.

Cori's disease /kôr′ēz/ [Carl F. Cori; Gerty T. Cori], a rare type of glycogen storage disease, in which the lack of an enzyme results in abnormally large deposits of glycogen in the liver, skeletal muscles, and heart. Signs are an enlarged liver, hypoglycemia, acidosis, and, occasionally, stunted growth. Symptoms can be controlled by giving the patient frequent small meals rich in carbohydrate and protein. Also called **Forbes' disease; glycogenosis; glycogen storage disease, type III.**

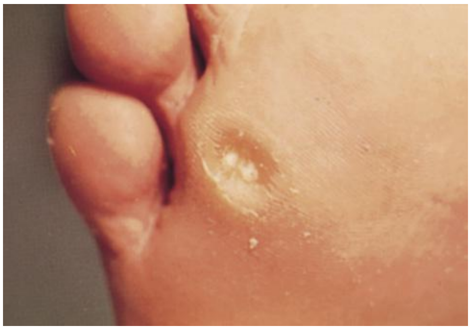
corium. See **dermis.**

corkscrew esophagus /kôrk′skro͞o/ [ME *cork,* bark; L, *scrofa,* sow; Gk, *oisophagos,* gullet], a neurogenic disorder in which normal peristaltic contractions of the esophagus are replaced by spastic movements that occur spontaneously or with swallowing or gastric acid reflux. Difficulty in swallowing, weight loss, severe pain over the upper chest, and a characteristic corkscrew image on radiogram are the symptoms usually present. Management may include the use of antispasmodic drugs, avoidance of cold fluids, surgical dilation, or myotomy. Compare **achalasia.** See also **dysphagia.**

cork worker's lung, hypersensitivity pneumonitis seen in cork handlers, caused by inhalation of moldy cork dust containing spores of various species of ***Penicillium.***

-cormia, -cormy, suffix meaning an "abnormal development of the trunk of the body": *camptocormia, nanocormia, schistocormia.*

corn [L, *cornu,* horn], a horny mass of condensed epithelial cells overlying a bony prominence. Corns result from chronic friction and pressure. The conic shape of the corn compresses the underlying dermis, making it thin and tender. Corns can become soft and macerated by perspiration. Treatment includes relief of the mechanical pressure and surgical paring or chemical peeling of the excess keratin. Also called **clavus.** Compare **callus.**



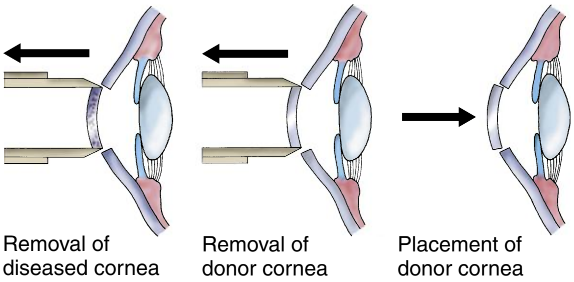
Corn *(Weston, Lane, and Morrelli, 2007)*

cornea /kôr′nē·ə/ [L, *corneus,* horny], the convex, transparent anterior part of the eye, comprising one sixth of the outermost tunic of the eye bulb. It allows light to pass through it to the lens. The cornea is a fibrous structure with five layers: the anterior corneal epithelium, continuous with that of the conjunctiva; the anterior limiting layer (Bowman's membrane); the substantia propria; the posterior limiting layer (Descemet's membrane); and the endothelium of the anterior chamber (keratoderma). It is dense, uniform in thickness, and nonvascular, and it projects like a dome beyond the sclera, which forms the other five sixths of the eye's outermost tunic. The degree of corneal curvature varies among different individuals and in the same person at different ages; the curvature is more pronounced in youth than in advanced age. —*corneal, adj.*

corneal abrasion /kôr′nē·əl/ [L, *corneus,* horny, *abrasio,* scraping], the rubbing off of the outer layers of the cornea.

corneal corpuscle, one of the fixed flattened connective tissue cells between the lamellae of the cornea. Also called **keratocyte.**

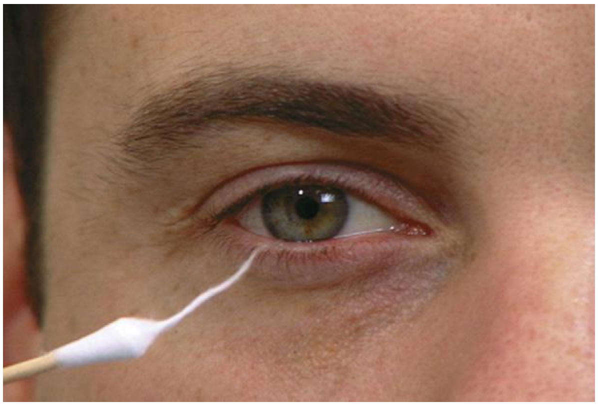
corneal grafting, transplantation of corneal tissue from one human eye to another, performed to improve vision in corneal scarring or distortion or to remove a perforating ulcer. Preoperative preparation includes constricting the pupil with a miotic drug, such as pilocarpine. With the patient under local anesthesia the affected area is excised, using an operating microscope; an identical section of clear cornea is cut from the donor eye and sutured in place, using an operating microscope. Cataract surgery may be performed at the same time. After surgery the eye is covered with a protective metal shield. The patient is cautioned against coughing, sneezing, vomiting, sudden movement, and lifting. The dressing is changed daily, and antibiotics are instilled. A complication that may occur after several weeks is a clouding over of the graft, a result of the rejection of foreign tissue. Corticosteroid drugs administered immediately postoperatively may prevent the reaction. Healing is slow, and the sutures are usually left in place for 1 year. Also called **corneal transplantation, keratoplasty.**



Corneal grafting *(Ignatavicius and Workman, 2010)*

corneal loupe, (in ophthalmology) a magnifying lens designed especially for examining the cornea.

corneal reflex, a protective mechanism for the eye in which the eyelids close when the cornea is touched. This reflex is mediated by the ophthalmic division of the fifth cranial nerve (sensory) and seventh cranial nerve (motor) and may be used as a test of integrity of those nerves. People who wear contact lenses may have a diminished or absent corneal reflex. Compare **conjunctival reflex.**



Assessment of the corneal reflex *(Swartz, 2009)*

corneal transplant. See **corneal grafting.**

corneal transplantation. See **corneal grafting.**

Cornelia de Lange's syndrome /kôr·nā′lē·ä dā läng′əz/ [Cornelia de Lange, Dutch pediatrician, 1871–1950], a congenital syndrome of severe mental retardation with many other abnormalities, such as dwarfism, brachycephaly, low-set ears, webbed neck, carp mouth, peculiar shape of the nose, bushy eyebrows meeting at the midline, unruly coarse hair on the forehead and neck, and flat spade-like hands with short tapering fingers.

corneoblepharon /kôr′nē·ōblef′əron/. See **symblepharon.**

corneous. See **horny, keratic** (def. 1).

corneus layer. See **stratum corneum.**

cornification /kôr′nifikā′shən/, the conversion of cells into the horny layer of the skin. Also called **keratinization.** —*cornify, v.*

corn oil, a refined fixed oil obtained from the corn plant, *Zea mays*, used as a solvent and vehicle for medicinal agents and as a vehicle for injections. It has also been promoted as a source of polyunsaturated fatty acids in special diets.

corn pad, a device that helps relieve the pressure and pain of a corn on the toes by transferring the pressure to surrounding unaffected areas. Corn pads are constructed of pliable fabric and fashioned in various ways to accommodate different sites on the feet. See also **corn.**

cornua /kôr′no͞o·ə/, an anatomical structure that resembles a horn, as on the coccyx.

cornual pregnancy /kôr′nyo͞o·əl/ [L, *cornu*, horn, *praegnans*, childbearing], an ectopic pregnancy in one of the straight or curved extensions of the body of the uterus. The signs include a uterus that is asymmetric and tender, as well as cramping and spotting. The cornu of the uterus usually ruptures between 12 and 16 weeks of the pregnancy unless the condition is treated surgically to remove the products of conception. In most cases the uterus can be repaired. Also called **interstitial pregnancy.** See also **ectopic pregnancy.**

cornu posterioris. See **posterior horn.**

coro-. See **core-.**

corona /kərō′nə/ [L, crown], **1.** a crown. **2.** a crownlike projection or encircling structure, such as a process extending from a bone. —**coronal, coronoid,** *adj*.

coronal plane. See **frontal plane.**

coronal section [L, *corona*, crown, *sectio*], a section of the body cut in the plane of the coronal suture, or parallel to it.

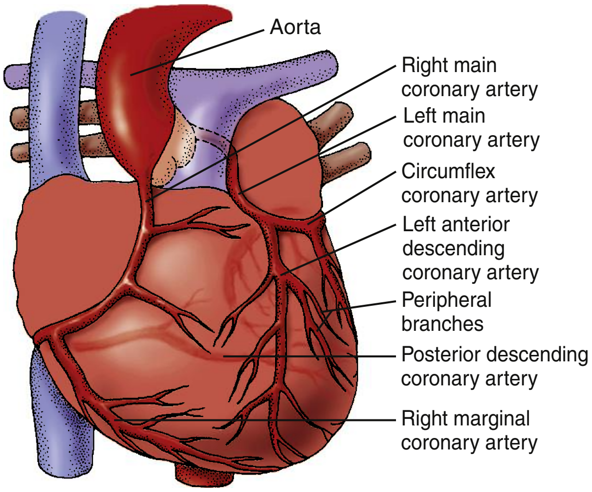
coronal suture, the serrated transverse suture between the frontal bone and the parietal bone on each side of the skull.

corona radiata. See **radiate crown.**

coronary /kôr′əner′ē/ [L, *corona*, crown], **1.** *adj*, pertaining to encircling structures, such as the coronary arteries. **2.** *adj*, pertaining to the heart. **3.** *n*, *nontechnical*. a myocardial infarction or occlusion.

coronary arteriovenous fistula, an unusual congenital abnormality characterized by a direct communication between a coronary artery, usually the right, and the right atrium or ventricle, the coronary sinus, or the vena cava. There may be a left-to-right shunt of small magnitude causing no symptoms, but a large shunt may result in growth failure, limited exercise tolerance, dyspnea, and anginal pain. Possible complications of a large shunt are bacterial endocarditis, rupture of an aneurysmal fistula, thrombus formation that causes occlusion or distal embolization, and in rare cases pulmonary hypertension and congestive heart failure. A loud continuous murmur heard at the lower or midsternal border of the heart suggests a coronary arteriovenous fistula; the diagnosis may be confirmed by coronary arteriography or aortography. Closure of the fistulous tract is a safe surgical procedure with excellent long-term results.

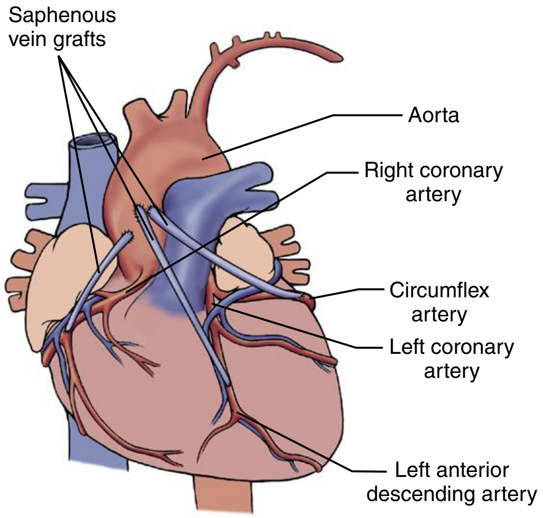
coronary artery, one of a pair of arteries that branch from the aorta, including the left and the right coronary arteries. Because these vessels and their branches supply the heart, any dysfunction or disease that affects them can cause serious, sometimes fatal complications. Coronary arterial anastomoses occur throughout the heart and are especially numerous within the interventricular and interatrial septa, at the apex of the heart, at the crux, over the anterior surface of the right ventricle, and between the sinus-node artery and the other atrial arteries. These anastomoses are more numerous and larger in the epicardium than in the endocardium, and they provide important collateral circulation in the recovery of patients who suffer coronary occlusions. The branches of the coronary arteries are affected by many different disorders, such as embolic, neoplastic, inflammatory, and noninflammatory diseases.



Aorta
Right main coronary artery
Left main coronary artery
Circumflex coronary artery
Left anterior descending coronary artery
Peripheral branches
Posterior descending coronary artery
Right marginal coronary artery

Coronary artery circulation *(Ignatavicius and Workman, 2010)*

coronary artery bypass graft (CABG), open heart surgery in which a prosthesis or a section of a vein or internal mammary artery is grafted from the aorta onto one of the coronary arteries, bypassing a narrowing or blockage in the coronary artery. The operation is performed in coronary artery disease to improve the blood supply to the heart muscle and to relieve anginal pain. Coronary arteriography pinpoints the areas of obstruction before surgery. Under general anesthesia and with the use of a cardiopulmonary bypass machine, one end of a 15- to 20-cm prosthesis or a segment of saphenous vein from the patient's leg is grafted to the ascending aorta. The other end is sutured to the clogged coronary artery at a point distal to the stoppage. The internal mammary artery may also be used as graft tissue. Usually double or triple grafts are done for multiple areas of blockage. After surgery, close observation in an intensive care unit is essential to ensure adequate ventilation and cardiac output. The systolic blood pressure is not allowed to drop significantly below the preoperative baseline, nor is it allowed to rise significantly, because hypertension can rupture a graft site. Arrhythmias are treated with medications or by electrical cardioversion. The patient is usually discharged within 5 to 8 days, unless complications occur.



Coronary bypass graft *(Phipps et al, 1999)*

coronary artery disease (CAD), an abnormal condition that may affect the heart's arteries and produce various pathological effects, especially the reduced flow of oxygen and nutrients to the myocardium. The most common kind of coronary artery disease is coronary atherosclerosis, now the leading cause of death in the Western world. Other coronary artery diseases include coronary arteritis and fibromuscular hyperplasia of the coronary arteries. Also called **coronary heart disease.**

■ OBSERVATIONS: Angina pectoris, the classic symptom of coronary artery disease, results from myocardial ischemia. Diagnosis of coronary artery disease is usually based on patient history and tests such as exercise stress tests, electrocardiography, coronary angiography, and myocardial perfusion imaging.

■ INTERVENTIONS: Treatment concentrates on reducing myocardial oxygen demand or on increasing oxygen supply. Therapy commonly includes the administration of nitrates, such as nitroglycerin or isosorbide dinitrate; a beta-adrenergic blocker; or calcium channel blockers. Surgical interventions include coronary artery bypass surgery, angioplasty, insertion of cardiac stents, and atherectomy. The prevalence of coronary artery disease highlights the importance of preventive measures, such as reduced caloric intake by the obese patient; lowered salt, fats, and cholesterol consumption; regular exercise; abstention from the use of tobacco products; and reduction of stress.

■ NURSING CONSIDERATIONS: The nurse monitors blood pressure and heart rate, records electrocardiograms during anginal episodes, and administers drugs, such as nitroglycerin. The nurse is especially alert to signs of ischemia and arrhythmias and, before the patient is discharged, stresses the importance of following the prescribed regimens of diet, medication, exercise, and cessation of tobacco use.

coronary artery fistula, a congenital anomaly characterized by an abnormal connection between a coronary artery and the right side of the heart or pulmonary artery.

coronary artery scan (CAS), a noninvasive method for the early detection of coronary atherosclerosis, using electron beam CT to detect and measure calcium, which is the marker for atherosclerosis, in the coronary arteries.

coronary bypass. See **coronary artery bypass graft.**

coronary care nursing, the nursing care provided in a hospital in a coronary care unit. Nursing in this setting requires

Decreasing risk factors for coronary artery disease

Risk factor	*Health-promoting behaviors*
Hypertension	• Have regular blood pressure (BP) checkups. • Take prescribed medications for BP control. • Reduce salt intake. • Stop tobacco use; avoid exposure to environmental tobacco (secondhand) smoke. • Control or reduce weight. • Perform physical activity regularly.
Elevated serum lipids	• Reduce total fat intake. • Reduce animal (saturated) fat intake. • Take prescribed medications for lipid reduction. • Adjust total caloric intake to achieve and maintain ideal body weight. • Engage in regular physical activity. • Increase amount of complex carbohydrates and vegetable proteins in diet.
Tobacco use	• Enroll in a smoking cessation program. • Change daily routines associated with smoking to reduce desire to smoke. • Substitute other activities for smoking. • Ask caregivers to support efforts to stop smoking. • Avoid exposure to environmental tobacco smoke.
Physical inactivity	• Develop and maintain at least 30 min of moderate physical activity on most days of the week. • Increase activities to a fitness level.
Stressful lifestyle	• Increase awareness of behaviors that are detrimental to health. • Alter patterns that are conducive to stress (e.g., get up 30 min. earlier so breakfast is not eaten on way to work). • Set realistic goals for self. • Reassess priorities in light of health needs. • Learn effective stress management strategies. • Seek professional help if feeling depressed, hopeless, anxious, etc. • Plan time for adequate rest and sleep.
Obesity	• Change eating patterns and habits. • Reduce caloric intake to achieve body mass index of 18.5-24.9 kg/m^2. • Increase physical activity to increase caloric expenditure. • Avoid fad and crash diets, which are not effective in the long run. • Avoid large, heavy meals.
Diabetes	• Follow the recommended diet. • Control or reduce weight. • Take prescribed antidiabetic medications. • Monitor blood glucose levels regularly.

From Lewis SL et al: *Medical-surgical nursing: assessment and management of clinical problems*, ed 8, St Louis, 2011, Mosby.

technical knowledge, judgment, and skills, as well as ability to give emotional support to patients and their families during the acute stage of cardiac dysfunction.

coronary care unit (CCU), a critical care unit used for the treatment and monitoring of patients experiencing acute cardiac episodes.

coronary collateralization, the spontaneous development of new blood vessels in or around areas of restricted blood flow to the heart muscle.

coronary heart disease. See **coronary artery disease.**

coronary ligament, one of the ligaments that connects the liver to the diaphragm.

coronary occlusion, an obstruction of an artery that supplies the heart muscle. When complete, it causes myocardial infarction; when incomplete, it may cause angina. The underlying pathophysiological characteristic is atherosclerotic plaque, which usually develops slowly by buildup of lipid and macrophage complexes. Rapid plaque accumulation is frequently caused by hemorrhage within a plaque. If the plaque ruptures, platelets aggregate, fibrin is deposited, spasm occurs, and a thrombus develops, resulting in acute myocardial infarction. Treatment includes prompt IV thrombolysis and administration of heparin. Primary percutaneous transvenous coronary angioplasty can achieve prompt reperfusion. See also **coronary artery disease.**

coronary plexus [L, *corona,* crown, *plexus,* plaited], a network of autonomic nerve fibers located near the base of the heart.

coronary sinus, the wide venous channel, about 2.25 cm long, situated in the coronary sulcus and covered by muscular fibers from the left atrium. Through a single semilunar valve it drains five coronary veins: the great cardiac vein, the small cardiac vein, the middle cardiac vein, the posterior vein of the left ventricle, and the oblique vein of the left atrium.

coronary sulcus, a surface groove encircling the heart that separates the atria from the ventricles. It contains the right coronary artery, the small cardiac vein, the coronary sinus, and the circumflex branch of the left coronary artery.

coronary thrombosis, development of a thrombus that blocks a coronary artery, often causing myocardial infarction and death. Coronary thromboses commonly develop in segments of arteries with atherosclerotic lesions.

coronary valve [L, *corona,* crown, *valva,* folding door], a semicircular fold of endocardium that prevents backflow of blood from the right atrium into the coronary sinus.

coronary vein, one of the veins of the heart that drain blood from the capillary beds of the myocardium through the coronary sinus into the right atrium. A few small coronary veins that collect blood from a small area in the right ventricle drain directly into the right atrium.

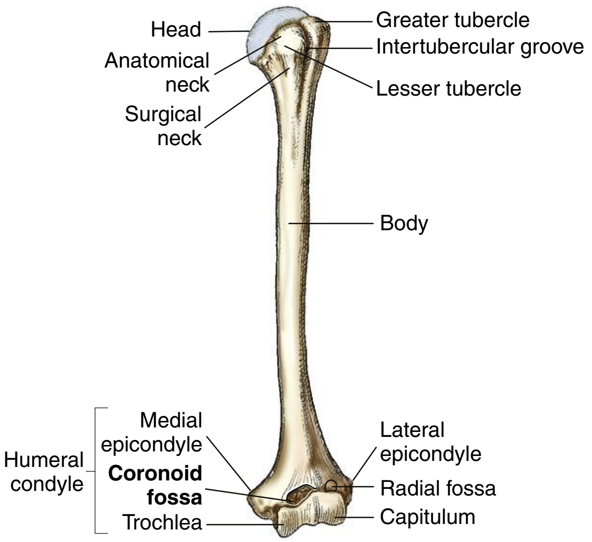
Coronaviridae /kôr′ənəvir′idē/, a family of four antigenic groups of single-stranded ribonucleic acid viruses. Some strains of the organism are associated with upper respiratory infections in humans.

coronavirus /kôr′ənəvī′rəs/ [L, *corona* + *virus,* poison], a member of Coronaviridae, a family of viruses that includes several types capable of causing acute respiratory illnesses, including SARS. These viruses infect a wide variety of mammals (including humans) and birds. Along with rhinoviruses, coronaviruses are considered the primary causes of the common cold. Reinfection with the same genotype can occur. Other diseases caused by coronaviruses include hepatitis, neurological disease, infectious peritonitis, nephritis, and pancreatitis.

coroner /kôr′ənər/ [L, *corona,* crown], a public official who investigates the causes and circumstances of deaths that occur within a specific legal jurisdiction or territory, especially those that may have resulted from unnatural causes. Also called **medical examiner.**

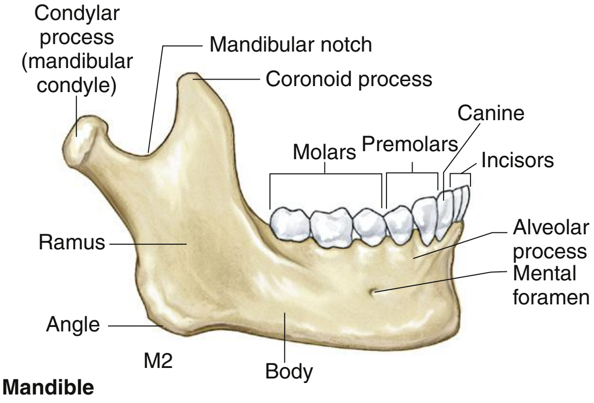
coronoid. See **corona.**

coronoid fossa /kô′rənoid/ [L, *corona* + Gk, *eidos,* form; L, *fossa,* ditch], a small depression in the distal dorsal surface of the humerus that receives the coronoid process of the ulna when the forearm is flexed.



Coronoid fossa *(Frank, Long, and Smith, 2012)*

coronoid process of the mandible, a prominence on the anterior surface of the ramus of the mandible to which each temporal muscle attaches.



Coronoid process of the mandible
(Patton and Thibodeau, 2010)

coronoid process of the ulna, a wide, flaring projection of the proximal end of the ulna. The proximal surface of the process forms the lower part of the trochlear notch.

corpectomy, the removal of a vertebral body.

corpor-, prefix meaning "body": *corpora, corporeal, corporic.*

corpora lutea. See **corpus luteum.**

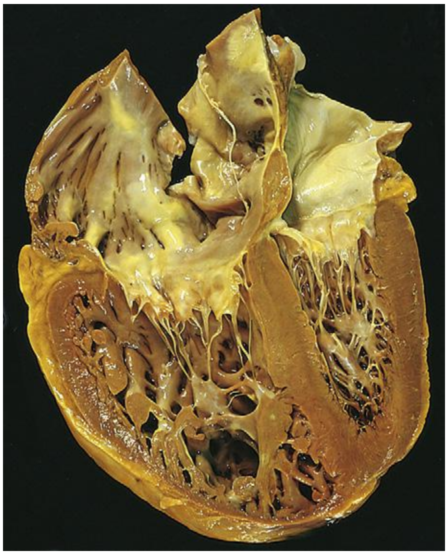
corporate practice of medicine, (in the United States) the role of nonpracticing physicians or nonprofessional corporations in employment relationships with physicians engaged in providing health care. Laws governing corporate practice of medicine vary among different states, but generally they require practitioner control over diagnosis and treatment, practitioner setting of fees, a reasonable relationship between services provided by layperson or corporation and amounts charged to the practitioner, and an unaltered practitioner-patient relationship.

corpse /kôrps/ [L, *corpus,* body], the body of a dead human being.

corpulence /kôr′pyələns/ [L, *corpus,* body], obesity.

corpulent /kôr′pyələnt/, obese.

cor pulmonale /kôr pŏŏl′mənal′ē/ [L, heart + *pulmoneus,* lungs], enlargement of the heart's right ventricle caused by primary lung disease. In some patients, the left ventricle also increases in size. Cor pulmonale eventually results in failure of the right ventricle, which cannot accommodate an increase in pressure as easily as the left ventricle. Pulmonary hypertension associated with this condition is caused by some disorder of the pulmonary parenchyma or of the pulmonary vascular system between the origin of the left pulmonary artery and the entry of the pulmonary veins into the left atrium.



Cor pulmonale *(Kumar et al, 2010)*

corpus. See **body.**

corpus albicans /kôr′pəs/, a pale white spot on the surface of the ovary that arises from the corpus luteum if conception does not occur. Compare **corpus luteum.**

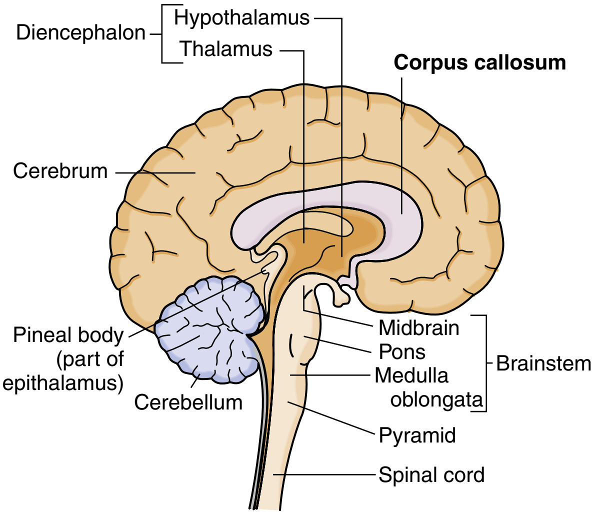
corpus amylaceum. See **colloid corpuscle.**

corpus callosum /kôr′pəs kalō′səm/, **1.** a transverse band of nerve fibers joining the cerebral hemispheres. It is located at the bottom of the longitudinal fissure between the two hemispheres and is covered by the cingulate gyrus. **2.** the largest commissure of the brain, connecting the cerebral hemispheres.

corpus cavernosum [L, body + *caverna* hollow place], a type of spongy erectile tissue within the penis or clitoris. The tissue becomes engorged with blood during sexual excitement.

corpuscle /kôr′pəsəl/ [L, *corpusculum,* little body], **1.** any cell of the body. **2.** a red or white blood cell. Also called **corpuscule.** —*corpuscular, adj.*

corpuscular radiation /kôrpus′kyələr/ [L, *corpusculum* + *radiare,* to emit rays], the radiation associated with subatomic particles, such as electrons, protons, neutrons, or alpha particles, which travel in streams at various velocities. All such particles have definite masses and have radiation properties very different from those of electromagnetic radiations, which have no mass and travel as waves at the speed of light. See also **background radiation, leakage radiation, scattered radiation.**

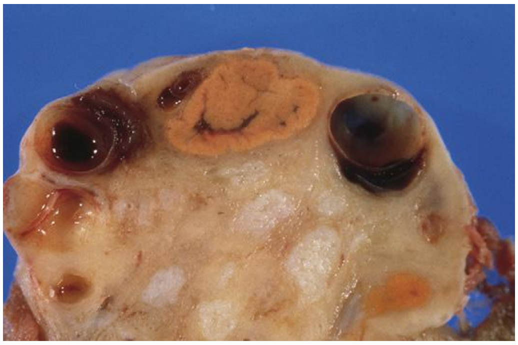


Corpus callosum *(Monahan et al, 2007)*

corpuscule. See **corpuscle.**

corpus femoris, body of femur, the main part or shaft of the femur.

corpus luteum /kôr′pəs lo͞o′tē·əm/ *pl.* **corpora lutea** [L, *corpus,* body, *luteus,* yellow], an anatomical structure on the ovary's surface, consisting of a spheroid of yellowish tissue 1 to 2 cm in diameter that grows within the ruptured ovarian follicle after ovulation. The pleated wall of the collapsed follicle is made up of several layers of granulosa cells that grow toward the center of the cavity to form the structure. During a woman's reproductive years, a corpus luteum forms after every ovulation. It acts as a short-lived endocrine organ that secretes progesterone, which serves to maintain the decidual layer of the uterine endometrium in the richly vascular state necessary for implantation and pregnancy. If conception occurs, the corpus luteum grows and secretes increasing amounts of progesterone. It reaches its maximum function and size (2 to 3 cm) at 10 to 12 weeks of gestation. It persists, slowly diminishing in size and function, until 6 months after the onset of gestation. During the 2 weeks before menstruation, the corpus luteum secretes progesterone in decreasing amounts, atrophies, undergoes fibrotic degeneration, and becomes a pale spot on the surface of the ovary. Compare **corpus albicans.**



Corpus luteum *(Greer et al, 2001)*

corpus spongiosum /spon′jē·ō′səm/, one of the cylinders of spongy tissue, with the corpora cavernosa, on the dorsum of the penis, erectile tissue, from bulb to glans. It contains the urethra and erectile tissue within labia minora.

corpus uteri, that part of the uterus above the isthmus and below the orifices of the fallopian tubes.

corpus vitreum. See **vitreous humor.**

corrected pressure [L, *corrigere,* to make straight], a method of applying Boyle's law of gas pressures to adjust simultaneously for changes in both pressure and humidity.

corrective emotional experience /kərek′tiv/, a process by which a patient gives up old behavior patterns and learns or relearns new patterns by reexperiencing early unresolved feelings and needs.

corrective exercise. See **therapeutic exercise.**

corrective therapist. See **kinesiotherapist.**

correlation /kôr′əlā′shən/ [L, *com* + *relatio,* a carrying back], (in statistics) a relationship between variables that may be negative (inverse), positive, or curvilinear. Correlation is measured and expressed by using numeric scales.

correlative differentiation /kərel′ətiv/, (in embryology) specialization or diversification of cells or tissues caused by an inductor or other external factor. Also called **dependent differentiation.**

correspondence, (in ophthalmology) the relationship between corresponding points on each retina. The simultaneous stimulation of the points results in the sensation of viewing a single object.

Corrigan's pulse [Dominic J. Corrigan, Irish physician, 1802–1880], a bounding pulse in which a great surge is felt, followed by a sudden and complete absence of force or fullness in the artery. This kind of pulse is associated with aortic regurgitation and occurs in excited emotional states; in various cardiac conditions, including patent ductus arteriosus; and as a result of systemic arteriosclerosis. Also called **collapsing pulse, water-hammer pulse.**

corrode. See **corrosive.**

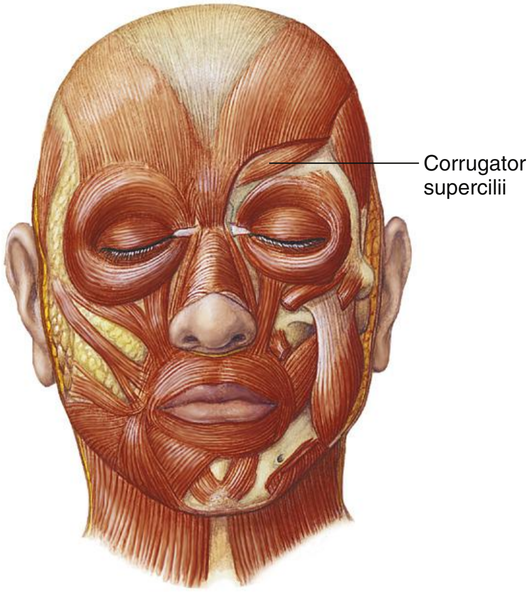
corrosion /kərō′zhen/, a result of an oxidation-reduction reaction, or deterioration of a substance by a destructive agent. See also **corrosive.**

corrosion of surgical instruments [L, *corrodere,* to gnaw away], the rusting of surgical instruments or the gradual wearing away of their polished surfaces caused by oxidation and the action of contaminants. Though minimized by the use of stainless steel alloys in the fabrication of the instruments, corrosion persists as a problem, even when cleaning procedures seem more than adequate. It usually results from inadequate cleaning and drying of surgical instruments after use, sterilization with solutions that eat into the surface, overexposure to such solutions, or a faulty autoclave. Cleanliness is the single most important factor in preventing corrosion. Any foreign material, either organic or inorganic, on the surface of stainless steel is likely to promote corrosion, and microscopic examinations often reveal foreign material and chlorides from cleaning solutions scattered over the surface of cleaned and sterilized instruments. The more chromium in the stainless steel alloys of which surgical instruments are made, the more resistant the instruments are to corrosion. Carbon, which hardens such alloys, also reduces their resistance to corrosion. Most corrosion of surgical instruments is superficial and may be removed by soaking in a solution of ammonia and alcohol or by repolishing by the manufacturer.

corrosive /kərō′siv/ [L, *corrodere,* to gnaw away], **1.** *adj,* eating away a substance or tissue, especially by chemical action. **2.** *n,* an agent or substance that eats away a substance or tissue. **—corrode,** *v.,* **corrosion,** *n.*

corrosive gastritis, an acute inflammatory condition of the stomach caused by the ingestion of an acid, alkali, or other corrosive chemical in which the lining of the stomach is eaten away by the corrosive substance. The amount of tissue destruction and recommended treatment depend on the nature of the corrosive agent and the extent of exposure. Also called **toxic gastritis.** Compare **chemical gastritis, erosive gastritis.** See also **acid poisoning, alkali poisoning.**

corrugator supercilii /kôr′əgā′tər so͞o′pərsil′ē·ī/ [L, *corrugare,* to wrinkle; *super,* above, *cilium,* eyelash], one of the three muscles of the eyelid. Arising from the medial end of the superciliary arch and inserting into the skin above the orbital arch, it is innervated by the temporal and zygomatic branches of the facial nerve and functions to draw the eyebrow downward and inward, as if to frown. Also called **corrugator.** Compare **levator palpebrae superioris, orbicularis oculi.**



Corrugator supercilii *(Patton and Thibodeau, 2010)*

-cort, suffix designating a cortisone derivative.

cortex *pl.* **cortices** /kôr′tisēz/ [L, bark], the outer layer of a body organ or other structure, as distinguished from the internal substance. **—***cortical, adj.*

cortex corticis, part of the renal cortex, consisting of a narrow peripheral zone where the renal columns do not have visible renal corpuscles.

cortex of the lens, the softer, external part of the lens of the eye.

cortic-, prefix meaning "cortex or bark": *corticipetal, corticobulbar, corticothalamic.*

cortical audiometry. See **audiometry.**

cortical blindness /kôr′tikəl/ [L, *cortex* + AS, *blind*], loss of vision that results from a lesion in the visual center of the cerebral cortex of the brain.

cortical bone, bone that is 70% to 90% mineralized.

cortical evoked potential, an evoked potential recorded from the cerebral cortex.

cortical fracture [L, *cortex* + *fractura,* break], a fracture that involves the cortex of a bone.

corticalization. See **collapsing pulse.**

cortical labyrinth, a network of tubules and blood vessels in the renal cortex.

cortical march, the spread of abnormal electrical activity from one area of the cerebral cortex to adjacent areas, characteristic of jacksonian epilepsy. Also called **epileptic march, jacksonian march.**

cortical radiate arteries, arteries originating from the arcuate arteries of the kidney and distributed to the renal glomeruli. Also called **interlobular arteries of kidney.**

cortical rim sign, in computed tomography of the kidney, a thin rim of peripheral cortex that is perfused and visible when other parts of the cortex are not because of capsular collateral arteries. It indicates cortical necrosis, renal vein thrombosis, or infarction of the nonperfused parts. Also called *rim s.*

cortical substance of cerebellum. See **cerebellar cortex.**

cortices. See **cortex.**

corticomedullary border, the area where the renal medulla and cortex come together.

corticopontocerebellar fibers, the corticopontine fibers and pontocerebellar fibers considered together.

corticospinal tract, any of two groups of nerve fibers (the **anterior corticospinal tract** and **lateral corticospinal tract**) that originate in the cerebral cortex and run through the spinal cord. They are responsible for carrying motor fibers.

corticosteroid /kôr′tikōstir′oid/ [L, *cortex* + *steros,* solid], any one of hormones elaborated by the adrenal cortex (excluding the sex hormones of adrenal origin) that influence or control key processes of the body. These processes include carbohydrate and protein metabolism, maintenance of serum glucose levels, electrolyte and water balance, and functions of the cardiovascular system, the skeletal muscle, the kidneys, and other organs. The corticosteroids synthesized by the adrenal glands include the glucocorticoids and the mineralocorticoids. The principal glucocorticoids are cortisol and corticosterone. The only physiologically important mineralocorticoid in humans is aldosterone. These hormones may be manufactured and administered exogenously. The glucocorticoids tend to cause the cells of the body to shift from carbohydrate catabolism to fat catabolism, to accelerate the breakdown of proteins to amino acids, and to help maintain normal blood pressure. The secretion of these hormones increases during stress, especially that produced by anxiety and severe injury. Chronic overproduction of these substances is associated with various disorders, such as Cushing’s syndrome. A high blood level of glucocorticoids markedly increases the number of eosinophils and decreases the size of lymphatic tissues, especially the thymus and the lymph nodes. The decrease in lymphocytes slows antibody formation and affects the body’s immune system. Aldosterone is the most powerful of the natural mineralocorticoids in the regulation of electrolyte balance, especially in the balance of sodium and potassium. Cortisol induces sodium retention and potassium excretion, but less effectively than aldosterone. The effects of the corticosteroids on the cardiovascular system, which are not precisely understood, are most evident in hypocortisolism, when the reduction in blood volume, accompanied by increased viscosity, may cause hypotension and cardiovascular collapse. The absence of corticosteroids decreases capillary permeability, decreases vasomotor response of small vessels, and reduces cardiac size and output. The skeletal muscles require adequate amounts of corticosteroids to function normally; excessive amounts cause them to function abnormally. Cortisol and its synthetic analogs can prevent or reduce inflammation by inhibiting edema, leukocytic migration, and disposition of collagen and by causing other complications associated with inflammatory processes. The antiinflammatory actions of synthetic hormones can be harmful, however, because they mask the disease process and prevent accurate observation of its progress. Hypoadrenalism may result from the too rapid withdrawal of such drugs after prolonged therapy. Toxic effects associated with prolonged large dose corticosteroid therapy include fluid and electrolyte imbalance, hyperglycemia and glycosuria, increased susceptibility to infections, myopathy, arrested growth, ecchymoses, Cushing’s syndrome, acne, and behavioral disturbances. Myopathy, characterized by weakness of the proximal musculature of the arms and the legs and associated shoulder and pelvic muscles, may also develop. Corticosteroid therapy may also produce behavioral changes, such as schizophrenia, suicidal tendencies, nervousness, and insomnia. See also **adrenal crisis.**

corticosteroid-binding globulin. See **transcortin.**

corticotroph /kor′tikōtrof′/, a small, irregularly stellate, acidophilic cell of the adenohypophysis, having small, sparsely distributed secretory granules and secreting adrenocorticotropic hormone and beta-endorphin. Also called *corticotrope,* **corticotropic cell.**

corticotroph adenoma. See **corticotropinoma.**

corticotropic cell. See **corticotroph.**

corticotropin. See **adrenocorticotropic hormone.**

corticotropinoma /kor′ti·kō·trō′pi·nō′mə/, a pituitary adenoma made up predominantly of corticotrophs. Excessive adrenocorticotropic hormone (corticotropin) secretion may cause Cushing’s disease or Nelson’s syndrome. See also **Cushing’s disease, Nelson’s syndrome.**

corticotropin-releasing hormone (CRH) /kôr′tikōtrop′in/, a polypeptide hormone secreted by the hypothalamus into the pituitary portal system where it triggers the release of adrenocorticotropic hormone from the pituitary gland.

cortisol /kôr′təsôl/, a steroid hormone produced naturally by the adrenal gland, identical to chemically synthesized hydrocortisone.

■ INDICATIONS: It is prescribed for adrenocortical insufficiency, topically for inflammation, and as an adjunct for the treatment of ulcerative colitis.

■ CONTRAINDICATIONS: Fungal infections or known hypersensitivity to this drug prohibits its systemic use. Viral or fungal infections of the skin, impaired circulation, or known hypersensitivity to this drug prohibits its topical use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions to this drug are GI, endocrine, neurological, fluid, and electrolyte disturbances. Hypersensitivity reactions may result from topical administration.

cortisone /kôr′təsōn/, a synthetic glucocorticoid.

■ INDICATION: It is prescribed for adrenocortical insufficiency inflammation.

■ CONTRAINDICATIONS: Fungal infections or known hypersensitivity to this drug prohibits its systemic use. Viral or fungal infections of the skin, impaired circulation, or known hypersensitivity to this drug prohibits its topical use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions to the systemic administration of the drug are GI, endocrine, neurological, fluid, and electrolyte disturbances, so the drug must be used with caution when there are pre-existing conditions. Skin reactions may result from topical administration. Therapy lasting longer than a few days can lead to hypothalamic-pituitary-adrenal suppression.

Corti’s organ. See **organ of Corti.**

Cortisporin, a trademark for several topical fixed-combination drugs that contain a glucocorticoid **(hydrocortisone)** and 2 to 3 antibacterials **(neomycin sulfate, polymyxin B sulfate,** and/or **bacitracin** zinc).

Corti’s tunnel. See **canal of Corti.**

cor triatriatum /kôr trī·ā′trē·ā′tum/, a congenital anomaly caused by failure of resorption of the embryonic common pulmonary vein, resulting in division of the left atrium by a fibromuscular diaphragm, the posterosuperior chamber receiving the pulmonary venous return and the anteroinferior chamber communicating with the left atrial appendage and mitral orifice. The orifice between the two compartments may be reduced or absent, producing pulmonary venous obstruction.

Corvert, a trademark for a drug that controls atrial fibrillation and atrial flutter **(ibutilide).**

Corynebacterium /kôr′inē′baktir′ē·əm/ [Gk, *koryne,* club, *bakterion,* small staff], a common genus of aerobic and facultative, anaerobic, gram-positive, nonmotile, rod-shaped curved bacilli that includes many species. The most common pathogenic species are *C. acnes,* commonly found in acne lesions, and *C. diphtheriae,* the cause of diphtheria. Nondiphtherial corynebacteria have been recognized as pathogenic, especially in immunocompromised patients. The most common infection with these organisms is bacteremia in association with infections involving devices such as heart valves, catheters, and neurological shunts. See also ***Propionibacterium.***

coryza. See **rhinitis.**

coryza spasmodica. See **hay fever.**

coryza virus. See **rhinovirus.**

Corzide, a trademark for a combination antihypertensive medication **(nadolol** and **bendroflumethiazide).**

cosine law /kō′sīn/, a rule that optimal irradiation occurs when the source of radiation is at right angles to the center of the area being irradiated.

Cosmegen, a trademark for an antineoplastic **(dactinomycin).**

cosmesis /kosmē′sis/, the use of cosmetics or surgery for preserving or enhancing self-image.

cosmetic acne, a type of contact acne, usually of a low grade, seen on the chin and cheeks of persons habitually using facial cosmetics. The usual lesions are closed comedones or papular pustules.

cosmetic dermatitis /kosmet′ik/ [Gk, *kosmesis,* adornment], a form of irritant or allergic contact dermatitis caused by ingredients in cosmetic products. The meaning is commonly broadened to include soaps, shampoos, deodorants, and depilatories in addition to perfumes, coloring agents, and toiletries. This inflammatory skin disease can be manifested in a broad spectrum, ranging from erythema to eczema.

cosmetic surgery, reconstruction of cutaneous or underlying tissues, performed to improve and correct a structural defect or to remove a scar, birthmark, or normal evidence of aging. Kinds of cosmetic surgery include **blepharoplasty, rhinoplasty, rhytidoplasty.** Compare **plastic surgery.** Also called **aesthetic surgery.**

cosmic radiation /kos′mik/, high-energy particles with great penetrating power that originate in outer space and reach the earth as normal background radiation. The particles include high-energy atomic nuclei.

cost-, costi-, costo-, prefix meaning “rib”: *costicartilage, costicervical, costifluous.*

costa /kos′tə/, *pl. costae* /kos′tē/, a rib.

costal /kos′təl/ [L, *costa,* rib], **1.** pertaining to a rib. **2.** situated near a rib or on a side close to a rib.

costal arch [L, *costa* + *arcus,* bow], an arch formed by the shafts of the ribs.

costal cartilage, the cartilage at the anterior end of each rib.

costal facet, one of three sites on each side of a typical thoracic vertebra for articulation with ribs.

costalgia /kostal′jə·ə/ [L, *costa,* rib; Gk, *algos,* pain], a pain in the ribs.

costal groove, a groove along the inferior margin of the superior rib that accommodates the intercostal nerves and associated major arteries and veins.

costal notch, an indentation beside a costal cartilage on the side of the sternum.

cost analysis [L, *costare,* to stand firm; Gk, *ana,* again, *lyein,* to loosen], an analysis of the disbursements of an activity, agency, department, or program.

COSTAR /kō′stär/, abbreviation for *COmputer STored Ambulatory Record* system, a system that creates and stores electronic patient records, including medical history, physical examination information, laboratory reports, diagnosis, and treatments.

cost-based value, a relative value scale used to determine the total units of services provided by a medical practice. The total cost of running the practice and the total units of service are then used to calculate the costs for each service provided.

cost-benefit analysis (CBA), a type of economic evaluation of medical care expense. It compares the expected monetary benefit derived from different health interventions with the expected cost of providing each of the interventions to determine the best or most profitable option.

cost-benefit ratio, a mathematic representation of the relationship of the cost of an activity to the benefit of its outcome or product.

cost cap, *(informal)* a limit on the amount of money that an agency, department, or institution may spend.

cost center, a department, division, or other subunit of an institution established within its accounting system so that the income and expenses of the subunit can be separated from the income or expenses of other centers and monitored for cost and benefit.

cost containment, a nursing intervention from the Nursing Interventions Classification (NIC) defined as management and facilitation of efficient and effective use of resources. See also **Nursing Interventions Classification.**

cost control, the process of monitoring and regulating the expenditure of funds by an agency or institution. Budgets, reports, and cost-accounting procedures are performed to achieve cost control.

costectomy /kostek′təmē/, surgical removal of a rib or resection of rib.

cost-effectiveness, the extent to which an activity is thought to be as valuable as it is expensive. A public-assistance program that issued vouchers for nutritious foods in pregnancy might be considered cost-effective if it lowered the costly incidence of perinatal morbidity.

cost-effectiveness analysis (CEA), a type of economic evaluation used to determine the best use of money available for medical care. It compares different kinds of interventions with similar, but not identical, effects on the basis of the cost per unit achieved.

Costen’s syndrome. See **temporomandibular joint pain dysfunction syndrome.**

cost model, (in the United States) a managed care system in which all components of patient care are defined as costs as opposed to sources of revenue.

costocervical /kos′tōsur′vikəl/ [L, *costa,* rib, *cervix,* neck], pertaining to or involving the ribs and the neck.

costochondral /kos′təkon′drəl/ [L, *costa* + Gk, *chondros,* cartilage], pertaining to a rib and its cartilage.

costochondritis /kos′təkondrī′tis/, an inflammation of the costal cartilage of the anterior chest wall, characterized by pain and tenderness.

costoclavicular /-klavik′yələr/ [L, *costa* + *clavicula,* little key], pertaining to or involving the ribs and the clavicle.

costoclavicular line, an imaginary vertical line between the sternal and midclavicular lines. Also called **parasternal line.**

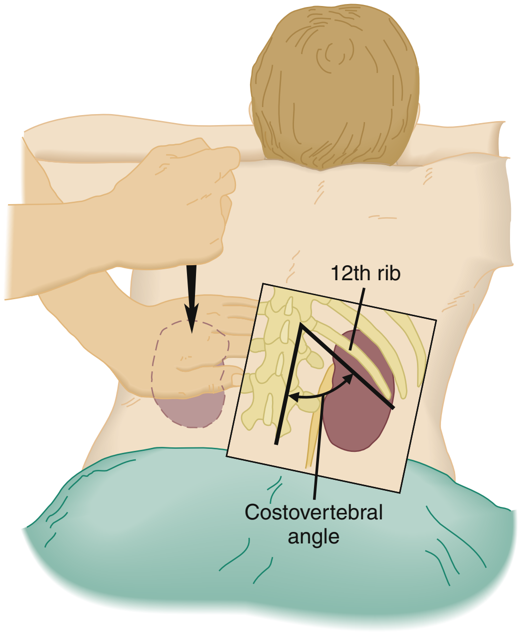
costophrenic (CP) angle /-fren′ik/ [L, *costa* + *phrenicus,* diaphragm], the angle between the diaphragm and the chest wall at the bottom of the lung.

costosternal /-stur′nəl/, pertaining to or involving the ribs and the sternum.

costotransverse articulation /-transvurs′/ [L, *costa* + *transversus,* a cross direction], any of the 20 gliding joints between the ribs and articulating vertebrae, except the eleventh and twelfth ribs. The five ligaments that associate with each costotransverse joint are the articular capsule, the superior costotransverse ligament, the posterior costotransverse ligament, the ligament of the neck of the rib, and the ligament of the tubercle of the rib.

costovertebral /-vur′təbrəl/, of or relating to a rib and the vertebral column.

costovertebral angle (CVA), one of two angles that outline a space over the kidneys. The angle is formed by the lateral and downward curve of the lowest rib and the vertical column of the spine itself. CVA tenderness to percussion is a common finding in pyelonephritis and other infections of the kidney and adjacent structures.



Percussion over the costovertebral angle
(Black and Hawks, 2005)

cost-sharing program, (in the United States) a financial risk-management strategy often used by insurance companies and self-insured employers in which employees share the cost of health services, such as through deductibles and coinsurance.

cost shifting, (in the United States) a mechanism for reducing inpatient costs by providing services in an outpatient setting. The inpatient cost per case is reduced, but the overall cost to the organization does not change.

cost-utility analysis (CUA), a type of economic evaluation of different approaches to managed health care costs. It compares the degree to which quality of life is improved per dollar spent. A quality-of-life index is used to compare interventions, including quality-adjusted life years.

cosyntropin /kō`sintrop′in/, a synthetic form of adrenocorticotropic hormone that is used in the diagnosis and treatment of adrenal hypofunction disorders such as Addison's disease to determine if the disorder is primary (adrenal dysfunction) or secondary (hypothalamic-pituitary axis dysfunction).

COTA, abbreviation for **certified occupational therapy assistant.**

Cotazym, a trademark for an enzyme (pancrelipase).

cot death. See **sudden infant death syndrome.**

cotton /kot′n/, **1.** a plant of the genus *Gossypium*. **2.** a textile material derived from the seeds of this plant.

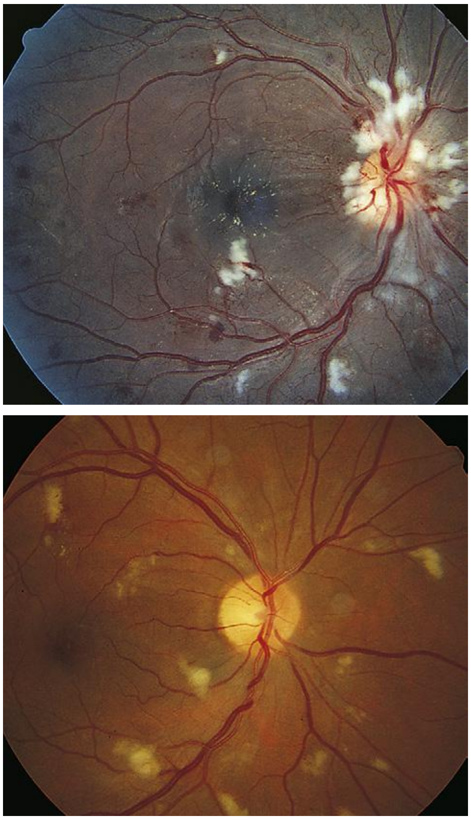
cotton-mill fever. See **byssinosis.**

cottonmouth, a poisonous pit viper *(Agkistrodon piscivorus)* commonly found near water and swamps of the southeastern part of the United States. The symptoms of the bite of a cottonmouth are rapid swelling, severe pain, skin discoloration at bite marks, and weakness. Antivenin and ventilatory/circulatory support are the usual treatments. Also called **water moccasin.**

Cottonmouth *(Auerbach, 2012/Courtesy Dr. Sherman Minton)*

Cotton's fracture, a fracture involving the medial, lateral, and posterior malleoli of the ankle. Also called **trimalleolar fracture.**

cotton-wool exudate [Ar, *qutun* + AS, *wull* + ME, *spot*], a white, fluffy-appearing lesion, an infarction of the nerve fiber layer, observed on the retina of patients with certain systemic conditions, such as diabetes, acquired immunodeficiency syndrome, hypertension, and lupus. It can also be observed in retinal infections.



Cotton-wool exudate in hypertensive disease
(Feehally et al, 2007/Courtesy J. Kinyoun, University of Washington)

cotyledon /kot′ilē′don/ [Gk, *kotyledon,* cup-shaped], one of the visible segments on the maternal surface of the placenta. A typical placenta may have 15 to 28 cotyledons, each consisting of fetal vessels, chorionic villi, and intervillous space.

cotyloid /kot′iloid/, cup-shaped, as the acetabulum.

cotyloid cavity. See **acetabulum.**

coudé catheter /ko͞odā′/ [Fr, *coude,* elbow], an elbowed catheter with an olive tip for a strictured urethra.

cough /kôf/ [AS, *cohhetan*], a sudden audible expulsion of air from the lungs. Coughing is preceded by inspiration, the glottis is partially closed, and the accessory muscles of expiration contract to expel the air forcibly from the respiratory passages. Coughing is an essential protective response that serves to clear the lungs, bronchi, and trachea of irritants and secretions or to prevent aspiration of foreign material into the lungs. It is a common symptom of diseases of the chest and larynx. Chronic coughing may be indicative of tuberculosis, lung cancer, bronchiectasis, asthma, or bronchitis. Otitis media, allergies, subdiaphragmatic irritation, congestive heart failure, and mitral valve disease may be associated with episodes of severe chronic coughing. Coughing is a reflex action that may be induced voluntarily and, to some extent, voluntarily inhibited. The cough-reflex center is located in the medulla of the brain. It responds to stimulation transmitted by the glossopharyngeal (CN9) or vagus (CN10) nerve. The reflex is initiated by chemical or mechanical irritation of the pharynx, larynx, or tracheobronchial tree. Because the function of coughing is to clear the respiratory tract of secretions, it is important that the cough expel accumulated debris. If it does not because of, for example, weakness or inhibition by pain, instruction in effective coughing and deep-breathing exercises is helpful. Persons with chronic coughs may obtain symptomatic relief through environmental controls that reduce irritants in and humidify air. Medication may help dilate the bronchi, liquefy secretions, and increase expectoration. Antitussive medications are sometimes prescribed even in the absence of mucus or congestion. When congestion is present and the patient is unable to cough up the mucus, an expectorant may be prescribed.

cough enhancement, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion of deep inhalation by the patient with subsequent generation of high intrathoracic pressures and compression of underlying lung parenchyma for the forceful expulsion of air. See also **Nursing Interventions Classification.**

cough fracture, a break in a rib, usually the fourth to eighth rib, caused by violent coughing.

cough syncope [AS, *cohhetan* + Gk, *syncope,* fainting], a temporary loss of consciousness during coughing. The coughing increases the intrathoracic pressure enough to impede venous return, thereby interfering with normal blood flow to the brain.

cough variant asthma, asthma characterized by minimal wheezing and a nonproductive, often severe, cough lasting from a few hours to days.

coulomb (C) /ko͞o′lōm/ [Charles A. de Coulomb, French physicist, 1736–1806], the SI unit of electricity equal to the quantity of charge transferred in 1 second across a conductor in which there is a constant current of 1 ampere, or 1 ampere-second.

Coulomb's law [Charles A. de Coulomb], (in physics) a law stating that the force of attraction or repulsion between two electrically charged bodies is directly proportional to the strength of the electrical charges and inversely proportional to the square of the distance between them.

coulometry /ko͞olom′ətrē/, a type of electroanalytic chemistry in which a reagent generated at the surface of an electrode reacts with a substance to be measured. The substance, usually a metal ion, is measured in terms of the coulombs required for the reaction.

Coulter counter /kōl′tər/ [W.H. Coulter, twentieth century American engineer], a trademark for an electric device that rapidly identifies and counts red and white blood cells present in a small specimen of human blood.

Coumadin, a trademark for an anticoagulant **(warfarin sodium).**

coumarin /ko͞o′mərin/, a class of orally active anticoagulant agents with warfarin as its prototype.

■ INDICATIONS: It is prescribed for prophylaxis and treatment of thrombosis and embolism.

■ CONTRAINDICATIONS: Known hypersensitivity to the drug prohibits its use. It is not prescribed to patients who are at risk for hemorrhage or who are pregnant.

■ ADVERSE EFFECTS: The most serious adverse reaction is hemorrhage. Many other drugs interact with this drug to increase or decrease its effect.

counseling^{1} [L, *consulere,* to consult], the act of providing advice and guidance to a patient or his or her family, a therapeutic technique that helps the patient recognize and manage stress and that facilitates interpersonal relationships between the patient and the family, significant others, or the health care team. See also **genetic counseling.**

counseling^{2}, a nursing intervention from the Nursing Interventions Classification (NIC) defined as use of an interactive helping process focusing on the needs, problems, or feelings of the patient and significant others to enhance or support coping, problem-solving, and interpersonal relationships. See also **Nursing Interventions Classification.**

counselor, a human services professional who deals with human development concerns through support, therapeutic approaches, consultation, evaluation, teaching, and research. Specializations include, but are not limited to, community counselor, gerontological counselor, spiritual counselor, grief counselor, marriage and family counselor/therapist, mental health counselor, school counselor, and student affairs practioner. See also **genetic counselor.**

count [L, *computere,* to calculate], a computation of the number of objects or elements present per unit of measurement. Kinds of counts include *Addis count,* **bacterial count, complete blood count,** and **platelet count.**

counterclaim [L, *contra,* against, *clamere,* to cry out], (in law) a claim made by a defendant establishing a cause for action in his or her favor against a plaintiff. The purpose of a counterclaim is to oppose or detract from a plaintiff's claim or complaint.

counterconditioning, a process used in behavioral therapy in which a learned response is replaced by an alternative response that is less disruptive.

countercurrent, a change in the direction of flow of a fluid. An example is the countercurrent in the ascending branch of a kidney tubule where osmolality undergoes a reversal after a gradual change in sodium chloride concentrations.

countercurrent multiplication, the mechanism in the loops of Henle of the renal tubules by which urine is concentrated. It is dependent on unique solute transport processes at different parts of the loops of Henle and the vasa recta.

counterinjunction /-injungk′shən/, (in transactional analysis) an overt message from the parent ego state of the mother or father that may be difficult to follow if it conflicts with earlier parental instructions. For example, the person may obey an earlier injunction to avoid close relationships, then be instructed later to "grow up and get married."

counterirritant, an agent used to produce an irritation in one part of the body intended to relieve irritation in some other part.

counterphobic behavior /-fō′bik/, an expression of reaction to a phobia by a patient who actively seeks exposure to the type of situation that precipitates phobic symptoms. Examples are thrill-seeking and risk-taking activities.

counterpulsation /-pulsā′shən/ [L, *contra* + *pulsare,* to beat], **1.** the action of a circulatory-assist pumping device that is synchronized with cardiac systole and diastole to decrease the work of the heart. **2.** the process of increasing the intraaortic pressure in diastole by inflation of an intraaortic balloon and deflation of the balloon immediately before the next systole.

counterregulatory hormones, glucagons, epinephrine, growth hormones, and core tissue that work to increase blood glucose levels by stimulating glucose production, and liver output and decreasing movement of glucose into cells.

countershock [L, *contra* + Fr, *choc*], a high-intensity, short-duration electric shock applied to an area of the heart, resulting in total cardiac depolarization. See also **cardioversion, defibrillation.**

counterstain, a second stain added to a previously stained tissue sample to make cellular details more distinct.

countertraction /-trak′shən/ [L, *contraz* + *trahere,* to pull], a force that counteracts the pull of traction, such as the force of body weight resulting from the pull of gravity. Orthopedic countertraction may be obtained by altering the angle of the body-weight force in relation to the pull of traction, such as by elevating the foot of the bed with blocks to attain the Trendelenburg position. The magnitude of countertraction is usually increased gradually by methodically changing the position of a patient and by adding or removing weights from weight hangers.

countertransference /-transfur′əns/, the conscious or unconscious emotional response of a psychotherapist or psychoanalyst to a patient. The response may be positive or negative but can provide useful data in the therapy.

countertransport /-trans′pôrt/ [L, *contra* + *trans,* across, *portare,* carry], the simultaneous transport of two different substances across the same membrane, each in the opposite direction.

counting cell hemocytometer [OFr, *conter* + L, *cella,* storeroom; Gk, *haima,* blood, *metron,* measure], a device for counting the number of cells in a volume of blood or other fluid. It consists of a microscope slide with a counting chamber. The chamber has a known volume and the slide has a ruled area to help count the cells.

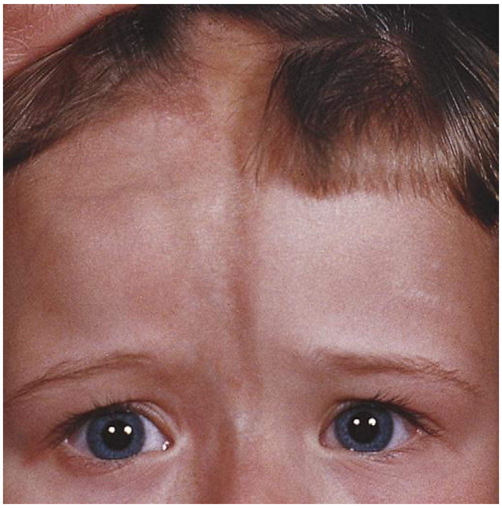
counts per minute (cpm), a measure of the rate of ionizing emissions by radioactive substances.

coup /ko͞o/ [Fr, blow], **1.** any blow or stroke or the effects of such a blow to the body, usually used with a French word identifying a type of stroke. **2.** also called *coup de sabre*. a wound resembling a sword cut. **3.** also called *coup desoleil*. See also **sunstroke. 4.** also called **coup sur coup.** administration of a drug in small amounts over a short period rather than in a single larger dose. **5.** also called **contrecoup.** an injury most often associated with a blow to the skull in which the force of the impact is transmitted through the skull bones to the opposite side of the head, where the bruise, fracture, or other sign of injury appears.

coupled pacing, a pacemaker mode designed to apply electrical stimulation near the end of the T-wave to create a retrograde activationof the atrioventricular (AV) node and in turn to prevent rapid ventricular conduction during atrial fibrillation (AF). See **pacing.**

coupled rhythm, heart beats occurring in pairs; the second beat is usually a premature ventricular contraction. See **bigeminal rhythm.**

couples' therapy, psychotherapy in which couples, who may be married or unmarried, undergo therapy together.



Coup de sabre *(du Vivier, 1993)*

coupling /kup′ling/ [L, *copula,* bonding], **1.** the act of coming together, joining, or pairing. **2.** (in genetics) the situation in linked inheritance in which the nonalleles of two or more mutant genes are located on the same chromosome and are close enough that they are likely to be inherited together. **3.** (in radiation therapy) the efficiency of transfer of power from an applicator to the treatment site. Compare **repulsion.** See also **cis configuration. 4.** (in cardiology) the regular occurrence of a premature beat.

coupling interval, the interval between the dominant heartbeat and a linked ectopic beat. It is measured from the beginning of a normal QRS complex to the beginning of the ectopic QRS complex that follows it.

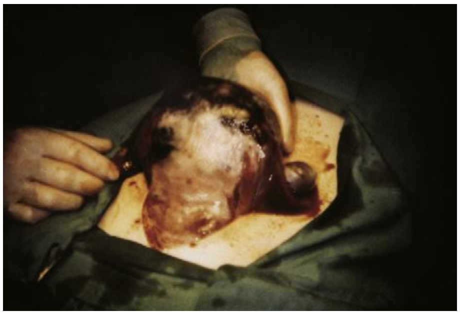
coup sur coup. See **coup.**

courseware /kôrs′wer/, software programs for use in instruction.

Courvoisier's law /ko͞orvô·äzē·āz′/ [Ludwig Courvoisier, Swiss surgeon, 1843–1918], a statement that the gallbladder is smaller than usual if a gallstone blocks the common bile duct but is dilated if the common bile duct is blocked by something other than a gallstone, such as pancreatic cancer.

couvade /ko͞oväd′/, a custom in some non-Western cultures whereby the husband goes through mock labor while his wife is giving birth.

Couvelaire uterus /ko͞ovəler′/ [Alexandre Couvelaire, French obstetrician, 1873–1948], a hemorrhagic process in uterine musculature that may accompany severe abruptio placentae. Extravasated blood effuses between the muscle fibrils and under the uterine peritoneum. The uterus takes on a purplish color and does not contract well. Also called **uteroplacental apoplexy.** See also **abruptio placentae.**



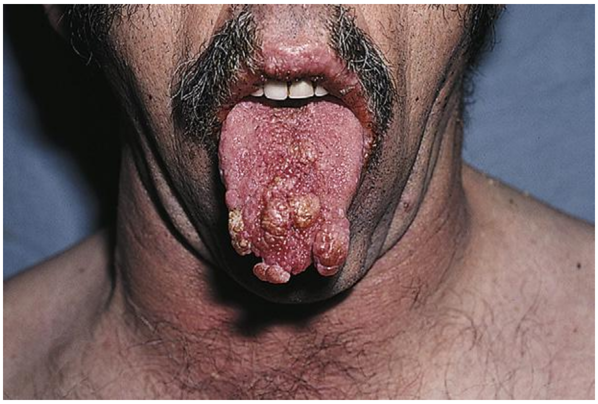
Couvelaire uterus *(Greer et al, 2001)*

covalent bond, a chemical bond that forms by the sharing of two electrons between atoms. A double bond is formed when four electrons are shared between two atoms; a triple bond is formed when six electrons are shared between two atoms.

coverage /kuv′ərij/, the extent to which services rendered by a health care program cover the potential need for them.

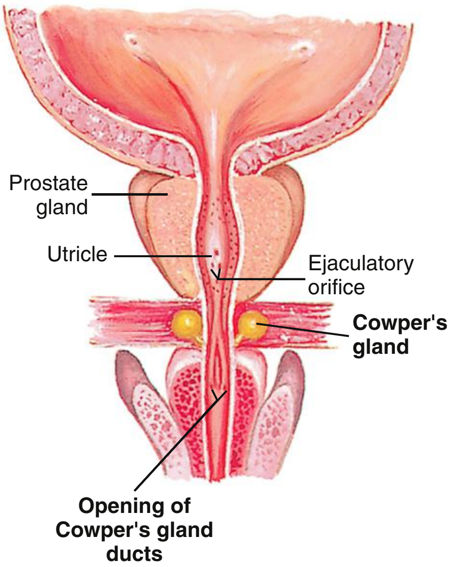
covered benefit, a health service included in the premium of a policy paid by or on behalf of the enrolled patient. Also called **benefit, covered service.**

Cowden's disease [Cowden, family name of the first recorded case], an autosomal-dominant disorder characterized by hypertrichosis, gingival fibromatosis, facial papules, hemangiomas, and postpubertal fibroadenomatous breast enlargement. Also called **hamartoma syndrome.**



Cowden's disease *(Callen et al, 2000)*

Cowper's gland /kou′pərz/ [William Cowper, English surgeon, 1666–1709], either of two round, pea-sized tubular glands embedded in the urethral sphincter of the male beneath the bulb of the male urethra. Normally yellow, they consist of several lobes with ducts that join and form a single excretory duct, emptying mucus into the urethra. Also called **bulbourethral gland.** Compare **Bartholin's gland.**



Cowper's gland *(Seidel et al, 2011)*

Cowper's syringocele, a cystlike swelling of a bulbourethral gland (Cowper's gland) or one of its ducts, seen in infant boys or occasionally in older males. Those in the duct are caused by obstruction of its orifice. Also called *Cowper's cyst*.

cowpox /kou′poks/ [AS, *cu* + ME, *pokkes*], a mild infectious disease characterized by a pustular rash, caused by the vaccinia virus. Animals that carry the vaccinia virus are cows, cats, and rodents. Human cases are usually rare. Transmission to humans can occur during the milking of a cow with active lesions on the udder and teats, but the disease is usually transmitted by domesticated cats. Cowpox infection usually confers immunity to smallpox, because of the similarity of the variola and vaccinia viruses. Also called **cat pox.** See also **smallpox, vaccinia.**

COX-2 inhibitors, cyclooxygenase-2 inhibitors, a group of nonsteroidal antiinflammatory drugs (NSAIDs) that act by inhibiting cyclooxygenase-2 activity and have fewer GI side effects than other NSAIDs. One of the members of this group is celecoxib.

coxa /kok′sə/ *pl. coxae* [L, hip], the hip joint; the head of the femur and the acetabulum of the innominate bone.

coxa adducta, coxa flexa. See **coxa vara.**

coxal articulation /kok′səl/ [L, *coxa* + *articularis*, relating to the joints], the ball-and-socket joint of the hip, formed by the articulation of the head of the femur into the cup-shaped cavity of the acetabulum. It involves seven ligaments and permits very extensive movements, such as flexion, extension, adduction, abduction, and medial and lateral rotation. Also called **hip joint.** Compare **shoulder joint.**

coxa magna, an abnormal widening of the head and neck of the femur.

coxa plana. See **Perthes disease.**

coxa valga, a hip deformity in which the angle normally formed by the axis of the head and neck of the femur and the axis of its shaft is significantly increased.

coxa vara, a hip deformity in which the angle normally formed by the axis of the head and neck of the femur and the axis of its shaft is decreased. Also called **coxa adducta, coxa flexa.**

coxa vara luxans, a fissure or crack in the neck of the femur with dislocation of the head, caused by coxa vara.

Coxiella burnetii, a gram-negative bacterium that grows preferentially in the vacuoles of the host cell and causes **Q fever.** It is distributed globally. Humans are very susceptible to infection, and the infectious dose may be very low. Also called ***Rickettsia burnetii.***

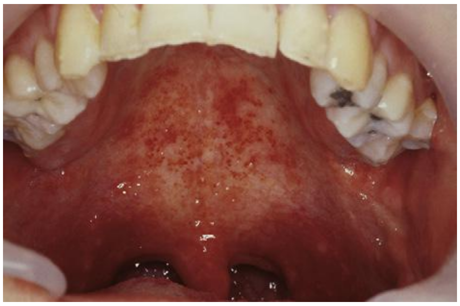
coxsackie virus /koksak′ē-/ [Coxsackie, New York; L, *virus*, poison], any of 30 serologically different small RNA enteroviruses associated with a variety of symptoms and primarily affecting children during warm weather. The coxsackieviruses resemble the virus responsible for poliomyelitis, particularly in size. Both are picornaviruses. Coxsackie viruses can be divided into two groups. Group A is the milder form, causing herpangina and hand-foot-and-mouth disease. Group B causes epidemic pleurodynia. Both types can cause myocarditis, pericarditis, aseptic meningitis, and several exanthems. There is no known preventive measure except isolation of infected persons, and the treatment is generally directed to relief of symptoms. See also **viral infection.**

CP, **1.** abbreviation for *candlepower.* **2.** abbreviation for **cerebral palsy. 3.** abbreviation for *chemically pure*.

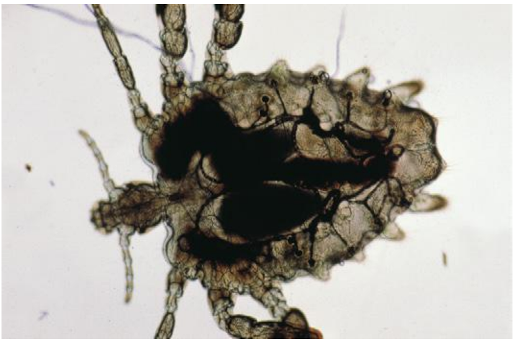
CPAN, abbreviation for *certified postanesthesia nurse*.

CPAP, abbreviation for **continuous positive airway pressure.**

CPD, **1.** abbreviation for **cephalopelvic disproportion. 2.** abbreviation for **childhood polycystic disease.** See



Coxsackie virus *(Conlon and Snydman, 2000)*



Crab louse *(White and Cox, 2006)*

polycystic kidney disease. 3. abbreviation for **congenital polycystic disease.** See **polycystic kidney disease.**

CPDA-1, abbreviation for *citrate phosphate dextrose adenine*.

C peptide, a biologically inactive residue of insulin formation in the beta cells of the pancreas. When proinsulin is converted to insulin, an equal amount of C peptide, a chain of amino acids, is also secreted into the bloodstream. Beta cell secretory function can be determined by measuring the C peptide in a blood sample.

C-peptide test, a blood test used to evaluate levels of C-peptide, which correlate with insulin levels in the blood. Direct measurement of C-peptide measures the capacity of the pancreatic beta cells to secrete insulin. It is used to evaluate patients with suspected insulinoma, renal failure, pancreas transplant, factitious hypoglycemia, radical pancreatectomy, and diabetes mellitus.

CPHA, abbreviation for the **Canadian Public Health Association.**

CPK, abbreviation for **creatine phosphokinase.** See **creatine kinase.**

CPM, abbreviation for **continuous passive motion**

cpm, abbreviation for **counts per minute.**

CPNP/A, abbreviation for *certified pediatric nurse practitioner/associate*.

CPPB, abbreviation for *continuous positive pressure breathing*. See **continuous positive airway pressure.**

CPPD, abbreviation for *calcium pyrophosphate dihydrate*. See **chondrocalcinosis.**

CPPV, abbreviation for **continuous positive pressure ventilation.**

CPR, abbreviation for **cardiopulmonary resuscitation.**

CPRAM, abbreviation for *controlled partial rebreathing anesthesia method*.

cps, abbreviation for **cycle per second.** See **hertz.**

CPT* codes,** a coding system, defined in the publication ***Current Procedural Terminology, for medical procedures that allows for comparability in pricing, billing, and utilization review.

cpu, CPU, abbreviation for **central processing unit.**

CQI, abbreviation for **continuous quality improvement.**

CR, **1.** abbreviation for **computed radiography. 2.** abbreviation for *controlled respiration*.

Cr, symbol for the element **chromium.**

crab louse [AS, *crabba* + *lus*], a species of louse, *Phthirus pubis,* that infests the hairs of the genital area. It is often transmitted between persons by sexual contact but can also be spread by shared bedding. Pubic lice are usually easily killed with 1% permethrin or pyrethrin shampoo. Also called **crabs.** Formerly called *Pediculus pubis*. See also **lice, pediculosis.**

crabs /krabz/, *(informal)* popular name for *Pthirus pubis*.

crack [ME, *craken*], a street drug made by chemically converting cocaine hydrochloride to a form that can be smoked. Smoking crack is a faster, more direct way of getting cocaine molecules into the brain. Because larger amounts of the drug reach the brain more quickly, the effects are more intense than when cocaine, in the white-powder form, is injected, ingested, or inhaled. Also called **crack cocaine, freebase.**

crack baby, an infant who was exposed to effects of cocaine in utero by a mother who used the "crack" form of the drug while pregnant. See also **cocaine baby.**

crack cocaine. See **cocaine hydrochloride, crack.**

cracked-pot sound [ME, *craken* + *pott* + L, *sonus,* sound], a sound sometimes heard on percussion over a cavity with an opening to a bronchus.

cracked tooth syndrome [ME, *craken;* AS, *toth*], a group of symptoms caused by the presence of a cracked tooth, including pain on pressure or application of cold, with pulpitis if untreated.

crackle, a common, abnormal respiratory sound consisting of discontinuous bubbling noises heard on auscultation of the chest during inspiration. Fine crackles have a popping sound produced by air entering distal bronchioles or alveoli that contain serous secretions, as in congestive heart failure, pneumonia, or early tuberculosis. Coarse crackles may originate in the larger bronchi or trachea and have a lower pitch. Crackles are not cleared by coughing. Formerly called **rale.** Compare **rhonchus, wheeze.** See also **coarse crackle.**

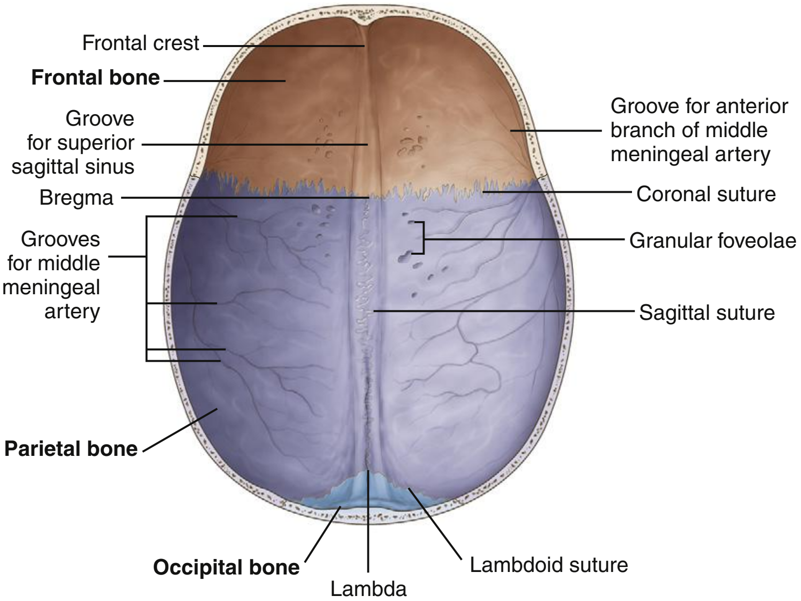
crackling rale. See **subcrepitant rale.**

cradle cap [AS, *cradel* + *caeppe*], a common seborrheic dermatitis of the scalp in infants, which consists of thick, yellow greasy or waxy scales that may be reddened. It may also involve the skin on the nose, eyebrows, ears, and skin of the trunk. Treatment includes application of oil or ointment to soften the scales and frequent shampoos. A weak 0.5% hydrocortisone cream can be effective in controlling the problem. Also called **seborrhea capitis.**

cramp [AS, *crammian,* to fill], **1.** a spasmodic and often painful contraction of one or more muscles. **2.** a pain resembling a muscular cramp. Kinds of cramps include **heat cramp** and **writer's cramp.** See also **charley horse, dysmenorrhea, torticollis.**

cranberry, an herbal product whose berries are harvested from a small shrub found in the United States from Alaska to Tennessee.

■ USES: It is used for urinary tract infections (UTIs) and works by decreasing bacterial adherence to the walls of the bladder, urethra, and so on. Although likely effective to some degree, patients should not rely on cranberry juice for treating UTIs.



Cranial cavity *(Drake, Vogl, and Mitchell, 2010)*

■ CONTRAINDICATIONS: Those with known hypersensitivity, oliguria, or anuria should not use cranberry.

-crania, suffix meaning "(condition of the) skull or head": *diastematocrania, hemicrania, platycrania.*

cranial. See **cranium.**

cranial arteritis. See **temporal arteritis.**

cranial bones /krā′nē·əl/ [Gk, *kranion,* cranium; AS, *ban*], the bones of the skull, particularly the part of the cranium that encloses the brain.

cranial cavity, the cavity of the skull containing the brain and other tissues. Also called **cerebral cavity.**

cranial fibrous joints, the sutures and ligaments connecting the bones of the skull to each other and the syndesmoses holding the teeth in their sockets.

cranial nerves [Gk, *kranion,* skull; L, *nervus*], the 12 pairs of nerves emerging from the cranial cavity through various openings in the skull. Beginning with the most anterior, they are designated by Roman numerals and named (I) olfactory, (II) optic, (III) oculomotor, (IV) trochlear, (V) trigeminal, (VI) abducens, (VII) facial, (VIII) vestibulocochlear (acoustic), (IX) glossopharyngeal, (X) vagal, (XI) accessory, and (XII) hypoglossal. The cranial nerves originate in the base of the brain and carry impulses for such functions as smell, vision, ocular movement, pupil contraction, muscular sensibility, general sensibility, mastication, facial expression, glandular secretion, taste, cutaneous sensibility, hearing, equilibrium, swallowing, phonation, tongue movement, head movement, and shoulder movement. Certain cranial nerves, particularly V, VII, and VIII, contain two or more distinct functional components considered as independent nerves by some authorities. Some anatomists also classify the terminal nerve as the first cranial. Also called **cerebral nerves.** See also the specific nerves.

cranial sensory ganglion, the ganglion found on the root of each cranial nerve, containing the cell bodies of afferent (sensory) neurons.

cranial sutures, the interlocking lines of fusion (fibrous joints) of the bones forming the skull. The lines gradually become less prominent as a person matures. Also called **suturae cranii.**

cranial synchondroses, the cartilaginous junctions between the bones of the cranium.

craniectomy /krā′nē·ek′təmē/ [Gk, *kranion,* cranium, *ektomē,* excision], the surgical removal of a portion of the cranium.

cranio-, prefix meaning "skull or cranium": *craniobuccal, craniognomy, craniosacral.*

craniocarpotarsal dystrophy. See **Freeman-Sheldon syndrome.**

craniocele. See **encephalocele.**

craniocervical /krā′nē·ōsur′vikəl/ [Gk, *kranion* + L, *cervix,* neck], pertaining to the junction of the skull and neck, particularly the area of the foramen magnum. Because of the complex of nerve fibers and blood vessels in the region and the flexibility of the cervical spine, craniocervical tissues are particularly vulnerable to a variety of compression and traction disorders.

craniodidymus /krā′nē·ōdid′iməs/ [Gk, *kranion* + *didymos,* twin], a two-headed fetus in which the bodies are fused.

craniofacial /-fā′shəl/ [Gk, *kranion,* cranium; L, *facies,* face], pertaining to the cranium and the face.

craniofacial dysostosis [Gk, *kranion* + L, *facies,* face; Gk, *dys,* bad, *osteon,* bone], an abnormal hereditary condition characterized by acrocephaly, exophthalmos, hypertelorism, strabismus, parrot-beaked nose, and hypoplastic maxilla with relative mandibular prognathism. This condition is transmitted as an autosomal-dominant trait. See also **dysostosis.**

craniohypophyseal xanthoma /krā′nē·ōhī′pōfiz′ē·əl/ [Gk, *kranion* + *hypo,* deficient, *phyein,* to grow, *xanthos,* yellow, *oma,* tumor], a condition in which cholesterol deposits are formed around the hypophyses of the bones, as in Hand-Schüller-Christian disease.

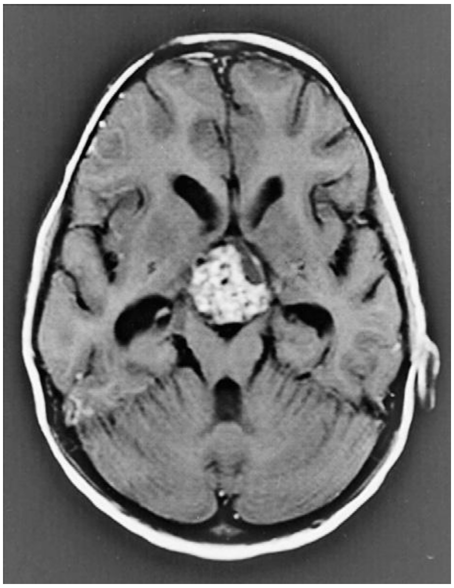
craniology /krā′nē·ol′əjē/, the study of the shape, size, proportions, and other features of the human skull. It is usually associated with anthropological research.

craniometaphyseal dysplasia /-met′əfiz′ē·əl/, an inherited bone disorder characterized by paranasal overgrowth, thickening of the skull and jaw, and entrapment of cranial nerves. The long bones have widened, club-shaped metaphyses. The patient may experience nasorespiratory infections, associated with bone overgrowth at the sinuses, and malocclusion of the jaws.

craniopagus /krā′nē·op′əgəs/ [Gk, *kranion* + *pagos,* fixed], conjoined twins united at the heads. Fusion can occur at the frontal, occipital, or parietal region. Also called **cephalopagus.**

craniopharyngeal /krā′nē·ōfərin′jē·əl/ [Gk, *kranion* + *pharynx,* throat], pertaining to the cranium and the pharynx.

craniopharyngioma /krā′nē·ōfərin′jē·ō′mə/, *pl. craniopharyngiomas, craniopharyngiomata,* a congenital pituitary tumor, appearing most often in children and adolescents, that arises in cells derived from Rathke's pouch or the hypophyseal stalk. The lesion, a solid or cystic body ranging in size from 1 to 8 cm, may expand into the third ventricle or the temporal lobe and frequently becomes calcified. The tumor may interfere with pituitary function, damage the optic chiasm, disrupt hypothalamic control of the autonomic nervous system, and cause hydrocephalus. Increased intracranial pressure, severe headaches, vomiting, stunted growth, defective vision, irritability, somnolence, and infantile genitalia are often associated with the lesion in children. Development of the tumor after puberty usually results in amenorrhea in women and loss of libido and potency in men. Also called **ameloblastoma, craniopharyngeal duct tumor, pituitary adamantinoma, Rathke's pouch tumor.**



Craniopharyngioma *(Goetz et al, 2007)*

cranioplasty /krā′nē·ōplast′tē/, plastic surgery performed on the skull.

craniosacral therapy, a form of gentle manual manipulation used for diagnosis and for making corrections in a system made up of cerebrospinal fluid, cranial and dural membranes, cranial bones, and sacrum. This system is proposed to be dynamic with its own physiological frequency. Through touch and pressure, tension is supposed to be reduced and cranial rhythms normalized, leading to improvement in health.

craniospinal /krā′nē·ōspī′nəl/ [Gk, *kranion,* skull + L, *spina,* backbone or spine], pertaining to the cranium and the vertebral column.

craniostenosis /krā′nē·ō′stənō′sis/ [Gk, *kranion* + *stenos,* narrow, *osis,* condition], a congenital deformity of the skull that results from premature closure of the sutures between the cranial bones. The severity of the malformation depends on which sutures close, the point in the developmental process where the closure occurred, and the success or failure of the other sutures to compensate by expansion. Impaired brain growth may or may not be involved. The most common form of the condition is permanent closure of the sagittal suture with anteroposterior elongation of the skull. Surgery is generally indicated when multiple sutures are fused to relieve cerebral pressure and may be performed for cosmetic reasons. See also **brachycephaly, oxycephaly, plagiocephaly, scaphocephaly. —***craniostenotic, adj.*

craniostosis /krā′nē·ostō′sis/ [Gk, *kranion* + *osteon,* bone, *osis,* condition], premature ossification of the sutures of the skull, often associated with other skeletal defects. The sutures close before or soon after birth. Without surgical correction the growth of the skull is inhibited, the head is deformed, and the eyes and brain are often damaged. Also called *craniosynostosis.*

craniotabes /krā′nē·ōtā′bēz/ [Gk, *kranion* + L, *tabes,* wasting], benign congenital thinness of the top and back of the skull of a newborn. The condition is common because the rate of brain growth exceeds the rate of calcification of the skull during the last month of gestation. The bones feel brittle when pressed by an examiner's fingers. Craniotabes disappears with normal nutrition and growth but may persist in infants in whom rickets develops.

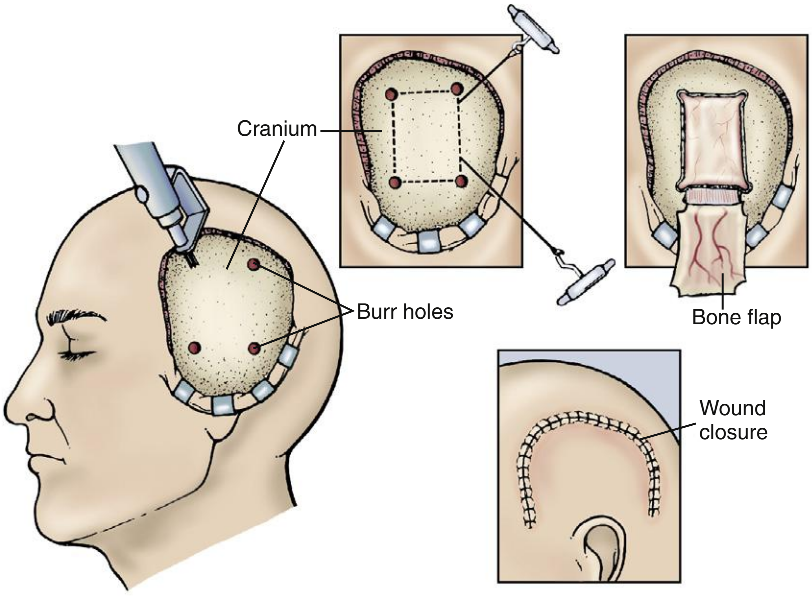
craniotomy /krā′nē·ot′əmē/ [Gk, *kranion,* cranium, *temnein,* to cut], any surgical opening into the skull, performed to relieve intracranial pressure, to control bleeding, or to remove a tumor. X-ray films of the skull are taken before surgery, and a computed tomographic (CT) scan or an electroencephalogram is done to establish the diagnosis. The operative site is shaved and cleansed. Parenteral corticosteroids are given to reduce cerebral edema. Mannitol is administered to decrease intracranial pressure. A semicircular skin incision is made just above the hairline, a series of burr holes is made and connected with a cut, and the flap of bone is removed. The meninges are incised, and the brain is exposed. The flap may be replaced after surgery or left off temporarily to prevent the buildup of pressure from cerebral edema. After surgery, if the cerebral area is involved, the head of the patient's bed is elevated to 45 degrees to reduce the risk of hemorrhage and edema; if the cerebellum or brainstem is affected, the patient may be kept flat. The dressing is checked frequently for blood and yellowish drainage of cerebrospinal fluid. Any moist areas are reinforced with sterile materials to prevent infection. Frequent assessment of neurological signs, respirations, and vital signs, including level of consciousness, speech, and strength, is essential.

craniotubular /-to͞ob′yələr/, pertaining to a bossing, or overgrowth, of bone that produces an abnormal contour and increased bone density. An example of a craniotubular disorder is craniometaphyseal dysplasia.

cranium /krā′nē·əm/ [Gk, *kranion,* skull], the bony portion of skull that holds the brain. It is composed of eight bones: the frontal, occipital, sphenoid, ethmoid, and paired temporal and parietal bones. **—cranial,** *adj.*

-cranium, suffix meaning "skull": *chondrocranium, desmocranium, endocranium.*

crankcase-spool catheter /krangk′kās/, a special elastic catheter stored within a plastic spool to facilitate its insertion, especially for hyperalimentation. When fully inserted, the crankcase-spool catheter is usually lodged in the subclavian vein. The catheter is highly flexible, and each revolution of the spool feeds about 5 inches of the catheter into the vein involved. When the crankcase-spool catheter is fully inserted, a radiographic exposure is made of the insertion



Craniotomy *(Phipps et al, 1999)*

area to confirm its correct placement. The crankcase-spool catheter is less irritating than a regular catheter, allows greater limb movement, and minimizes the risk of thrombosis. It may, however, cause complications, such as occlusion, phlebitis, infection, and catheter sensitivity. Occlusion of the vein, a common risk, is usually countered by flushing the vein with dilute streptokinase.

crash [ME, *crasschen,* to break violently], a serious malfunction of computer hardware or software that generally results in the loss of function and any data that have not been saved to a file.

crash cart, a cart carrying emergency equipment and supplies, such as medications, suction devices, sutures, scalpels, surgical needles, sponges, swabs, retractors, hemostats, forceps, airways, O_2 supplies, IV supplies, tracheal tubes, and often a cardiac monitor with a defibrillator. Hospital emergency departments and intensive care units usually have several crash carts equipped according to prescribed specifications. Efficient, effective emergency care often depends on the careful provisioning of crash carts and the precise knowledge of their layouts.

-crasia, **1.** suffix meaning "(condition of a) mixture, good or bad": *eucrasia, orthocrasia, spermacrasia*. **2.** suffix meaning a "(specified) condition involving loss of control": *copracrasia, uracrasia*.

crater, a pitlike depression, such as where an ulcer has been surgically removed.

-cratia, suffix meaning "(condition of) incontinence": *uracratia*.

cravat bandage /krəvat′/ [Fr, *cravate,* scarf, *bande,* strip], a triangular bandage, folded lengthwise. It may be used as a circular, figure-eight, or spiral bandage to control bleeding or to tie splints in place.

cravat bandage for clenched fist, a pressure dressing made by folding the points of a triangular bandage to form a band about the fist.

cravat bandage for fracture of the clavicle, a sling dressing that includes a 2- to 4-inch soft pad in the armpit. The triangular bandage is placed with the center point on the affected shoulder. The hand and wrist are laid against it. The opposite ends are lifted to cover and support the arm. The bandage ends are drawn together and tied at the back.

cravat elbow bandage, a triangular dressing that holds the elbow at a 45-degree angle, beginning with the center over the point of the elbow. The bandage is completed with one end around the forearm and the other around the upper arm.

cravat sling bandage, a support for a fractured arm prepared by laying the wrist on the center of the triangular bandage while the forearm is at a right angle. The two ends of the bandage are carried around the neck and tied.

crawling reflex. See **symmetric tonic neck reflex.**

C-reactive protein (CRP) /-rē·ak′tiv/, a protein not normally detected in the serum but present in many acute inflammatory conditions and with necrosis. CRP appears in the serum before the erythrocyte sedimentation rate begins to rise, often within 24 to 48 hours of the onset of inflammation. Acute rheumatic fever is monitored with serial estimations of CRP because the serum level of the protein is the most sensitive indicator of rheumatic activity. Bacterial infections and widespread neoplastic disease are also associated with C-reactive protein in the serum. CRP disappears when an inflammatory process is suppressed by salicylates, steroids, or both. Also called **serum C-reactive protein.**

C-reactive protein (CRP) test, a blood test used to detect and diagnose bacterial infectious disease, postsurgical wound infection, and inflammatory disorders such as acute rheumatic fever and rheumatoid arthritis. In addition, it is used as an adjunct in detecting acute bacterial meningitis in an acutely febrile child and a cardiovascular risk assessment marker when high sensitivity assays are used.

cream [Gk, *chrisma,* oil], **1.** the portion of milk rich in butterfat. **2.** any fluid mixture of thick consistency. Creams are often used as a method of applying medication to the surface of the body. Compare **ointment.**

crease [ME, creste, crest], an indentation or margin formed by a doubling back of tissue, such as the folds on the palm of the hand and sole of the foot.

creat-, prefix meaning “flesh”: *creaton, creatorrhea, creatotoxism*.

creatinase /krē·at′i·nās/ [Gk, *kreas,* flesh], an enzyme that catalyzes the conversion of creatine to sarcosine and urea.

creatine /krē′ətēn, -tin/ [Gk, *kreas,* flesh], an important nitrogenous compound produced by metabolic processes in the body. Combined with phosphorus, it forms a high-energy phosphate. In normal metabolic reactions the phosphorus is transferred to a molecule of adenosine diphosphate to produce a molecule of very high-energy adenosine triphosphate. See also **creatinine.**

creatine kinase (CK), an enzyme of the transferase class in muscle, brain, and other tissues. It catalyzes the transfer of a phosphate group from adenosine triphosphate to creatine, producing adenosine diphosphate and phosphocreatine. The reaction stores energy in muscle and brain tissue. Also called **creatine phosphokinase.** See also **Duchenne’s muscular dystrophy.**

creatine kinase (CK) test, a blood test used to detect damage to the heart muscle, skeletal muscles, and brain. Serum CK levels are elevated whenever such damage occurs. CK is the main cardiac enzyme studied in patients with heart disease.

creatine phosphate (CP) [Gk, *kreas,* flesh; Du, *potasschen*], an enzyme that increases in blood levels when muscle damage has occurred, as in pseudohypertrophic muscular dystrophy.

creatine phosphokinase. See **creatine kinase.**

creatinine /krē·at′inēn, -nin/, a substance formed from the metabolism of creatine, commonly found in blood, urine, and muscle tissue. It is measured in blood and urine tests as an indicator of kidney function. Normal adult blood levels of creatinine are 0.5 to 1.1 mg/dL for females and 0.6 to 1.2 mg/dL for males; the numbers decrease in elderly patients because of a smaller muscle mass. See also **creatine.**

creatinine clearance test, a diagnostic test for kidney function. It measures the rate at which creatinine is cleared from the blood by the kidney.

creatinine height index (CHI), a measurement of a 24-hour urinary excretion of creatinine, which is generally related to the patient’s muscle mass and an indicator of malnutrition, particularly in young males.

creatinuria /kre′ətinŏŏr′ē·ə/, increased concentration of creatine in the urine, as seen in muscular dystrophy, poliomyelitis, and various other conditions.

creatorrhea, the presence of undigested muscle fibers in the feces.

credentialing /kriden′shəling/, examination and review of the credentials of individuals meeting a set of educational or occupational criteria and therefore being licensed in their field. Strict credentialing is required by both hospital and managed care accreditation bodies. The process is conducted periodically because of the responsibility of the organization for any claims of malpractice by its staff. See also **certify.**

credentials /kriden′shelz/, a predetermined set of standards, such as licensure or certification, establishing that a person or institution has achieved professional recognition in a specific field of health care. See also **credentialing.**

Credé’s maneuver /kredā′z/ [Karl S. Credé, German physician, 1819–1892], a technique for aiding the expulsion of the placenta. The uterus is pushed toward the birth canal by pressure exerted by the thumb of one hand on the posterior surface of the abdomen and the other hand on the anterior surface.

Credé’s method /kredā′z/ [Karl S. Credé], a technique for promoting the expulsion of urine by manual compression of the bladder through external pressure on the lower abdominal wall.

Credé’s prophylaxis /kredā′z/ [Karl S. Credé], the instillation of a 1% silver nitrate solution into the conjunctiva of newborns to prevent ophthalmia neonatorum.

creep, a rheological effect of metals and other solid materials that may become elongated or deformed as a result of a load being applied for a long period. For example, creep can occur in silver amalgam fillings that have been in place for some time.

creeping eruption. See **cutaneous larva migrans.**

cremaster /krimas′tər/ [Gk, *kremastos,* hanging], a thin muscular layer that spreads out over the spermatic cord in a series of loops. It is a continuation of the obliquus internus. The muscle arises from the inguinal ligament and inserts into the crest of the pubis and into the sheath of the rectus abdominis. It is innervated by the genital branch of the genitofemoral nerve and functions to draw the testis up toward the superficial inguinal ring in response to cold or to stimulation of the nerve.

cremasteric arteries, the arteries that originate from the external iliac artery and accompany the spermatic cord into the scrotum in men or follow the round ligament of the uterus through the inguinal canal in women.

cremasteric fascia, a layer contributed by the internal oblique muscle to the coverings of the structures traversing the inguinal canal. This layer contains the cremasteric muscle.

cremasteric muscle. See **cremasteric fascia.**

cremasteric reflex /krē′məster′ik/, a superficial neural reflex elicited by stroking the skin of the upper inner thigh in a male. This action normally results in a brisk retraction of the testis on the side of the stimulus. The reflex is lost in diseases of the pyramidal tract above the level of the first lumbar vertebra. See also **superficial reflex.**

crematorium /krē′mətôrē·əm/, a facility for the disposal of dead bodies by burning.

crenated, scalloped or notched.

crenated erythrocytes, the formation of abnormal notching around the edge of a red blood cell.

crenation /krinā′shən/ [L, *crena,* notch], the formation of notches or leaflike scalloped edges on an object. Red blood cells exposed to a hypertonic saline solution acquire a notched, shriveled surface as a result of the osmotic effect of the solution. They are then called crenated red blood cells. —*crenate*, **crenated,** *adj*.

creosol /krē′əsol/, an oily liquid that is one of the active constituents (phenol) of creosote. It should not be confused with **cresol.**

creosote /krē′əsōt/, a flammable oily liquid with a smoky odor that is used primarily as a wood preservative. It can cause a wide variety of health problems, ranging from cancer and corneal damage to convulsions, dermatitis, and vertigo. Persons who work with treated wood are usually at the greatest risk of exposure. See also **phenol poisoning.**

crepitant /krep′itənt/ [L, *crepitans,* crackling], pertaining to the feel or sound of crackling or rattling, or of rough surfaces being rubbed together.

crepitant crackle [L, *crepitans,* crackling], an abnormal breathing sound produced at the end of inspiration and caused by air entering collapsed alveoli or just collapsed alveoli and atelectasis that contain fibrous exudate. It occurs in pneumonia, tuberculosis, and pulmonary edema.

crepitus /krep′itəs/ [L, crackling], **1.** flatulence or the noisy discharge of fetid gas from the intestine through the anus. **2.** a sound or feel that resembles the crackling noise heard when rubbing hair between the fingers or throwing salt on an open fire. Crepitus is associated with gas gangrene, rubbing of bone fragments, air in superficial tissues, or crackles of a consolidated area of the lung in pneumonia. **3.** a clicking sound often heard in movement of joints, for example, in temporomandibular joint resulting from joint irregularities. Also called **crepitation.**

cresc-, prefix meaning "to grow": *crescograph.*

crescendo angina /krishen′dō/ [L, *crescere,* to increase], a form of angina pectoris associated with ischemic electrocardiographic changes and marked by increased frequency, provocation, intensity, or character.

crescendo murmur [L, *crescere,* to increase, *murmur,* humming], a murmur of steadily increasing intensity to a sudden termination.

crescent /kres′ənt/ [L, *crescere,* to increase], **1.** *adj,* shaped like a new moon. **2.** *n,* a structure that has this shape.

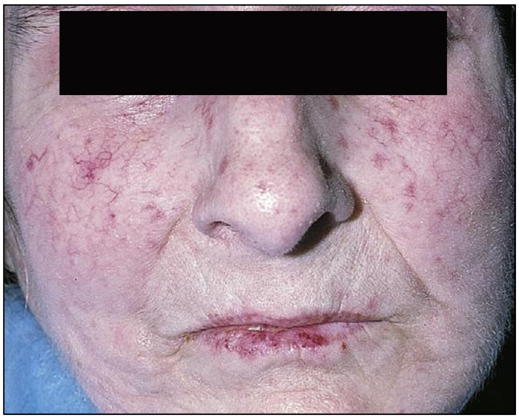
crescent bodies /kres′ənt/, **1.** (in a blood smear) large, pale, crescent-shaped cells produced from fragile erythrocytes as a blood film preparation is made. **2.** large, round bodies with pink crescentlike margins found in the blood of some anemia patients. Also called **achromocytes, selenoid cells.**

cresol /krē′sol/, a mixture of three isomers of an organic acid in a liquid with a phenolic odor. It is derived from coal tar and used in synthetic resins and disinfectants. Cresol is a potentially lethal protoplasmic poison that can be absorbed through the skin. Symptoms of chronic poisoning include skin eruptions, digestive disorders, uremia, jaundice, nervous disorders, vertigo, and mental changes. Acute poisoning by oral intake of 8 g or more can cause circulatory collapse and death. See also **phenol poisoning.**

crest, a narrow elongated elevation, as the iliac crest.

Crestor, a trademark for **rosuvastatin.**

CREST syndrome /krest/, abbreviation for *c*alcinosis, *R*aynaud's phenomenon, *e*sophageal dysfunction, *s*clerodactyly, and *t*elangiectasis. CREST syndrome is a disease of skin and blood vessels and, in severe cases, the lungs, digestive tract, or heart. To be diagnosed with CREST, an individual must display at least two of the five symptoms. It is often associated with scleroderma.



CREST syndrome *(White and Cox, 2006)*

cretin. See **cretinism.**

cretin dwarf /krē′tən/, a person in whom short stature is caused by infantile hypothyroidism and severe deficiency of thyroid hormone. Also called **hypothyroid dwarf.** See also **cretinism.**

cretinism /krē′təniz′əm/ [Fr, *cretin,* idiot], a congenital condition characterized by severe hypothyroidism and often associated with other endocrine abnormalities. Myxedema is the acquired form of hypothyroidism. Typical signs of cretinism include dwarfism, mental deficiency, puffy facial features, dry skin, large tongue, umbilical hernia, and muscular incoordination. The disorder occurs usually in areas where the diet is deficient in iodine and where goiter is common. Early treatment with thyroid hormone generally promotes normal physical growth but may not prevent mental retardation. The use of iodized salt dramatically reduces the incidence of cretinism in a population. The condition is rare in the United States, but in some areas, including parts of Ecuador, the Himalayas, and Zaire, more than 5% of the people are affected. See also **familial cretinism. —cretin,** *n., cretinous, adj.*

cretinoid, resembling a cretin or the state of cretinism.

Creutzfeldt-Jakob disease /kroits′felt yä′kôp/ [Hans G. Creutzfeldt, German neurologist, 1885–1964; Alfons M. Jakob, German neurologist, 1884–1931], a rare fatal encephalopathy caused by infectious prion particles. The disease occurs in middle age. Symptoms are progressive dementia, dysarthria, muscle wasting, and various involuntary movements such as myoclonus and athetosis. Deterioration is obvious week to week. Death ensues, usually within a year. There is no known cure. It is the human variant of mad cow disease. Transmission between humans is unusual, but the disease has been observed years after exposure to needles, instruments, and electrodes previously used in the treatment of a patient with the disease. Isolation is not necessary. Special care in disposal or sterilization of potentially infective items is always necessary. Also called **Jakob-Creutzfeldt disease, spastic pseudoparalysis, spastic pseudosclerosis.** See also **prion disease.**

crevice /krev′is/, a cleft or fissure, like that between the gum and the neck of a tooth.

CRH, abbreviation for **corticotropin-releasing hormone.**

crib /krib/ [L, *cribrum,* sieve], **1.** any racklike structure. **2.** a removable anchorage from an orthodontic appliance. **3.** a habit-breaking orthodontic appliance used for the treatment of tongue-thrust swallowing.

crib death. See **sudden infant death syndrome.**

cribriform /krib′rifôrm′/ [L, *cribum,* sieve], describing a structure with many perforations or punctures, as in the cribriform plate of the ethmoid bone.

cribriform carcinoma. See **adenocystic carcinoma.**

cribriform plate of the ethmoid bone, a sieve-like structure that allows small olfactory nerve fibers to pass through its foramina from the nasal mucosa to the olfactory bulb.

crico-, prefix meaning "ring": *cricoderma, cricoid, cricoidectomy.*

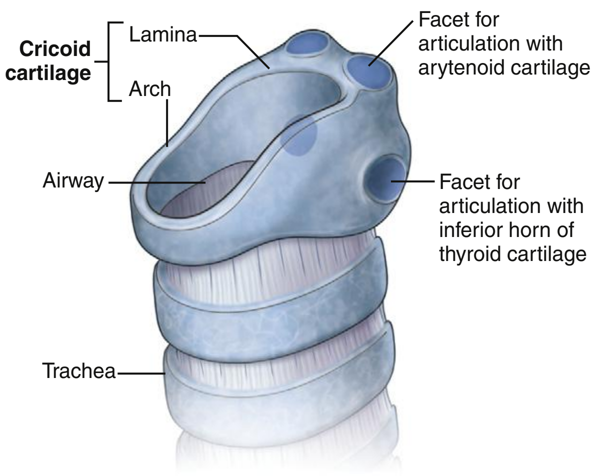
cricoarytenoid muscles, one of the muscles that opens and closes the rima glottidis, innervated by the laryngeal branches of the vagus nerves.

cricoid /krī′koid/ [Gk, *krikos,* ring, *eidos,* form], *adj,* having a ring shape (for example, the **cricoid cartilage**).

cricoid cartilage, a ring-shaped cartilage of the larynx, consisting of a narrow anterior arch and a posterior wide quadrilateral lamina, connected to the thyroid cartilage by the cricothyroid ligament at the level of the sixth cervical vertebra.

cricoidectomy /-ek′təmē/ [Gk, *krikos* + *eidos* + *ektomē,* excision], a surgical procedure for removing the cricoid cartilage.

cricoid pressure, a technique to reduce the risk of the aspiration of stomach contents during induction of general anesthesia. The cricoid cartilage is pushed against the body of the sixth cervical vertebra, compressing the esophagus to prevent passive regurgitation. The technique cannot, however, stop active vomiting. Cricoid pressure is applied



Cricoid cartilage
Lamina
Arch
Facet for articulation with arytenoid cartilage
Airway
Facet for articulation with inferior horn of thyroid cartilage
Trachea

Cricoid cartilage *(Drake, Vogl, and Mitchell, 2010)*

before intubation, immediately after injection of anesthetic drugs, and as a part of "rapid sequence" intubation. Once a mainstay of aspiration prevention, the effectiveness of this technique has recently been called into question. Cricoid pressure may also be used to move the larynx posteriorly to facilitate visualization during laryngoscopy. Also called **Sellick's maneuver.**

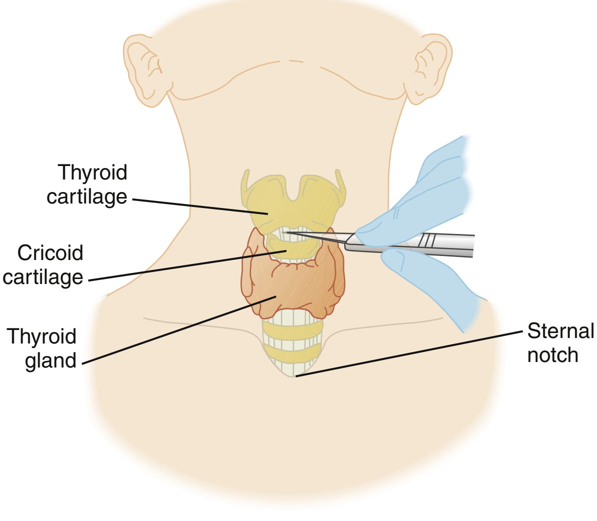
Cricoid pressure *(Shade et al, 2007)*

cricopharyngeal /krī′kōfərin′jē·əl/ [Gk, *krikos* + *pharynx,* throat], pertaining to the cricoid cartilage and the pharynx.

cricopharyngeal incoordination, a defect in the normal swallowing reflex. The cricopharyngeus muscle ordinarily serves as a sphincter to keep the top of the esophagus closed except when the person is swallowing, vomiting, or belching. The trachea remains open for breathing, but air normally does not enter the esophagus during respiration. In swallowing the reverse effect occurs, and the larynx is closed while food slides past it into the esophagus, which is located immediately behind the larynx. When the somewhat complex series of neuromuscular actions is not properly coordinated as a result of disease or injury, the patient may choke, swallow air, regurgitate fluid into the nose, or experience discomfort in swallowing food. See also **dysphagia.**

cricothyroid membrane /-thī′roid/, a fibroelastic membrane including the cricothyroid ligament that connects the cricoid and thyroid cartilages. Also called **elastic membrane.**

cricothyrotomy /krī′kōthīrot′əmē/ [Gk, *krikos* + *thyreos,* shield, *eidos,* form, *temnein,* to cut], an emergency incision into the larynx, performed to open the airway in a person who is choking. A small vertical midline cut is made just below the thyroid cartilage and above the cricoid cartilage. The incision is opened farther with a transverse cut through the cricothyroid membrane, and the wound is spread open with a knife handle or other dilator. The new opening must be held open with a tracheostomy tube that is open at both ends to allow air to move in and out. The cartridge end of a ballpoint pen will suffice in an emergency until a tracheostomy can be done. Also called *cricothyroidotomy*. Compare **tracheostomy.**



Cricothyrotomy *(Black and Hawks, 2009)*

cricotracheal ligament, the ligament that runs from the lower border of the cricoid cartilage to the adjacent upper border of the first tracheal cartilage.

cri-du-chat syndrome. See **cat-cry syndrome.**

Crigler-Najjar syndrome /krig′lər naj′är/ [John F. Crigler, Jr., American pediatrician, b. 1919; Victor A. Najjar, Lebanese-born American microbiologist, b. 1914], a congenital familial autosomal anomaly, in which glucuronyl transferase, an enzyme, is deficient or absent. The condition is characterized by nonhemolytic jaundice, an accumulation of unconjugated bilirubin in the blood, and severe disorders of the central nervous system. See also **hyperbilirubinemia of the newborn.**

crime [L, *crimen*], any act that violates a law and may have criminal intent.

Crimean-Congo hemorrhagic fever /krīmē′ən/, an arbovirus infection caused by the virus *Nairovirus* of the family Bunyaviridae, transmitted to humans through the bite of a tick, characterized by fever, dizziness, muscle ache, vomiting, headache, and other neurological symptoms. After several days in severe cases, bleeding from the skin and mucous membranes, particularly from the mouth and nose; bloody sputum or vomit; and blood-tinged feces may be seen. Transfusion may be necessary to replace lost blood; otherwise treatment is symptomatic and supportive. The mortality rate is approximately 30%. Death occurs in the second week of infection. No specific medication or therapy is available for prevention or cure. It occurs mainly in Russia, Asia, and Africa; agricultural workers are most often afflicted. See also **hemorrhagic fever, Omsk hemorrhagic fever.**

criminal psychology, the study of the mental processes, motivational patterns, and behavior of criminals.

crin-, prefix meaning "to separate or secrete": *crinin, crinogenic*.

-crinat, suffix designating an ethacrynic acid-derived diuretic.

-crine, suffix designating an acridine derivative.

-crine, -crinia, suffix meaning "(condition of) endocrine secretion": *hypercrinia, neurocrinia*.

-crisia, **1.** suffix meaning a "diagnosis or judgment": *acrisia, urocrisia*. **2.** suffix meaning a "(specified) condition of endocrine secretion": *hypercrisia, hyperendo-crisia, hypocrisia*.

crisis /krī′sis/ [Gk, *krisis,* turning point], **1.** a transition for better or worse in the course of a disease, usually indicated by a marked change in the intensity of signs and symptoms. **2.** a turning point in events affecting the emotional state of a person, such as death or divorce. A crisis can result in personality growth or personality disorganization. **3.** a characteristically self-limiting period of from 4 to 6 weeks that constitutes a transitional phase representing both the danger of increased psychological vulnerability and an opportunity for personal growth. See also **crisis intervention.**

crisis intervention^1, (in psychiatry) a short-term intense therapy that emphasizes identification of the event that triggered the emotional trauma. Focus is on neutralizing the trauma and mobilizing coping skills.

crisis intervention^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as use of short-term counseling to help the patient cope with a crisis and resume a state of functioning comparable to or better than the precrisis state. See also **Nursing Interventions Classification.**

crisis-intervention unit, a group trained in emergency medical treatment and in various methods for rendering psychiatric therapeutic assistance to a person or group of persons during a period of crisis, especially instances involving suicide attempts or drug abuse. Such networks are found within community hospitals, in health care centers, or as specialized self-contained units, such as suicide-prevention centers, and operate 24 hours a day. The primary objectives of such crisis assistance are to help the person cope with the immediate problem and to offer guidance and support for long-term therapy.

crisis resolution, (in psychiatry) the development of effective adaptive and coping devices to resolve a crisis.

crisis theory, a conceptual framework for defining and explaining the phenomena that occur when a person faces a problem that appears to be unsolvable. The theory is the basis of crisis therapy.

crisscross inheritance [*Christ cross;* L, *in* + *hereditas,* in heredity], the inheritance of characteristics or conditions from the parent of the opposite sex.

crista. See **crest.**

crista ampullaris /kris′tə am′pəlar′is/ [L], the most prominent part of a localized thickening of the membrane that lines the ampullae of the semicircular ducts, covered with neuroepithelium containing endings of the vestibular nerve.

crista galli, a prominent wedge of bone projecting superiorly from the ethmoid.

crista obliqua, an elevated crest of variable prominence, consisting jointly of the triangular ridge of the distobuccal cusp and the distal ridge of the mesiolingual cusp. It courses obliquely across the occlusal surface of the maxillary molars to link the apices of the distobuccal and the mesiolingual cusps.

crista terminalis. See **terminal crest.**

criterion /krītir′ē·ən/ *pl. criteria* [Gk, *kriterion,* a means for judging], a standard or rule by which something may be judged, such as a health condition, or a diagnosis established. Criteria are sets of rules or principles against which something may be measured, such as health care practices.

critical care. See **intensive care.**

critical care unit (CCU), a specially equipped hospital area designed for the treatment of patients with sudden life-threatening conditions. CCUs contain resuscitation and monitoring equipment and are staffed by personnel specially trained and skilled in recognizing and immediately responding to cardiac and other emergencies. See also **intensive care unit.**

critical organs /krit′ikəl/ [Gk, *krisis,* turning point, *organon,* instrument], tissues that are the most sensitive to irradiation, such as the gonads, lymphoid organs, and intestine. The skin, cornea, oral cavity, esophagus, vagina, cervix, and optic lens are the second-most sensitive organs to irradiation.

critical path development, a nursing intervention from the Nursing Interventions Classification (NIC) defined as constructing and using a timed sequence of patient care activities to enhance desired patient outcomes in a cost-efficient manner. See also **Nursing Interventions Classification.**

critical pathway. See **clinical pathway.**

critical period [Gk, *kritikos,* critical, *peri,* near, *hodos,* way], a period during a developmental or rehabilitation crisis. Examples are the brief period in which a zygote may be formed, in which a patient may survive a myocardial infarction, or when an embryo is most vulnerable to effects of medications used by the mother.

critical period of development, **1.** a specific time during which the environment has its greatest impact on an individual's development. **2.** the time during gestation when critical organ systems are formed.

critical point, the temperature and pressure at which, in a sealed system, the density of the liquid form of a substance is equal to the density of its gas form, and the two are not visibly separated, becoming a single fluid phase instead.

critical pressure, the pressure exerted by a fluid in a closed system at the critical temperature.

critical temperature, the highest temperature at which a substance can exist as a liquid.

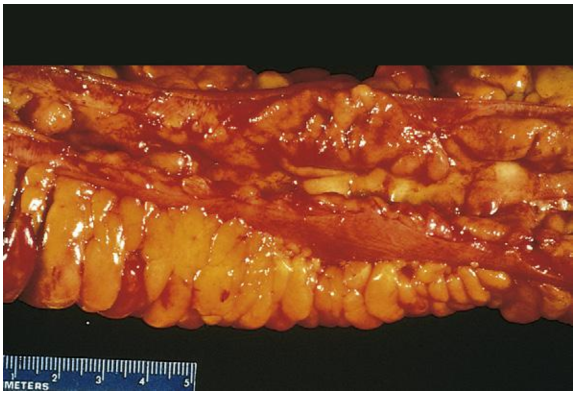
Crixivan, a trademark for an antiretroviral protease inhibitor **(indinavir).**

CRNA, abbreviation for **certified registered nurse anesthetist.**

CRNI, abbreviation for *certified registered nurse, intravenous*.

crocodile shagreen /shagrēn′/, a rare degenerative disorder involving either of two membranes of the cornea in which the cornea exhibits opacities separated by clear zones. The disorder may affect Descemet's deep membrane or Bowman's superficial membrane.

Crohn's disease /krōnz/ [Burrill B. Crohn, American physician, 1884–1983], a chronic inflammatory bowel disease of unknown origin, usually affecting the ileum, the colon, or another part of the GI tract. Diseased segments may be separated by normal bowel segments, which give it the characteristic "skip lesions." Also called **regional enteritis.** Compare **ulcerative colitis.** See also **colitis, ileitis.**



Crohn's disease *(Kumar et al, 2007)*

Comparison of ulcerative colitis and Crohn's disease

Ulcerative colitis	*Crohn's disease*
Usual area affected	
Left colon, rectum	Distal ileum, right colon Can occur anywhere in gastrointestinal tract
Extent of involvement	
Diffuse areas, contiguous	Segmental areas, noncontiguous
Inflammation	
Mostly mucosal	Transmural
Mucosal appearance	
Shallow mucosal ulcerations, edematous, superficial bleeding	Cobblestone effect, granulomas Thickened walls, narrowed lumen
Complications	
Loss of absorption and elasticity Replacement of mucosa by scar tissue Development of pseudopolyps that may become malignant Toxic megacolon Hemorrhoids Bleeding	Fistulas Perianal disease Strictures Abscesses Perforation Anemia Malabsorption of fat and fat-soluble vitamins

From Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives*, ed 8, St Louis, 2007, Mosby.

Cromer blood group /krō′mər/, a blood group consisting of 12 red cell antigens located on the complement regulatory glycoprotein, decay-accelerating factor (DAF of CD55).

-cromil, suffix designating a cromoglycic acid-type antiallergic agent.

cromolyn sodium /krom′əlin/, a drug that blocks mast cell degranulation in response to antigen, which leads to decreased release of histamine, leukotrienes, and other inflammatory mast cell products. Also called **cromoglycic acid.**

■ INDICATION: It is prophylactically prescribed to prevent bronchial asthma.

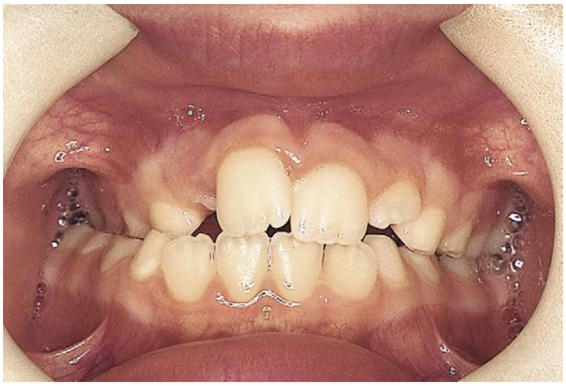
■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use; the drug is effective only for asthma prophylaxis, not treatment of an acute asthma attack.

■ ADVERSE EFFECTS: Bronchospasm, wheezing, nasal congestion, pharyngeal irritation, and other hypersensitivity reactions may occur.

Cronkhite-Canada syndrome /krong′kīt/ [Leonard W. Cronkhite, American physician, b. 1919; Wilma J. Canada, twentieth-century American radiologist], an abnormal familial condition characterized by GI polyposis accompanied by ectodermal defects, such as nail atrophy, alopecia, and excessive skin pigmentation. In some individuals it is also accompanied by protein-losing enteropathy, malabsorption, and deficiency of blood calcium, potassium, and magnesium.

cross [L, *crux*], **1.** (in genetics) a mating between individuals with different phenotypes. Kinds of crosses include **dihybrid cross, monohybrid cross, polyhybrid cross,** and **trihybrid cross. 2.** any individual, organism, or strain produced from such a mating.

cross-bite [L, *crux* + AS, *bitan, toth*], occlusion with the line of the mandibular teeth or a single tooth anterior and/or buccal to the maxillary teeth.



Cross-bite *(Millett and Welbury, 2000)*

crossbreeding [L, *crux* + *bredan*], the production of offspring by the mating of individuals of different varieties, strains, or species; hybridization. See also **inbreeding.** *—crossbred, adj.*

crossed amblyopia [L, *crux,* cross; Gk, *amblys,* dull, *ops,* eyes], a visual disorder in which the patient is unable to see on one side of the visual field, associated with hemianesthesia of the opposite side of the body. Also called **amblyopia cruciata.**

crossed extension reflex, one of the spinally mediated reflexes normally present in the first 2 months of life, demonstrated by the adduction and extension of one leg when the foot of the other leg is stimulated. When present in adults, it indicates hyperactive reflexes.

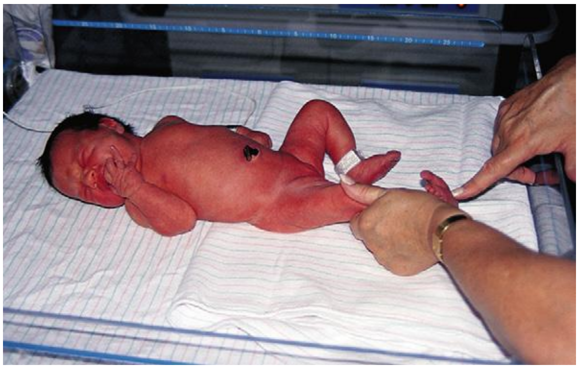
crossed fused ectopic kidney, one with crossed renal ectopia.

crossed grid, an assembly of two parallel x-ray grids that are oriented at right angles to each other to eliminate scattered radiation from more than one direction during radiography. Also called **crosshatch grid.** See also **grid.**

crossed leg palsy, palsy of the fibular nerve, caused by sitting with one leg crossed over the other.

crossed reflex, any neural reflex in which stimulation of one side of the body results in a response on the other, such as the consensual light reflex.

cross-eye, *informal*. See **esophoria**, **esotropia.**



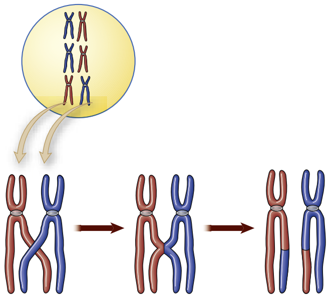
Crossed extension reflex *(Lowdermilk et al, 2012/Courtesy Marjorie Pyle, RNC, Lifecircle, Costa Mesa, CA)*

cross-fertilization, **1.** the union of gametes from different species or varieties to form hybrids. **2.** the fertilization of the flower of one plant by the pollen of a different plant. Also called **allogamy.**

crosshatch grid. See **crossed grid.**

cross infection [L, *crux,* cross, *inficere,* to stain], the transmittal of an infection from one patient in a hospital or health care setting to another patient with different pathogenic microorganisms in the same environment. It is often seen in autoimmune diseases.

crossing over, the exchange of sections of chromatids between homologous pairs of chromosomes during the prophase stage of the first meiotic division. Crossing over occurs through the formation of chiasmata and results in the recombination of genes. Also called **chiasmatypy.**



Crossing over *(Patton and Thibodeau, 2010)*

cross-link /kros′link′/, a bond formed between polymer chains, either between different chains or between different parts of the same chain.

crossmatching [L, *crux* + AS, *gemaecca,* matching], a procedure in blood transfusions and organ transplantation. The recipient's erythrocytes or leukocytes are incubated with the donor's serum and vice versa. Various testing procedures are then performed to ensure that the donor and recipient have blood group compatibility or histocompatibility. Compare **blood typing.** See also **ABO blood group, Rh factor, transfusion, transfusion reaction.**

crossover /kros′ovər/ [L, *crux* + AS, *ofer*], the result of the recombination of genes on homologous pairs of chromosomes during meiosis. See also **crossing over.**

cross-reacting antibody [L, *crux,* cross, *re* + *agere,* to act; Gk, *anti* + AS, *bodig,* body], an antibody that reacts with antigens that are similar to, but different than, the specific antigens with which it originally reacted.

cross-resistance, resistance to a particular antibiotic that often results in resistance to other antibiotics, usually from a similar chemical class, to which the bacteria may not have been exposed. Cross-resistance can occur, for example, to both colistin and polymyxin B or to both clindamycin and lincomycin.

cross section, **1.** a transverse section cut through a structure. **2.** (in nuclear physics) of a specific atom or particle at a specific radiation, the area perpendicular to the direction of the radiation that one attributes to the atom or particle.

cross-sectional [L, *crux* + *secare,* to cut], (in statistics) pertaining to the sampling of a defined population at one point in time, performed in a nonexperimental research design. Compare **longitudinal.**

cross-sectional anatomy, the study of the relationship of the structures of the body by the examination of cross sections of the tissue or organ. Compare **surface anatomy.**

cross-sensitivity, a sensitivity to one substance that predisposes an individual to sensitivity to other substances that are related in chemical structure. Cross sensitivity with allergic reactions may develop between antibiotics of similar chemical structures.

cross-sequential /-sikwen′shəl/ [L, *crux* + *sequi,* to follow], (in statistics) pertaining to data that compare several cohorts at different points in time.

cross-species transplant, a tissue or organ from an animal of one species that has been implanted into an animal of another species. Also called **xenotransplant.**

Cross syndrome. See **oculocerebral-hypopigmentation syndrome.**

cross-tolerance, a tolerance to other drugs that develops after exposure to a different agent. An example is the cross-tolerance that develops between alcohol and barbiturates.

crotalid /krot′älid/, pit viper.

Crotalus /krot′älus/, a large genus of venomous rattlesnakes with numerous species in North America and others in Central and South America. See also **snakebite.**

crotamiton /krōtam′iton/, a scabicide.

■ INDICATIONS: It is prescribed in the treatment of scabies and other pruritic skin diseases.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. It is not applied near the eyes or on the mouth or raw skin.

■ ADVERSE EFFECTS: Among the most serious adverse reactions are irritation and allergic reactions of the skin.

croup /kro͞op/ [Scot, to croak], an acute infection of the upper and lower respiratory tract that occurs primarily in infants and young children 3 months to 3 years of age after an upper respiratory tract infection. It is characterized by hoarseness; irritability; fever; a distinctive harsh, brassy cough; persistent stridor during inspiration; and dyspnea and tachypnea, resulting from obstruction of the larynx. Cyanosis or pallor occurs in severe cases. The most common causative agents are the parainfluenza viruses, especially type 1, followed by the respiratory syncytial viruses and influenza A and B viruses. Croup can also be caused by bacteria, allergies, and inhaled irritants. Also called **acute laryngotracheobronchitis, angina trachealis, exudative angina, laryngostasis.** Compare **acute epiglottitis. —croupous, croupy,** *adj.*

■ OBSERVATIONS: Transmission occurs through infection with airborne particles or with infected secretions. Leukocytosis with an increased proportion of polymorphonuclear cells may be present at first, followed by leukopenia and lymphocytosis. A lateral neck x-ray film shows subepiglottic narrowing and a normal-sized epiglottis, which differentiate the condition from acute epiglottitis. Onset of the acute stage is rapid, usually occurs at night, and may be precipitated by exposure to cold air. The child's condition often improves in the morning, but it may worsen at night.

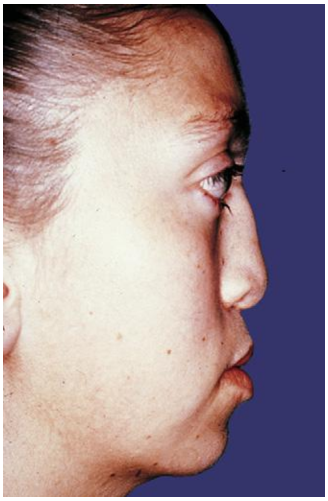
■ INTERVENTIONS: Routine treatment consists of bed rest, adequate fluid intake, and alleviation of airway obstruction to ensure adequate respiratory exchange. Children with mild infections are usually managed at home with supportive measures, such as use of acetaminophen to reduce fever and vaporizers, humidifiers, or steam from hot running water in an enclosed bathroom to reduce the spasm of the laryngeal muscles and to free secretions. Hospitalization is indicated for children with dehydration; progressive stridor and respiratory distress; and hypoxia, cyanosis, or pallor. Endotracheal intubation and tracheostomy may be necessary. Humidity and oxygen are usually prescribed. The vital signs are continuously monitored; changes in pulse and respiration may be early signs of hypoxia and impending airway obstruction. Fluids are often given intravenously to reduce physical exertion and the possibility of vomiting, with its attendant increased risk of aspiration. Corticosteroids and inhaled racemic epinephrine are often used. Other drugs, such as expectorants, bronchodilators, and antihistamines, are rarely used, and sedatives are contraindicated because they exert a depressant effect on the respiratory tract.

■ CARE CONSIDERATIONS: The primary focuses of care are to ease breathing by providing humidity and to monitor continuously for signs of respiratory distress and impending airway obstruction, with intubation and tracheostomy equipment kept readily available. To conserve the child's energy and to reduce apprehension, the health care provider encourages rest, disturbs the child as little as possible, remains in attendance, provides comfort with a familiar toy or other device, and encourages parental involvement whenever possible. Fever is usually reduced by the cool atmosphere of the mist tent; antipyretics are given as needed. To prevent chilling, frequent changes of clothing and bed linen are often necessary in the humid environment. The health care provider also explains the condition to the parents and discusses appropriate care after discharge, including continued use of humidity and ensuring of adequate hydration and proper nutrition. In most children the condition is relatively mild and runs its course in 3 to 7 days. The infection may spread to other areas of the respiratory tract and may cause complications, such as bronchiolitis, pneumonia, and otitis media. The most serious complication is laryngeal obstruction, which may cause death. If a tracheostomy is required, as may happen with a small percentage of children, other complications, such as infection, atelectasis, cannula occlusion, tracheal bleeding, granulation, stenosis, and delayed healing of the stoma, may develop.

Croupette /kro͞opet′/, a trademark for a device that provides cool humidification with the administration of oxygen or of compressed air. The Croupette consists of a nebulizer with attached tubing that connects with a canopy to enclose the patient and contain the humidifying mist. The patient's environment may be cooled by using a Croupette with its own refrigeration unit. This device is most often used with pediatric patients to relieve hypoxia and liquefy secretions. Also called **cold mist tent.**

croupous, croupy. See **croup.**

Crouzon's disease /kro͞ozonz′/ [Octave Crouzon, French neurologist, 1874–1938; L, *dis* + Fr, *aise*, ease], a familial disease characterized by a malformed skull and various ocular disorders, including exophthalmos, divergent squint, and optic atrophy.



Crouzon's disease *(Carlson, 2009/Courtesy A.R. Burdi, Ann Arbor, Michigan)*

crowding /kroud′ing/ [ME, *crowden*], the condition in which the teeth are too close together and have abnormal positions such as overlapping, displacement in various directions, or torsion. See **arch length**, **arch length deficiency**, **arch width**.

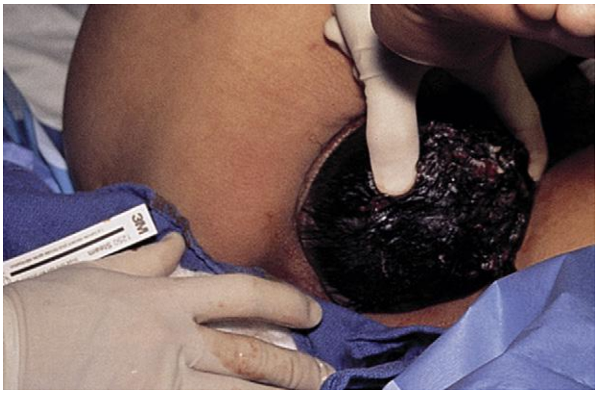
Crow-Fukase syndrome. See **POEMS syndrome.**

crowing inspiration. See **laryngismus stridulus.**

crown [L, *corona*], **1.** the upper part of an organ or structure, such as the top of the head. **2.** the portion of a human tooth that is covered by enamel.

crown-heel length [L, *corona* + AS, *hela, lengthu*], the length of an embryo, fetus, or newborn as measured from the crown of the head to the heel. It is compared to the standing height of an older individual.

crowning [L, *corona*], (in obstetrics) the phase at the end of labor in which the fetal head is seen at the introitus of the vagina. The labia are stretched in a crown around the head just before birth.



Crowning *(Lowdermilk et al, 2012/Courtesy Dr. Michael S. Clement)*

crown/root ratio. See **clinical-crown/clinical-root ratio.**

crown-rump length, the length of an embryo, fetus, or newborn as measured from the crown of the head to the prominence of the buttocks.

crown static, an x-ray film artifact caused by a buildup and discharge of electrons in the film emulsion. It is most likely to appear during periods of low environmental humidity.

CRP, abbreviation for **C-reactive protein.** See **C-reactive protein test.**

CRRN, abbreviation for *certified rehabilitation registered nurse*.

CRST syndrome. See **CREST syndrome**.

CRT, **1.** abbreviation for **cadaveric renal transplant. 2.** abbreviation for **cathode ray tube. 3.** abbreviation for **certified respiratory therapist.**

crucial /kro͞o′shəl/ [L. *crucialis*], severe and decisive.

crucial bandage. See **T bandage.**

cruciate /kro͞o′shē·āt/ [L, *crux*, cross], shaped like a cross.

cruciate anastomosis /kro͞o′shē·āt/ [L, *crux,* cross; Gk, *anastomoein,* to provide a mouth], an anastomosis in the upper part of the thigh, formed between the first perforating branch of the profunda femoris artery, the inferior gluteal artery, and the lateral and medial femoral circumflex arteries.

cruciate ligament of the atlas [L, *crux,* cross, *ligare,* to bind], a crosslike ligament attaching the atlas to the base of the occipital bone above and the posterior surface of the body of the axis below.

crucible /kro͞o′səbəl/, a cone-shaped vessel made of a refractory material, used in chemistry to melt or calcine materials at temperatures too high for other laboratory equipment to tolerate.

cruciform /kro͞o′sifôrm/ [L, *crux*, cross], in the shape of a cross.

cruciform ligament, any cross-shaped band of white fibrous tissue connecting bones and forming a joint capsule. Examples are the anterior and posterior cruciate ligaments of the knee and the cruciate ligament of the atlas.

crude birth rate [L, *crudus,* raw; ME, *burth* + L, *reri,* to reckon], the number of births per 1000 people in a population during 1 year. Compare **birth rate, refined birth rate, true birth rate.**

crude herb, the raw plant, before it is processed or dried.

cruor /kro͞o′ôr/ [L, blood], a blood clot containing erythrocytes.

crur-, prefix meaning "leg or thigh": *crura, crural, crureus*.

crura. See **crus.**

crural /kro͞o′rəl/, pertaining to the leg, between knee and ankle.

crural hernia [L, *crus,* leg, *hernia,* rupture], **1.** a hernia that protrudes behind the posterior layer of the femoral sheath. Also called **Cloquet's hernia. 2.** a common type of groin hernia that occurs most often in obese females.

crural ligament. See **inguinal ligament.**

crura of anthelix, the two ridges on the external ear marking the superior termination of the anthelix and bounding the triangular fossa.

crureus. See **vastus intermedius.**

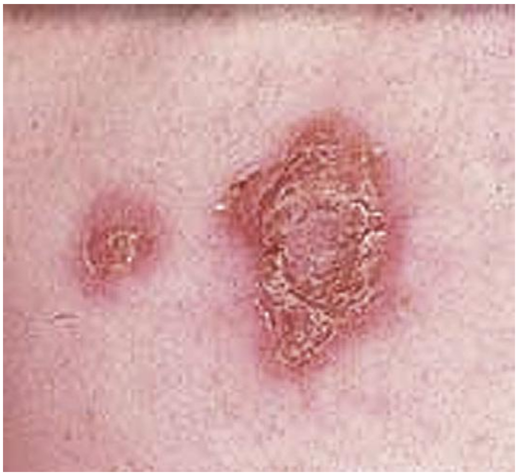
crus /krus/ *pl*. **crura** [L, leg], **1.** the leg, from knee to foot. **2.** a structure resembling a leg, such as the crura of anthelix.

crus cerebri /ser′əbrī, -brē/ [L, *crus* + *cerebrum,* brain], either of the two cerebral peduncles, composed of the descending fiber tracts passing from the cerebral cortex to form the longitudinal fascicles of the pons. Also called **basis pedunculi cerebri.**

crushing wound /krush′ing/ [ME, *crushen* + AS, *wund*], a break in the external surface of the body caused by a severe force applied against the tissues. The body structures may be crushed without signs of external bleeding.

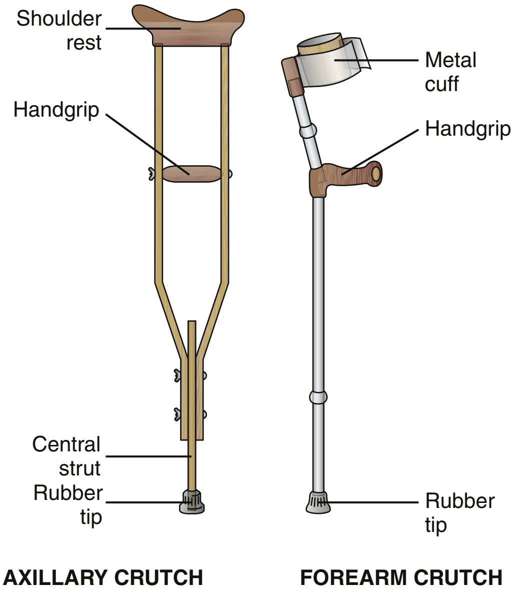
crush syndrome [ME, *crushen*], a severe, life-threatening condition caused by extensive crushing trauma, characterized by destruction of muscle and bone tissue, hemorrhage, and fluid loss resulting in hypovolemic shock, hematuria, renal failure, and coma. Massive supportive therapy, including fluids, electrolytes, antibiotics, analgesia, oxygen, and intensive care with close monitoring of all vital functions, is usually necessary.

crust [L, *crusta,* shell], a solidified, hard outer layer formed by the drying of a body exudate, such as blood or pus, common in dermatological conditions such as eczema, impetigo, seborrhea, and favus and during the healing of burns and lesions; a scab. Also called *crusta*.



Crust *(du Vivier, 1993)*

crutch [AS, *cryce*], a wooden or metal staff that aids a person in walking. The most common kind of crutch is the axillary crutch, which reaches from the ground almost to the axilla. It has a padded, curved surface at the top that fits under the arm and a crossbar that is held in the hand at the level of the palms to support the body. It is important that the crutches be properly fitted and that the person be taught how to use them safely and how to achieve a stable and acceptable gait. See also **Canadian crutch.**

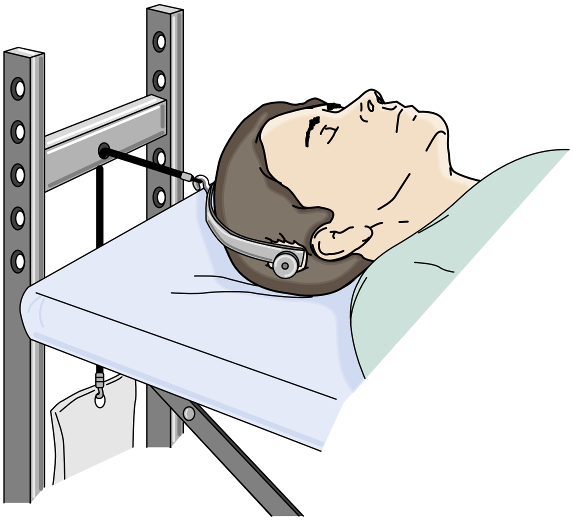


Types of crutches *(Bonewit-West, 2012)*

Crutchfield tongs [William G. Crutchfield, American neurosurgeon, 1900–1972; ME, *tonges*], an instrument that is attached to the skull to hyperextend the head and neck of patients with fractured cervical vertebrae for the purpose of immobilizing and aligning the vertebrae.

■ METHOD: The tips of the tongs are inserted into small burr holes drilled in each parietal region of the skull; the surrounding skin is sutured and covered with a collodion dressing. A rope tied to the center of the tongs passes over a pulley at the head of the bed and is attached to a weight of 10 to 20 pounds, which hangs freely.

■ OUTCOME CRITERIA: A patient may be immobilized by Crutchfield tongs for weeks before surgery is performed. During an operation on the cervical spine and spinal cord, the tongs may be left in place for proper alignment.



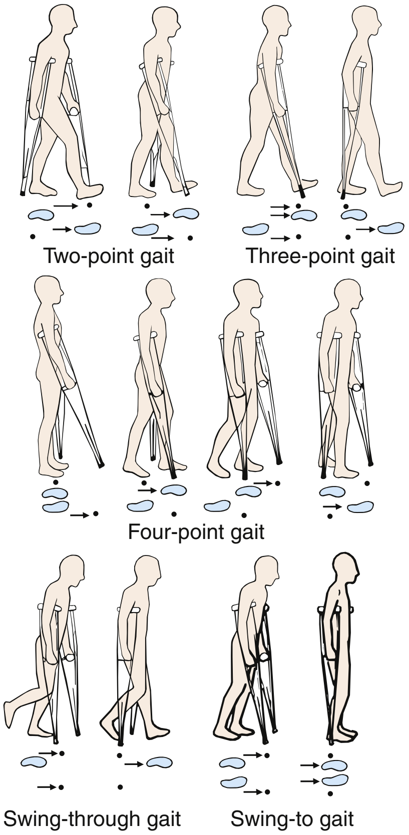
Crutchfield tongs *(Monahan et al, 2007)*

crutch gait, a gait achieved by a person using crutches. The gait selected and learned is determined by the physical and functional abilities of the patient and the diagnosis. In a two-point gait, the patient uses each crutch with the opposing leg. In a three-point gait, weight is borne on the noninvolved leg, then on both crutches, and then on the noninvolved leg again. Weight-bearing on the involved leg initially is partial or prevented. A four-point gait gives stability but requires bearing weight on both legs. Each leg is used alternately with each crutch. The swing-to and swing-through gaits are often used by paraplegic patients with weight-supporting braces on the legs. Weight is borne on the supported legs. The crutches are placed one stride in front of the person, who then swings to that point or through the crutches to a spot in front of them.

crutch palsy, the temporary or permanent loss of sensation or muscle control resulting from pressure on the radial nerve by a crutch. The radial nerve passes under the axillary area superficially. Pressure, often caused by mismatching of the height of the patient and the crutch, can lead to paralysis of the elbow and wrist extensors.

Cruveilhier-Baumgarten syndrome /krYvāyā′boum′gärtən/ [Jean Cruveilhier, French pathologist, 1791–1874; Paul Baumgarten, German pathologist, 1848–1928], recanalization of the paraumbilical veins with cirrhosis of the liver, portal hypertension, and splenomegaly.

crux /kruks, kro͝oks/ [L], **1.** cross. **2.** a difficult problem. **3.** a vital, basic, or decisive point.



Crutch gaits

Cruz trypanosomiasis. See **Chagas' disease.**

cry [OFr, *crier*], **1.** a sudden, loud voluntary or automatic vocalization in response to pain, fear, or a startle reflex. **2.** weeping, as a reaction to pain or an emotional response to depression or grief. **3.** see **cat-cry syndrome.**

crying vital capacity (CVC), a measurement of the tidal volume while an infant is crying. The CVC may be valuable in monitoring infants with lung diseases that cause changes in functional residual capacity.

cryo-, cry-, crymo-, prefix meaning "cold": *cryocautery, cryophilia, cryotolerant*.

cryoanesthesia /krī′ō·an′isthē′zhə/ [Gk, *kryos*, cold, *aisthesis*, feeling], local anesthesia produced by applying a tourniquet and chilling an area to near-freezing temperature. It is used to diminish neural sensitivity to pain during brief minor surgical procedures.

cryocautery /krī′ōkô′tərē/ [Gk, *kryos* + *kauterion*, branding iron], the application of any substance, such as solid carbon dioxide, that destroys tissue by freezing. Also called **cold cautery.**

cryogen /krī′əjən/ [Gk, *kryos* + *genein*, to produce], **1.** a chemical that induces freezing, used to destroy diseased tissue without injury to adjacent structures. Cell death is caused by dehydration after cell membranes rupture. **2.** (in magnetic resonance imaging [MRI]) a chemical used to cool the MRI electromagnet so that the magnet remains superconducting and higher magnified strengths can be achieved. Kinds of cryogens include **carbon dioxide, liquid nitrogen,** *liquid helium*, and **nitrous oxide.** —*cryogenic, adj*.

cryoglobulin /krī′ōglob′yo͝olin/ [Gk, *kryos* + L, *globulus*, small sphere], an abnormal plasma protein that precipitates and coalesces at low temperatures and dissolves and disperses at body temperature.

cryoglobulinemia /krī′ōglob′yo͝olinē′mē·ə/ [Gk, *kryos* + L, *globulus,* small sphere; Gk, *haima,* blood], the presence of cryoglobulins in the blood. Presence of cryoglobulins may be associated with a variety of clinical disorders including Waldenström's macroglobulinemia, hepatitis C, multiple myeloma, and leukemia.

cryoglobulin test, a blood test to assess the presence of cryoglobulin, which is associated with lymphoid malignancies, connective tissue disease, acute and chronic infections, and liver disease.

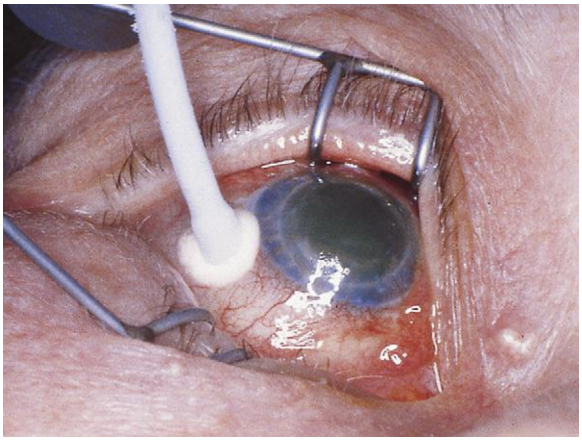
cryonics /krī·on′iks/ [Gk, *kryos,* cold], the techniques in which cold is applied for a variety of therapeutic goals, including brief local anesthesia, destruction of superficial skin lesions, and preservation of cells, tissue, organs, or the entire body. —*cryonic, adj.*

cryoprecipitate /-prisip′itāt/, **1.** any precipitate formed on cooling of a solution. **2.** a preparation rich in factor VIII needed to restore normal coagulation in hemophilia. It is collected from fresh human plasma that has been frozen and thawed.

cryopreservation /krī′ōpres′ərvā′shən/, a method of preserving tissues and organs in a viable state at extremely low temperatures.

cryostat /krī′ōstat/ [Gk, *kryos* + *statos,* standing], a device used in surgical treatment of pathological disorders that consists of a special microtome used for freezing and slicing sections of tissue for study by a surgical pathologist. See also **microtome.**

cryosurgery /-sur′jərē/ [Gk, *kryos* + *cheirourgos*], use of subfreezing temperature to destroy tissue. Cryosurgery is performed in the destruction of the ganglion of nerve cells in the thalamus in the treatment of **Parkinson's disease**, in the destruction of the pituitary gland to halt the progress of some kinds of metastatic cancer, and in the treatment of various cancers and lesions of the skin. The process is also used in ophthalmology to cause the edges of a detached retina to heal and to remove cataracts. The coolant is circulated through a metal probe, chilling it to as low as –160° C (–256° F), depending on the chemical used. The moist tissues adhere to the cold metal of the probe and freeze. Cells are dehydrated as their membranes burst; eventually they are discarded or absorbed by the body. No specific postoperative nursing care is required.



Cryosurgery *(Jaffe, 1996)*

cryotherapy /krī′ōther′əpē/ [Gk, *kryos* + *therapeia*], a treatment using cold as a destructive medium. Cutaneous tags, warts, condyloma acuminatum, and actinic keratosis are some of the common skin disorders responsive to cryotherapy. Solid carbon dioxide or liquid nitrogen is applied briefly with a sterile cotton-tipped applicator or cryospray instrument. Blistering, followed by necrosis, results. The procedure may be repeated.

crypt /kript/ [Gk, *kryptos,* hidden], a blind pit or tube on a free surface. Some kinds of crypts are **anal crypt, dental crypt,** and **synovial crypt.**

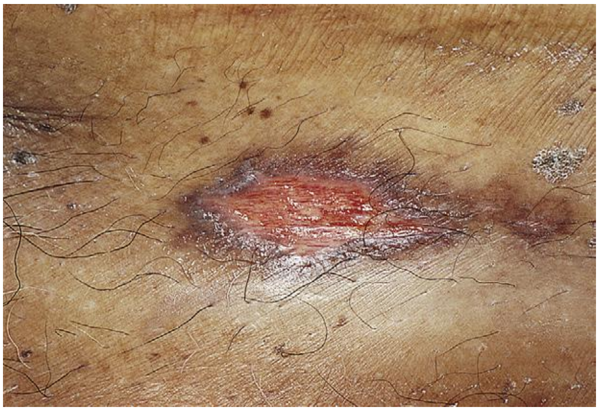
crypt-. See **crypto-.**

cryptic /krip′tik/ [Gk, *kryptos,* hidden], pertaining to something concealed.

crypto-, crypt-, krypto-, prefix meaning "hidden": *cryptocephalus, cryptocrystalline, cryptodidymus.*

cryptocephalus /krip′tōsef′ələs/ [Gk, *kryptos* + *kephale,* head], a malformed fetus that has a small, underdeveloped head. —*cryptocephalic, cryptocephalous, adj., cryptocephaly, n.*

cryptococcosis /krip′tōkokō′sis/, an infectious disease caused by the fungus ***Cryptococcus neoformans,*** which, after inhalation, spreads from the lungs to the brain and central nervous system, skin, skeletal system, and urinary tract. The disease occurs in all parts of the world, but 85% of the cases occur in North America, where it is most likely to afflict persons with immunodeficiencies such as human immunodeficiency virus (HIV) and middle-aged men in the southeastern United States. It is especially associated with breathing dust from pigeon droppings. It is characterized by the development of nodules or tumors filled with a gelatinous material in visceral and subcutaneous tissues. Initial symptoms may include coughing or other respiratory effects because the lungs are a primary site of infection. After the fungus spreads to the meninges, neurological symptoms, including headache, blurred vision, and difficulty in speaking, may develop. The diagnosis is made by isolation and identification of the fungus in sputum, pus, or tissue biopsy specimens. Amphotericin B and fluconazole may be administered to control the infection. In patients with HIV, maintenance therapy with fluconazole may be indicated, but it does not affect survival and is not considered cost-effective. Also called **Buschke's disease, European blastomycosis, torulosis.** See also ***Cryptococcus*** and specific fungal infections.



Cryptococcosis *(Callen et al, 2000)*

Cryptococcus /-kok′əs/, a genus of encapsulated yeasts that reproduce by budding rather than by producing spores. Many nonpathogenic species of *Cryptococcus* are commonly found in the soil and on the skin and mucous membranes of people who are well. Certain pathogenic species exist. *C. neoformans* is the most important. See also **fungus, yeast.**

Cryptococcus neoformans, a species of encapsulated yeasts that causes cryptococcosis, a potentially fatal infection that can affect the lungs, skin, and brain.

cryptodidymus /krip′tōdid′əməs/ [Gk, *kryptos* + *didymos,* twin], conjoined twins, one of which is a small, underdeveloped fetus concealed within the body of the other, more fully formed autosite.

crypt of iris, any one of the small pits in the iris along its free margin encircled by the circulus arteriosus minor. Also called **crypt of Fuchs.**

crypt of Lieberkühn, gland in the intestinal mucous membrane. See **Lieberkühn's glands.**

cryptogenic /-jen′ik/ [Gk, *kryptos,* hidden, *genein,* to produce], **1.** *adj*, pertaining to a disease of unknown cause. **2.** *n*, a parasitic organism living within another organism.

cryptogenic infection, a disease caused by pathogenic microorganisms of obscure or unknown origin.

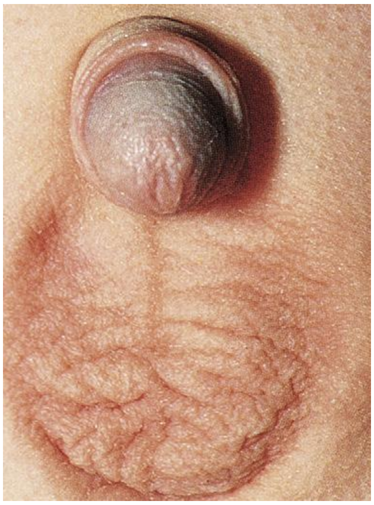
cryptogenic septicemia, a systemic infection in which pathogens are present in the bloodstream but no primary focus of infection can be identified.

cryptomenorrhea /krip′tōmenôrē′ə/ [Gk, *kryptos* + L, *mens,* month; Gk, *rhoia,* flow], an abnormal condition in which the products of menstruation are retained within the vagina because of an imperforate hymen or, less often, within the uterus because of an occlusion of the cervical canal. Cryptomenorrhea is usually accompanied by subjective symptoms of menstruation with scant or absent flow and sometimes by severe pain. If the flow is completely obstructed, uterotubal reflux of menstrual flow into the pelvic cavity may cause peritonitis, pain, adhesions, and endometriosis. **—***cryptomenorrheal, adj.*

cryptophthalmos /krip′təfthal′məs/ [Gk, *kryptos* + *ophthalmos,* eye], a developmental anomaly characterized by complete fusion of the eyelids, usually with defective formation or lack of eyes.

cryptophthalmos syndrome. See **Fraser's syndrome.**

cryptorchidism /kriptôr′kidiz′əm/ [Gk, *kryptos,* hidden, *orchis,* testis], a developmental defect in which one or both testicles fail to descend into the scrotum and are retained in the abdomen or inguinal canal. The testes normally migrate into the scrotal sac at birth, but normal testicular descent depends on timely and synchronous development of other embryonic structures. If spontaneous descent does not occur by the age of 1 year, hormonal injections may be given. If injections are unsuccessful, orchiopexy is usually performed before age 3. Also called **cryptorchid testis**, **cryptorchis, undescended testis.**



Cryptorchidism *(Zitelli and Davis, 1992/Courtesy Dr. Ellen Wald, Children's Hospital of Pittsburgh)*

cryptosporidiosis, an opportunistic infection caused by the intestinal parasites *Cryptosporidium parvum,* a very common parasite in animals, and *C. hominis*. The disease was relatively unknown as a human pathogen before a 1993 epidemic in the Milwaukee, Wisconsin area, where 400,000 persons were stricken with diarrhea after drinking water contaminated with the parasite. Other sources of infection include raw or undercooked foods contaminated with *Cryptosporidium* oocysts, direct contact with infected humans or animals, and contact with recreational water. Symptoms of watery diarrhea, abdominal cramps, nausea, vomiting, and low-grade fever may appear 2 to 10 days after infection. They may lead to dehydration and weight loss. The symptoms may last 1 or 2 weeks and may be life-threatening to persons with suppressed immune systems. Treatment emphasizes rest, replenishment of body fluids and electrolytes, and medications to control diarrhea. Paromomycin may be partially effective in the treatment of cryptosporidiosis in persons with HIV infection. There is no known safe and effective cure for cryptosporidiosis. A new drug, nitzoxanide, has been approved for the treatment of diarrhea caused by cryptosporidiosis, but it should be used only in patients with healthy immune systems. Fecal material from patients suffering from crytosporidiosis is infectious and should be handled accordingly. Care should be taken to avoid infection of immunocompromised patients by means of contact with symptomatic patients in a hospital environment.

cry reflex, a normal infantile reaction to pain, hunger, or need for attention. The reflex may be absent in an infant born prematurely or in poor health.

crystal /kris′təl/ [Gk, *krystallos*], a solid substance, either organic or inorganic, the atoms or molecules of which are arranged in a regular, repeating three-dimensional pattern, which determines the shape of a crystal. **—crystalline,** *adj.*

crystal gold. See **mat gold.**

crystalline, describing material with a regular geometric shape. Crystalline substances have a very narrow melting point range.

crystalline lens /kris′təlin, -līn/ [Gk, *krystallos* + L, lentil], a transparent structure of the eye, enclosed in a capsule, situated between the iris and the vitreous humor, and slightly overlapped at its margin by the ciliary processes. It refracts light to focus images on the retina. The capsule of the lens is a transparent elastic membrane that touches the free border of the iris anteriorly and is secured by the suspensory ligament of the lens. The circumference of the capsule recedes from the iris to form the posterior chamber of the eye. The lens is a transparent biconvex structure with the posterior surface more convex than the anterior, derived from surface ectoderm. It is composed of a soft cortical material, a firm nucleus, and concentric laminae and is covered anteriorly by transparent epithelium. In the fetus the lens is very soft and has a slightly reddish tint; in the adult it is colorless and firm; in old age it becomes flattened, more dense, slightly opaque, and amber-tinted. See also **eye.**

crystallization /kris′təlīzā′shən/ [Gk, *krystallos,* rock crystal], the production of crystals, either by cooling a liquid or gas to a solid state or by cooling a solution until the solute precipitates as a crystalline deposit. *crystalize, v.*

crystalloid /kris′təloid/ [Gk, *krystallos* + *eidos,* form], a substance in a solution that can diffuse through a semipermeable membrane. Compare **colloid.**

crystalluria /kris′təlo͝or′ē·ə/, the presence of crystals in the urine. The condition may be a source of urinary tract irritation; adequate intake of alkali can prevent it. However, crystals are commonly found in urine and are usually insignificant. Cystine crystals, or uric acid crystals, precipitate in acid urine. Phosphate, or oxalate, crystals precipitate in alkaline urine.

Crystodigin, a trademark for a cardiac glycoside **(digitoxin).**

Cs, symbol for the element **cesium.**

CS, abbreviation for **cesarean section.**

c-section. See **cesarean section.**

CSF, **1.** abbreviation for **cerebrospinal fluid.** **2.** abbreviation for **colony-stimulating factor.**

CSN, abbreviation for *certified school nurse*.

C-spine, abbreviation for **cervical spine.**

CSR, abbreviation for **Cheyne-Stokes respiration.**

c-src, a tyrosine kinase that participates in signal transduction pathways that regulate growth of cells. It hybridizes with oncogenes of the highly virulent Rous sarcoma virus. The human c-src gene is located at 20g12-13 on the long arm of chromosome 20.

CST, **1.** abbreviation for **contractions stress test.** **2.** abbreviation for **Certified Surgical Technologist.**

CT, abbreviation for **computed tomography.**

CT number. See **Hounsfield unit.**

CTX, abbreviation for **clinical trial exemption.**

Cu, symbol for the element **copper.**

CUA, abbreviation for **cost-utility analysis.**

Cuban itch. See **alastrim.**

cubic centimeter (cc, cu cm, cm^3) [Gk, *kybos* + L, *centum,* hundred; Gk, *metron,* measure], a theoretical cube or its equivalent, each edge of which is 1 centimeter long. One cu cm is equivalent to 1 mL.

Cubicin, a trademark for **daptomycin.**

cubic millimeter (cu mm, mm^3), a unit of volume equal to one millionth of a liter. One cubic millimeter is equivalent to 1 microliter.

cubital /kyo͞o′bitəl/, pertaining to the elbow.

cubital fossa, a depression in the front of the elbow, immediately lateral to the tendon of the biceps brachii muscle.

cubitus /kyo͞o′bitəs/, **1.** the elbow. **2.** the forearm.

cuboidal epithelium /kyo͞oboi′dəl/ [Gk, *kybos,* cube, *eidos,* form, *epi,* above, *thele,* nipple], simple epithelial cells that are generally cube-shaped and one layer thick.

cuboid bone /kyo͞o′boid/ [Gk, *kybos,* cube, *eidos,* form], the outer cuboidal tarsal bone on the lateral side of the foot, proximal to the fourth and fifth metatarsal bones. It articulates with the calcaneus, lateral cuneiform, and fourth and fifth metatarsal bones and occasionally with the navicular. Also called **os cuboideum.**

cuboidodigital reflex. See **Mendel's reflex.**

cu cm, abbreviation for **cubic centimeter.**

cue /kyo͞o/, a stimulus that determines or may prompt the nature of a person's response.

cuff, an inflatable elastic tube that is placed around a limb and inflated with air to restrict arterial circulation during blood pressure examination. See also **cuffed endotracheal tube, Dacron cuff.**

cuffed endotracheal tube, an endotracheal tube with a balloon at one end that may be inflated to tighten the fit in the lumen of the airway. The balloon forms a cuff that prevents gastric contents from passing into the lungs and gas from leaking back from the lungs. Both high-pressure and low-pressure cuffs are used. Overinflation of the cuff can cause contusion, hemorrhage, mucosal sloughing, or stenosis.

cuffing, a pathological condition in which cufflike borders of leukocytes form around small blood vessels, as in certain infections.

cuirass /kwiras′/ [Fr, *cuirasse,* breastplate], **1.** also called *cuirass ventilator*. a negative-pressure full-body respirator. It consists of a rigid shell that conforms to the surfaces of the body from the neck to the hips. Ventilating pressure is delivered through a flexible hose attached to the top of the device. An electrically driven pump is adjusted to match the timing of the patient's spontaneous breathing. **2.** a tightly fitted chest bandage.

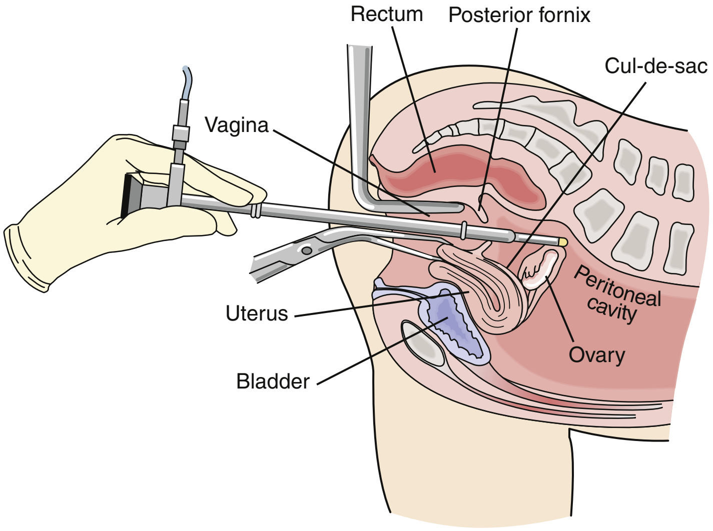
cul-de-sac /kul′dəsak, kYdesok′/ *pl. culs-de-sac, cul-de-sacs* [Fr, bottom of the bag], a blind pouch or cecum, such as the conjunctival cul-de-sac and the dural cul-de-sac.

cul-de-sac of Douglas [James Douglas, Scottish anatomist, 1675–1742], a pouch formed by the caudal portion of the parietal peritoneum. Also called **pouch of Douglas, rectouterine excavation, rectouterine pouch.**

culdocentesis /kul′dōsentē′sis/, the use of needle puncture or incision through the vagina to remove intraperitoneal fluid, including purulent material.

culdoplasty /kul′dōplas′tē/ [Fr, *cul-de-sac,* bottom of the bag; Gk, *plassein,* to mold], plastic surgery to correct a defect in the posterior fornix of the vagina.

culdoscope /kul′dəskōp′/, an endoscope with an attached light that can be inserted through the posterior wall of the vagina for examination of the pelvic viscera.

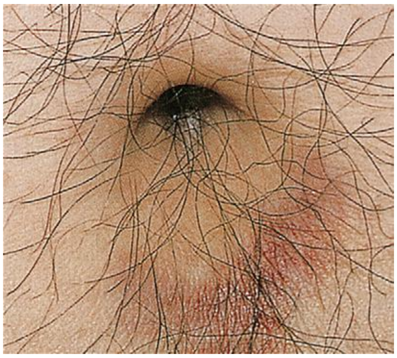


Culdoscope *(Phipps et al, 2003)*

culdotomy /kuldot′əmē/, incision or needle puncture of cul-de-sac of Douglas by way of the vagina.

Culex /koo′leks/, a genus of humpbacked mosquitoes (Culicidae). It includes species that transmit viral encephalitis and filariasis. *Culex pipiens* is the most widely distributed mosquito globally.

Cullen's sign [Thomas S. Cullen, American gynecologist, 1868–1953], the appearance of faint, irregularly formed hemorrhagic patches on the skin around the umbilicus. The discolored skin is usually blue-black and becomes greenish brown or yellow. Cullen's sign may appear 1 to 2 days after the onset of anorexia and the severe, poorly localized abdominal pains that are characteristic of acute hemorrhagic pancreatitis. It is also present in massive upper GI hemorrhage and ruptured ectopic pregnancy. Compare **Grey Turner's sign.** See also **pancreatitis.**



Cullen's sign *(Greig and Garden, 1996)*

Culp-De Weerd pyeloplasty, pyeloplasty in which a spiral flap is turned down and incorporated into the adjacent ureter.

culs-de-sac. See **cul-de-sac.**

cult, a specific complex of beliefs, rites, and ceremonies associated with some particular person or object, which is maintained by a social group. A cult is often considered as having magical significance.

cultural assimilation /kul′chərəl/, a process by which members of an ethnic minority group lose cultural characteristics that distinguish them from the dominant cultural group or take on the cultural characteristics of another group.

cultural event, a communication of meaning that takes place each time one member of a society interacts with another member.

cultural healer, a member of an ethnic or cultural group who uses traditional methods of healing rather than modern scientific methods to provide health care for other members of the group or members of another ethnic minority group.

culturally relativistic perspective, an ability to understand the behavior of transcultural patients (those who move from one culture to another) within the context of their own culture. See also **transcultural nursing.**

cultural relativism, a concept that health and normality emerge within a social context and that the content and form of mental health will vary greatly from one culture to another. Differences may result from variations in stressors, symbolic interpretation, acceptance of expression and repression, and cohesion and tolerance of deviation of social groups.

culture /kul′chər/ [L, *colere,* to cultivate], **1.** (in microbiology) a laboratory test involving the cultivation of microorganisms or cells in a special growth medium. See also **medium. 2.** (in psychology) a set of learned values, beliefs, customs, and behavior that is shared by a group of interacting individuals.

culture-bound, pertaining to a health condition that is specific to a particular culture, such as a belief in the effects of certain kinds of prayer or the "evil eye."

culture brokerage, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the deliberate use of culturally competent strategies to bridge or mediate between the patient's culture and the biomedical health care system. See also **Nursing Interventions Classification.**

culture medium. See **medium.**

culture procedure, (in bacteriology) any of several techniques for growing colonies of microorganisms to identify a pathogen and to determine its sensitivity to various antibiotics. Usually a specimen is secured by using sterile technique and a small amount is placed into or on one or more culture media, because different organisms are nourished by different nutrients and grow best at different specific pH levels. The environment in which the media are held during observation is maintained at body temperature, and the ambient oxygen level is adjusted to achieve an aerobic or anaerobic state. All procedures are aseptic, and all equipment is sterile to prevent accidental contamination of the media. As colonies appear in or on the media, small amounts of each (there are often several) are spread onto other media to allow examination of a pure specimen of the microorganisms.

culture shock, the psychological effect of a drastic change in the cultural environment of an individual. The person may exhibit feelings of helplessness, discomfort, and disorientation in attempting to adapt to a different cultural group with dissimilar practices, values, and beliefs.

cum /ko͝om/ [L], together with.

cu mm, abbreviation for **cubic millimeter.**

cumulative /kyo͞o′myəlā′tiv/ [L, *cumulare,* to pile on], increasing by incremental steps with an eventual total that may exceed the expected result.

cumulative action, **1.** the increased activity of a therapeutic measure or agent when administered repeatedly, as the cumulative action of a regular exercise program. **2.** the increased activity demonstrated by a drug when repeated doses accumulate in the body and exert a greater biological effect than the initial dose.

cumulative dose, the total dose that accumulates as a result of repeated exposure to radiation or a radiopharmaceutic product.

cumulative gene. See **polygene.**

cumulus /kyo͞o′myo͞o·ləs/ *pl. cumuli* [L], a little mound, usually formed by a collection of cells.

cune-, prefix meaning "wedge": *cuneate, cuneiform, cuneus.*

cuneate /kyo͞o′nē·āt/ [L, *cuneus,* wedge], (of tissue) wedge-shaped, especially in relation to cells of the nervous system.

cuneiform /kyo͞onē′əfôrm′/ [L, *cuneus,* wedge, *forma*], **1.** *adj,* (of bone and cartilage) wedge-shaped. **2.** *n,* bone of the foot between the navicular and metatarsals.

cuneiform bone. See **triangular bone.**

cuneiform cartilage [L, *cuneus,* wedge, *forma* + *cartilago*], one of two small pieces of yellow elongated elastic laryngeal cartilage at the edge of the aryepiglottic fold, above and anterior to the corniculate cartilage.

-cuneo, cuneo-, suffix meaning “wedge-shaped structures”: *cuneus, cuneiform.*

cuneus /kyo͞o′nē·əs/, a wedge-shaped region of the cerebral cortex lying between the parietooccipital and postcal-carine sulci on the mesial surface of the occipital lobe.

cunnilingus /kun′əling′gəs/, the oral stimulation of the female genitalia.

cup arthroplasty of the hip joint [L, *cupa,* cask; Gk, *arthron,* joint, *plassein,* to mold], the surgical replacement of the head of the femur by a metal or plastic mold to relieve pain and increase motion in arthritis or to correct a deformity. The damaged or diseased bone is removed, and the acetabulum and the head of the femur are reshaped. A cup is inserted between the two and becomes the articulating surface of the femur. After surgery the patient’s legs are placed between an abduction pillow to hold them in a position of abduction extension and internal rotation to keep the cup in place in the acetabulum. Continued abduction may be necessary for 6 weeks. Possible complications include infection, thrombophlebitis, pulmonary embolism, and fat embolism. The patient receives extensive physical therapy. A walker or crutches are necessary to prevent full weight-bearing for 6 months, and an exercise program must be followed for several years. Compare **hip replacement.** See also **arthroplasty, knee replacement, osteoarthritis, plastic surgery.**

cup/disc ratio, (in ophthalmology) the mathematic relationship between the horizontal or vertical diameter of the optic nerve cup and the diameter of the optic disc.

cupola. See **cupula.**

cupping, a counterirritant technique of applying a suction device to the skin to draw blood to the surface of the body.

Cupping devices *(Swartz, 2009)*

cupping and vibrating, a technique for dislodging and removing mucus and fluid from the lungs. See also **percussion.**

■ METHOD: Cupping consists of the rhythmic percussion of the affected segments of the lungs or bronchi by the practitioner’s cupped hands. It is begun gently and is increased in forcefulness as the patient tolerates increased percussion. To perform vibrating, the practitioner places his or her hands over the affected area and alternately tenses and contracts the muscles of the hand, arm, and shoulder. The vibratory movements are transmitted to the patient’s chest, increasing the turbulence and velocity of exhaled air in the small bronchi. See also **postural drainage.**

■ INTERVENTIONS: Cupping is never performed over breast tissue, over the spine, or below the ribs because it causes discomfort and can damage soft tissue. After head-down postural drainage with cupping and vibrating, the patient is helped to a position favorable for effective coughing and asked to breathe deeply at least three times and to cough at least twice.

■ OUTCOME CRITERIA: Thick, tenacious mucus is difficult to evacuate from the bronchi, the bronchioles, and the alveoli. As an adjunct to postural drainage, cupping and vibrating may greatly facilitate clearing the passages. The patient can breathe more deeply and with less effort, and the potential for development of pneumonia or atelectasis is reduced.

cupric /kyo͞o′prik/ [L, *cuprum,* copper], pertaining to copper in its divalent form, as cupric sulfate. Also called *copper (II),* as in copper (II) sulfate.

cupric sulfate, a crystalline salt of copper used as an emetic, astringent, and fungicide, as an oral antidote to phosphorus poisoning, as a topical treatment of cutaneous phosphorus burns, and as a catalyst in iron deficiency anemia.

Cuprimine, a trademark for a chelating agent used in treating poisoning by heavy metals (D-penicillamine).

cupula /kyo͞o′pələ/, any cup- or dome-shaped structure, such as the top of a lymphatic nodule in the small intestine. Also spelled **cupola.**

cupular caecum of cochlear duct, the closed blind apical end of the cochlear duct.

cupulolithiasis /kyo͞o′pyo͝olōlithī′əsis/ [L, *cupula,* little cup; Gk, *lithos,* stone], a severe, long-lasting vertigo brought on by movement of the head to certain positions. Among the many possible causes are otitis media, ear surgery, and injury to the inner ear. In addition to extreme dizziness, signs are nausea, vomiting, and ataxia. There is no treatment except avoidance of the offending head positions. See also **positional vertigo.**

curanderismo. See **Latin American medical practices.**

curare /kyo͝orä′rē/ [S. Am. Indian, *ourari*], a substance derived from tropical plants of the genus *Strychnos*. It is a potent neuromuscular blocker that acts by preventing transmission of neural impulses across the myoneural junctions. A large dose can cause complete paralysis, but action is usually reversible with acetylcholinesterase inhibitors (cholinergic agonists). Pharmacological preparations of the substance are used as adjuncts to general anesthesia. The use of curare or other neuromuscular blocking agents requires respiratory and ventilatory assistance by a qualified anesthetist or anesthesiologist. Also called **tubocurarine chloride.**

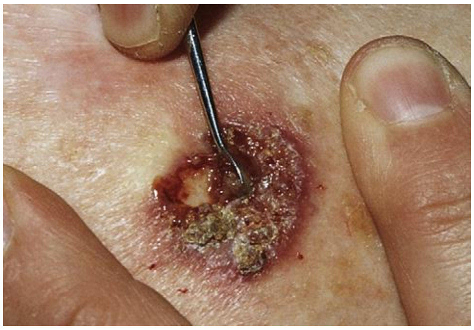
curariform /kyo͝orä′rifôrm′/ [*curare* + L, *forma*], **1.** chemically similar to curare. **2.** having the effect of curare.

curative treatment. See **treatment.**

cure /kyo͝or/ [L, *cura*], **1.** restoration to health of a person afflicted with a disease or other disorder. **2.** the favorable outcome of the treatment of a disease or other disorder. **3.** a course of therapy, a medication, a therapeutic measure, or another remedy used in treatment of a medical problem, as faith healing, fasting, rest cure, or work cure.

curet /kyo͝oret′/ [Fr, *curette,* scoop], **1.** *n,* a surgical instrument shaped like a spoon or scoop for scraping and removing material or tissue from an organ, cavity, or surface. A curet may be blunt or sharp and is designed in a shape and size appropriate to its use. Also called curette. **2.** *v,* to remove tissue or debris with such a device. Kinds of curets include **Hartmann’s curet.**

curettage /kyo͝or′ətäzh′/ [Fr, *curette,* scoop], scraping of material from the wall of a cavity or other surface, performed to remove tumors or other abnormal tissue or to obtain tissue for microscopic examination. Curettage also refers to clearing unwanted material from fistulas and areas of chronic infection. It may be performed with a blunt or a sharp curet or by suction.



Curettage *(Habif, 1996)*

curie (Ci) /kyo͝or′ē/ [Marie Skladowska Curie, Polish-born chemist and physicist, 1867–1934; Pierre Curie, French chemist and physicist, 1859–1906; both Nobel laureates], a unit of radioactivity used before adoption of the becquerel (Bq) as the SI unit. It is equal to 3.70 × 10^{10} Bq.

curing /kyo͞or′ing/ [L, *curare,* to take care of or heal], (in dentistry) a method for promoting and accelerating hardening processes by using dampness, heat, cold, chemical agents, electromagnetic radiation, or other agents.

curium (Cm) /kyo͞o′rē·əm/ [Marie S. Curie; Pierre Curie], a radioactive metallic element. Its atomic number is 96. Its atomic mass is 247. Curium is an artificial element produced by bombarding plutonium with helium ions in a cyclotron. Numerous isotopes of curium are produced by bombarding lighter transuranium elements. Curium is so radioactive that it glows in the dark.

-curium, suffix designating a neuromuscular blocking agent.

Curling's ulcer [Thomas B. Curling, English surgeon, 1811–1888], a duodenal ulcer that develops in people who have suffered severe stress, such as superficial burns, intracranial lesions, or severe bodily injury. Curling first diagnosed it in patients who had severe burns. The pathophysiological characteristics include hypotension from shock, which decreases the blood supply to gastric mucosa, which leads to ischemia. Also called **Curling's stress ulcer.**

CURN, abbreviation for *certified urological registered nurse.*

-curonium, suffix designating a neuromuscular blocking agent.

currant jelly clot /kur′ənt/ [ME, *corauns* + L, *gelare,* to congeal; AS, *clott*], a red, jellylike blood clot that is rich in hemoglobin from erythrocytes in the clot.

current /kur′ənt/ [L, *currere,* to run], **1.** a flowing or streaming movement. **2.** a flow of electrons along a conductor in a closed circuit; an electric current. **3.** certain physiological electrical activity and characteristics of blood circulation. Physiological currents include abnerval current, action current, axial current, centrifugal current, centripetal current, compensating current, demarcation current, and electrotonic current. See also **alternating current, direct current, volt, watt.**

-current, suffix meaning "running, flowing, happening": *concurrent, excurrent, intercurrent.*

current of injury. See **demarcation current.**

Current Procedural Terminology (CPT), a system developed by the American Medical Association for standardizing the terminology and coding used to describe medical services and procedures. See also ***CPT*** **codes.**

current validity. See **validity.**

curriculum vitae (CV) /kərik′ələm wē′tī, -vē′tē/ *pl. curricula vitae* [L, *curriculum,* course, *vita,* life], a summary of educational and professional experiences, including activities and honors, to be used in applications for employment, for biographic citations on professional meeting programs, or for related purposes. Also called *resume*, **résumé.**

Curschmann's spiral /ko͝orsh′monz/ [Heinrich Curschmann, German physician, 1846–1910; Gk, *speira,* coil], coiled fibrils of mucus occasionally found in the sputum of persons with bronchial asthma.

cursor /kur′sər/, a moving marker or pointer on a computer monitor that indicates a position.

curtain effect /kur′tən/, an artifact produced when chemical processing stains are not properly squeezed from an x-ray film during development of a radiograph.

curvature /kur′vəchər/, a bending or curving of a line from the course of a straight line.

curvature myopia, a type of nearsightedness caused by refractive errors associated with an excessive curvature of the cornea.

curve [L, *curvare,* to bend], (in statistics) a straight or curved line used as a graphic method of demonstrating the distribution of data collected in a study or survey.

curve of Carus [Karl G. Carus, German anatomist, 1789–1869], the normal axis of the pelvic outlet. Also called **circle of Carus.**

curve of occlusion, **1.** an imaginary curved surface that is described by the incisal and occlusal surfaces of the teeth. **2.** the curve of dentition on which lie the occlusal surfaces of the teeth. See also **reverse curve.**

curve of Spee /shpā, spē/ [Ferdinand Graf von Spee, German embryologist, 1855–1937], the anatomical curvature of the occlusal alignment of the teeth. It begins at the tip of the lower canine, follows the buccal cusps of the natural premolars and molars, and continues to the anterior border of the mandibular ramus. It is a useful landmark for arrangement of dental images or radiographs. Compare **compensating curve.**

curve of Wilson /wil′sən/, the curvature of the cusps of the teeth as projected on the frontal plane. That of the mandibular dental arch is concave and that of the maxillary dental arch is convex.

curvi-, prefix for terms relating to curvature.

curvilinear /cur′vilin′ē·ər/ [L, *curvus,* bent, *linea,* line], pertaining to a curved line.

curvilinear trend [L, *curvus,* bent, *linea,* line; AS, *trendan,* to turn], (in statistics) a trend in which a graphic representation of the data yields a curved line. The value of the independent variable may be expressed as a polynomial coefficient; by a more complete mathematic expression, such as a logistic curve; or by a smoothing process, such as a moving average.

Curvularia /ker′vular′eə/, a genus of imperfect fungi commonly found in soil and elsewhere. *C. lunata* is found in human mycetomas (chronic granulomatous disease).

cushingoid /ko͝osh′ingoid/ [Harvey W. Cushing, American surgeon, 1869–1939; Gk, *eidos,* form], having the habitus and facies characteristic of **Cushing's disease:** fat pads on the upper back and face, ruddy complexion, striae on trunk, thin legs, and excess facial hair.

Cushing's disease /ko͝osh′ingz/ [Harvey W. Cushing], a metabolic disorder characterized by abnormally increased secretion of adrenocortical steroids, particularly cortisol, caused by increased amounts of adrenocorticotropic hormone (ACTH) secreted by the pituitary, such as by a pituitary adenoma. Excess adrenocortical hormones result in accumulations of fat on the abdomen, chest, upper back, and face and occurrence of edema, hyperglycemia, increased gluconeogenesis, muscle weakness, purplish striae on the skin, decreased immunity to infection, osteoporosis with susceptibility to bone fractures, acne, and facial hair growth in women. Diabetes mellitus may become a chronic condition. Therapy is aimed at removal or destruction of ACTH secreting tissue, most commonly by surgical or radiological procedures. The adrenal glands may be totally or subtotally removed and pharmacological preparations of adrenal steroids administered. Also called **hyperadrenalism.** Compare **Cushing's syndrome.**

Cushing's syndrome [Harvey W. Cushing], a metabolic disorder resulting from the chronic and excessive production of cortisol by the adrenal cortex or by the administration of glucocorticoids in large doses for several weeks or longer. When occurring spontaneously, the syndrome represents a failure in the body's ability to regulate the secretion of cortisol or adrenocorticotropic hormone (ACTH). (Normally cortisol is produced only in response to ACTH, and ACTH is not secreted in the presence of high levels of cortisol.) The most common cause of the syndrome is a pituitary tumor that increases secretion of ACTH. Also called **hyperadrenocorticism.** See also **Addison's disease, Cushing's disease, Nelson's syndrome.**

■ OBSERVATIONS: Characteristically the patient with Cushing's syndrome has a decreased glucose tolerance; central obesity; round "moon" face; supraclavicular fat pads; an overhanging, striae-covered pad of fat on the chest and abdomen; buffalo hump; scant menstrual periods or decreased testosterone levels; muscular atrophy; edema; hypokalemia; and some degree of emotional change. The skin may be abnormally pigmented and fragile; minor infections may become systemic and long-lasting. Children with the disorder may stop growing. Hypertension, kidney stones, and psychosis may also occur.

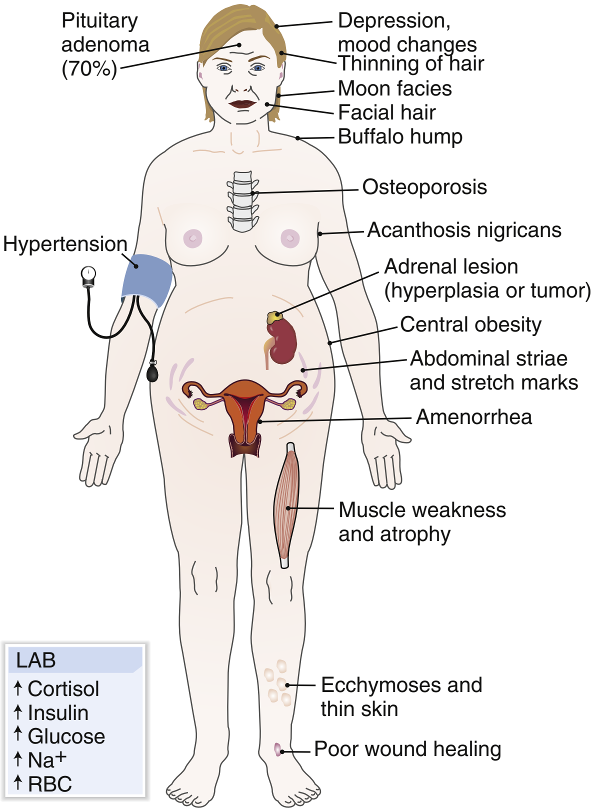
■ INTERVENTIONS: The objective of all treatment is decreased cortisol secretion. The source of the excess ACTH is discovered by a series of tests that challenge the function of the adrenal and pituitary glands. If the excess ACTH is caused by an adenoma of the anterior pituitary, irradiation or surgical excision of the tumor corrects the condition. If the condition is the result of medication, decreasing or changing the dosage may alleviate the symptoms.

■ NURSING CONSIDERATIONS: In caring for children the nurse normally observes height and weight, because rapidly developing obesity and failure to grow are suggestive of Cushing's syndrome. Some medications used for some forms of the condition may cause nausea and anorexia, somnolence, and lethargy. The patient is informed of this possibility. Nursing care of the hospitalized patient with Cushing's syndrome is similar to that of patients with Addison's disease, Cushing's disease, and other endocrinological disorders. Weight and electrolyte and fluid balance are monitored, an adequate balanced diet is urged, and emotional changes are observed with a goal of maintaining emotional equilibrium.

cushion [OFr, *coissin*], any anatomical structure that resembles a pad or pillow.

cusp [L, *cuspis,* point], **1.** a sharp projection or a rounded eminence that rises from the chewing surface of a tooth, such as the two pyramidal cusps that arise from the premolars. **2.** any one of the small flaps on the valves of the heart, as the ventral, dorsal, and medial cusps of the right atrioventricular valve.

cuspid /kus′pid/ [L, *cuspis,* point], a tooth with one cusp, or point; a canine tooth. Also called **unicuspid.**



Cushing's syndrome *(Damjanov, 2008)*

cuspless tooth /kusp′les/, a tooth without cusps, or prominences, on its occlusal surface, possibly as a result of attrition.

custodial care /kəstō′dē·əl/ [L, *custodia,* guarding, *garrire,* to chatter], services and care of a nonmedical nature provided on a long-term basis, usually for convalescent and chronically ill individuals. Kinds of custodial care include **board, personal assistance,** and *room*.

customary and reasonable charge, (in the United States) a fee usually established by health insurance or government agencies that is considered to be the "usual" cost of a specific medical service. The fee is commonly based on the amount the company or agency will pay for that service and may vary with geographic area.

cut, a split in both strands of a DNA molecule. See also **nick.**

cut-, prefix meaning "skin": *cutaneous, cuticle, cuticularization*.

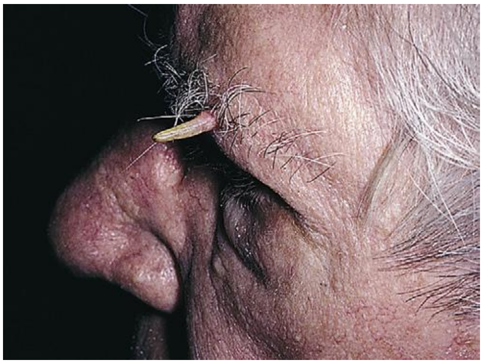
cutaneous /kyo͞otā′nē·əs/ [L, *cutis,* skin], pertaining to the skin.

cutaneous absorption, the taking up of substances through the skin.

cutaneous anaphylaxis, a localized hypersensitivity reaction in the form of a wheal and flare. It occurs in sensitized individuals when, as a test of sensitivity to various allergens, an antigen is injected into the skin. See also **antiserum anaphylaxis.**

cutaneous anthrax. See **anthrax.**

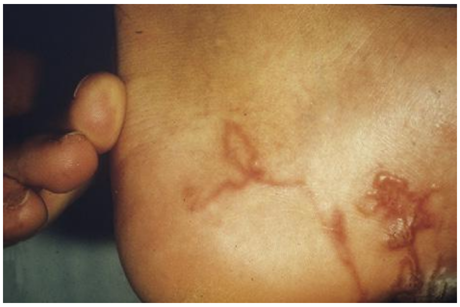
cutaneous horn, a protruding kerotic growth of the skin, the base of which may show changes of actinic keratosis or carcinoma.



Cutaneous horn *(Callen et al, 2000)*

cutaneous immunofluorescence biopsy, a microscopic examination of skin tissue for evaluation and diagnosis of immunological-mediated dermatitis.

cutaneous larva migrans, a skin condition caused by a hookworm, *Ancylostoma braziliense,* a parasite of cats and dogs. Its ova are deposited in the ground with the feces of infected animals, develop into larvae, and invade the skin of people, particularly bare feet, although any skin may be involved. The larvae rarely develop into adult hookworms in the human body, but as they migrate through the epidermis, a trail of inflammation follows the burrow, causing severe pruritus. Secondary infections often occur if the skin has been broken by scratching. It is the most commonly tropically acquired dermatosis. Beaches and other moist sandy areas are common locations of infection. Also called **creeping eruption.**



Cutaneous larva migrans *(Conlon and Snydman, 2000)*

cutaneous leishmaniasis, a dermatological disease caused by the parasite *Leishmania tropica,* transmitted to humans by the bite of the sand fly. This form of leishmaniasis, characterized by ulcerative lesions, occurs primarily in Africa, Asia, and some Mediterranean countries. Oriental sore causes no systemic symptoms, but the sores are susceptible to secondary infections. Treatment options include infrared therapy and injection of ulcers with sodium antimony gluconate. Also called **Aleppo boil, Delhi boil, Old World leishmaniasis, oriental sore, tropical sore.** See also **leishmaniasis.**

cutaneous lupus erythematosus, one of the two main types of lupus erythematosus. It may involve only the skin or may precede involvement of other body systems. It may be chronic (discoid lupus erythematosus); subacute (systemic lupus erythematosus); or acute (characterized by an acute edematous, erythematous eruption, often with systemic exacerbations). The acute form may be the presenting symptom of systemic lupus erythematosus, such as after sun exposure.

cutaneous membrane. See **skin.**

cutaneous nerve, any mixed peripheral nerve that supplies a region of the skin.

cutaneous nevus [L, *cutis,* skin, *naevus,* birthmark], a congenital discoloration of a skin area, such as a strawberry birthmark.

cutaneous papilloma, a small brown or flesh-colored outgrowth of skin, occurring most frequently on the neck of an older person. Also called **cutaneous tag, skin tag.**

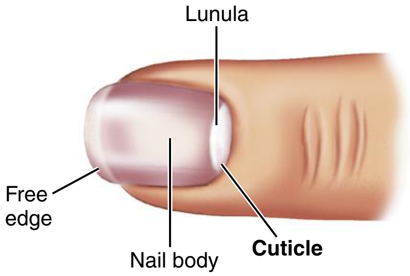
cutaneous sensation [L, *cutis,* skin, *sentire,* to feel], a sensation experienced in or arising from receptors of the skin.

cutaneous stimulation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as stimulation of the skin and underlying tissues for the purpose of decreasing undesirable signs and symptoms such as pain, muscle spasm, or inflammation. See also **Nursing Interventions Classification.**

cutaneous tag. See **cutaneous papilloma.**

cutdown [ME, *cutten* + *doun*], a dissection to access a vein for puncture that is not accessible by venipuncture. The skin is cleansed before the procedure; the incision is sutured, and a sterile dressing is applied at its conclusion. See also **hyperalimentation, venipuncture.**

cuticle /kyo͞o′təkəl/ [L, *cuticula,* little skin], **1.** See **epidermis. 2.** the sheath of a hair follicle. **3.** the thin edge of cornified epithelium at the base of a nail.

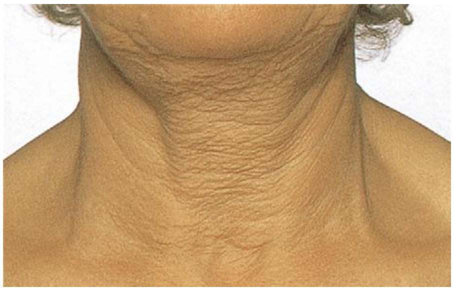


Cuticle *(Herlihy, 2011)*

cuticula /kyo͞otik′yələ/, the cuticle, a narrow region of epidermis that covers the proximal surface of a fingernail or toenail.

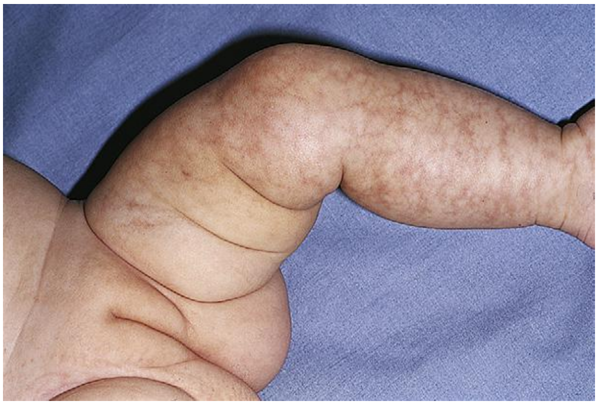
cutis. See **skin.**

cutis laxa /kyo͞o′təs/ [L, skin, *laxus,* loose], abnormally loose, relaxed skin resulting from an absence of elastic fibers in the skin, usually a hereditary condition.



Cutis laxa *(Lawrence and Cox, 2002)*

cutis marmorata, skin that has a "marbled" appearance caused by conspicuous dilation of small vessels. See also **livedo.**



Cutis marmorata *(Callen et al, 2000)*

cutting oil dermatitis, a skin disorder that affects machinists and others who use cutting oils as coolants and lubricants. Exposure to the oil obstructs hair follicles, sweat ducts, and sebaceous glands, leading to development of comedones and folliculitis. Sometimes there are secondary infections complicated by minute metal particles in the oil.

cuvette /kyo͞ovet′/ [Fr, *cuva,* tub], a small transparent tube or container with specific optical properties. The chemical composition of the container determines the vessel's use, such as Pyrex glass for examining materials in the visible spectrum or silica for those in the ultraviolet range. It is used in laboratory research and analyses, such as photometric evaluations, colorimetric determinations, and turbidity studies.

CV, **1.** abbreviation for **closing volume. 2.** abbreviation for **curriculum vita.**

CVA, **1.** abbreviation for **cerebrovascular accident. 2.** abbreviation for **costovertebral angle.**

CVB, abbreviation for *chorionic villus biopsy*. See **chorionic villus sampling.**

CVC, abbreviation for **crying vital capacity.**

CVID, abbreviation for **common variable immunodeficiency.**

CVP, **1.** abbreviation for **central venous pressure. 2.** an anticancer drug combination of *c*yclophosphamide, *v*incristine, and *p*rednisone.

CVP monitor, abbreviation for **central venous pressure monitor.**

CW, abbreviation for **continuous wave.**

cyan-. See **cyano-.**

cyanide poisoning /sī′ənid, -nīd/ [Gk, *kyanos,* blue], poisoning resulting from the ingestion or inhalation of cyanide from such substances as bitter almond oil, wild cherry syrup, prussic acid, hydrocyanic acid, or potassium or sodium cyanide. Characterized by impaired intracellular oxygenation, symptoms include tachycardia, drowsiness, seizures, headache, apnea, and cardiac arrest. Death may result within 1 to 15 minutes.

cyano-, cyan-, prefix meaning "blue": *cyanochroia, cyanocrystallin, cyanodermia.*

cyanobacteria /sī′ənōbaktir′ē·ə/ [Gk, *kyanos,* blue + *bacterion,* small staff], blue-green bacteria, unicellular or filamentous organisms that fix both carbon dioxide (in the presence of light) and nitrogen. Several species are common causes of water pollution and cause cyanobacteria poisoning. Formerly called **blue-green algae.**

cyanobacteria poisoning, poisoning by cyanobacteria, usually as a result of drinking contaminated water. In most cases it is a subacute condition characterized by liver damage with jaundice and sometimes bloody diarrhea and photosensitization. Drinking of heavily contaminated water may cause acute symptoms including muscle tremors, ataxia, dyspnea, cyanosis, and hyperesthesia so that a slight touch may cause convulsions and opisthotonos, which can be fatal. Also called **blue-green algae poisoning.**

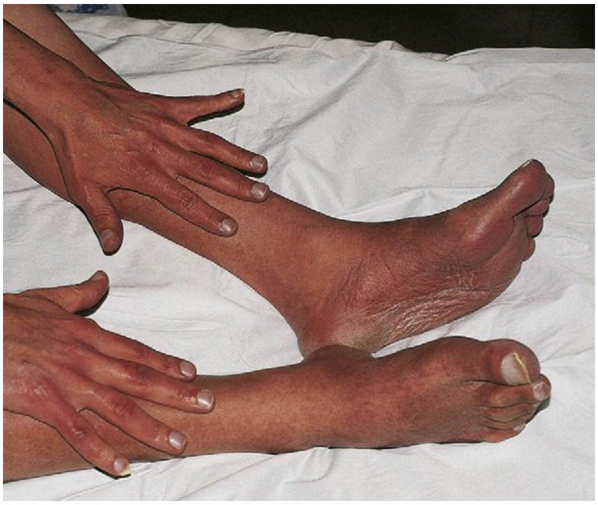
cyanocobalamin /sī′ənōkōbal′əmin/ [Gk, *kyanos* + Ger, *kobald,* mine goblin], a red crystalline, water-soluble substance that is the common pharmaceutic form of vitamin B_{12}. It is involved in the metabolism of protein, fats, and carbohydrates; normal blood formation; and neural function. It is the first substance containing cobalt found to be vital to life. It cannot be produced synthetically but can be obtained from cultures of *Streptomyces griseus*. Rich dietary sources are liver, kidney, meats, fish, and dairy products. Deficiency can be caused by the absence of intrinsic factor (produced in the stomach), which is necessary for the absorption of cyanocobalamin from the GI tract. Deficiency can also occur in persons whose diet is strictly vegetarian, thereby excluding meat and dairy sources of the nutrient. Symptoms of deficiency include nervousness, neuritis, numbness and tingling in the hands and feet, poor muscular coordination, and menstrual disturbances. Cyanocobalamin (via injection) is used in the prophylaxis and treatment of pernicious anemia, tropical and nontropical sprue, and other macrocytic and megaloblastic anemias. It is relatively nontoxic, even when administered in amounts greater than those recommended for therapeutic purposes. Also called **antipernicious anemia factor, vitamin B_{12}, extrinsic factor.** See also **intrinsic factor, pernicious anemia.**

cyanomethemoglobin /sī′ənō′met·hē′məglō′bin/ [Gk, *kyanos* + *meta,* together with, *haima,* blood; L, *globus,* ball], product of an in vitro reaction in which hemoglobin from whole blood is reduced to methemoglobin and converted to a stable red pigment using potassium ferricyanide and potassium cyanide. Cyanmethemoglobin has absorption peaks at 416 and 541 nm.

cyanopsia /sī′ənop′sē·ə/, a visual condition in which everything appears to have a blue tint.

cyanosed /sī′ənōst/, having a bluish discoloration of the skin, fingernails, and mucous membranes caused by a deficiency of oxygen in the blood. Also called **cyanotic.**

cyanosis /sī′ənō′sis/ [Gk, *kyanos,* blue, *osis,* condition], bluish discoloration of the skin and mucous membranes caused by an excess of deoxygenated hemoglobin in the blood or a structural defect in the hemoglobin molecule, such as in methemoglobin. **—cyanotic,** *adj.*



Cyanosis of the extremities *(Swartz, 2009)*

cyanotic. See **cyanosed.**

cyanotic congenital heart defect /sī′ənot′ik/, an inborn heart defect that allows the mixing of unsaturated (venous) blood with saturated (arterial) blood to produce cyanosis.

cyberknife /sī′bərnīf/, a robotic radiosurgery system that delivers multiple beams of radiation, used to treat benign tumors and cancers and other medical conditions located anywhere in the body. It consists of a linear accelerator and a robotic arm.

cybernetics /sī′bərnet′iks/, the science of control and communication in living and nonliving systems, as in comparative study of electronic computers and the living brain.

cycl-. See **cyclo-.**

cyclamate /sī′kləmāt/, an artificial nonnutritive sweetener formerly used in the form of calcium or sodium salt.

cyclandelate /sīklan′dəlāt/, a peripheral vasodilator.

■ INDICATIONS: It is prescribed in the treatment of muscular ischemia and peripheral vascular obstruction or spasm.

■ CONTRAINDICATIONS: Pregnancy or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Tachycardia, weakness, GI distress, and flushing may occur.

cyclarthrosis /sī′klärthrō′sis, sik′-/, a pivot joint, capable of rotation.

cycle [Gk, *kyklos,* circle], a series of events that recurs at specified intervals. An example is influenza, which usually occurs in an annual cycle.

cyclencephaly /sīk′lənsef′əlē/ [Gk, *kyklos,* circle, *enkephalos,* brain], a developmental anomaly characterized by the fusion of the two cerebral hemispheres. —*cyclencephalic, cyclencephalous, adj., cyclencephalus, n.*

cycle per second. See **hertz.**

cyclic /sik′lik, sī′klik/ [Gk, *kyklos,* circle], pertaining to or occurring in a cycle or cycles, such as a chemical compound that contains a ring of atoms in the nucleus. See also **closed-chain.**

cyclic adenosine monophosphate (cAMP) /sik′lik, sī′klik/, a cyclic nucleotide formed from adenosine triphosphate by the action of adenyl cyclase. This cyclic compound, known as the "second messenger," participates in the action of catecholamines, vasopressin, adrenocorticotropic hormone, and many other hormones. Also called **adenosine 3′,5′-cyclic monophosphate.**

cyclic guanosine monophosphate (cGMP), a substance that mediates the action of certain hormones in a manner similar to that of cyclic adenosine monophosphate. In response to the stimulation of cholinergic receptors in a parasympathetic nerve, guanylate cyclase triggers the conversion of guanosine triphosphate to cGMP with the release of various enzymes. Atropine, an anticholinergic drug, can block cholinergic stimulation by means of this process.

cyclic neutropenia /sik′lik no͞o′trōpē′nē·ə/, a chronic type of neutropenia that abates and recurs, accompanied by malaise, fever, stomatitis, and various types of infections.

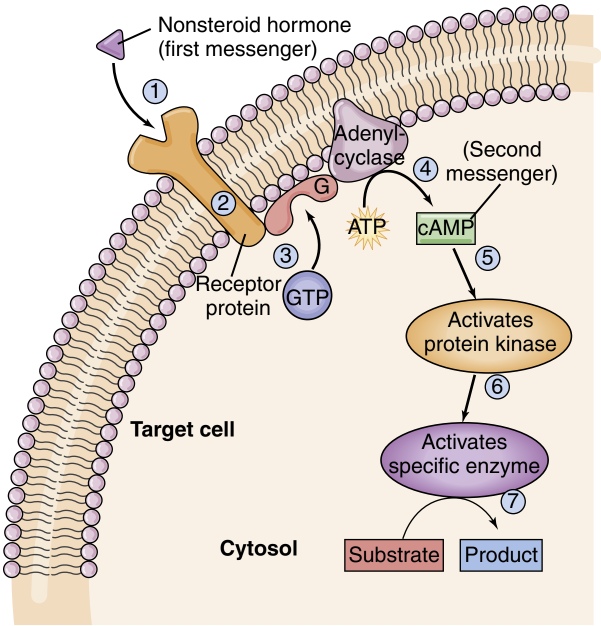
cyclic phosphate. See **cyclic adenosine monophosphate.**

cyclic vomiting, periodic episodes of vomiting associated with migraine and usually accompanied by headaches and symptoms of ketosis. The episodes may begin in childhood.

cyclin /sī′klin/, one of a class of intracellular proteins that appear during the eukaryotic cell cycle. The cyclin concentration increases during the cycle until halfway to the mitosis stage, when it drops to zero. Cyclin may act as a molecular switch that activates mitosis when its concentration reaches a certain point.

cyclin-dependent kinase (CDK), a protein kinase that is activated by cyclin.

-cycline, suffix designating a tetracycline-derivative antibiotic.



Cyclic AMP *(Monahan et al, 2007)*

cycling /si′kling/, the ending of an inspiratory phase of mechanical ventilation.

cyclitis /siklī′tis/ [Gk, *kyklos* + *itis*], inflammation of the ciliary body that causes redness of the sclera adjacent to the cornea of the eye.

cyclizine hydrochloride /sī′klizēn/, an antihistamine and antiemetic/antivertigo agent.

■ INDICATIONS: It is prescribed in the treatment or prevention of motion sickness or vertigo.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. It is not given to newborns or lactating mothers.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are skin rash, hypersensitivity reactions, and tachycardia. Drowsiness, dryness of the mouth, and worsening vision occur commonly.

cyclo-, cycl-, prefix meaning "round, recurring," often with reference to the eye: *cyclodialysis, cycloid, cyclops.*

cyclobenzaprine hydrochloride /sī′kləben′zəprēn/, a muscle relaxant.

■ INDICATION: It is prescribed in the short-term treatment of muscle spasm.

■ CONTRAINDICATIONS: Hyperthyroidism, cardiac arrhythmia, cardiac failure, concomitant use of a monoamine oxidase inhibitor, or known hypersensitivity to this drug prohibits its use. It is used with caution in conditions in which anticholinergics are contraindicated.

■ ADVERSE EFFECTS: The most serious adverse effects are hypersensitivity reactions. Drowsiness, dry mouth, and dizziness commonly occur.

cyclocephaly. See **cyclopia.**

Cyclocort, a trademark for a glucocorticoid **(amcinonid).**

cyclodestruction /sī′klədistruk′shən/, (in ophthalmology) a procedure to damage the ciliary body in order to diminish the production of aqueous fluid in the treatment of glaucoma, usually done by cryotherapy.

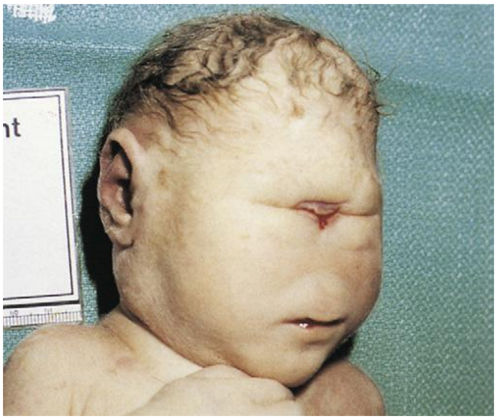
cyclodialysis /-dī·al′isis/, **1.** a surgical procedure performed on patients with glaucoma. A pathway is opened between the anterior chamber of the eye and the suprachoroidal space, allowing excess fluid to drain and reducing intraocular pressure. **2.** separation of the ciliary body from the sclera, usually as a result of trauma, causing decreased intraocular pressure, or hypotony.

cycloduction /-duk′shən/, (in ophthalmology) the range of rotation of an eye around its visual axis, which allows binocular single vision to be maintained when the head is tilted.

cyclooxygenase /si′klō·ok′səjĕnās/, an activity of the enzyme prostaglandin endoperoxide synthase.

cyclophosphamide /-fos′fəmīd/, an alkylating agent.
■ INDICATIONS: It is prescribed in the treatment of neoplasms and as an immunosuppressant in organ transplantation.
■ CONTRAINDICATIONS: It is teratogenic in animals. It is not used during pregnancy. Adequate methods of contraception should be considered for both males and females who are using it. It is used neither in patients with known hypersensitivity to the drug nor in patients with severely depressed bone marrow function. It is used with caution with impaired renal or hepatic function or with various blood disorders.
■ ADVERSE EFFECTS: Among the more serious adverse reactions are anorexia, vomiting, alopecia, leukopenia, cardiotoxicity, thrombocytopenia, and potentially serious hemorrhagic cystitis.

cyclopia /sīklō′pē·ə/ [Gk, *Cyclops,* mythic one-eyed giant], a developmental anomaly characterized by fusion of the orbits into a single cavity containing one eye. The condition is usually combined with various other head and facial defects. Also called **cyclocephaly, synophthalmia. —cyclops,** *n.*



Cyclopia in a neonate *(Moore, Persaud, and Shiota, 2000/ Courtesy Dr. A.E. Chudley, Department of Pediatrics and Child Health, University of Manitoba, Children's Hospital)*

cycloplegia /sī′kləplē′jə/ [Gk, *kyklos* + *plege,* stroke], paralysis of accommodation, as induced by certain ophthalmic drugs to allow examination of the eye. It causes pupillary dilation and relaxation of accommodation. See also **cycloplegic.**

cycloplegic /sī′kləplē′jik/, **1.** *adj,* pertaining to a drug or treatment that causes paralysis of the ciliary muscles of the eye. **2.** *n,* one of a group of anticholinergic drugs used to paralyze the ciliary muscles of the eye for ophthalmological examination or surgery. Any of the cycloplegics may cause adverse effects in persons sensitive to anticholinergics.

cycloplegic refraction, a type of static refraction, measured after lens accommodation is paralyzed by administration of cycloplegic eyedrops.

cyclopropane /sī′klōprō′pān/, an explosive anesthetic gas. It has been replaced by the nonflammable halogenated hydrocarbons and is no longer used in the United States.

cyclops. See **cyclopia.**

cycloSERINE /sī′klōser′ēn/, an antibiotic.
■ INDICATIONS: It is prescribed in the treatment of active pulmonary and extrapulmonary tuberculosis.
■ CONTRAINDICATIONS: Epilepsy, depression, severe anxiety, psychosis, severe renal insufficiency, excessive concurrent use of alcohol, or known hypersensitivity to this drug prohibits its use.
■ ADVERSE EFFECTS: Among the most serious reactions are central nervous system toxic effects, including tremor, drowsiness, convulsions, and psychotic changes. Pyridoxine may be given concurrently to prevent these effects. Other side effects include arrhythmias and optic neuritis.

Cyclospora cayetanensis, a pathogenic protozoon that causes diarrhea, cramps, and fever in humans. The microorganism, a coccidian parasite about 0.01 mm in diameter, was identified in 1979, after the first known cases of the infection were diagnosed. Before 1996 only three outbreaks of *Cyclospora* infection had been reported in the United States and Canada. It is diagnosed much more frequently now, and is often referred to as "traveler's diarrhea". Although *Cyclospora* is transmitted by the fecal-oral route, person-to-person transmission is unlikely because oocytes require days to weeks under favorable conditions to become infectious after leaving an infected host.

cycloSPORIN^{1} /-spôr′ēn/, an alternative term for cyclosporin A, an immunosuppressive medication often administered after organ transplants.

cyclosporin^{2} /-spôr′in/, any of a group of biologically active metabolites of *Tolypocladium inflatum Gams* and certain other fungi. Nine have been identified and are designated cyclosporin A through I. The major forms are cyclosporin A and C, which are cyclic oligopeptides with immunosuppressive, antifungal, and antipyretic effects. As immunosuppressants, cycloSPORINE primarily affect T lymphocytes. They are widely used in organ transplantation to suppress rejection and are known to be a human carcinogen. Also spelled **ciclosporin.**

cyclothymic disorder /-thīm′ik/ [Gk, *kyklos* + *thymos,* mind], a disorder of mood, wherein the essential feature is a chronic mood disturbance of at least 2 years' duration, involving numerous periods of depression and hypomania, but not of sufficient severity and duration to meet the criteria for a major depressive or manic episode. See also **bipolar disorder, depression, dysthymic disorder.**

cyclothymic personality, a personality characterized by swings in mood from elation to depression.

cyclotomy /sīklot′əmē/, a surgical procedure for the correction of a defect in the ciliary muscle of the eye.

cyclotron /sī′klətron/ [Gk, *kyklos* + *electron,* amber], a device used to accelerate charged particles or ions. The particles bombard targets where they create radioactive species, which can be used as radiopharmaceuticals or to make neutrons for radiotherapy.

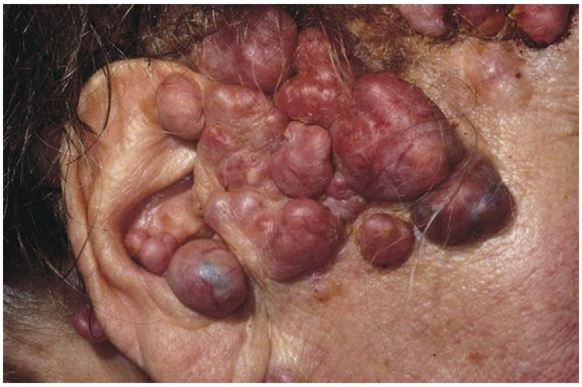
cyclotropia /sī′klōtrō′pe·ə/, (in ophthalmology) a condition in which the ocular position of one eye is rotated around its axis with respect to the other eye.

cylinder, a solid body having a circular transverse section. Exceptions include hollow gas cylinders, crossed cylinders used to measure astigmatism, and terminal cylinders of sensory nerve fibers.

cylindrical grasp /silin′drikəl/, the normal position of the hand and fingers when holding cylindrical objects, such as a glass tumbler, railing, or pot handle. The fingers and thumb close and flex around the object, which is stabilized against the palm of the hand. It occurs as a reflex action in infants and later develops into a voluntary gross grasp.

cylindrical lens, a lens with at least one nonspherical surface, used to correct astigmatism.

cylindroma /sil′indrō′mə/ *pl. cylindromas, cylindromata* [Gk, *kylindros,* cylinder], a tumor that appears to have cylinders of stroma surrounded by epithelial cells. See also **adenocystic carcinoma.**



Cylindroma *(Hordinsky, Sawaya, and Scher, 2000)*

cyma line /sī′mə/, an S-shaped line seen on radiographs at the articulation of the talonavicular and calcaneocuboid bones of the foot. An abnormality in the joint, including pronation or supination of the talar head, appears as a broken cyma line on radiographs.

Cymbalta, a trademark for **duloxetine.**

cyno-, cyn-, prefix meaning "dog, doglike": *cynobax, cynocephalic, cynophobia.*

cypionate /sī′pyōnāt/, contraction of *cyclopentanepropionate.*

cyproheptadine hydrochloride /sī′prōhep′tədēn/, an antihistamine.

■ INDICATIONS: It is prescribed in the treatment of hypersensitivity reactions, including rhinitis, skin rash, and pruritus.

■ CONTRAINDICATIONS: Asthma or known hypersensitivity to this drug prohibits its use. It is not given to newborns or lactating mothers.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are skin rash, hypersensitivity, and tachycardia. Drowsiness and dry mouth commonly occur.

Cyprus fever. See **brucellosis.**

Cys, abbreviation for the amino acid **cysteine.**

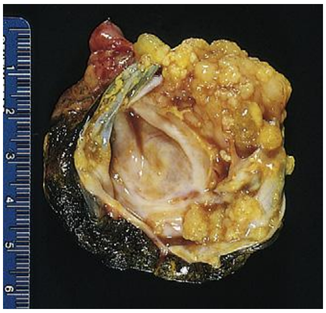
cyst /sist/ [Gk, *kystis,* bag], a closed sac in or under the skin lined with epithelium and containing fluid or semisolid material, for example, a **sebaceous cyst.** It may or may not be infected.—**cystic,** *adj.*

cyst-. See **cysto-.**

-cyst, -cystis, suffix meaning a "pouch or bladder": *enterocyst, microcyst, zoocyst.*

cystadenocarcinoma /sis′tədē′nəkär′sinō′mə/, a type of pancreatic tumor that evolves from a mucus cystadenoma. Clinical features include epigastric pain and a palpable abdominal mass that may also be seen by ultrasonography or computed tomographic scan. It is treated by surgical removal of the tumor or total pancreatectomy.

cystadenoma /sis′tədinō′mə/ *pl. cystadenomas, cystadenomata* [Gk, *kystis* + *aden,* gland, *oma,* tumor], **1.** an adenoma associated with a cystoma. **2.** an adenoma containing multiple cystic structures. The cysts may be serous, containing serum, or pseudomucinous, containing clear serous fluid or thick, viscid fluid.



Serous cystadenoma *(Kumar et al, 2007/Courtesy Dr. Christopher Crum, Brigham and Women's Hospital)*

Cystagon, a trademark for a product used in the treatment of nephropathic cystinosis **(cysteamine bitartrate).**

cystathioninemia /sis′təthī′əninē′mē·ə/, an inherited metabolic disorder, caused by a deficiency of the enzyme cystathionase, that causes an excess of the amino acid methionine. Some patients are asymptomatic whereas others show signs of mental retardation as well as thrombocytopenia and acidosis. It is treated with large doses of pyridoxine (vitamin B_6).

cysteamine /siste′ämēn′/, a sulfhydryl amine that is part of coenzyme A. It reduces intracellular cystine levels and is used in treatment of nephropathic cystinosis. It is administered orally.

cysteamine bitartrate, an anticysteine that reacts with cystine in the cell lysosomes to convert it to cysteine and a mixed disulfide compound, which can then exit the lysosome in patients with a metabolic defect causing cystinosis.

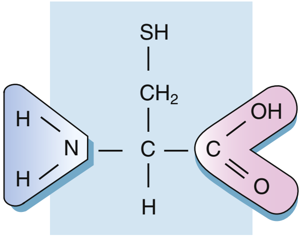
■ INDICATIONS: It is prescribed in the treatment of an inherited amino acid metabolic disease in which cysteine accumulates in the cells and can lead to the formation of crystals that can damage various organs, especially the kidneys (nephropathic cystinosis).

■ CONTRAINDICATIONS: It should not be given to patients with allergy to cysteamine or penicillamine, depression, drowsiness, lethargy, neurological disorders, or diseases of the liver or digestive tract.

■ ADVERSE EFFECTS: The side effects most often reported include vomiting, diarrhea, constipation, appetite loss, nausea, headaches, convulsions, and seizures.

cystectomy /sistek′təmē/ [Gk, *kystis* + *ektomē,* excision], a surgical procedure in which all or part of the urinary bladder is removed, as may be required in treating bladder cancer.

cysteine (Cys) /sis′tēn/, an amino acid containing a polar side chain found in many proteins in the body, including keratin. It is a metabolic precursor of cystine and an important source of sulfur for various body functions. Compare **cystine.**



Chemical structure of cysteine

cysti-. See **cysto-.**

cystic /sis′tik/ [Gk, *kystis,* bag], **1.** pertaining to a cyst. **2.** pertaining to a fluid-filled sac, such as the gallbladder or urinary bladder.

cystic acne. See **acne conglobata.**

cystic bile, concentrated bile stored in the gallbladder.

cystic carcinoma, a malignant neoplasm containing closed cavities or saclike spaces. These tumors may occur in the breast and ovary.

cystic diverticulum, a ventral outgrowth at the base of the hepatic diverticulum in the embryo. It gives rise to the gallbladder and cystic duct.

cystic duct, the duct through which bile from the gallbladder passes into the common bile duct.

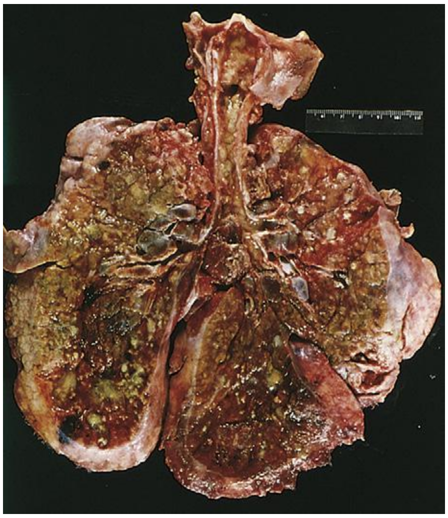
cystic emphysema. See **bullous emphysema.**

cysticercosis /sis′tisərkō′sis/ [Gk, *kystis* + *kerkos,* tail, *osis,* condition], an infection and infestation by the larval stage of the pork tapeworm *Taenia solium* or the beef tapeworm *T. saginata*. The eggs are ingested and hatch in the intestine; the larvae invade the subcutaneous tissue, brain, eye, muscle, heart, liver, lung, and peritoneum. They attach themselves with two rows of hooklets, grow, mature, and become covered with a dense, fibrous capsule. The invasive, early phase of the infection is characterized by fever, malaise, muscle pain, and eosinophilia. Years later seizures and personality change may appear if the brain is affected, and calcification and destruction of local structures are apparent in other infested areas of the body. Prophylaxis depends on eating only thoroughly cooked pork or beef. The antiparasitic drugs praziquantel or albendazole may be used to treat this infection on a case by case basis. In some cases, surgery may be necessary to remove cysticerci.

cysticercus /sis′tisur′kəs/, a larval form of tapeworm of the genus *Taenia*. It consists of a single scolex enclosed in a bladderlike cyst.

cystic fibroma, a fibrous tumor in which cystic degeneration has occurred.

cystic fibrosis (CF), an inherited autosomal-recessive disorder of the exocrine glands, causing those glands to produce abnormally thick secretions of mucus, elevation of sweat electrolytes, increased organic and enzymatic constituents of saliva, and overactivity of the autonomic nervous system. The glands most affected are those in the pancreas and respiratory system and the sweat glands. Cystic fibrosis is usually recognized in infancy or early childhood, chiefly among Caucasians. The earliest manifestation is meconium ileus, an obstruction of the small bowel by viscid stool. Other early signs are a chronic cough, frequent, foul-smelling stools, and persistent upper respiratory infections. The most reliable diagnostic tool is the sweat chloride test, which shows elevations of levels of chloride. Because there is no known cure, treatment is directed at prevention of respiratory infections, which are the most frequent cause of death. Mucolytic agents and bronchodilators are used to help liquefy the thick, tenacious mucus. Physical therapy measures, such as postural drainage and breathing exercises, can also dislodge secretions. Broad-spectrum antibiotics may be used prophylactically. The nurse's role is vital in instructing the family in health promotion and in all aspects of the child's care. Particular attention is paid to teaching the child and family the use of pancreatic enzymes, equipment, food selection, prevention of infection, and techniques of expectorating sputum. The nurse can provide emotional support for the family and counsel them on community resources. Life expectancy in cystic fibrosis has improved markedly over the past several decades, and with early diagnosis and treatment most patients can be expected to reach adulthood. Surgery may be indicated for some cases that cannot be treated effectively with medications. Heart-lung and double-lung transplantation have been successful. Also called **fibrocystic disease of the pancreas, mucoviscidosis.**



Cystic fibrosis *(Kumar et al, 2010/Courtesy Dr. Eduardo Yunis, Children's Hospital of Pittsburgh, Pittsburgh, Pennsylvania)*

cystic fibrosis transmembrane conductance regulator, a regulator of secretion in many exocrine tissues. Abnormalities in the gene cause cystic fibrosis, leading to abnormal chloride channels in cell membranes of the respiratory epithelium, pancreas, salivary glands, sweat glands, intestines, and reproductive tract. Also called *cystic fibrosis transmembrane regulator, cystic fibrosis transmembrane regulator protein*.

cystic goiter, an enlargement of the thyroid gland, containing cysts resulting from mucoid or colloid degeneration or liquefaction.

cystic hygroma. See **cystic lymphangioma.**

cystic kidney [Gk, *kystis,* bag; ME, *kidenei*], pertaining to any of several kidney disorders in which cysts form, including congenital polycystic disease, solitary renal cysts, or cortical cysts associated with nephrosclerosis.

cystic kidney disease, cystic disease of kidney. See **acquired cystic kidney disease** and **polycystic kidney disease.**

cystic lymphangioma, a cystic growth formed by lymph vessels, usually congenital and occurring most frequently in the neck, axilla, or groin of children. Also called **cystic hygroma, lymphangioma cysticum.**

cystic mastitis, a form of mammary dysplasia with inflammation and the formation of nodular cysts in the breast tissue. The cysts contain a turbid fluid. Symptoms may vary with individual breast changes that occur during the menstrual cycle.

cystic mole. See **hydatid mole.**

cystic myxoma, a tumor of connective tissue that has undergone cystic degeneration.

cystic nephroblastoma, multilocular cyst of kidney.

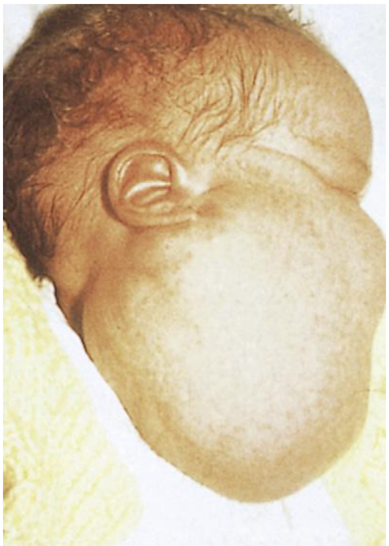
cystic neuroma, a neoplasm of nerve tissue that has degenerated and become cystic. Also called **false neuroma.**

cystic pyelitis, pyelitis with formation of submucosal cysts.

cystic pyeloureteritis, a type of ureteral inflammation in which there are subendothelial cysts projecting into the lumen of the ureter and renal pelvis.

cystic renal dysplasia, renal or kidney developmental abnormality in which there are cysts.

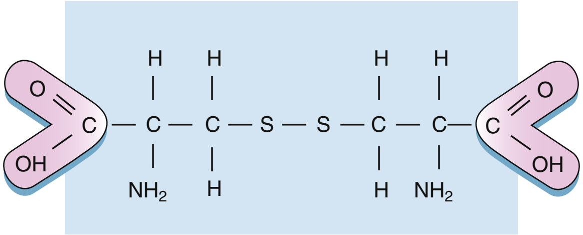
cystic tumor, a tumor with cavities or sacs containing a semisolid or a liquid material.



Cystic lymphangioma *(Greig and Garden, 1996)*

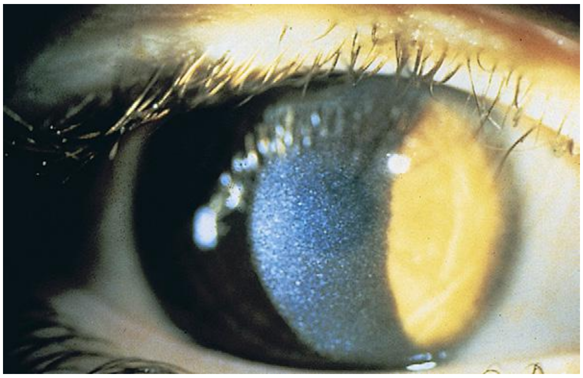
cystido-. See **cysto-.**

cystine /sis′tin/, a compound consisting of two cysteine residues joined by a disulfide (S-S) linkage. Compare **cysteine.**

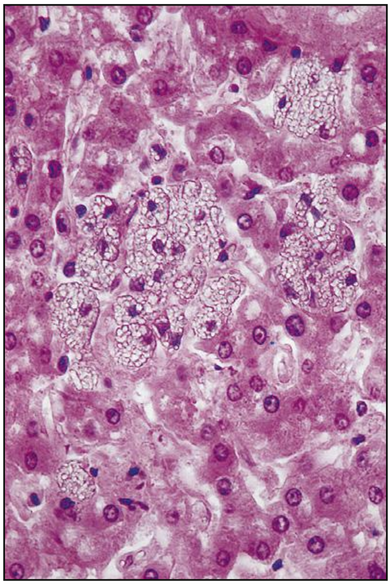


Chemical structure of cystine

cystinosis /sis′tinō′sis/ [*cystine* + Gk, *osis,* condition], a congenital disease characterized by glucosuria; proteinuria; cystine deposits in the liver, spleen, bone marrow, and cornea; rickets; excessive amounts of phosphates in the urine; and retardation of growth. Also called *cystine storage disease,* **Fanconi's syndrome.** See also **cystine.**



Cystinosis: myriad tiny opacities give the cornea a cloudy appearance *(Yanoff, 1996/Courtesy Dr. D. B. Schaffer)*



Cystinosis: cystine crystals seen in hypertrophied Kupffer cells *(Burt, Portmann, and Ferrell, 2012)*

cystinuria /sis′tino͝or′ē·ə/ [*cystine* + Gk, *ouron,* urine], **1.** abnormal presence of the amino acid cystine in the urine collected in a 24-hour specimen. **2.** an inherited defect of the renal tubules, characterized by excessive urinary excretion of cystine and several other amino acids. The disorder is caused by an autosomal-recessive trait that impairs cystine reabsorption by the kidney tubules. In high concentration, cystine tends to precipitate in the urinary tract and form kidney or bladder stones. Treatment attempts to prevent the formation of stones or to dissolve them by increasing the volume of urine flow, decreasing the pH of the urine, and increasing the solubility of cystine. In addition to a large fluid intake, sodium bicarbonate, acetazolamide, and, in refractory cases, D-penicillamine are sometimes prescribed.

-cystis. See **-cyst.**

cystitis /sistī′tis/ [Gk, *kystis* + *itis,* inflammation], an inflammatory condition of the urinary bladder and ureters, characterized by pain, urgency and frequency of urination, and hematuria. It may be caused by a bacterial infection, calculus, or tumor. Increased sexual activity in women can cause cystitis, and certain venereal diseases such as gonorrhea and chlamydia may cause cystitis-like symptoms. Depending on the diagnosis, treatment may include antibiotics, increased fluid intake, bed rest, medications to control bladder wall spasms, and, when necessary, surgery.

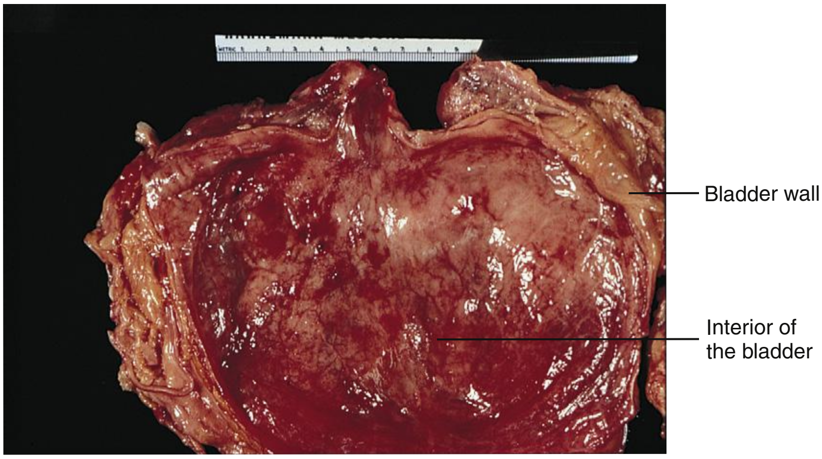
-cystitis, suffix meaning "inflammation of the bladder or cyst": *epicystitis, gonecystitis, pericystitis.*

cystitis colli, inflammation of the bladder and bladder neck.

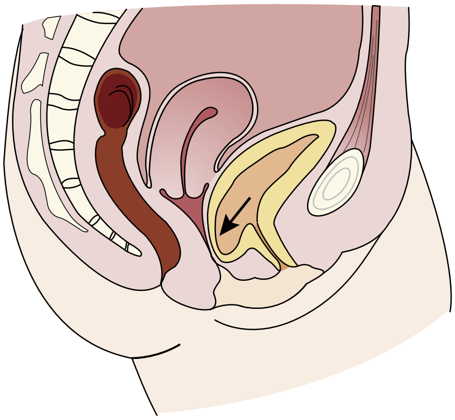
cystitis cystica, cystitis with formation of multiple submucosal cysts in the bladder wall.

cysto-, cyst-, cysti-, cystido-, prefix meaning "bladder, cyst, or sac": *cystocele, cystodynia, cystomyoma.*

cystocele /sis′təsēl′/ [Gk, *kystis* + *kele,* hernia], a herniation or protrusion of the urinary bladder through the wall of the vagina. Compare **rectocele, vesicocele.**



Cystitis *(Damjanov, 2012)*



Cystocele *(Young-Adams and Proctor, 2011)*

cystochromoscopy /sisʹtəkrōmos′kəpē/, examination of the bladder after administration of a colored dye, performed as an investigation of renal function and urinary system condition. Also called **chromocystoscopy.**

cystofibroma /-fībrō′mə/, a fibrous benign tumor that contains or is covered with cysts.

cystogram /sis′təgramʹ/ [Gk, *kystis* + *gramma*, record], a radiograph produced by cystography.

cystography /sistog′rəfē/, the radiographic examination of the urinary bladder after introduction of a radiopaque contrast medium.

cystoid /sis′toid/ [Gk, *kystis*, bag + *eidos*, form], pertaining to or resembling a cyst or bladder.

cystoid macular edema, thickening of the macula with cystic changes, increased fluid within the sensory retina of the macula, and disruption of the blood-retinal barrier and consequent leakage on fluorescein angiography, with leaking capillaries in the posterior pole and around the optic disc, often a result of cataract surgery.

cystojejunostomy /-jiʹjo͞onos′təmē/, drainage of a cyst, such as a pancreatic pseudocyst, into the jejunum.

cystolith. See **vesical calculus.**

cystolithalopaxy /-lith′əlōpekʹsē/, removal of a kidney stone from the urinary bladder by crushing, followed by extraction of the particles by means of irrigation.

cystolithotomy /-lithot′əmē/, removal of a bladder stone from the urinary bladder following surgical opening of the bladder. Also called **cystolithectomy, vesical lithotomy.**

cystoma /sistō′mə/ *pl. cystomas, cystomata* [Gk, *kystis* + *oma*, tumor], any tumor or growth containing cysts, especially one in or near the ovary.

-cystoma, suffix meaning a "cystic tumor": *enterocystoma, hydrocystoma, inocystoma.*

cystometer /sistom′ətər/, an instrument that measures bladder capacity in relation to changing urine pressure.

cystometrogram /sisʹtōmet′rəgramʹ/, the graphic results of the measurements made during cystometrography. The term is also used to describe the test.

cystometrography (CMG) /sisʹtōmətrog′rəfē/, a urological procedure that measures the amount of pressure exerted on the bladder at various bladder volumes. The test helps determine bladder capacity, bladder wall compliance, detrusor stability, and sensations of filling. It is often done in conjunction with electromyography and other urodynamic tests.

cystometry /sistom′ətrē/ [Gk, *kystis* + *metron*, measure], the study of bladder function by use of a cystometer.

cystoparesis /sis′tōpäreʹsis/, paralysis of the urinary bladder. Also called *cystoplegia.*

cystoprostatectomy /-prosʹtətek′təmē/, surgical removal of the bladder, prostate gland, and seminal vesicle.

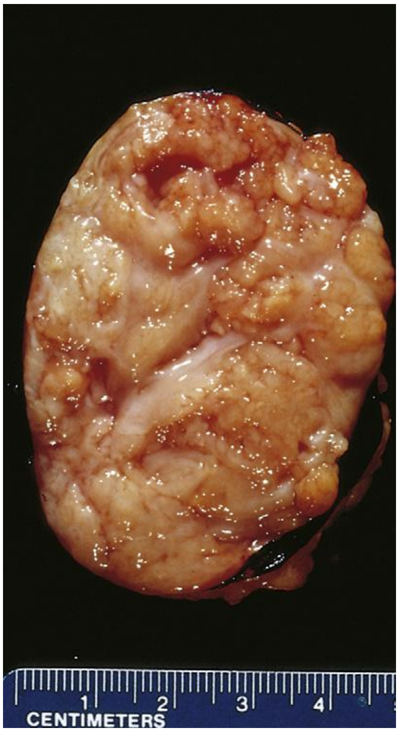
cystosarcoma phyllodes /sisʹtōsärkō′mə filō′dēs/, a malignant stromal breast tumor that grows rapidly and tends to recur if not adequately excised.

cystoscope /sis′təskōpʹ/ [Gk, *kystis* + *skopein*, to look], an instrument for examining and treating lesions of the urethra or bladder. There are both rigid and flexible types. The rigid instrument consists of an obturator for introduction, an outer sheath, a lighting system, a viewing lens, and ports for catheters and operative devices. The flexible cystoscope is a self-contained endoscope with ports for instrumentation and irrigation. Flexible cystoscopes are more commonly used today and incorporate fiberoptics.

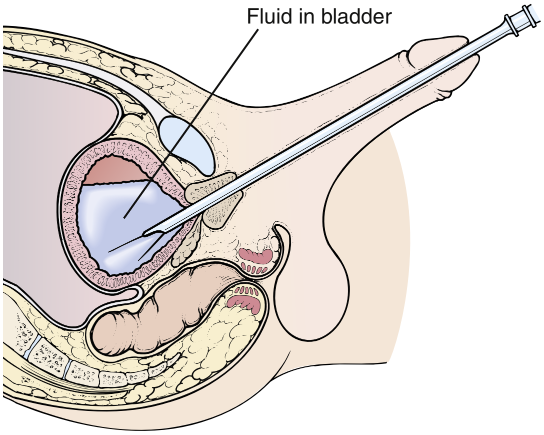
cystoscopic. See **cystoscopy.**

cystoscopic urography. See **retrograde cystoscopy.**

cystoscopy /sistos′kəpē/, insertion of a rigid or flexible cystoscope into the urethra for visualization and instrumentation of the lower urinary tract. The procedure is often performed



Cystosarcoma phylloides *(Skarin, 2010/Courtesy Dr. N. Weidner, Brigham and Women's Hospital, Boston, Massachusetts)*



Cystoscope in the male bladder *(Monahan et al, 2007)*

in urological offices with local anesthesia. The bladder is distended with water while the patient is supine or in the lithotomy position. After the examination the patient is observed for the common complications of local urethral trauma and signs of urinary infection. See also **cystoscope.** **—cystoscopic,** *adj.*

Cystospaz, a trademark for an anticholinergic/antispasmodic (L-hyoscyamine).

cystostomy /sistos′təmē/, an opening made in the bladder for drainage, usually through a catheter inserted through the abdominal skin.

cystotomy /sistot′əmē/, incision of the urinary bladder, often performed for removal of a calculus.

cystoureterography /sis′təyŏŏr′ətərog′rəfē/, the radiographic examination of the bladder and ureters after introduction of a radiopaque contrast medium.

cystourethrogram /sis′təyŏŏrē′thrəgram′/, a radiograph produced by cystourethrography.

cystourethrography /sis′təyŏŏr′ēthrog′rəfē/, the radiographic examination of the urethra and urinary bladder after introduction of a radiopaque contrast medium.

cysts of liver, small single, simple watery cysts on the liver, usually secondary to another disorder such as cystic kidney disease.

cyt-, cyto-, prefix meaning "cell or cytoplasm": *cytochrome, cytogenesis, cytosome*.

Cytadren, a trademark for an inhibitor of adrenocorticosteroid biosynthesis (aminoglutethimide).

cytapheresis /sī′tōfer′əsis/ [Gk, *kytos* + *aphairesis,* withdrawal], selective removal of a cellular component of blood by apheresis. Red cells, granulocytes, or platelets may be harvested. Cytapheresis is used to collect specific components from blood donors, or, in the case of therapeutic cytapheresis, to remove excess cellular components from patients with blood disorders.

cytarabine /siter′əbēn/, an antineoplastic agent. Also called **arabinosylcytosine,** *ARA-C,* **cytosine arabinoside.**

■ INDICATIONS: It is prescribed in the treatment of acute and chronic myelocytic leukemia, acute lymphocytic leukemia, and erythroleukemia.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: The most serious adverse reactions are bone marrow depression, stomatitis, phlebitis, liver toxicity, fever, and GI disturbances.

-cyte, suffix meaning a "cell" of a specified type: *gliacyte, hemocyte, plasmacyte*.

-cythemia, -cythaemia, suffix meaning a "condition involving cells in the blood": *achroiocythemia, rhestocythemia, thrombocythemia*.

cyto-. See **cyt-.**

cytoanalyzer /sī′tō·an′əlī′zər/, an electronic device that screens samples of smears of suspected malignancies.

cytoarchitectonic /sī′tō·är′kitekton′ik/ [Gk, *kytos,* cell; L, *architectura,* architecture], pertaining to the cellular arrangement within a tissue or structure.

cytoarchitecture /-är′kitek′chər/, the typical pattern of cellular arrangement within a particular tissue or organ, as in the cerebral cortex. *—cytoarchitectural, adj.*

cytobiotactic, cytobiotaxis. See **cytoclesis.**

cytoblast. See **nucleus.**

cytocentrum. See **centrosome.**

cytocerastic. See **cytokerastic.**

cytochemism /sī′tōkem′izəm/ [Gk, *kytos* + *chemeia,* alchemy], the chemical activity within the living cell, specifically the various reactions to and affinity for chemical substances.

cytochemistry /-kem′istrē/, the study of the various chemicals within a living cell and their actions and functions.

cytochrome /si′tōkrōm/ [Gk, *kytos,* cell, *chroma,* color], **1.** a class of hemoproteins whose function is electron transport. These proteins have the ability to change the valence of the heme iron, alternating between ferrous and ferric states. **2.** proteins involved in mitochondrial electron transport systems associated with adenosine triphosphate (ATP) production.

cytochrome-*c* oxidase, an enzyme complex of the inner mitochondrial membrane that catalyzes the transfer of electrons from cytochrome *c* to oxygen, oxidizing cytochrome and reducing oxygen in the final step of the electron transport chain by which oxygen is used for fuel combustion.

cytochrome-*c* oxidase deficiency, a hereditary defect in the cytochrome-*c* oxidase complex that prevents the transfer of electrons from cytochrome *c* to molecular oxygen, ultimately halting adenosine triphosphate production. Manifestations are extremely variable and include myopathies, encephalopathies, ocular and cardiac defects, sensorineural deafness, Fanconi syndrome, diabetes mellitus, and short stature. Inheritance may be autosomal recessive, X-linked, or, possibly, maternal (mitochondrial), depending on the part of the cytochrome-*c* oxidase complex that is affected.

cytochrome P-450 [Gk, *kytos,* cell, *chroma,* color], a protein involved with extramitochondrial electron transport in the liver and in the metabolism or bioactivation of drugs.

cytocide [Gk, *kytos* + L, *caedere,* to kill], any substance that is destructive to cells. —*cytocidal, adj.*

cytoclesis /sī′tōklē′sis/ [Gk, *kytos* + *klesis,* calling for], the influence exerted by one cell on the action of other cells; the vital principle of all living tissue. Also called **cytobiotaxis.** —**cytobiotactic,** *cytocletic adj.*

cytoctony /sītok′tənē/ [Gk, *kytos* + *ktonos,* killing], the destruction of cells in culture by viruses.

cytode /sī′tōd/ [Gk, *kytos* + *eidos,* form], the simplest type of cell, consisting of a protoplasmic mass without a nucleus, such as a bacterium.

cytodendrite /-den′drīt/, .See **dendrite.**

cytodiagnosis /-dī′əgnō′sis/, diagnosis of a suspected pathological tissue by a microscopic examination of the cells in the sample.

cytodieresis /sī′tōdī·er′isis/ *pl. cytodiereses* [Gk, *kytos* + *diairesis,* separation], cell division, especially the phenomena involving the division of the cytoplasm. See also **cytokinesis, meiosis, mitosis.** —*cytodieretic, adj.*

cytodifferentiation /-dif′əren′shē·ā′shən/ [Gk, *kytos* + L, *differentia,* difference], **1.** a process by which embryonic cells acquire biochemical and morphological properties essential for specialization and diversification. **2.** the total and gradual transformation from an undifferentiated to a fully differentiated state.

cytofluorograph /-flôr′əgraf/, a diagnostic instrument used to measure the level of CD4 T lymphocytes in human immunodeficiency virus–positive patients. The lymphocytes are stained with specific monoclonal antibodies.

cytogene /sī′təjēn/ [Gk, *kytos* + *genein,* to produce], a self-replicating particle within the cytoplasm of a cell that is derived from genes in the nucleus and is capable of transmitting hereditary information.

cytogenesis /sī′tōjen′əsis/ [Gk, *kytos* + *genein,* to produce], the origin, development, and differentiation of cells. —**cytogenetics, cytogenic,** *adj.*

cytogeneticist /sī′tōjənet′isist/, a scientist who specializes in cytogenetics.

cytogenetics /sī′tōjənet′iks/, the branch of genetics that studies the cellular constituents concerned with heredity, primarily the structure, function, and origin of the chromosomes. One kind of cytogenetics is **clinical cytogenetics.** Also called **cytogenics.** —**cytogenetics,** *adj.*

cytogenetic technologist, an allied health professional who studies chromosomes. The cytogenetic technologist determines how specimens will be collected, transported, and handled for cytogenetic analysis. After receiving a baccalaureate degree, cytogenetic technologists complete a 1-year certificate program.

cytogenic /-jen′ik/, pertaining to the formation of cells.

cytogenic gland, a glandular organ that secretes living cells, specifically the testes and ovary.

cytogenic reproduction, the formation of a new organism from a germ cell, either sexually through the fusion of gametes to form a zygote or asexually by means of spores. Also called **cytogony.**

cytogenics. See **cytogenetics.**

cytogeny /sītoj′ənē/, **1.** See **cytogenetics**. **2.** the origin and development of cells. —*cytogenic, cytogenous, adj.*

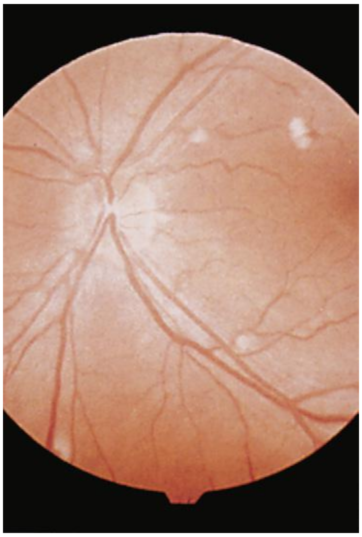
cytogony /sītog′ənē/. See **cytogenic reproduction.**

cytohistogenesis /sī′tōhis′tōjen′əsis/ [Gk, *kytos* + *histos,* tissue, *genein,* to produce], the structural development and formation of cells. —*cytohistogenetic, adj.*

cytohyaloplasm. See **hyaloplasm.**

cytoid /sī′toid/ [Gk, *kytos* + *eidos,* form], like a cell.

cytoid body, a small white spot on the retina of each eye seen by using an ophthalmoscope to examine the eyes, often noted in patients affected with systemic lupus erythematosus.



Cytoid body *(Moll, 1997)*

cytokerastic /sī′tōkəras′tik/ [Gk, *kytos* + *kerastos,* mixed], pertaining to or characteristic of cellular development from a simple to a more complex arrangement. Also spelled **cytocerastic.**

cytokine /sī′təkīn/, one of a large group of low-molecular-weight proteins secreted by various cell types and involved in cell-to-cell communication, coordinating antibody and T cell immune interactions, and amplifying immune reactivity. Cytokines include colony-stimulating factors, interferons, interleukins, and lymphokines, which are secreted by lymphocytes.

cytokine assay, a blood test to detect interleukins, used predominantly for research. Clinically, cytokine assays may be used to measure the progression of inflammatory disease, AIDS, and various malignancies; determine disease risk; determine treatment of disease; and monitor patients receiving cytokine or anticytokine therapy.

cytokine network, a group of cytokines that modulate and regulate signaling between cells during immune responses. According to the immune network model, T cells and B cells mutually interact, responding to cytokines as well as antigens. This interaction allows the cytokines to direct T cells to antiviral or antitumor functions or to promote allergic reactions.

Types and functions of cytokines

Type	*Primary Functions*
Interleukins (ILs)	
IL-1	Augments the immune response; inflammatory mediator; promotes maturation and clonal expansion of B cells; enhances activity of NK cells; activates T cells, activates macrophages
IL-2	Induces proliferation and differentiation of T cells; activation of T cells, NK cells, and macrophages; stimulates release of other cytokines (α-IFN, TNF, IL-1, IL-6)
IL-3 (multicolony colony-stimulating factor)	Hematopoietic growth factor for hematopoietic precursor cells
IL-4	B cell growth factor; stimulates proliferation and differentiation of B cells; induces differentiation into T_H2 cells; stimulates growth of mast cells
IL-5	B cell growth and differentiation; promotes growth and differentiation of eosinophils
IL-6	T and B cell growth factor; enhances the inflammatory response; promotes differentiation of B cells into plasma cells; stimulates antibody secretion; induces fever; synergistic effects with IL-1 and TNF
IL-7	Promotes growth of T and B cells
IL-8	Chemotaxis of neutrophils and T cells; stimulates superoxide and granule release
IL-9	Enhances T cell survival; mast cell activation
IL-10	Inhibits cytokine production by T and NK cells; promotes B cell proliferation and antibody responses; potent suppressor of macrophage function
IL-11	Synergistic action with IL-3 and IL-4 in hematopoiesis; is a multifunctional regulator of hematopoiesis and lymphopoiesis; osteoclast formation; elevates platelet count; inhibits proinflammatory cytokine production
IL-12	Promotes α-IFN production; induction of T helper cells; activates NK cells; stimulates proliferation of activated T and NK cells
IL-13	B cell growth and differentiation; inhibits proinflammatory cytokine production
IL-14	Stimulates proliferation of activated B cells
IL-15	Mimics IL-2 effects; stimulates proliferation of T cells and NK cells
IL-16	Proinflammatory cytokine; chemoattractant of T cells, eosinophils, and monocytes
IL-17	Promotes release of IL-6, IL-8, and G-CSF; enhances expression of adhesion molecules. Associated with the Th17 response.
IL-18	Induces α-IFN, IL-2, and GM-CSF production; important role in development of T helper cells; enhances NK activity; inhibits production of IL-10
IL-19	Similar to IL-10
IL-20	Similar to IL-10
IL-21	Similar to IL-2, IL-4, and IL-5
IL-22	Similar to IL-10
IL-23	Similar to IL-12; promotes memory T cell proliferation
IL-24	Similar to IL-10
IL-25	Promotes T_H2 cytokine production
IL-26	Similar to IL-10
IL-27	Similar to IL-12
Interferons (IFNs)	
α-Interferon (α-IFN)	Type 1 interferon. Inhibits viral replication; activates NK cells and macrophages; antiproliferative effects on tumor cells
β-Interferon (β-IFN)	Type 1 interferon. Produced by fibroblasts and has anti-viral activity. Used in treatment of multiple sclerosis.
γ-Interferon (γ-IFN)	Type 2 interferon. Activates macrophages, neutrophils, and NK cells; promotes B cell differentiation; inhibits viral replication. Hallmark cytokine of a Th1 reaction.
Tumor necrosis factor (TNF)	Activates macrophages and granulocytes; promotes the immune and inflammatory responses; kills tumor cells; is responsible for extensive weight loss associated with chronic inflammation and cancer
Colony-Stimulating Factors (CSFs)	
Granulocyte colony-stimulating factor (G-CSF)	Stimulates proliferation and differentiation of neutrophils; enhances functional activity of mature PMNs
Granulocyte-macrophage colony-stimulating factor (GM-CSF)	Stimulates proliferation and differentiation of PMNs and monocytes
Macrophage colony-stimulating factor (M-CSF)	Promotes proliferation, differentiation, and activation of monocytes and macrophages
Erythropoietin	Stimulates erythroid progenitor cells in bone marrow to produce red blood cells

NK, Natural killer; *PMN,* polymorphonuclear neutrophil.

Modified from Lewis SL et al: Medical-surgical nursing: assessment and management of clinical problems, ed 8, St Louis, 2011, Mosby.

cytokinesis /sī′tōkinē′sis, -kīnē′sis/ [Gk, *kytos* + *kinesis,* movement], the division of the cytoplasm, exclusive of nuclear division, that occurs during the final stages of mitosis and meiosis to form daughter cells. See also **karyokinesis.** —*cytokinetic, adj.*

cytologic, cytological. See **cytology.**

cytological map [Gk, *kytos* + *logos,* science; L, *mappa,* table napkin], a graphic representation of the location of genes on a chromosome, based on correlating the genetic recombination results of testcrosses with the structural analysis of chromosomes that have undergone changes, such as deletions or translocations, as detected by banding techniques.

cytological sputum examination, a microscopic examination of a specimen of bronchial secretions, including a search for cells that may be cancerous or otherwise abnormal.

cytologist /sītol′əjist/, a biologist who specializes in the study of cells, especially one who uses cytological techniques in the differential diagnosis of neoplasms.

cytology /sītol′əjē/ [Gk, *kytos* + *logos,* science], the study of cells, including their formation, origin, structure, function, biochemical activities, and pathological characteristics. Kinds of cytology include **aspiration biopsy cytology** and **exfoliative cytology.** Also called **cell biology.** —**cytologic, cytological,** *adj.*

cytolymph. See **hyaloplasm.**

cytolyses. See **cytolysis.**

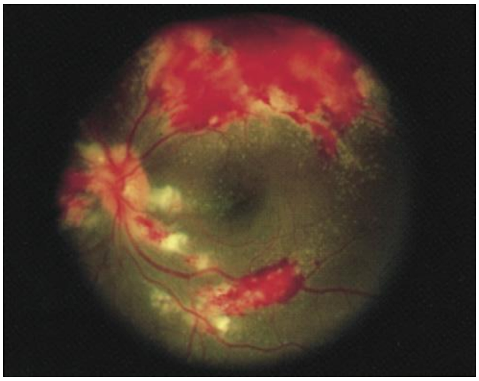
cytolysin /sītol′isin/ [Gk, *kytos* + *lyein,* to loosen], an antibody that dissolves antigenic cells. Examples of cytolysin are **bacteriolysin** and **hemolysin.**

cytolysis /sītol′isis/ *pl.* **cytolyses** [Gk, *kytos* + *lyein,* to loosen], the destruction or breakdown of cells, primarily by the disintegration of the plasma membrane. A kind of cytolysis is **immune cytolysis.** —*cytolytic, adj.*

cytomegalic /sī′tōmegal′ik/, describing a condition characterized by abnormally large cells.

cytomegalic inclusion disease (CID) [Gk, *kytos* + *megas,* large; L, *in, claudere,* in enclosure], a viral infection caused by ***cytomegalovirus*** (CMV), a member of the herpesvirus family. It is characterized by malaise, fever, lymphadenopathy, pneumonia, hepatosplenomegaly, and superinfection with various bacteria and fungi as a result of the depression of immune response characteristic of herpesviruses. It is primarily a congenitally acquired disease of newborns, transmitted in utero. Results may range from spontaneous abortion or fatal neonatal illness to birth of a normal infant, depending on such factors as the virulence of the viral strain, fetal age when infected, and primary or recurrent nature of the mother's infection. About 10% of newborns with congenital CMV show clinical signs, such as microcephaly, retarded growth, hepatosplenomegaly, hemolytic anemia, and pathological fracture of long bones. In 5% to 25% of asymptomatic infections, infants develop significant psychomotor, hearing, ocular, or dental abnormalities. Good hygiene is recommended to avoid transmission. Women who work with young children and are pregnant or planning to become pregnant are at high risk, especially if their first CMV infection is acquired during pregnancy. There is no specific treatment. Antiviral drugs such as ganciclovir and acyclovir are used in immunocompromised patients to prevent infection or reduce viral load in infected patients. See also **TORCH syndrome.**

cytomegalovirus **(CMV)** /sī′tōmeg′əlōvī′rəs/ [Gk, *kytos* + *megas,* large; L, *virus,* poison], a member of a group of large species–specific herpes–type viruses with a wide variety of disease effects. Infection results in characteristically enlarged cells with intranuclear inclusions. Opportunistic infection with this virus is common in immunocompromised individuals, causing clinical illnesses such as cytomegalovirus retinitis, pneumonia, esophagitis, colitis, adrenalitis and hepatitis. It can also cause cytomegalic inclusion disease, a variety of gastrointestinal infections, and encephalitis. See also **cytomegalic inclusion disease, TORCH syndrome.**



Cytomegalovirus retinitis

(Seidel et al, 2006/Courtesy Dr. Douglas A. Jabs, The Wilmer Ophthalmological Institute, The Johns Hopkins University and Hospital)

cytomegalovirus disease. See **cytomegalic inclusion disease.**

cytomegalovirus (CMV) test, a blood test for CMV infection.

cytomegalovirus immune globulin, a purified immunoglobulin derived from pooled adult human plasma selected for high titers of antibody against cytomegalovirus. It is administered intravenously for treatment and prophylaxis of cytomegalovirus disease in transplant recipients.

cytomegaly /cītōmeg′ālē/, abnormal enlargement of a cell or group of cells.

Cytomel, a trademark for a thyroid hormone (**liothyronine sodium).**

cytometer /sītom′ətər/ [Gk, *kytos* + *metron,* measure], a device for counting and measuring the number of cells within a specified amount of fluid, such as blood, urine, or cerebrospinal fluid.

cytometry /sītom′ətrē/, the counting and measuring of cells, specifically blood cells. —*cytometric, adj.*

cytomitome /sī′təmī′tōm/ [Gk, *kytos* + *mitos,* thread], the fibrillary network within the cytoplasm of a cell, as contrasted with that inside the nucleus. See also **karyomitome.**

cytomorphology /-môrfol′əjē/ [Gk, *kytos* + *morphe,* shape, *logos,* science], the study of the various forms of cells and the structures contained within cells. —*cytomorphologic, cytomorphological, adj.; cytomorphologist, n.*

cytomorphosis /sī′tōmôr′fəsis/ *pl. cytomorphoses* [Gk, *kytos* + *morphosis,* shaping], the various changes that occur within a cell during the entire course of its life cycle.

cyton. See **perikaryon.**

cytopathic /-path′ik/, pertaining to the effect of disease or another disorder on a cell, such as damage from a virus or nuclear radiation.

cytopathogenic effect /-path′əjen′ik/, the degenerative or morphological changes in a cultured cell caused by cytopathic damage, including chromosomal aberrations, membrane permeability, and protein synthesis. The damage is especially associated with the multiplication of certain viruses.

cytopathological /sītōpath′olojikal/, relating to, or characterizing, cytopathology.

cytopathology /-pathol′əjē/, the study of changes at the cellular level caused by disease.

cytopenia /-pē′nē·ə/ [Gk, *kytos* + *penes,* poor], a deficiency in numbers of the blood cell elements.

cytophagy /sītof′əjē/, cell destruction by phagocytes.

cytophotometer /sī′tōfətom′ətər/ [Gk, *kytos* + *phos,* light, *metron,* measure], an instrument for measuring light density through stained portions of cytoplasm, used for locating and identifying chemical substances within cells.

cytophotometry /sī′tōfətom′ətrē/, the identification of chemical substances within cells, by using a cytophotometer. Also called **microfluorometry.** **—***cytophotometric, adj.*

cytophysiology /-fis′ē·ol′əjē/ [Gk, *kytos* + *physis,* nature, *logos,* science], the study of the biochemical processes involved in the functioning of individual cells. **—***cytophysiologic, cytophysiological, adj.; cytophysiologist, n.*

cytoplasm /sī′təplaz′əm/ [Gk, *kytos* + *plassein,* to mold], all of the substance of a cell other than the nucleus and the cell wall. See also **cell, nucleus.**

cytoplasmic bridge. See **intercellular bridge.**

cytoplasmic inheritance /sī′tōplaz′mik/, the acquisition of traits or conditions controlled by self-replicating substances within the cytoplasm, such as mitochondria or chloroplasts, rather than by genes on the chromosomes in the nucleus. The phenomenon occurs in plants and some animals but has not been demonstrated in humans.

Cytosar-U, trademark for an antineoplastic **(cytarabine).**

cytoscopy /sītos′kəpē/ [Gk, *kytos* + *skopein,* to watch], the diagnostic study of cells obtained from patient specimens with the aid of microscopes and other laboratory equipment.

cytosine (C) /sī′təsin/, a pyrimidine base that is a component of DNA and RNA. In free or uncombined form it occurs in trace amounts in most cells, usually as a product of the enzymatic hydrolysis of nucleic acids and nucleotides. On hydrolysis, it is converted to urea and ammonia. See also **thymine, uracil.**

cytosine arabinoside. See **cytarabine.**

cytosis /sītō′sis/, a condition in which there is a greater than normal number of cells in a tissue or organ.

cytoskeleton /-skel′ətən/ [Gk, *kytos* + *skeletos,* dried body], the cytoplasmic elements, including the tonofibrils, keratin, and other microfibrils, that function as a supportive system within a cell, especially an epithelial cell.

cytosol /sī′tōsôl/, the liquid medium of the cytoplasm, i.e., cytoplasm minus organelles and nonmembranous insoluble components.

cytosome /sī′təsōm/, a multilayered, membrane-bound, lamellar body found in type II pneumocytes. It is a precursor of pulmonary surfactant.

cytotechnologist, an allied health professional who works with a pathologist to detect changes in body cells that may be important in early diagnosis of cancer and other diseases. The cytotechnologist prepares cellular samples and examines them under a microscope to evaluate for abnormalities in structure.

cytotoxic. See **cytotoxin.**

cytotoxic anaphylaxis [Gk, *kytos* + *toxikon,* poison, *hyper,* above], complement-dependent hypersensitivity to foreign cells or to alterations of cell-surface antigens that is mediated by immunoglobulin G (IgG) or IgM. It causes immediate destruction of cells, as seen in hemolytic disease of the newborn and in severe transfusion reactions. Also called **cytotoxic hypersensitivity, type II hypersensitivity.** Compare **anaphylactic hypersensitivity, immunocomplex hypersensitivity.** See also **immune gamma globulin.**

cytotoxic drug, any pharmacological compound that inhibits the proliferation of cells within the body. Such compounds as the alkylating agents and the antimetabolites designed to destroy cells (with a high growth fraction) are commonly used in chemotherapy. Cytotoxic agents have a potential for producing teratogenesis, mutagenesis, and carcinogenesis.

cytotoxic hypersensitivity. See **cytotoxic anaphylaxis.**

cytotoxic hypersensitivity reaction. See **hypersensitivity reaction.**

cytotoxic killer T cell, a type of T lymphocyte that has the ability to cause lysis of specific target cells, such as cells containing viral antigens or intracellular bacteria. See also **CD4, CD8 cell.**

cytotoxic T cell. See **CD8 cell.**

cytotoxin /sī′tōtok′sin/ [Gk, *kytos* + *toxikon,* poison], a substance that has a toxic effect on certain cells. An antibody may act as a cytotoxin. **—cytotoxic,** *adj.*

cytotrophoblast /sī′tōtrof′əblast′/ [Gk, *kytos* + *trophe,* nutrition, *blastos,* germ], the inner layer of cells of the trophoblast of the early mammalian embryo that gives rise to the outer surface and villi of the chorion. Also called **Langhans' layer.** Compare **syncytiotrophoblast.** **—***cytotrophoblastic, adj.*

cytotropism /sī′tōtrop′izm/, a characteristic of some cells and agents that enables them to approach other cells or selectively bind them.

Cytovene, a trademark for an antiviral **(ganciclovir).**

Cytoxan, a trademark for an antineoplastic **(cyclophosphamide).**

cytoxic T lymphocytes [L, *natura* + ME, *kullen,* to kill, *cella,* storeroom], antigen-stimulated T lymphocytes that attack antibody-coated (opsonized) antigens and effect cell-mediated cytotoxicity.

CYVADIC, an anticancer drug combination of cyclophosphamide, vinCRIStine, DOXOrubicin, and dacarbazine.

D

d, symbol for one tenth.

D, **1.** symbol for *dead space gas*. **2.** symbol for **diffusing capacity.** **3.** abbreviation for **diopter.** **4.** abbreviation for **dexter.** **5.** abbreviation for **vitamin D.** **6.** symbol for **density.** **7.** symbol for **diameter.**

d4T, symbol for *dideoxythymidine*.

Da, symbol for **dalton.**

DA, abbreviation for **developmental age.**

daboia /dəboi′ə/ [Hind, *dabna,* to lurk], a local name for Russell's viper, a large, very poisonous snake indigenous to India and Southeast Asia. Its venom is used in some laboratories to test the coagulation pathway.

dacarbazine /dekär′bəzēn/, an alkylating agent used as an antineoplastic.

■ INDICATIONS: It is prescribed primarily in the treatment of malignant melanoma and Hodgkin's disease.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are bone marrow depression, GI symptoms, kidney and liver impairment, alopecia, and fever.

daclizumab, an immunosuppressant.

■ INDICATIONS: It is used to help prevent acute allograft rejection in renal transplant patients.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug contraindicates its use.

■ ADVERSE EFFECTS: Life-threatening effects are pulmonary edema, tachycardia, thrombosis, renal tubular necrosis, and hydronephrosis. Other adverse effects include headache, prickly sensation, coughing, atelectasis, congestion, constipation, abdominal pain, pyrosis, hypertension, bleeding, oliguria, dysuria, renal damage, and impaired wound healing. Common side effects include chills, tremors, dyspnea, wheezing, vomiting, nausea, and diarrhea.

Dacogen, a trademark for **decitabine.**

D/A converter. See **digital-to-analog converter.**

dacrocystorhinotomy (DCR), the establishment of a new lacrimal duct for direct drainage into the nasal cavity to treat dacryocystitis resistant to antibiotic treatment.

Dacron cuff, a sheath of Dacron surrounding an atrial or venous catheter to prevent accidental displacement.

dacryadenitis. See **dacryoadenitis.**

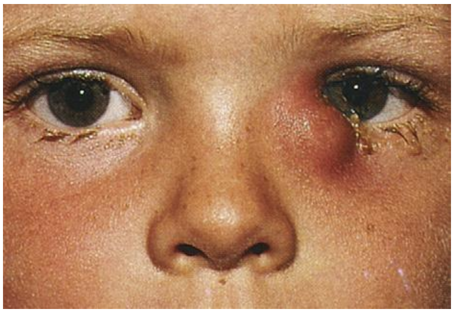
dacryo-, dacry-, prefix meaning "tears": *dacryocele, dacryolin, dacryorrhea*.

dacryoadenitis /dak′rē·ō·ad′ənī′tis/, an inflammation of the lacrimal gland. The condition may be seen in mumps infection that involves a lacrimal gland. Also called **dacryadenitis** /-ad′ənī′tis/.

dacryocyst /dak′re·ōsist′/ [Gk, *dakryon,* tear, *kytis,* bag], a lacrimal sac at the medial angle of the eye.

dacryocystectomy /dak′rē·ōsistek′təmē/ [Gk, *dakryon* + *kytis,* bag, *ektomē,* excision], partial or total excision of the lacrimal sac.

dacryocystitis /dak′rē·ōsistī′tis/, an infection of the lacrimal sac caused by obstruction of the nasolacrimal duct. It can be chronic or acute and is congenital in some cases. It is characterized by tearing and discharge from the eye. In the acute phase the sac becomes inflamed and painful. The disorder is nearly always unilateral and usually occurs in infants. It occurs on the left side more commonly than on the right because of the structure of the lacrimal sac. Systemic administration of antibiotics is usual; local topical treatment is seldom effective; rarely a dacryocystorhinostomy may be required. Compare **dacryostenosis.**



Dacryocystitis *(Zitelli and Davis, 2007)*

dacryocystorhinostomy /dak′rē·ōsis′tôrīnos′təmē/ [Gk, *dakryon* + *kytis,* bag, *rhis,* nose, *stoma,* mouth], a surgical procedure for restoring drainage into the nose from the lacrimal sac when the nasolacrimal duct is obstructed.

dacryon. See **tears.**

dacryostenosis /dak′rē·ōstinō′sis/ [Gk, *dakryon* + *stenos,* narrow, *osis,* condition], an abnormal stricture of the nasolacrimal duct, occurring either as a congenital condition or as a result of infection or trauma. Dacryocystorhinostomy may be required to correct this condition. Compare **dacryocystitis.**

dactinomycin /dak′tinōmī′sin/, an antibiotic used as an antineoplastic agent.

■ INDICATIONS: It is prescribed in the treatment of a variety of malignant neoplastic diseases, including testicular cancer, melanoma, Wilms' tumor, and rhabdomyosarcoma.

■ CONTRAINDICATIONS: Herpes zoster infection, chickenpox, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are bone marrow depression, severe GI disturbances, proctitis, alopecia, and ulcers of the mouth.

dactyl /dak′til/ [Gk, *daktylos,* finger], a digit (finger or toe). —**dactylic** /daktil′ik/ *adj.*

dactyl-. See **dactylo-.**

-dactyl, suffix meaning "digit (finger or toe)": *hermodactyl, pachydactyl, pentadactyl*.

dactyledema /dak′tilidē′mə/, edema of the fingers or toes.

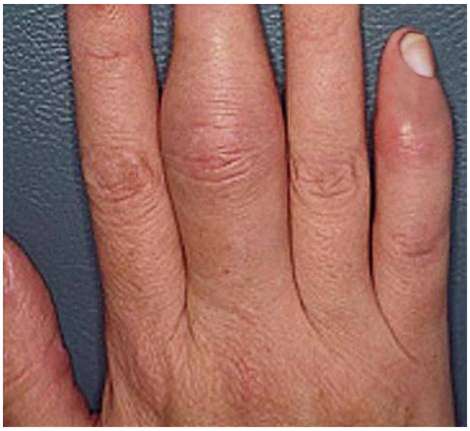
-dactylia, -dactyly, suffix meaning "(condition of the) fingers or toes": *ankylodactylia, heptadactylia, oligodactylia*.

dactylic. See **dactyl.**

dactylion /daktil′ē·on/, a condition of complete or partial webbing of fingers.

dactylitis /dak′tilī′tis/, **1.** a painful inflammation of the fingers or toes, usually associated with sickle cell anemia or certain infectious diseases, particularly syphilis or tuberculosis. **2.** a sausage-shaped digit associated with psoriatic arthritis.

dactylo-, dactyl-, prefix meaning "finger or toe": *dactylophasia, dactylospasm, dactylosymphysis*.



Dactylitis of middle finger *(Gottilieb, 2008)*

dactylus. See **digit.**

-dactyly. See **-dactylia.**

DAF, abbreviation for *decay accelerating factor*.

DAI, abbreviation for **diffuse axonal injury.**

daily adjusted progressive resistance exercise (DAPRE), a program of isotonic exercises that allows for individual differences in the rate at which a patient regains strength in an injured or diseased body part.

daily living skills. See **activities of daily living.**

Daily Reference Values (DRVs), a set of dietary standards for eight nutrients and food compartments: total fat, saturated fat, cholesterol, total carbohydrates, dietary fiber, protein, potassium, and sodium. They are part of the U.S. Food and Drug Administration Daily Value label reference.

dairy food substitute, a group of foods that includes imitation cream, coffee whitener, cheese, and ice cream. Although similar in taste and texture to genuine dairy products, nondairy products can differ markedly in composition from products they resemble. Some substitutes may contain milk components despite nondairy claims.

Dakin's solution [Henry D. Dakin, American biochemist, 1880–1952; L, *solutus,* dissolved], an antiseptic solution containing boric acid and 0.4% to 0.5% of sodium hypochlorite, used for wound irrigation and treatment of athlete's foot.

dalfopristin /dalfo′pristin/, a semisynthetic antibacterial effective against a variety of gram-positive organisms. It is used in conjunction with quinupristin in the treatment of serious bacteremia caused by vancomycin-resistant *Enterococcus faecium* and complicated skin and skin structure infections caused by ***Streptococcus pyogenes*** or methicillin-sensitive ***Staphylococcus aureus;*** it is administered intravenously.

Dalmane, a trademark for a benzodiazepine sedative-hypnotic **(flurazepam hydrochloride).**

dalteparin sodium, a low-molecular-weight heparin.

■ INDICATIONS: It is prescribed to prevent deep vein thrombosis in adults undergoing abdominal surgery who are at risk for clotting. It is also used for the treatment of unstable angina and non-Q-wave myocardial infarction to prevent ischemic complications in patients with concurrent aspirin therapy.

■ CONTRAINDICATIONS: It should not be given to patients with allergy to dalteparin, heparin, or pork products or to patients with certain blood disorders.

■ ADVERSE EFFECTS: The side effects most often reported include heavy or unusual bleeding, black stools, or bruising or pain at the site of injection.

dalton [John Dalton, English chemist and mathematician, 1766–1844], **1.** an unofficial unit of atomic mass, based on $^1/_{16}$ of the gram mass of oxygen, now based on $^1/_{12}$ the mass of carbon-12. **2.** (in biochemistry) unit (kilodaltons) that expresses the molecular weight (mass) of proteins and nucleic acids. See also **atomic mass.**

daltonism /dôl′təniz′əm/ [John Dalton], *(informal)* a form of red-green color blindness. It is genetically transmitted as a sex-linked autosomal-recessive trait.

Dalton's law of partial pressures /dôl′tənz/ [John Dalton], (in physics) a law stating that the total pressure exerted by a mixture of gases is equal to the sum of the pressures that could be exerted by the gases if they were present alone in the container in the same quantity at the same temperature. See also **Avogadro's law, Boyle's law, Gay-Lussac's law.**

dam, a barrier to the flow of fluid, as a dam placed around a tooth to protect it from saliva during restoration. See also **rubber dam.**

damages /dam′ijəs/ [L, *damnum,* loss], (in law) a sum of money awarded to a plaintiff by a court as compensation for any loss, detriment, or injury to the plaintiff's person, property, or rights caused by the malfeasance or negligence of the defendant. **Actual damages** are awarded to reimburse the plaintiff for the loss or injury sustained. **Nominal damages** are awarded to show that a legal wrong has been committed although no recoverable loss can be determined. **Punitive damages** exceed the actual cost of injury or damage and are awarded when the defendant has acted with malice or reckless disregard of the plaintiff's rights.

damp [AS, vapor], a potentially lethal atmosphere in caves and mines. **Black damp** or **choke damp** is caused by absorption of the available oxygen by coal seams. **Fire damp** is composed of methane and other explosive hydrocarbon gases. **White damp** is another name for carbon monoxide.

damping [AS, vapor], a gradual decrease in the amplitude of a series of waves or oscillations, such as an arterial pressure waveform.

danaparoid, an anticoagulant.

■ INDICATIONS: It is used to prevent vein thrombosis in hemodialysis, stroke, elective surgery for malignancy or total hip replacement, and hip fracture surgery.

■ CONTRAINDICATIONS: Hypersensitivity to this drug, sulfites, or pork products prohibits its use. Other factors that contraindicate its use include hemophilia, leukemia with bleeding, thrombocytopenia, purpura, cerebrovascular hemorrhage, cerebral aneurysm, severe hypertension, and other severe cardiac disease.

■ ADVERSE EFFECTS: Life-threatening side effects include hemorrhage and thrombocytopenia. Hypersensitivity reactions and rash are additional adverse effects.

danazol /dan′əzol/, a synthetic androgen that acts to suppress the output of gonadotropins from the pituitary, suppress ovarian hormone production, and directly block ovarian hormone receptors.

■ INDICATIONS: It is prescribed in the treatment of endometriosis, fibrocystic breast disease, and hereditary angioedema when alternative hormonal therapy is ineffective, contraindicated, or intolerable.

■ CONTRAINDICATIONS: Genital bleeding; cardiac, liver, or kidney dysfunction; or known hypersensitivity to this drug prohibits its use. It is not prescribed during pregnancy or lactation.

■ ADVERSE EFFECTS: Among the most serious adverse reactions are muscle spasms, nausea, weight gain, acne, edema, oily skin, voice changes, and other androgenic effects.

dance/movement therapy, (in psychology), a movement-based therapeutic technique that aids in release of expressions or feelings and aids in promoting feeling and awareness. It is an intimate and powerful medium for therapy because it is a direct expression of the mind and body.

dance reflex [ME, *dauncen* + L, *reflectere,* to bend back], a normal response in the neonate to simulate walking by a reciprocal flexion and extension of the legs when held in an erect position and inclined forward, with the soles touching a hard surface. The reflex disappears by about 3 to 6 weeks of age and is replaced by controlled, deliberate movement. Also called **step reflex, stepping reflex.**

dander, dry scales shed from the scalp.

dandruff /dan′druf/, an excessive amount of scaly material composed of dead, keratinized epithelium shed from the scalp that may be a mild form of seborrheic dermatitis or psoriasis. Treatment with a keratolytic shampoo is usually recommended to soften and remove the scales.

dandy fever. See **dengue fever.**

Dandy-Walker cyst [Walter E. Dandy, American neurosurgeon, 1886–1946; Arthur E. Walker, American surgeon, b. 1907–1995], a cystic malformation of the fourth ventricle of the brain resulting from hydrocephalus. Diagnosis of the defect is made with computed tomographic scan, x-ray films, and less commonly a ventriculogram. Also called **Dandy-Walker malformation.** See also **hydrocephalus, shunt.**

Danocrine, a trademark for an anterior pituitary suppressant **(danazol).**

danthron /dan′thron/, a stimulant laxative. Products containing danthron are no longer available in the United States since it was found to be carcinogenic in animal models.

Dantrium, a trademark for a skeletal muscle relaxant used in the treatment of malignant hyperthermia or malignant hyperpyrexia **(dantrolene sodium).**

dantrolene sodium /dan′trəlēn/, a skeletal muscle relaxant that acts directly on the skeletal muscle to prevent the release of calcium from the sarcoplasmic reticulum that is needed for muscle contraction.

■ INDICATIONS: It is prescribed in the treatment of muscle spasticity resulting from injury to the spinal cord or cerebrum when the person is immobile and flaccid limbs are preferable to spastic limbs. It is not indicated in treatment of spasm from rheumatic disorders. It is used intravenously for the management of malignant hyperthermia.

■ CONTRAINDICATIONS: Dantrolene should not be used when spastic muscles are needed to maintain posture or balance. Liver dysfunction or known hypersensitivity to this drug also prohibits its use.

■ ADVERSE EFFECTS: The most serious adverse reaction is potentially fatal hepatotoxicity. Common reactions include confusion, drowsiness, diarrhea, dizziness, fatigue, and muscular weakness. Side effects may continue for several days.

DAP, **1.** abbreviation for **Draw-a-Person Test. 2.** abbreviation for **dose area product.**

dapiprazole /däpip′räzōl/, an alpha-adrenergic blocking agent used topically on the conjunctiva as the hydrochloride salt to reverse pharmacologically-induced mydriasis.

DAPRE, abbreviation for **daily adjusted progressive resistance exercise.**

dapsone (DDS) /dap′sōn/, a bacteriostatic and bactericidal sulfone derivative.

■ INDICATIONS: It is prescribed in the treatment of leprosy and dermatitis herpetiformis and for prophylaxis against toxoplasmosis and *Pneumocystis carinii* in immunocompromised patients.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. It is not recommended for use during pregnancy or lactation.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are hemolysis (particularly in people who have glucose-6-phosphate dehydrogenase deficiency), leprosy reactional state, methemoglobinemia, neuropathy, nausea, anorexia, toxic hepatic aplastic anemia, and skin rash. Dapsone was carcinogenic in animal models.

-dapsone, suffix designating a diaminodiphenylsulfone-derivative antimycobacterial agent.

daptomycin, a miscellaneous antiinfective.

■ INDICATIONS: This drug is used to treat complicated skin and skin structure infections caused by ***Staphylococcus aureus*** (including methicillin-resistant strains), *S. agalactiae, S. dysgalactiae,* and *Enterococcus faecalis* (vancomycin-susceptible strains only).

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include hypotension, hypertension, increased creatinine phosphokinase, nausea, constipation, diarrhea, vomiting, dyspepsia, headache, insomnia, dizziness, muscle pain or weakness, arthralgia, fungal infection, urinary tract infection, anemia, nephrotoxicity, rash, and pruritus. A life-threatening side effect is pseudomembranous colitis.

Daraprim, a trademark for an antimalarial **(pyrimethamine).**

darbepoetin alfa, a hematopoietic agent used to treat anemia associated with chronic renal failure or anemia in nonmyeloid malignancies.

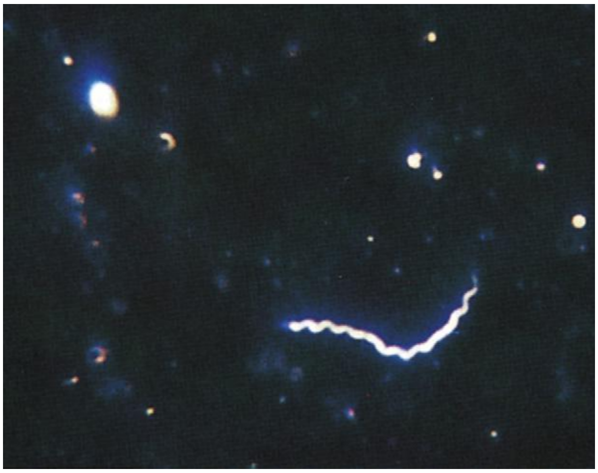
Darbid, a trademark for an anticholinergic (isopropamide iodide).

Darier's disease. See **keratosis follicularis.**

Darier's sign /däryāz′/ [Jean F. Darier, French dermatologist, 1856–1938], a burning or itching sensation induced by stroking skin lesions in cases of urticaria pigmentosa. The area may become raised and red.

dark adaptation, a normal increase in sensitivity of the retinal rod cells of the eye to detect any light that may be available for vision in a dimly lighted environment. The process is accompanied by an adjustment of the pupils to allow more light to enter the eyes.

darkfield microscopy [AS, *deorc,* hidden, *feld,* field; Gk, *mikros,* small, *skopein,* to look], examination of a microscopic specimen illuminated by a peripheral light source. The illumination causes the specimen to appear to glow against a dark background. In laboratory diagnosis, the technique is used primarily to identify the syphilis spirochete. Also called *darkfield illumination,* **ultramicroscopy.**



Darkfield microscopy: positive examination
(Morse et al, 2003)

dark-film fault [AS, *deorc,* hidden, *filmen,* skin; L, *fallere,* to disappoint], a defect in a photograph or radiograph that appears as an excessively darkened image or image area. It is caused by accidental exposure or overexposure of the film to light or radiation, excessive development, or an unsafe darkroom light.

darkroom, a room in a hospital or similar facility for the storage and processing of light-sensitive materials, such as x-ray film.

Darling's disease. See **histoplasmosis.**

dartoic tissue, tissue that resembles the tunica dartos, as in a tumor with muscular elements.

dartos fascia, the thin layer of subcutaneous tissue underlying the skin of the scrotum, consisting mainly of nonstriated muscle fibers (the dartos muscle). Also called *dartos,* **tunica dartos.**

darunavir, an antiretroviral.

■ INDICATION: This drug is used to inhibit HIV-1 protease by preventing maturation of the virus.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include dizziness, somnolence, anorexia, dry mouth, nephrolithiasis, rash, pain, asthenia, hyperlipidemia, and lipodystrophy. Life-threatening side effects include insulin-resistant hyperglycemia and ketoacidosis. Common side effects include headache, insomnia, diarrhea, abdominal pain, nausea, and vomiting.

Darvocet-N, a trademark for a fixed-combination drug containing an analgesic-antipyretic **(acetaminophen)** and an opioid analgesic (propoxyphene napsylate).

Darvon, a trademark for an opioid analgesic **(propoxyphene hydrochloride).**

Darvon Compound, a trademark for a fixed-combination drug containing an opioid analgesic **(propoxyphene hydrochloride)** and aspirin.

Darvon-N, a trademark for an opioid analgesic (propoxyphene napsylate).

darwinian. See **darwinian theory.**

darwinian ear /därwin′ē·ən/ [Charles R. Darwin, English naturalist, 1809–1882], an external ear with an upper border that projects upward in a flat, sharp edge.

darwinian reflex. See **grasp reflex.**

darwinian theory [Charles R. Darwin], the theory of Charles Darwin that organic evolution results from the natural selection of those variants of organisms that are best suited to survive in their environment. Also called **darwinism.** Compare **lamarckism. —darwinian,** *adj.*

darwinian tubercle. See **auricular tubercle.**

darwinism. See **darwinian theory.**

Darwin's tubercle. See **auricular tubercle.**

DAS, abbreviation for **data acquisition system.**

dasatinib, a miscellaneous antineoplastic.

■ INDICATIONS: This drug is used to treat chronic myelogenous leukemia, accelerated blast crisis, and chronic phase and acute lymphoblastic leukemia.

■ CONTRAINDICATIONS: Pregnancy and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include headache, dizziness, insomnia, neuropathy, asthenia, arrhythmias, chest pain, congestive heart failure, pericardial effusion, constipation, diarrhea, GI bleeding, mucositis, stomatitis, fluid retention, edema, increased or decreased weight, pain, arthralgia, myalgia, cough, dyspnea, pulmonary edema and hypertension, pneumonia, and urinary tract infection. Life-threatening side effects include central nervous system hemorrhage, vomiting, neutropenia, thrombocytopenia, and bleeding. Common side effects include nausea, anorexia, abdominal pain, rash, and pruritus.

DASE, abbreviation for **Denver Articulation Screening Examination.**

DASH (Dietary Approach to Stop Hypertension) diet, a diet high in fruits, vegetables, and low-fat dairy products; low in saturated and total fats; low in cholesterol; and high in fiber. The diet is often described as the three plus five plan: three dairy, five fruits, and five vegetables per day. Research studies support the hypothesis that this diet reduces blood pressure and may play a role in prevention of high blood pressure.

data /dā′tə, dat′ə, dä′tə/ *sing.* **datum** [L, *datum,* giving], **1.** pieces of information, especially those that are part of a collection to be used in an analysis of a problem, such as the diagnosis of a health problem. **2.** facts stored and processed by a computer.

data acquisition system (DAS), a radiation detection system that measures the amount of radiation passing through a patient. In computed tomography, the system also converts analog signals to digital data that can be analyzed by a computer.

data analysis, (in research) the phase of a study that includes classifying, coding, and tabulating information needed to perform quantitative or qualitative analyses according to the research design and appropriate to the data. Data analysis follows collection of information and precedes its interpretation or application.

database, a store or bank of information in a form that can be processed by computer.

data clustering, the grouping of related information from a patient's health history, physical examination, and laboratory results as part of the process of making a diagnosis.

data collection, (in research) the phase of a study that includes the gathering of information and identification of sampling units as directed by the research design. Data collection precedes data analysis.

data processing, the techniques and practices involved in the manipulation of information by a computer.

data retrieval, the recovery of information from an organized filing system, such as a computer database, index card file, or color-coded record folders.

dataset /dā′təset/, a collection of similar and related data for processing by computer.

data source, the origin of information relevant to a patient's level of wellness and health patterns.

data validation, the process of determining whether information gathered during the process of data collection is complete and accurate.

date/acquaintance rape, a sexual assault or rape by a person known to the victim, such as a date, employer, friend, or casual acquaintance. See also **rape.**

datum. See **data.**

daughter cell [ME, *doughter,* female, child; L, *cella,* storeroom], one of the cells produced by the division of a parent cell.

daughter chromosome [ME, *doughter,* female, child; Gk, *chroma,* color, *soma,* body], either of the paired chromatids that separate and migrate to the opposite ends of the cell during the anaphase stage of mitosis. Each contains the complete genetic information of the original chromosome and is formed during interphase by the replication of the DNA in the chromosome.

daughter cyst, a small secondary parasitic cyst, usually a derivative of a hydatid cyst.

daughter element, an element that results from the radioactive decay of another element. For example, technetium-99 is the daughter element created by the decay of molybdenum-99.

daughter product. See **decay product.**

DAUNOrubicin citrate liposomal /dô′nōro͞o′bisin/, an anthracycline antibiotic antineoplastic agent.

■ INDICATION: It is prescribed in the treatment of advanced Kaposi's sarcoma in HIV patients.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. It is also contraindicated in pregnancy, during lactations and in patients with systemic infections or cardiac disease.

■ ADVERSE EFFECTS: Serious adverse effects include chest pain and edema.

Davidoff's cells. See **cells of Paneth.**

Davidson regimen. See **toilet training.**

da Vinci surgical system /də·vin′chē/, a proprietary robotic platform for minimally invasive surgery, consisting of a console, a patient-side cart to which a set of up to four electromechanical arms is attached, and a 3-D video display system. Instruments mounted on the robotic arms are introduced into the patient's body through minute incisions. The system translates the hand motions of the surgeon seated at the console into movements of the instruments inside the patient. The surgeon views the operative field through a 3-D camera attached to one of the arms.

Davis ureterotomy, an open procedure combining a ureteral incision with intubation, usually for long or multiple strictures below the ureteropelvic junction.

DAWN /dôn/, abbreviation for **Drug Abuse Warning Network.**

dawn phenomenon [ME, *daunen* + Gk, *phainomenon,* anything seen], a tendency for persons with type 1 diabetes mellitus to experience hyperglycemia upon awakening in the morning because of increased cortisol and growth hormone secretion in the predawn hours. Compare **Somogyi effect (phenomenon).**

day blindness. See **hemeralopia.**

day care [OE, *daeg* + *cearu*], a specialized program or facility that provides care for preschool children, usually within a group framework, either as a substitute for or an extension of home care, particularly for single parents or for two parents both employed outside the home. Day-care groups vary in size and function and range from casual neighborhood parent–supervised play groups to formal nursery schools or organized centers run by trained personnel. Most day-care programs incorporate a daily schedule of quiet play, outdoor activities, group games and projects, creative or educational play, and snack and rest periods.

daydream, a usually nonpathological reverie that occurs while a person is awake. The content is usually the imagined fulfillment of wishes that are not disguised.

day health care services, the provision of hospitals, nursing homes, or other facilities for health-related services to adult patients who are ambulatory or can be transported and who regularly use such services for a certain number of daytime hours but do not require continuous inpatient care. See also **adult day-care center.**

day hospital [OE, *daeg* + L, *hospes,* guest], a psychiatric facility that offers a therapeutic program during daytime hours for patients. See also **partial hospitalization program.**

day patient. See **inpatient.**

day sight. See **nyctalopia.**

dB, abbreviation for **decibel.**

Db, symbol for the element **dubnium.**

DBMS, abbreviation for *database management system*.

D&C, abbreviation for **dilation and curettage.**

DC, abbreviation for **direct current.**

d/c, **1.** abbreviation for *discontinue*. **2.** abbreviation for *diarrhea and constipation*. **3.** abbreviation for **discharge.**

DCC gene, (*d*eleted in *c*olorectal *c*arcinoma) a gene normally expressed in the mucosa of the colon but reduced or absent in a small proportion of patients with colorectal cancer.

DCR, abbreviation for **dacrocystorhinotomy.**

DD, abbreviation for **developmental disability.**

DDAVP, a trademark for an antidiuretic **(desmopressin acetate).**

ddC, abbreviation for 2′3′-dideoxycytidine. See **zalcitabine.**

DDD pacing, a specific type of electrical heart pacemaker. The letters indicate *D*ual pacing for both chambers, *D*ual chamber activity sensing, and *D*ual response (triggering and inhibition).

ddI, **1.** abbreviation for *2′,3′-dideoxyinosine*, an antiretroviral medication. **2.** abbreviation for **dideoxyinosine.**

D-dimer test, a simple and confirmatory test for disseminated intravascular coagulation that can also indicate when a clot is lysed by thrombolytic therapy. The fragment D-dimer assesses both thrombin and plasmin activity.

DDP, -DDP. See **cisplatin.**

D.D.S., abbreviation for *Doctor of Dental Surgery*.

DDST, abbreviation for **Denver Developmental Screening Test.**

DDT (dichlorodiphenyltrichloroethane), a nonbiodegradable water-insoluble chlorinated hydrocarbon once used worldwide as a major insecticide, especially in agriculture. In recent years knowledge of its adverse impact on the environment has led to restrictions in its use. In addition, because tolerance in formerly susceptible organisms develops rapidly, DDT has been largely replaced by organophosphate insecticides in the United States, where DDT was banned by the FDA in 1971. It is still used as a pediculicide where epidemic-scale delousing is justified, as in barracks and refugee camps. Its value as a scabicide is marginal, because scabies and crab lice quickly become resistant to it. See also **scabicide.**

DDT poisoning. See **chlorinated organic insecticide poisoning.**

D&E, abbreviation for **dilation and evacuation.**

DE, abbreviation for **dose equivalent.**

de-, prefix meaning "to do the opposite, away, off, to remove entirely, down or from": *decapitation*, *decartation*, *dedentition*.

DEA, abbreviation for **Drug Enforcement Agency.**

deactivation /dē·ak′tivā′shən/ [L, *de*, from, *activus*, active], the process of becoming or making something inactive or inoperable.

dead, pertaining to the absence of all vital functions in a previously living organism.

dead-end host [AS, *dead* + *ende* + L, *hospes,* guest], **1.** a host from which infectious agents are not transmitted to other susceptible hosts. **2.** any host organism from which a parasite cannot escape to continue its life cycle. Humans are dead-end hosts for trichinosis, because the larvae encysted in muscle and human flesh are unlikely to be a source of food for other animals susceptible to this parasite. Compare **definitive host, intermediate host, reservoir host.**

dead fetus syndrome, a condition in which the fetus has died but has remained in the uterus for some time. The condition leads to a blood coagulation disorder and disseminated intravascular coagulation, and the eventual delivery is usually accompanied by massive bleeding. See also **disseminated intravascular coagulation.**

deadly quartet. See **syndrome X.**

dead pulp. See **nonvital pulp.**

dead space [AS, dead; L, *spatium*], **1.** a cavity that remains after the incomplete closure of a surgical or traumatic wound, leaving an area in which blood can collect and delay healing. **2.** the amount of lung in contact with ventilating gases but not in contact with pulmonary blood flow. **Alveolar dead space** is characterized by alveoli that are ventilated by the pulmonary circulation but are not perfused. The condition may exist when pulmonary circulation is obstructed, as by a thromboembolus. **Anatomical dead space** is an area in the trachea, bronchi, and air passages containing air that does not reach the alveoli during respiration. As a general rule, the volume of air in the anatomical dead space in milliliters is approximately equal to the weight in pounds of the individual affected. Certain lung disorders, such as emphysema, increase the amount of anatomical dead space. **Physiological dead space** is an area in the respiratory system that includes the anatomical dead space together with the space in the alveoli occupied by air that does not contribute to the oxygen–carbon dioxide exchange.

dead space effect, any of several potential adverse effects, including hypoxemia and hypercapnia, produced by dead space in the lungs, particularly alveolar dead space.

deaf [AS], **1.** *adj,* unable to hear; hard of hearing. **2.** *n,* people who are unable to hear or who have hearing impairment. **—deafness,** *n.*

deafferentation /dē·af′ərəntā′shən/ [L, *de,* from, *ad* + *ferre,* to bear], the elimination or interruption of afferent nerve impulses.

deaf-mute, a person who is unable to hear or to speak.

deaf-mutism [AS, *deaf* + L, *mutus*], a state of being both unable to hear and unable to speak.

deafness, a condition characterized by a loss of hearing that makes it impossible for an individual to understand speech through hearing alone. In assessing deafness, the ears are examined for drainage, crusts, accumulation of cerumen, or structural abnormality. It is determined whether the hearing loss is conductive or sensory, temporary or permanent, and congenital or acquired in childhood, adolescence, or adulthood. The effect of aging is evaluated. A psychosocial assessment is conducted to ascertain whether the individual is well adjusted to hearing loss or reacts to the disability with fear, anxiety, frustration, depression, anger, or hostility. In all cases the degree of loss and the kind of impairment causing it are determined. See also **conductive hearing loss, sensorineural hearing loss.**

■ OBSERVATIONS: Many conditions and diseases may result in hearing loss. More than 21 million people in the United States have some degree of hearing loss; of them, more than 50% are above 65 years of age. The person with a slight hearing loss may be initially unaware of the problem. Recognition, diagnosis, and early treatment may help prevent further impairment and prevent frustration, embarrassment, and danger for the person. An older person with a hearing impairment usually has a sensorineural loss. High-frequency sounds are hard to hear, and discernment of such softer speech sounds such as /s/ and /f/ becomes difficult. A severe or sudden hearing loss usually drives the person to seek help. If the loss is sudden, confusion, fear, and even panic are common. The person's speech becomes loud and slurred. There is new danger because the person cannot hear horns, whistles, or sirens and has not developed a way to cope with the impairment safely. The congenitally deaf person needs special speech and language intervention before reaching school age.

■ INTERVENTIONS: The treatment of hearing loss depends on the cause. Merely removing impacted cerumen from the external auditory canal may significantly improve hearing. Hearing aids, amplification of sound, or speech reading may be useful. Speech therapy is useful in teaching a person to speak or helping a person to retain the ability to speak.

■ NURSING CONSIDERATIONS: Caring for a deaf person who is hospitalized for treatment of another problem requires certain adjustments in communication between nurse and patient. If the patient uses a hearing aid, its placement and operation are checked before the speaker begins to talk; the voice is modulated to a level that is comfortable for the patient, and the speaker stands or sits where the lips are visible to the deaf individual. If the patient uses sign language, an interpreter or another means of communication is sought; when a pad and pencil are used, a frequent practice with the newly deaf, the messages are written clearly in short, simple phrases, and adequate time is allowed for the patient to understand and answer. The bed is located so that the patient can see the door.

deaminase /dē·am′ināს/ [L, *de,* away, *amine,* ammonia; Fr, *diastase,* enzyme], one of the subclasses of enzymes that catalyze the hydrolysis of the NH_2 bond in amino compounds, usually with the concomitant removal of ammonia. The enzymes are usually named according to the substrate, such as **adenosine deaminase, guanine deaminase,** or **guanosine deaminase.** Also called **aminohydrolase.**

deamination /dē′aminā′shən/, the removal, usually by hydrolysis, of the NH_2 radical from an amino compound. Also called **deaminization.**

dean [L, *decanus,* chief of ten], chief executive and educational officer of a unit of a university, school, or college.

dean's tax, a portion of physician practice plan income in an academic medical center that is allocated for the support of the medical school.

dearterialization /dē′ärtir′ē·əlīzā′shən/, **1.** conversion of oxygenated arterial blood into venous blood. **2.** interruption of the supply of arterial blood to an organ or body part.

death [AS], **1.** apparent death; the cessation of life as indicated by the absence of all vital functions. **2.** legal death; the total absence of activity in the brain and central nervous system, the cardiovascular system, and the respiratory system as observed and declared by a qualified professional. See also **cell death, emotional care of the dying patient, stages of dying, sudden infant death syndrome.**

death chill. See **algor mortis.**

death instinct, instinctive behavior that tends to be self-destructive.

death mask [AS, *death* + Fr, *masque*], an image or cast made from clay, wax, plaster of paris, or other moldable material of the face after death.

death rate, the number of deaths occurring within a specified population during a particular period, usually expressed in terms of deaths per 1000 persons per year.

death rattle, a sound produced by air moving through mucus that has accumulated in the throat of a dying person who has lost the cough reflex. It is often accompanied by agonal respiration.

death trance, a state in which a person appears to be dead.

"death with dignity" [AS, *death* + L, *dignus,* worthy], the philosophical concept that a terminally ill client should be allowed to die naturally and comfortably, rather than experience a comatose, vegetative life prolonged by mechanical support systems.

DeBakey forceps, atraumatic tissue forceps used to grasp fine tissue.

DeBakey forceps *(Courtesy Intuitive Surgical, Inc.)*

debility /dibil′itē/, feebleness, weakness, or loss of strength. See also **asthenia.** —*debilitating, adj.*

debridement /debrēdmäN′/ [Fr, *debridle,* remove], **1.** the removal of dirt, foreign objects, damaged tissue, and cellular debris from a wound or a burn to prevent infection and to promote healing. In treating a wound, debridement is the first step in cleansing. It also allows thorough examination of the extent of the injury. In treating a burn, debridement of the eschar may be performed in a hydrotherapy bath. —*debride, v.* **2.** (in dentistry) the removal of all supragingival and subgingival biofilms, calculus, plaque-retentive anomalies, and diseased root surfaces that harbor bacteria.

debris /dəbrē′/, the dead, diseased, or damaged tissue and any foreign material that is to be removed from a wound or other area being treated.

Debrox, a trademark for a topical antiinfective **(carbamide peroxide).**

debt /det/ [L, *debere,* to owe], something owed. See also **oxygen debt.**

debug /dibug′, dē′bug/ [L, *de* + Welsh, *bwg,* hobgoblin], to find and correct errors in computer software or hardware.

dec-, **1.** prefix meaning “ten”: *decagram, decaliter, decipara.* **2.** prefix meaning “tenth”: *decigram, deciliter, decinormal.*

Decaderm, a trademark for a synthetic analog of cortisol **(dexamethasone).**

Decadron, a trademark for a glucocorticoid **(dexamethasone).**

Deca-Durabolin, a trademark for an androgen (nandrolone decanoate).

decalcification /dēkal′sifikā′shən/ [L, *de* + *calyx,* lime, *facere,* to make], loss of calcium salts from the teeth and bones caused by malnutrition, malabsorption, or other dietary or physiological factors, such as immobility. It may result, particularly in older people, from a diet that lacks adequate calcium. Malabsorption may be caused by a lack of vitamin D necessary for the absorption of calcium from the intestine; an excess of dietary fats that can combine with calcium to form an indigestible soaplike compound; the presence of oxalic acid, which can combine with calcium to form a relatively insoluble calcium oxalate salt; hormonal changes of menopause; or a relative lack of acid in the digestive tract, which can decrease the solubility of calcium. Other factors include the parathyroid hormone control of the calcium level in the bloodstream, the ratio of calcium to phosphorus in the blood, and the relative activity of osteoblast cells that form calcium deposits in the bones and teeth and osteoclast cells that absorb calcium from bones and teeth. Bone tissue tends to be maintained in quantities no greater than needed to meet current physical stress. Therefore inactive and, particularly, bedridden people lose calcium from their bones; osteoclastic activity exceeds osteoblastic activity, and decalcification occurs. See also **calcium, mineral.**

decannulation /dēkan′yəlā′shən/ [L, *de,* from, *cannula,* small reed], the removal of a cannula or tube that may have been inserted during a surgical procedure.

decanoic acid. See **capric acid.**

decant, the process of separating fluid from a solid sediment by pouring off the top liquid layer.

decapitation /dēkap′itā′shən/, literally, cutting off the head, as the head of a bone or the head of a fetus when delivery is not possible otherwise. This is no longer performed in clinical practice.

decay /dikā′/, **1.** a gradual deterioration that accompanies the end of life. **2.** a gradual deterioration, usually caused by bacteria and other decomposers, of the body of an organism after death. **3.** the process of disintegration of a radioactive substance.

decay product [L, *de* + *cadere,* to fall, *producere,* to produce], a stable or radioactive nuclide formed by the disintegration of a radionuclide, either directly or as a result of successive transformation in a radioactive series. Also called **daughter product.**

decay time, the period required for a wavelength to go from peak amplitude to 0 volt (V).

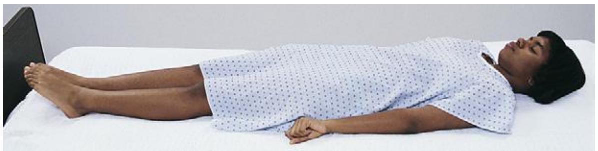
deceleration /dēsel′ərā′shən/ [L, *de* + *accelerare,* to hasten], a decrease in the speed or velocity of an object or reaction. Compare **acceleration.**

deceleration injury, an injury resulting from a collision between a rapidly moving body part and a stationary object.

deceleration phase, (in obstetrics) the latter part of active labor, characterized by a decreased rate of dilation of the cervical os on a Friedman curve.

decerebrate /dēser′əbrāt/, **1.** lacking a cerebrum. **2.** lacking neural communication between the cerebrum and lower portions of the central nervous system.

decerebrate posture [L, *de* + *cerebrum,* brain, *ponere* to place], the position of a patient, who is usually comatose, in which the arms are extended and internally rotated and the legs are extended with the feet in forced plantar flexion. It is usually observed in patients afflicted by compression of the brainstem at a low level. Also called **decerebrate rigidity.**



Decerebrate posture *(Seidel et al, 2006)*

decerebrate rigidity. See **decerebrate posture, tonic labyrinthine reflex.**

decerebration /-brā′shən/ [L, *de,* from, *cerebrum*], the process of removing the brain or of cutting the brainstem above the level of the red nucleus, thus eliminating cerebral function.

deci-, prefix indicating one tenth.

decibel (dB) /des′əbəl/ [L, *decimus,* one tenth, *bel,* Alexander G. Bell, Canadian inventor, 1847–1922], a unit of measure of the intensity of sound. A decibel is one tenth of 1 bel (B); an increase of 1 B is perceived as a 10-fold increase in loudness, based on a sound-pressure reference level of 0.0002 dyne/cm^2, or 20 micropascals.

decidua /disij′o͞o·ə/ [L, *decidere,* to fall off], the epithelial tissue of the endometrium lining the uterus. It envelops the conceptus during gestation and is shed in the puerperium. It is also shed periodically with menstruation. Kinds of decidua are **decidua basalis, decidua capsularis,** and **decidua vera.** See also **amniotic sac.**

decidua basalis, the decidua of the endometrium in the uterus that lies beneath the implanted ovum. Also called **decidua serotina.**

decidua capsularis, the decidua of the endometrium of the uterus covering the implanted ovum. Also called **decidua reflexa.**

decidual endometritis /disij′o͞o·əl/, an inflammation or infection of any portion of the decidua during pregnancy. See also **endometritis.**

decidua menstrualis, the endometrial mucosa shed during menstruation.

decidua parietalis. See **decidua vera.**

decidua reflexa. See **decidua capsularis.**

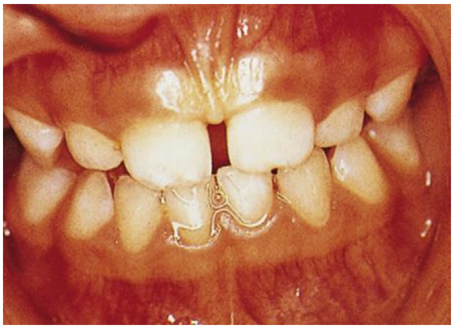
decidua serotina. See **decidua basalis.**

decidua vera, the decidua of the endometrium lining the uterus, except for those areas beneath and above the implanted and developing ovum called, respectively, the decidua basalis and the decidua capsularis. Also called **decidua parietalis.**

deciduoma /disij′o͞o·ō′mə/, a benign or malignant tumor of endometrial tissue. A deciduoma may develop after a pregnancy, regardless of the outcome. It may be detected on a Papanicolaou's smear.

deciduous /də·sid′yo͞o·əs/ [L, *decidere,* to fall off], falling off or shed at maturity.

deciduous dentition. See **primary dentition.**



Deciduous dentition *(Zitelli and Davis, 2007)*

decigram (dg), a unit of mass in the metric system equal to 100 milligrams or one tenth of a gram.

deciliter (dL), a unit of volume in the metric system equal to 100 milliliters or one tenth of a liter.

decimeter (dm), a unit of length in the metric system equal to 10 centimeters or one tenth of a meter.

decision making, the process of evaluating available information and reaching a judgment or conclusion based on that information.

decision-making, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability to make judgments and choose between two or more alternatives. See also **Nursing Outcomes Classification.**

decision-making support, a nursing intervention from the Nursing Interventions Classification (NIC) defined as providing information and support for a patient who is making a decision regarding health care. See also **Nursing Interventions Classification.**

decision tree, a systematic method of managing a problem by graphically organizing the probabilities of outcomes of alternative treatments. At each decision node or branch a possible alternative is matched with its relative worth, quality of life, freedom from disability, and other factors on which a prognosis may be based.

decitabine, an agent that prevents DNA methylation, halting growth of rapid proliferation blasts.

■ INDICATIONS: This drug is used to treat naive and experienced myelodysplastic syndrome.

■ CONTRAINDICATIONS: Pregnancy, lactation, severe neurotoxicity, severe blood dyscrasias, and known hypersensitivity to this drug prohibit its use. Its use is also contraindicated in children.

■ ADVERSE EFFECTS: Adverse effects of this drug include confusion, abdominal pain, dyspepsia, hematoma, and cellulitis. Life-threatening side effects include neutropenia, thrombocytopenia, leukopenia, and anemia. Common side effects include headache; anxiety; dizziness; hypoesthesia; insomnia; edema; murmur; hypotension; nausea; anorexia; vomiting; diarrhea; constipation; stomatitis; alopecia; ecchymosis; erythema; pallor; petechiae; pruritus; rash; swelling of the face; urticaria; decreased potassium, sodium, magnesium, and albumin; increased or decreased glucose; myalgia; arthralgia; back pain; chest wall pain; pain in the limbs; cough; crackles; hypoxia; pharyngitis; pneumonia; and pulmonary edema.

declarative memory /dēkler′ətiv/, the mental registration, retention, and recall of past experiences, sensations, ideas, knowledge, and thoughts. This memory has a high cognitive basis. The original information must be relayed through either the amygdala or hippocampal nuclear structures before long-term storage is possible.

Declomycin, a trademark for an antibacterial **(demeclocycline hydrochloride).**

decoction /dikok′shən/ [L, *de* + *coquere,* to cook], a liquid medicine made from an extract of water-soluble substances, usually with the aid of boiling water. Herbal remedies are usually decoctions. See also **concoction.**

decode /dikōd′/, to interpret coded information into a form usable by a receiver.

decoded message, (in communication theory) a message as translated by a receiver. If it is correctly interpreted within the context of the message as sent by the sender, the decoded message is the same as the encoded message. If it is not understood and interpreted as sent, it is not the same as the encoded message and is potentially misinterpreted.

decoic acid. See **capric acid.**

decoloration, the natural loss or removal of color, as by bleaching.

decompensation /dē′kəmpənsā′shən/ [L, *de* + *compensare,* to balance], **1.** the failure of a system, as cardiac decompensation in heart failure. **2.** (in psychology) the failure of a defense mechanism.

decomposition /dē′kəmpəsish′ən/ [L, *de* + *componere,* to put together], the breakdown of a substance into simpler chemical forms. —*decompose, v.*

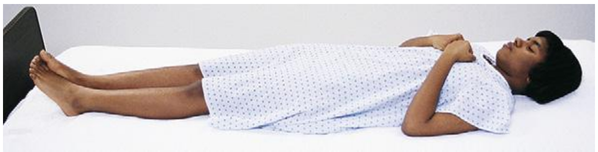
decompression /dē′kəmpresh′ən/ [L, *de* + *comprimere,* to press together], **1.** a technique used to readapt an individual to normal atmospheric pressure after exposure to higher pressures, as in diving. **2.** the removal of pressure caused by gas or fluid in a body cavity, such as the stomach or intestinal tract.

decompression sickness, a painful, sometimes fatal syndrome caused by the formation of nitrogen bubbles in the tissues of divers, caisson workers, and aviators who move too rapidly from environments of higher to those of lower atmospheric pressures. Nitrogen breathed in air under pressure dissolves in tissue fluids. When ambient pressure is reduced too rapidly, nitrogen goes out of solution faster than it can be circulated to the lungs for expiration. Gaseous nitrogen then accumulates in the joint spaces and peripheral circulation, impairing tissue oxygenation. Disorientation, severe pain, and syncope follow. Treatment entails rapid return of the patient to an environment of higher pressure (hyperbaric therapy) followed by gradual decompression. Death is more often caused by drowning during syncope than by decompression sickness itself. Also called **bends, caisson disease, diver's palsy, diver's paralysis.** Compare **barotrauma.**

decongestant [L, *de* + *congerere,* to pile up], **1.** *adj,* pertaining to a substance or procedure that eliminates or reduces congestion or swelling. **2.** *n,* a decongestant drug. Adrenergic drugs (α-1 stimulants), such as ephedrine and pseudoephedrine, that cause vasoconstriction of nasal mucosa are used as decongestants.

decontamination /dā′kəntam′inā′shən/, the process of removing foreign material such as blood, body fluids, or radioactivity. It does not eliminate microorganisms but is a necessary step preceding disinfection or sterilization.

decorticate posture /dēkôr′tikāt/ [L, *de* + *cortex,* bark, *ponere,* to place], the position of a comatose patient in which the upper extremities are rigidly flexed at the elbows and at the wrists. The legs also may be flexed. The decorticate posture indicates a lesion in a mesencephalic region of the brain. In some instances the posture may be produced by applying a painful stimulus to a comatose patient. Also called *decorticate rigidity.*



Decorticate posture *(Seidel et al, 2006)*

decortication /dēkôr′tikā′shən/ [L, *de* + *cortex,* bark], (in medicine) the removal of portions of the cortex or surface layer of an organ or structure, such as the kidney, the brain, and the lung. —*decorticate, v., adj.*

decrement /dek′rəmənt/ [L, *de* + *crescere,* to grow], a decrease or stage of decline, as of a uterine contraction.

decremental conduction /dek′rəmen′təl/, transmission of an electric impulse in which the amplitude of the impulse decreases with distance.

decrepitate percussion /dēkrep′itit/, a crackling noise produced by tapping the thoracic or abdominal wall of a patient with a respiratory disorder.

decrudescence /dē′kro͞odes′əns/ [L, *de,* from, *crudescere,* to become bad], a decrease in the severity of symptoms.

decubital /dikyo͞o′bitəl/ [L, *decumbere,* to lie down], pertaining to bedsores.

decubitus /dikyo͞o′bitəs/ [L, *decumbere,* to lie down], a recumbent or horizontal position, as lateral decubitus, lying on one side.

decubitus angina, a condition characterized by periodic attacks of cardiac pain that occur when a person is lying down.

decubitus position, a position used in producing a radiograph of the chest or abdomen of a patient who is lying down, with the central ray horizontal. The patient may be prone (ventral decubitus), supine (dorsal decubitus), or on the left or right side (left or right lateral decubitus). Also called **decubitus projection.**

decubitus posture, the position assumed by a bedridden patient to rest on his or her side to relieve the pressure of body weight on the sacrum, heels, or other areas vulnerable to pressure (decubitus) ulcers.

decubitus projection. See **decubitus position.**

decubitus ulcer. See **pressure ulcer.**

decubitus ulcer care. See **pressure ulcer care.**

decussate /dəkus′āt/ [L, *decussis,* intersection], to cross in the form of an "X," as certain nerve fibers from the retina cross at the optic chiasm. —**decussation,** *n.*

decussation /di′kusā′shən/ [L, *decussare,* to make a cross], a crossing of central nervous system fibers in the brain, as some fibers on the left side cross to the right side, and vice versa.

decussation of pyramids [L, *decussare,* to make a cross; Gk, *pyramis*], the crossing of nerve fibers of the corticospinal motor tract at the ventral side on the lower portion of the medulla oblongata.

dedifferentiation. See **anaplasia.**

deductible /dēduk′tibəl/, an amount paid each year by a health insurance plan enrollee before benefits begin. It is not synonymous with copayment.

deduction [L, *deducere,* to lead], a system of reasoning that leads from a known principle to an unknown, or from the general to the specific. Deductive reasoning is used to test diagnostic hypotheses.

deemed status /dēmd/ [AS, *deman,* to judge; L, *status,* a standing], a status conferred on a hospital or other organization by a professional standards review organization in formal recognition that the organization's review, continued-stay review, and medical care evaluation programs meet certain effectiveness criteria.

deep artery of the thigh, the largest branch of the femoral artery and the major source of blood supply to the thigh. Also called **profunda femoris artery.**

deep auricular artery, a small branch of the maxillary artery that contributes to the blood supply of the external acoustic meatus.

deep bite. See **closed bite.**

deep brachial artery [As, *dyppan,* to dip; Gk, *brachion,* arm, *arteria,* airpipe], a branch of each of the brachial arteries, arising at the distal border of the teres major, passing deeply into the arm between the long and lateral heads of the triceps brachii, and supplying the humerus and muscles of the upper arm. It has five branches: ascending, radial collateral, middle collateral, muscular, and nutrient. Also called **superior profunda artery.**

deep brain stimulation (DBS), patient-controlled, continuous, high-frequency electrical stimulation of a specific area of the brain by means of an implanted electrode, which is controlled by a battery implanted just below the clavicle. The electrical signals block those signals from the brain causing tremors and some other related problems, such as occur in Parkinson's disease, essential tremor, and dystonia.

deep breathing and coughing exercises, movements used to improve pulmonary gas exchange or to maintain respiratory function, especially after prolonged inactivity or general anesthesia. Incisional pain after surgery in the chest or abdomen often inhibits normal respiratory movements.

■ METHOD: The patient is assisted to a comfortable position, supine or sitting up. An analgesic may be given before the exercises if pain is present. Inhalation through the nose and exhalation through the mouth are encouraged. With the incision supported, the patient is asked to cough after a deep inhalation. If pain prevents the patient from producing a deep, effective cough, a series of short barklike coughs (also known as machine gun or huf-huf coughs) may be encouraged.

■ INTERVENTIONS: Simple techniques and encouragement significantly improve the effectiveness of the exercises. Positioning increases comfort, allows the abdominal contents to fall away from the diaphragm, and encourages full expansion of the chest wall on inspiration. If an incision is present, it may be supported with the hands or with a book or pillow held against the abdomen. The patient is often reluctant to breathe deeply or to cough. Adequate analgesia, encouragement, and explanation of the benefits of the exercises may overcome that resistance. Various devices are available for use in deep breathing and coughing, such as those used during atelectasis to strengthen the muscles used in expiration and to empty the alveoli of retained gas.

■ OUTCOME CRITERIA: When shallow breathing replaces deep breathing, mucus tends to dry in the airway, damaging the membranes that line the passages. Coughing and deep breathing improve ventilation and gas exchange by clearing the mucus and allowing moisturized air to enter the bronchi, bronchioles, and alveoli, preventing atelectosis and pneumonia.

deep circumflex iliac artery, a branch of the external iliac artery that, with the interior epigastric artery, supplies the inferior part of the abdominal wall.

deep dorsal vein, the vein that drains the erectile tissues of the clitoris and penis.

deep fascia, the most extensive of three kinds of fascia comprising an intricate series of connective sheets and bands that hold the muscles and other structures in place throughout the body, wrapping the muscles in gray, feltlike membranes. The deep fasciae comprise a continuous system, splitting and fusing in an elaborate network attached to the skeleton and divided into the outer investing layer, the internal investing layer, and the intermediate membranes. Compare **subcutaneous fascia, subserous fascia.**

deep heat, the application of heat in the treatment of deep body tissues, particularly muscles and tendons. The thermal effects may be produced with shortwave therapy, phonophoresis, or ultrasound.

deepithelialization. See **epithelial debridement.**

deep lamellar endothelial keratoplasty (DLEK), a procedure in which a small incision is used to remove only the diseased tissue without transplanting the entire cornea. Only the inside layer of the cornea is replaced. This technique avoids the astigmatism that often occurs with penetrating keratoplasty and greatly reduces the risk of infection. Also called **lamellar transplant, split-thickness transplant.** See also **corneal grafting.**

deep massage, massage techniques whose purpose is to reach structures beneath the superficial tissue, using effleurage, direct pressure, or friction applied perpendicular to the fibers of the affected tissue.

deep palmar arch, the termination of the radial artery, joining the deep palmar branch of the ulnar artery in the palm of the hand.

deep perineal pouch, a thin space superior to the perineal membrane that contains a layer of skeletal muscle and various neurovascular elements.

deep petrosal nerve, a nerve formed in the internal carotid plexus that leaves the plexus in the middle cranial fossa and joins the greater petrosal branch of the facial nerve. It carries postganglionic sympathetic fibers destined mainly for blood vessels.

deep reflexes [ME, *dep,* hollow; L, *reflectere,* to bend back], any reflexes caused by stimulation of a deep body structure, such as a tendon reflex.

deep sedation, a state of a depressed level of consciousness with a partial loss of protective reflexes. The individual may not be able to maintain their airway and may not respond to verbal commands, but responds purposefully following repeated or painful stimulation. This state is produced by pharmacological means. The patient maintains normal cardiovascular function.

deep sensation, the awareness or perception of pain, pressure, or tension in the deep layers of the skin, muscles, tendons, or joints. Such sensations are conveyed to the brain via the spinal column. Compare **superficial sensation.**

deep structure, (in linguistics and neurolinguistics) the deeper experience and meaning to which surface structures in a communication may refer.

deep temporal artery, one of the branches of the maxillary artery on each side of the head. It branches into the anterior portion and the posterior portion, both rising between the temporalis and the pericranium to supply the temporalis and to anastomose with the middle temporal artery. The anterior branch communicates with the lacrimal artery by small branches that pierce the zygomatic bone and the great wing of the sphenoid. Compare **middle temporal artery, superficial temporal artery.**

deep tendon reflex (DTR), a brisk contraction of a muscle in response to a sudden stretch induced by a sharp tap by a finger or rubber hammer on the tendon of insertion of the muscle. Absence of the reflex may be caused by damage to the muscle, peripheral nerve, nerve roots, or spinal cord at that level. A hyperactive reflex may indicate disease of the pyramidal tract above the level of the reflex arc being tested. Generalized hyperactivity of DTRs may be caused by hyperthyroidism. Kinds of DTRs include **Achilles tendon reflex, biceps reflex, brachioradialis reflex, patellar reflex,** and **triceps reflex.** Also called **myostatic reflex, tendon reflex.**

deep transverse metatarsal ligaments, the ligaments that link together the distal heads of the metatarsals at the metatarsophalangeal joints.

deep transverse perineal muscle, a muscle on each side of the perineal membrane thought to stabilize the position of the perineal body, a midline structure along the posterior edge of the perineal membrane.

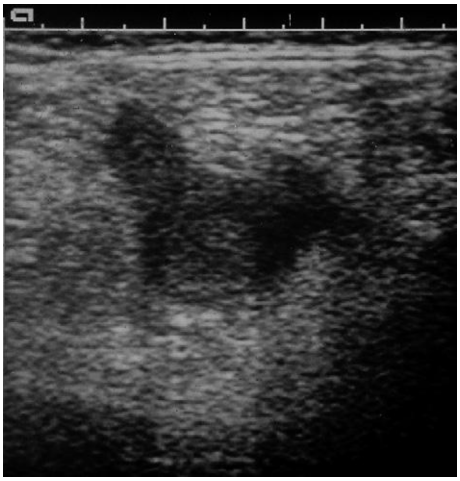
deep vein, one of the many systemic veins that accompany the arteries, usually enclosed in a sheath that wraps both the vein and the associated artery. Various structures, such as the skull, vertebral column, and liver, are served by less closely associated arteries and veins. Compare **superficial vein.**

deep vein thrombosis (DVT), a disorder involving a thrombus in one of the deep veins of the body, most commonly the iliac or femoral vein. Symptoms include tenderness, pain, swelling, warmth, and discoloration of the skin. A deep vein thrombus is potentially life threatening. Treatment, including bed rest and use of thrombolytic and anticoagulant drugs, is directed to preventing movement of the thrombus toward the lungs. See also **pulmonary embolism.**

■ OBSERVATIONS: It may be asymptomatic or manifest as tenderness, pain, warmth, and swelling in the affected extremity with deep reddish or blue color. There is a positive Homans' sign in about 10% of cases, which affects a lower extremity. Serial compression ultrasonography is the initial test used for diagnosis. Magnetic resonance direct thrombus imaging may be used for thrombi undetectable on ultrasound. Contrast venography remains the gold standard for detection of lower extremity DVT. Chronic venous insufficiency and pulmonary embolus are the most common complications of thrombosis.

■ INTERVENTIONS: Initial treatment is heparin or enoxaparin followed by warfarin for maintenance treatment for 3 to 6 months. Continued monitoring of prothrombin time and partial thromboplastin time is done during anticoagulant therapy. Ligation, clipping, plication, and thrombectomy are surgical alternatives when thrombus fails to respond to anticoagulant therapy. An extravascular vena cava interruption with possible placement of intracaval filter is used for cases involving probable emboli. Analgesics are given for pain; however, aspirin is contraindicated because it interferes with platelet function. Enoxaparin may be used with patients at high risk for DVT to prevent thrombus formation.

■ NURSING CONSIDERATIONS: Acute care nursing goals focus on prevention of pulmonary emboli, pain relief, prevention of skin breakdown, and prevention of complications related to anticoagulant therapy. Bed rest is instituted for the first several days after beginning anticoagulant with elevation of affected extremity above the level of the heart and use of warm, moist packs. When ambulation is resumed, compression stockings are used to support vein walls and reduce pain and swelling. Individuals are closely observed for signs of bleeding (e.g., gums, nasal mucosa, stool, and urine). Safety precautions are instituted to prevent bruising while on anticoagulants and to prevent skin ulceration of affected extremity. Individuals are monitored for manifestations of pulmonary emboli, including sudden dyspnea, tachypnea, and pleuritic chest pain. Education is important and includes effects and side effects of anticoagulant therapy; need for ongoing blood tests to monitor clotting and regulate anticoagulant dosage; avoidance of activities that may precipitate bleeding; avoidance of anticoagulant over-the-counter medications that may interfere with clotting (e.g., aspirin/aspirin products, NSAIDs, and herbal products). Education is needed about signs of pulmonary embolus and the need for immediate medical attention should they occur. Instruction is provided to prevent pooled blood in the lower extremities, including regular use of compression garments and avoidance of prolonged standing, sitting, or walking. Teaching also includes prevention of future thrombosis episodes, such as avoidance or correction of modifiable risk factors (e.g., tobacco use or alcohol abuse, use of oral contraceptives or hormone replacement therapy, and prolonged periods of inactivity), regular exercise program, proper posture, and balanced diet with weight loss if indicated.



Deep vein thrombosis in pregnancy: ultrasound scan *(Greer et al, 2001)*

deep x-ray therapy, the treatment of internal neoplasms, such as Wilms' tumor of the kidney, Hodgkin's disease, and other cancers, with ionizing radiation from an external source. The dose delivered is determined according to the radiosensitivity, size, pathological grade, and differentiation of the tumor; the tolerance of normal surrounding tissue to irradiation; and the patient's condition. Deep x-ray therapy frequently causes nausea, malaise, diarrhea, and skin reactions, such as blanching, erythema, itching, burning, oozing, or desquamation, but with modern techniques the ray is beamed directly to the site, reducing side scatter, and the skin can be spared. Because tumor cells are hypoxic and are more effectively eradicated when they are well oxygenated, the patient may breathe hyperbaric oxygen or atmospheric oxygen with 5% carbon dioxide during therapy.

deerfly fever. See **tularemia.**

DEET, abbreviation for *diethyltoluamide,* an insect repellant.

defaecation. See **defecation.**

defamation /def′əmā′shən/ [L, *diffamare,* to discredit], any communication, written or spoken, that is untrue and that injures the good name or reputation of another or that in any way brings that person into disrepute.

default judgment /difôlt′/ [L, *defallere,* to lack, *judicare,* to decide], (in law) a judgment rendered against a defendant as a result of the defendant's failure to appear in court or to answer the plaintiff's claim within the proper time.

defecation /def′ikā′shən/ [L, *defaecare,* to clean], the elimination of feces from the digestive tract through the rectum. Also spelled **defaecation.** See also **constipation, diarrhea, feces.** —*defecate* /def′ikāt/, *v.*

defecation reflex. See **rectal reflex.**

defecography /def′əkog′rəfē/, the radiographic examination of the rectum and anal canal of patients with defecative dysfunction. A barium sulfate paste is instilled directly into the rectum, and the patient is seated on a radiolucent commode in front of a fluoroscope. Lateral projections of the rectum and anal canal are recorded during defecation.

defective /difek′tiv/ [L, *defectus,* a failing], pertaining to something that is imperfect, or, as in an outdated term, to an individual who may be suffering from any disorder.

defendant /difen′dənt/, (in law) the party named in a plaintiff's complaint and against whom the plaintiff's allegations are made. The defendant must respond to the allegations.

defense /də·fens′/ [L, *defendere,* to ward off], the practice of, or measures taken to ensure, self-protection.

defense mechanism [L, *defendere,* to repulse, *mechanicus,* machine], an unconscious intrapsychic reaction that offers protection to the self from stress or a threat. Defense mechanisms are of two types: those that diminish anxiety and are used by an individual to integrate more fully into society and those that do not reduce anxiety but simply postpone the effects of feeling it. Anxiety-reducing defenses include compensation, identification, introjection, some forms of repression, and sublimation. Defenses that postpone full expression of anxiety include denial, displacement, isolation, projection, reaction formation, rationalization, regression, some forms of repression, suppression, and undoing.

defense reflex, an autonomic defensive response by an animal when threatened. The response may consist of dilated pupils, baring of claws, or raising of feathers or hair.

defensin /difen′sin/, a peptide with natural antibiotic activity found within human neutrophils. Three types of defensins have been identified, each consisting of a chain of about 30 amino acids. Similar molecules occur in white blood cells of other animal species. They show activity toward viruses and fungi, in addition to bacteria.

defensive radical therapy /difen′siv/, (in psychology) a view of the therapeutic process in which the therapist begins at the patient's present state and encourages the patient to avoid self-defeating behavior as a survival tactic. The goal is to create social awareness clients can use in coping with oppressive environments.

deferasirox, a rarely used heavy metal chelating agent.

- ■ INDICATION: This drug is used to treat chronic iron overload.
- ■ CONTRAINDICATIONS: Lactation, severe hepatic or renal disease, and known hypersensitivity to this drug prohibit its use. Its use is also contraindicated in children.

deferens /def′ərenz/ [L], carrying away. Also **deferent.**

deferent duct. See **vas deferens.**

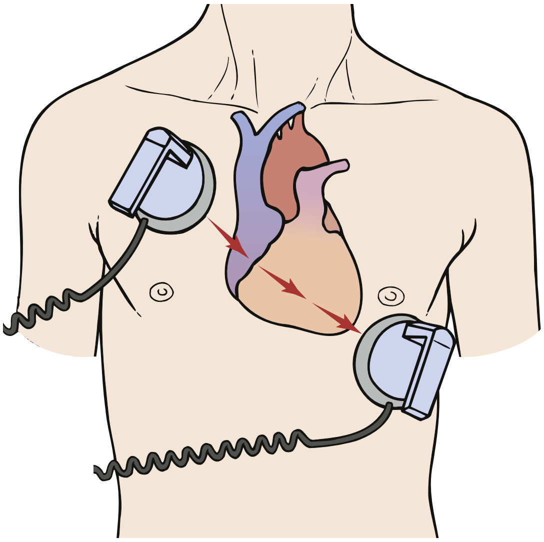
deferoxamine mesylate /dē′fərok′səmēn/, a chelating agent with specific affinity for ferric iron and low affinity for calcium.

- ■ INDICATIONS: It is prescribed in the treatment of acute iron intoxication and chronic iron overload.
- ■ CONTRAINDICATIONS: Renal disease or anuria prohibits its use.
- ■ ADVERSE EFFECTS: Among the most serious adverse reactions are hypotension, tachycardia, dysuria, visual difficulties, and anaphylactoid reactions.

defervescence /di′fərves′əns/ [L, *defervescere,* to reduce heat], the diminishing or disappearance of a fever. —*defervescent, adj.*

defibrillate /difī′brilāt, difib′-/ [L, *de* + *fibrilla,* little thread], to stop fibrillation of the ventricles by delivering an electrical shock through the chest wall. See also **defibrillation.**

defibrillation /difī′brilā′shən/, the termination of ventricular fibrillation or pulseless ventricular tachycardia (inefficient, asynchronous contraction) by delivery of an electric shock to the patient's precordium. It is a common emergency measure generally performed by a physician or specially trained nurse or paramedic. Defibrillation may be accomplished with defibrillator or special defibrillator pads. In external defibrillation, one paddle is placed to the right of the upper sternum below the clavicle, and the other is applied to the midaxillary line of the left lower rib cage. In internal defibrillation, which may be performed during open-heart surgery, the paddles are placed directly on the heart. The defibrillator, usually a condenser-discharge system, is set to deliver between 200 and 360 J. If shocks fail to restore a perfusion rhythm, cardiopulmonary resuscitation is begun. Repeat shocks also are attempted periodically until ventricular fibrillation ceases. —**defibrillate,** *v.*



Paddle placement and current flow in defibrillation *(Lewis et al, 2011)*

defibrillator /difī′brilā′tər, difib′-/, a device that delivers an electrical shock at a preset voltage to the myocardium. It is used for restoring the normal cardiac rhythm and rate when the heart has stopped beating or is fibrillating. See also **implantable cardioverter-defibrillator.**

defibrillator management: external, a nursing intervention from the Nursing Interventions Classification (NIC) defined as care of the patient receiving defibrillation for termination of life-threatening cardiac rhythm disturbances. See also **Nursing Interventions Classification.**

defibrillator management: internal, a nursing intervention from the Nursing Interventions Classification (NIC) defined as care of the patient receiving permanent detection and termination of life-threatening cardiac rhythm disturbances through the insertion and use of an internal cardiac defibrillator. See also **Nursing Interventions Classification.**

defibrination, the in-vitro removal of fibrin from blood to prevent clotting.

defibrination syndrome. See **disseminated intravascular coagulation.**

deficiency /difish′ənsē/, a lack or shortage of something.

deficiency disease [L, *de* + *facere,* to make, *dis,* opposite of; Fr, *aise,* ease], a condition resulting from the lack of one or more essential nutrients in the diet; from metabolic dysfunction; or from impaired digestion or absorption, excessive excretion, or increased biological requirements. Compare **malnutrition.** See also **avitaminosis.**

deficiency of sweating [AS, *swaetan*], a failure of the sweat glands to secrete perspiration in normal amounts. The condition may be the result of a congenital defect, a blockage of the sweat ducts as a sequel to prickly heat, excessive heat, autonomic neuropathy, or conditions such as hemorrhage or diarrhea that cause body fluid loss. Also called **anhidrosis.**

deficit /def′isit/, any deficiency or difference from what is normal, such as an oxygen deficit, a cause of hypoxia.

defined formula diet, nutritional support provided by simple elemental nutritive components that require no further digestive breakdown and thus are readily absorbed. Examples include free amino acids from hydrolyzed protein and the simple sugar glucose, a carbohydrate. Also called *chemically defined formula diet,* **elemental formula.**

definitive /difin′ətiv/ [L, *definitivus,* a limiting], **1.** final; clearly established without doubt or question. **2.** (in embryology) fully formed in the final differentiation of a tissue, structure, or organ. Compare **primitive. 3.** (in parasitology) pertaining to the host in which the parasite undergoes the sexual phase of its reproductive cycle.

definitive host, any host organism in which a parasite reproduces sexually. The female ***Anopheles*** mosquito is the definitive host for malaria. Humans are definitive hosts for pinworms, schistosomes, and tapeworms. Also called **primary host.** Compare **dead-end host, intermediate host, reservoir host.** See also **host.**

definitive prosthesis, a permanent prosthetic device that replaces an immediate-fit appliance such as a pylon. In some cases a definitive prosthesis is used only when full weight-bearing on an artificial limb is feasible, which may follow amputation by 6 weeks or longer.

definitive treatment, any therapy generally accepted as a specific cure of a disease. Compare **expectant treatment, palliative treatment.**

defloration /def′lôrā′shən/ [L, *de* + *flos,* flower, *atio,* process], the rupture of the vaginal hymen. Defloration may occur during sexual intercourse, during a gynecological examination, through the use of tampons, in athletic sports activity, or by surgery if necessary to remove an obstruction to menstrual flow.

deformity /difôr′mitē/ [L, *deformis*, misshapen], distortion, disfigurement, flaw, malformation, or misshape that affects the body in general or any part of it. It may be the result of disease, injury, or birth defect. Examples include Arnold-Chiari deformity, in which a part of the brain protrudes through the base of the skull into the spinal canal, and seal-fin deformity, characterized by a deviation of the fingers as an effect of rheumatoid arthritis.

deg, **1.** abbreviation for **degeneration. 2.** abbreviation for **degree.**

degenerate [L, *degenerare*], **1.** *v*, (də·jen′er·āt) to change from a higher to a lower type or form. **2.** *adj*, (də·jen′er·ət) characterized by degeneration.

degeneration (deg) /dijen′ərā′shən/ [L, *degenerare,* to become unlike others], the gradual deterioration of normal cells and body functions.

degenerative /dijen′ərətiv/ [L, *degenerare,* to become unlike others], pertaining to or involving degeneration or change to a lower or dysfunctional form.

degenerative chorea. See **Huntington's disease.**

degenerative disease, any disease in which deterioration of structure or function of tissue occurs. Kinds of degenerative diseases include **arteriosclerosis, cancer,** and **osteoarthritis.**

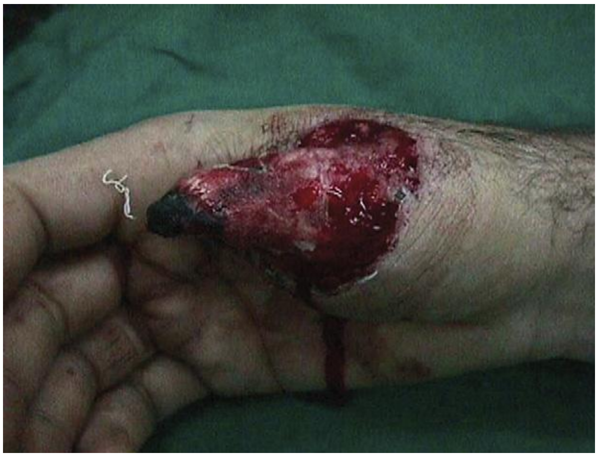
degenerative joint disease. See **osteoarthritis.**

degenerative lesion [L, *degenerare,* to become unlike others, *laesio,* hurting], an injury or disease state that results in loss of function.

degenerative neuralgia [L, *degenerare,* to become unlike others; Gk, *neuron,* nerve, *algos,* pain], a form of neuralgia caused by degenerative changes in nervous tissue, which usually affects older people.

degenerative neuritis [L, *degenerare,* to become unlike others; Gk, *neuron,* nerve, *itis,* inflammation], an inflammation caused by degenerative changes in nervous tissue.

degloving /dēglov′ing/ [L, *de* + AS, *glof*], **1.** an injury to an extremity—finger, hand, arm, leg, or foot—in which the soft tissue down to the bone, including neurovascular bundles and sometimes tendons, is traumatically peeled off. **2.** (in dentistry) the exposure of the bony mandibular anterior or posterior regions by oral surgery or trauma. **3.** removal of latex or vinyl hand coverings.



Degloving injury of the thumb *(Fatemi, 2007)*

deglutition /di′glo͞otish′ən/ [L, *deglutire,* to swallow], swallowing.

deglutition apnea, the normal absence of respiration during swallowing.

Degos' disease. See **malignant atrophic papulosis.**

degradation /di′grədā′shən/ [L, *de* + *gradu,* step], the conversion of a chemical compound to a less complex compound, usually by splitting off one or more groups or subgroups of atoms, as in deamination. —*degrade, adj.*

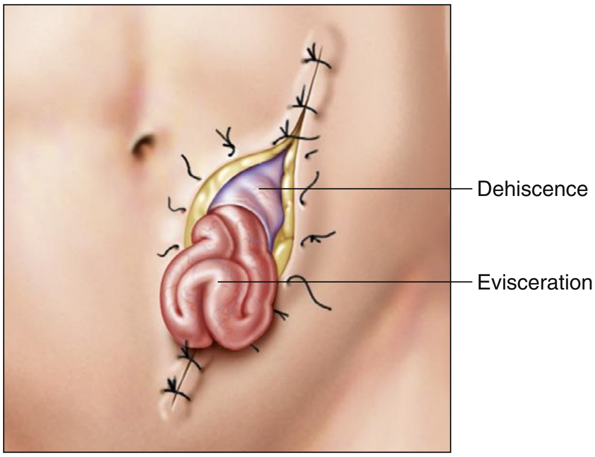
degranulation /dēgran′yəlā′shən/, the release of granules from cells, such as mast cells and basophils.

degree (deg) [Fr, *degre*], one of the divisions or intervals marked on a scale of units of measurement.

degrees of freedom (df), a statistical measure of the number of independent observations or choices among members in a sample. It is used in determining the statistical significance of findings during data analysis.

degustation /dē′gəstā′shən/ [L, *degustare,* to taste], the act of tasting.

dehiscence /dihis′əns/ [L, *dehiscere,* to gape], the separation of a surgical incision or rupture of a wound closure, typically an abdominal incision.



Wound dehiscence *(Ignatavicius and Workman, 2010)*

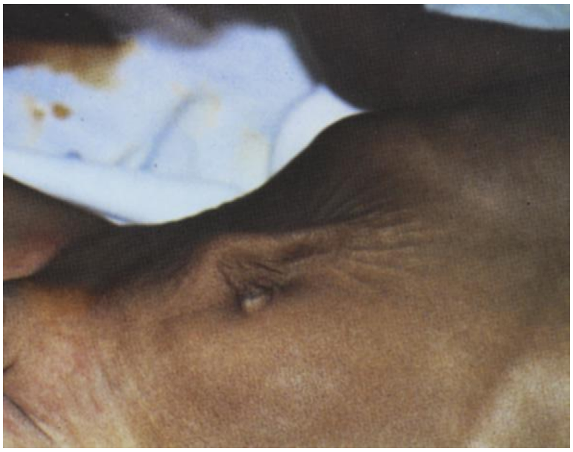
dehumanization /dihyo͞o′mənīzā′shən/ [L, *de,* from, *humanitas,* human nature], the process of losing altruistic or individual qualities, as may occur in some psychotic states or in environments that produce emotional trauma (prisoner-of-war). It may be influenced by external forces.

dehumidifier /dē′yo͞omid′ifī′ər/, an apparatus to remove moisture in the atmosphere.

dehydrate /dihī′drāt/ [L, *de* + Gk, *hydor,* water], **1.** to remove or lose water from a substance. **2.** to lose excessive water from the body.

dehydrated alcohol, a clear, colorless, highly hygroscopic liquid with a burning taste, containing at least 99.5% ethyl alcohol by volume. Also called **absolute alcohol**, *anhydrous alcohol*.

dehydration /di′hīdrā′shən/, **1.** excessive loss of water from body tissues. Dehydration is accompanied by a disturbance in the balance of essential electrolytes, particularly sodium, potassium, and chloride. It may follow prolonged fever, diarrhea, vomiting, acidosis, and any condition in which there is rapid depletion of body fluids. It is of particular concern among infants and young children because their electrolyte balance is normally precarious. Signs of dehydration include poor skin turgor (not a reliable sign in the elderly), flushed dry skin, coated tongue, dry mucous membranes, oliguria, irritability, and confusion. Normal fluid volume and balanced electrolyte values are the primary goals of therapy. **2.** rendering a substance free from water. Also called **anhydration.**



Dehydration resulting in poor skin turgor

(Zitelli and Davis, 2007)

dehydration fever, a fever that frequently occurs in newborns, thought to be caused by dehydration. Also called ***inanition fever.*** Compare **inanition, starvation.**

dehydration of gingivae, the drying of gum tissue, often the result of mouth breathing. Dehydration lowers the resistance of the gingivae to infection.

dehydrogenate, to remove hydrogen atoms, as in the oxidation processes.

deinstitutionalization /dē·in′stityo͞o′shənal′īzā′shən/ [L, *de* + *instituere,* to put in place], a change in the location and focus of mental health care from an institutional to a community setting.

Deiters' nucleus /dī′tərz, dē′terz/ [Otto F.C. Deiters, German anatomist, 1834–1863], one of the vestibular nuclei located in the brainstem.

DEJ, abbreviation for **dentinoenamel junction.**

déjà vu /dāzhä vY′, -vē′, -vo͞o′/ [Fr, previously seen], the sensation or illusion that one is encountering a set of circumstances or a place that was previously experienced. The phenomenon, which is normal in everyone but occurs more frequently or continuously in certain emotional and organic disorders, results from some unconscious emotional connection with the present experience. Compare **jamais vu, paramnesia.**

Déjérine-Klumpke's paralysis. See **Klumpke's palsy.**

Déjérine-Roussy syndrome. See **thalamic syndrome.**

Déjérine-Sottas disease /dezh′ərin sot′əz, -sotäz′/ [Joseph J. Déjérine, French neurologist, 1849–1917; Jules Sottas, French neurologist, 1866–1943], a rare congenital spinocerebellar disorder characterized by the development of palpable thickenings along peripheral nerves, degeneration of the peripheral nervous system, pain, paresthesia, ataxia, and diminished sensation and deep tendon reflexes. Diagnosis is made by a histological examination of a peripheral nerve. There is no specific treatment. Also called **progressive interstitial hypertrophic neuropathy.**

deka-, prefix indicating the multiple 10.

del, abbreviation for **deletion.**

Delaney clause, a 1960 amendment to the 1938 Federal Food, Drug, and Cosmetic Act regulating food additives. It prohibits the use of any food substance found to be carcinogenic in humans or animals. Food products not previously found to be carcinogenic were classified historically as "Generally Regarded As Safe," or GRAS.

Delano, Jane A, (1862–1919), an American nurse who organized the American Red Cross Nursing Service, an association formed to supply nurses to the military forces. She became director of the Nurses' Training School of the University of Pennsylvania in 1891 and was later appointed director of the Bellevue Hospital Training School for Nurses in New York, where she had been trained. On a trip to survey nursing conditions in Europe, she died after surgery for a mastoid infection at Base Hospital, Savenay, France, in March 1919.

delavirdine, a nonnucleoside reverse transcriptase inhibitor.

■ INDICATIONS: It is used to treat HIV-1 in combination with zidovudine or didanosine.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to atevirdine prohibits its use.

■ ADVERSE EFFECTS: Life-threatening effects are hepatotoxicity, neutropenia, leukopenia, thrombocytopenia, anemia, granulocytopenia, and nephrotoxicity. Other adverse effects include diarrhea, abdominal pain, nausea, fatigue, headache, rash, pain, myalgia, vomiting, and dyspepsia.

delayed dentition. See **retarded dentition.**

delayed echolalia [Fr, *delai,* time extension; Gk, *echo,* sound, *lalein,* to babble], a phenomenon, commonly seen

Clinical manifestations of dehydration

Manifestation	*Isotonic (loss of water and salt)*	*Hypotonic (loss of salt in excess of water)*	*Hypertonic (loss of water in excess of salt)*
Skin			
Color	Gray	Gray	Gray
Temperature	Cold	Cold	Cold or hot
Turgor	Poor	Very poor	Fair
Feel	Dry	Clammy	Thickened, doughy
Mucous membranes	Dry	Slightly moist	Parched
Tearing and salivation	Absent	Absent	Absent
Eyeball	Sunken	Sunken	Sunken
Fontanel	Sunken	Sunken	Sunken
Body temperature	Subnormal or elevated	Subnormal or elevated	Subnormal or elevated
Pulse	Rapid	Very rapid	Moderately rapid
Respirations	Rapid	Rapid	Rapid
Behavior	Irritable to lethargic	Lethargic or comatose; convulsions	Marked lethargy with extreme hyperirritability on stimulation

From Hockenberry MJ, Wilson D: *Wong's nursing care of infants and children,* ed 9, St Louis, 2011, Mosby.

in schizophrenia, involving the meaningless automatic repetition of overheard words and phrases. It occurs hours, days, or even weeks after the original stimulus.

delayed graft [ME, *delaein,* to leave; Gk, *graphein,* stylus], a type of skin graft that is partially elevated and reinserted later in the same place.

delayed hypersensitivity, the type of hypersensitivity which (as opposed to immediate hypersensitivity) takes 24 to 72 hours to develop and is mediated by T lymphocytes rather than by antibodies. Compare **immediate hypersensitivity.**

delayed hypersensitivity reaction, a reaction of cellular immunity, named in contrast to immediate hypersensitivity reactions because its onset is 24 to 72 hours after the antigenic challenge. The term is usually used to denote the subset of type IV hypersensitivity reactions involving cytokine release and macrophage activation, as opposed to direct cytolysis, but can be used more broadly, sometimes even as a synonym for type IV hypersensitivity reaction. The classic delayed hypersensitivity reaction is the tuberculin reaction observed in skin testing. See also **hypersensitivity reaction**.

delayed language, failure of language to develop at the expected age.

delayed onset muscle soreness, muscle weakness, restricted range of motion, and tenderness on palpation, occurring 24 to 48 hours after intense or prolonged muscular activity.

delayed postpartum hemorrhage, hemorrhage occurring later than 24 hours after giving birth. It is most often caused by retained fragments of the placenta, a laceration of the cervix or vagina that was not discovered or was not completely sutured, or subinvolution of the placental site within the uterus. Characteristics of delayed postpartum hemorrhage are heavy bleeding and signs of impending shock and anemia. The cause is diagnosed and treated. A laceration is closed with suture, retained fragments of placenta are removed, infection is treated with antibiotics, or the relaxed uterus is caused to contract by the administration of ergonovine (Ergotrate) or oxytocin.

delayed sensation, a feeling or impression that is not experienced immediately after a stimulus. See also **sensation.**

delayed symptom [Fr, *delai* + Gk, *symptoma,* that which happens], a symptom such as shock that does not appear until after the precipitating cause.

delayed treatment seeker, (in psychology) a person who delays seeking treatment for a problematic life event such as a sexual assault until months or years after the event, usually after a precipitating event such as an anniversary reaction.

delayed-type hypersensitivity (DTH), a delayed hypersensitivity. See also **cell-mediated immune response.**

delayed vomiting, vomiting occurring much later than its stimulus, such as several hours after a meal or several days after a course of chemotherapy.

Delecato-Doman theory, a therapeutic concept that full neurological organization of a disabled or mentally retarded child requires that the child pass through developmental patterns covering progressively higher anatomical levels of the nervous system. The first five levels take the child from infantile reflexes through walking. The sixth covers cortical hemispheric dominance.

delegation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as transfer of responsibility for the performance of patient care while retaining accountability for the outcome. See also **Nursing Interventions Classification.**

deleterious/delˊitirʹē·əs/ [Gk,*deleterios,*destroyer], harmful or dangerous.

deletion (del) /dilēʹshən/ [L,*deletionum,* destruction], the loss of a piece of a chromosome.

deletion syndrome, any of a group of congenital autosomal anomalies that result from the loss of part of a chromosome as a result of breakage of a chromatid during meiosis. An example is cat-cry syndrome, which results from the absence of the short arm of chromosome 5.

Delhi boil. See **cutaneous leishmaniasis.**

deliberate biological programming /dilibʹərit/ [L, *deliberare,* to weigh carefully], the Hayflick theory of aging, based on studies showing that human cells contain biological clocks that predetermine death after undergoing mitosis a finite number of times. Research based on this theory indicated that the average human life span is 115 years.

deliberate hypotension, a technique in general anesthesia in which a short-acting hypotensive agent is administered to reduce blood pressure and thus bleeding during surgery. The procedure facilitates surgery by making vessels and tissues more visible and reducing blood loss. Also called **hypotensive anesthesia, hypotensive technique**.

delinquency /dilingʹkwənsē/ [L, *delinquere,* to fail], **1.** negligence or failure to fulfill a duty or obligation. **2.** an offense, fault, misdemeanor, or misdeed; a tendency to commit such acts. See also **juvenile delinquency.**

delinquent /dilingʹkwənt/, **1.** *adj,* characterized by neglect of duty or violation of law. **2.** *n,* one whose behavior is characterized by persistent antisocial, illegal, violent, or criminal acts. See also **juvenile delinquent.**

délire de toucher /dālirʹdə to͞oshāʹ/ [Fr], an abnormal desire or irresistible urge to touch objects.

delirious. See **delirium.**

delirious mania /dilirʹē·əs/, an extreme form of the manic state in which activity is so frenzied, confused, and incoherent that it is difficult to discern any link between affect and behavior.

delirium /dilirʹē·əm/ [L, *delirare,* to rave], **1.** a state of frenzied excitement or wild enthusiasm. **2.** an acute organic mental disorder characterized by confusion, disorientation, restlessness, clouding of the consciousness, incoherence, fear, anxiety, excitement, and, often, illusions; hallucinations, usually of visual origin; and, at times, delusions. The condition is caused by disturbances in cerebral functions that may result from a wide range of metabolic disorders, including nutritional deficiencies and endocrine imbalances; postpartum or postoperative stress; ingestion of toxic substances, such as various gases, metals, or drugs, including alcohol; and other causes of physical and mental shock or exhaustion. The symptoms are usually of short duration and reversible with treatment of the underlying cause; in extreme cases, however, in which the toxic condition is exceedingly severe or prolonged, permanent brain damage may occur. Kinds of delirium include **acute delirium, chronic delirium, delirium tremens, exhaustion delirium,** *senile delirium,* and **traumatic delirium.** Compare **dementia. —delirious,** *adj*.

■ OBSERVATIONS: There is a rapid onset and acute change in mentation. Manifestations include fluctuating levels of consciousness; disorientation; impaired memory; inability to maintain or shift attention; irritability, agitation, restlessness, and hyperactivity; perceptual disturbance, hallucinations, and delusions; rambling and fragmented speech; and impaired sleep-wake cycle. There are typically lucid intervals with symptoms worsening at night. Duration of symptoms is limited. There are four *DSM-IV* diagnostic criteria for delirium: (1) disturbance of consciousness with reduced awareness and diminished abilities to focus and to maintain or shift attention; (2) a change in cognition, such as disorientation, memory loss, or language disturbance; (3) the development of the disturbance over a period of hours to days, with fluctuation during the day; and (4) evidence from clinical exam and/or lab findings that the disturbance is caused by physiological consequences of a medical condition. Delirium places medically ill individuals at greater risk for medical complications (pneumonia and decubitus) and is associated with functional decline and institutional placement. Delirium may lead to dementia.

■ INTERVENTIONS: Intervention centers around removal or withdrawal from toxic agents (alcohol and barbiturates) and IV sedation with antianxiety and antipsychotic agents for agitation, seizure activity, and tremors. Adequate fluid and electrolyte balance is also crucial.

■ NURSING CONSIDERATIONS: Nursing care during an acute episode of delirium is aimed at support, reduction of confusion and agitated behavior, and prevention of injury. Interventions include seizure precautions, safety precautions (e.g., prevent wandering and climbing over bedrails), environmental control (adequate lighting, noise reduction, clear space, removal of hazards, avoidance of sensory extremes, and allowance for adequate sleep), reorientation procedures (e.g., clocks, calendars, familiar objects, use of glasses and hearing aids), consistency of caretakers, and family involvement. Restraints should be avoided. Tactics to prevent delirium are crucial in susceptible individuals (e.g., those with chronic or mental illness, altered sensory perception, or neurological disease; those with elevated ammonia, increased blood urea nitrogen, or hypoxia; those on CNS stimulants or depressants), and those in altered environments (e.g., ICU, isolation, incubators, and institutions). This is accomplished by assessing and removing noxious environmental stimuli while increasing meaningful stimuli. Reduction of risk factors (e.g., sleep deprivation, visual or hearing impediments, adverse medications, dehydration, and pain) and use of orienting features (e.g., clocks, calendars, windows, and familiar objects) are important, as is maintaining verbal and nonverbal contact, with judicious use of touch. Structuring and explaining routines and procedures and interpreting sights, sounds, and smells in the environment are also crucial in preventing delirium.

delirium constantium, (in psychiatry) a patient's reiteration of a fixed idea.

delirium management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as provision of a safe and therapeutic environment for the patient who is experiencing an acute confusional state. See also **Nursing Interventions Classification.**

delirium of persecution [L, *delirare,* to rave, *persecutor,* to pursue], a state of clouded consciousness or decreased sensorium in which the person believes others are threatening or conspiring against him or her.

delirium tremens (DTs), an acute and sometimes fatal psychotic reaction caused by abrupt cessation of excessive intake of alcoholic beverages. Initial symptoms include loss of appetite, insomnia, and general restlessness, which are followed by agitation; excitement; disorientation; mental confusion; vivid and often frightening hallucinations; acute fear and anxiety; illusions and delusions; coarse tremors of the hands, feet, legs, and tongue; fever; increased heart rate; extreme perspiration; GI distress; and precordial pain. The episode, which usually constitutes a medical emergency, typically lasts from 3 to 6 days and is generally followed by a deep sleep. See also **alcohol withdrawal syndrome, Korsakoff's psychosis.**

delivery /diliv′ərē/ [L, *de* + *liberare,* to free], (in obstetrics) the birth of a child. Also called **parturition.** See also **Bradley method, Lamaze method, Leboyer method of delivery, Read method.**

delivery room, a unit of a hospital used for childbirth and infant resuscitation.

DeLorme technique, a method of exercise with weights for the purpose of strengthening muscles in which sets of repetitions are repeated with rests between sets. The technique involves isotonic exercise and determination of the maximum level of resistance. See also **progressive resistance exercise.**

delousing /dēlou′sing/ [L, *de,* from; AS, *lus*], ridding a person or object of an infestation of lice.

delta /del′tə/, Δ, δ, fourth letter of the Greek alphabet.

delta-1-testolactone. See **testolactone.**

delta-9-tetrahydrocannabinol (THC), a pharmacologically active ingredient of cannabis that has been used in treating some cases of nausea and vomiting associated with cancer chemotherapy. See also **cannabis, dronabinol.**

delta agent, a defective viral agent that occurs only in association with hepatitis B infection. It causes chronic hepatitis and progressive liver damage. The delta agent is able to induce infection only when it is a coinfection present along with hepatitis B. It occurs in 5% of people with hepatitis; it infects about 15 million people worldwide.

delta-aminolevulinic acid test, a urine test to diagnose porphyria. It can also be used to diagnose lead intoxication, chronic alcoholic disorders, and diabetic ketoacidosis.

delta hepatitis. See **hepatitis D.**

delta optical density analysis [Gk, *delta,* fourth letter of Greek alphabet, *optikos,* of sight; L, *densus,* thick; Gk, a loosening], a technique used to diagnose anemia in a fetus by measuring the proportion of bilirubin decomposition products in the amniotic fluid. The method involves spectrographic examination of a fluid sample. It measures the bilirubin and bilirubin-products concentration according to the wavelengths of light absorbed by the hemolytic products, as the bilirubin products alter the normal color of the amniotic fluid. The data are sometimes expressed in terms of δOD_{450}, the number representing the wavelength in nanometers at which maximum absorption of light by bilirubin occurs. If the delta optical density analysis indicates the fetus is moderately to severely anemic, immediate delivery is usually recommended when the gestational age permits. Otherwise, intrauterine fetal blood transfusions may be recommended.

Deltavirus /del′təvī′rəs/ [hepatitis *delta* + *virus*], a genus of satellite viruses that require a helper hepatitis B virus for their replication. An individual consists of spherical virion 35-37 nanometers in diameter with an envelope derived from the helper virus surrounding a spherical core 18 nm in diameter; the genome consists of a single molecule of single-stranded, negative-sense, circular RNA (size 1.7 kb). It contains a single species, hepatitis D virus. See also **hepatitis D.**

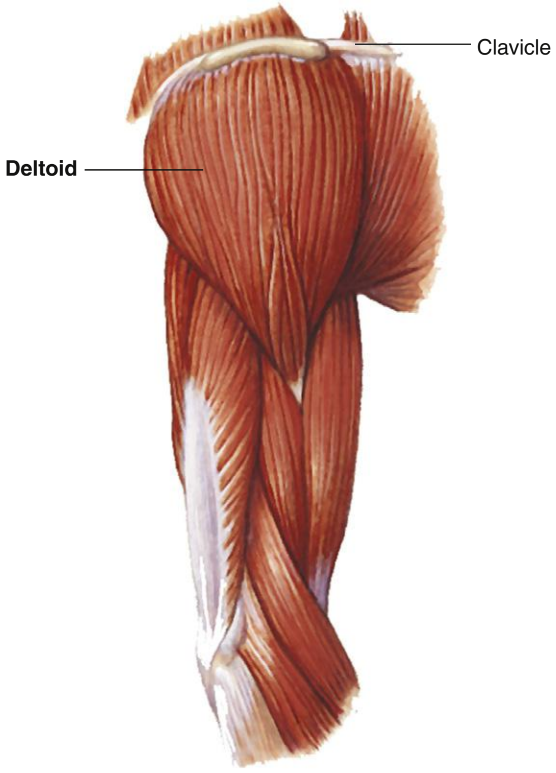
delta wave, **1.** also called *delta rhythm,* the slowest of several types of brain waves, characterized by a frequency of 4 Hz and a relatively high voltage. Delta waves are "deep-sleep waves" associated with a dreamless state from which an individual is not easily aroused. Compare **alpha wave, beta wave, theta wave.** **2.** (in cardiology) a slurring of the QRS portion of an electrocardiogram tracing caused by preexcitation in Wolff-Parkinson-White syndrome.

deltoid /del′toid/ [Gk, *delta,* triangular, *eidos,* form], **1.** triangular. **2.** pertaining to the deltoid muscle that covers the shoulder.

deltoideus. See **deltoid muscle.**

deltoid ligament [Gk, *delta* + L, *ligamentum*], the medial ligament of the ankle joint.

deltoid muscle, a large, thick triangular muscle that covers the shoulder joint. It is the prime mover of arm abduction. It is also a synergist of arm flexion, extension, and medial and lateral rotation. Also called **deltoideus.**



Deltoid muscle *(Patton and Thibodeau, 2010)*

deltopectoral triangle. See **clavipectoral triangle.**

delusion /dilo͞o′zhən/ [L, *deludere,* to deceive], a persistent aberrant belief or perception held inviolable by a person despite evidence that refutes it. Kinds of delusion include **delusion of being controlled, delusion of grandeur, delusion of persecution, nihilistic delusion,** *paranoid delusion,* and **somatic delusion.** Compare **illusion.**

delusion management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promoting the comfort, safety, and reality orientation of a patient experiencing false, fixed beliefs that have little or no basis in reality. See also **Nursing Interventions Classification.**

delusion of being controlled, the false belief that one's feelings, beliefs, thoughts, and acts are governed by some external force, as experienced in various forms of schizophrenia. See also **delusion.**

delusion of grandeur /grän′dyo͝or/, the gross exaggeration of one's importance, wealth, power, or talents, as manifested in such disorders as megalomania, general paresis, and paranoid schizophrenia. It may have a somatic or religious theme. See also **delusion.**

delusion of persecution, a morbid belief that one is being mistreated, harassed, or conspired against, as seen in paranoia and paranoid schizophrenia. The patient may single out a person or group as the source of persecution. See also **delusion.**

delusion of poverty, (in psychology) a false belief of a person that he or she is impoverished or will be deprived of material possessions.

delusion of reference. See **idea of reference.**

demand pacemaker [L, *demandere,* to give in charge, *passus,* step; ME, *maken*], a device used to stimulate the heart electrically when the heart's own impulses are not sufficient. The device measures the interval between the heart's native beats and delivers a stimulating pulse whenever that interval exceeds a set value.

demarcation /dē′märkā′shən/ [L, *de,* from, *marcare,* to mark], the process of setting limits or boundaries.

demarcation current [L, *de* + *marcare,* to mark], an electrical current that flows from an uninjured to an injured end of a muscle. Also called **current of injury.**

deme /dēm/ [Gk, *demos,* common population], a small, local, closely related, interbreeding population of organisms, usually occupying a circumscribed area. Also called **genetic population.**

demecarium bromide /dē′məker′ē·əm/, an ophthalmic anticholinesterase agent.

■ INDICATION: It is prescribed in the treatment of open-angle glaucoma.

■ CONTRAINDICATIONS: Active uveal inflammation and/or glaucoma associated with iridocyclitis, bronchial asthma, peptic ulcer, epilepsy, recent myocardial infarction, pregnancy, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse reactions are bradycardia, diarrhea, eye irritation, hypotension, headache, formation of cysts, and lens opacities.

demeclocycline hydrochloride /dēmek′lōsī′klēn/, a tetracycline antibiotic.

■ INDICATIONS: It is prescribed in the treatment of various gram-positive and gram-negative bacterial infections, including those in which use of penicillin is contraindicated.

■ CONTRAINDICATIONS: Renal or liver dysfunction, pregnancy, early childhood, or known hypersensitivity to this drug or to other tetracycline medication prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are GI disturbances, phototoxicity, potentially serious superinfections, and hypersensitivity reactions. Discoloration of teeth may occur in children exposed to the drug in utero or before 8 years of age.

demented /dimen′tid/ [L, *de,* away from, *mens,* mind], pertaining to a form of mental disorder in which cognitive functions are affected. Central features are memory loss and inability to learn new material. Common causes are organic brain disorders.

dementia /dimen′shə/ [L, *de* + *mens,* mind], a progressive organic mental disorder characterized by chronic personality disintegration, confusion, disorientation, stupor, deterioration of intellectual capacity and function, and impairment of control of memory, judgment, and impulses. Dementia caused by drug intoxication, hyperthyroidism, pernicious anemia, paresis, subdural hematoma, benign brain tumor, hydrocephalus, insulin shock, and tumor of islet cells of the pancreas can be reversed by treating the condition; Alzheimer's disease, Pick's disease, and other organic forms of dementia are generally considered irreversible, progressive, and incurable. However, conditions that cause the decline may be treatable or partially reversible. Kinds of dementia include **dementia paralytica, Pick's disease, secondary dementia, senile dementia, senile dementia-Alzheimer type,** and **toxic dementia.**

dementia management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as provision of a modified environment for the patient who is experiencing a chronic confusional state. See also **Nursing Interventions Classification.**

dementia management: bathing, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the reduction of aggressive behavior during cleaning of the body. See also **Nursing Interventions Classification.**

dementia of the Alzheimer type, dementia occurring in Alzheimer disease, being of insidious onset and gradually progressive course, with histopathological changes characteristic of Alzheimer disease that are not due to other central nervous system, systemic, or substance-induced conditions known to cause dementia. It is characterized as *early onset* or *late onset* depending on whether or not it begins by the age of 65.

dementia paralytica. See **general paresis.**

dementia praecox. See **schizophrenia.**

dementia syndrome of depression, reversible dementia occurring in association with depression in the elderly, the cognitive deficits resolving with treatment of the depression.

Demerol, a trademark for an opioid analgesic **(meperidine hydrochloride).**

Demerol Hydrochloride, a trademark for an opioid analgesic **(meperidine hydrochloride).**

-demic, suffix meaning "relating to people or a district": *epidemic, philodemic, prosodemic.*

demigauntlet bandage /dem′igônt′lit/ [L, *demidus,* half; Fr, *gant,* glove], a glovelike bandage over the hand that leaves the fingers free. See also **gauntlet bandage.**

demineralization /dēmin′əral′īzā′shən/ [L, *de* + *minera,* mine], a decrease in the amount of minerals or inorganic salts in tissues, as occurs in certain diseases.

demise /dimīz′/ [OFr, *demettre,* to put away], death, destruction, or end of existence.

democratic style /dem′okrat′ik/, people-centered leadership in which the group participates openly in decision making for group goals.

demography /dəmog′rəfē/ [Gk, *demos,* people, *graphein,* to record], the study of human populations, particularly the size, distribution, and characteristics of members of population groups. Demography is applied in studies of health problems involving ethnic groups, populations of a specific geographic region, religious groups with special dietary restrictions, and members of population groups that may represent a typical cross section of the entire nation. Compare **epidemiology.**

demonstrative /dimon′strətiv/, pertaining to a concept or an action that accompanies and illustrates speech, such as indication of the size of an object with the hands. See also **circum-speech.**

De Morgan's spots. See **cherry angioma.**

de Morsier's syndrome. See **septooptic dysplasia.**

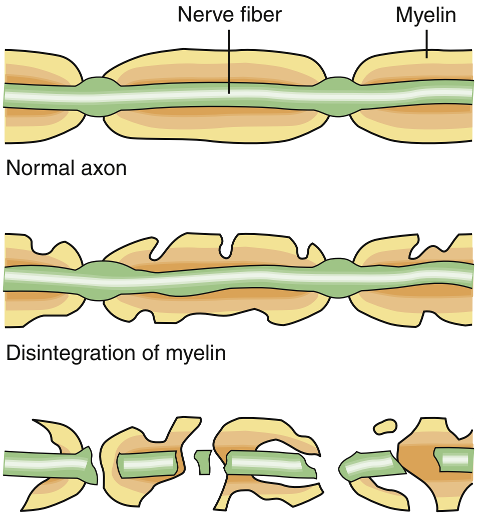
Demser, a trademark for an antihypertensive **(metyrosine).**

demulcent /dimul′sənt/ [L, *demulcere,* to stroke down], **1.** *n,* any of several oily substances used for soothing and reducing irritation of surfaces that have been abraded or irritated, especially mucosal surfaces. **2.** *adj,* soothing, as a counterirritant or balm.

Demulen, trademark for an oral contraceptive containing an estrogen **(ethinyl estradiol)** and a progestin **(ethynodiol diacetate).**

demyelinate /dēmī′əlināt′/, to remove or destroy the myelin surrounding the axons of nerve cells.

demyelination /dimī′əlinā′shən/ [L, *de* + Gk, *myelos,* marrow], the process of destruction or removal of the myelin sheath from a nerve or nerve fiber.



Process of demyelination *(Monahan et al, 2007)*

denasality. See **hyponasality.**

denaturation /dēnā′chərā′shən/ [L, *de* + *natura,* natural], **1.** the alteration of the basic nature or structure of a substance. **2.** the process of making a potential food or beverage substance unfit for human consumption although it may still be used for other purposes, such as a solvent.

denatured alcohol /dēnā′chərd/, ethyl alcohol made unfit for ingestion by the addition of acetone or methanol, used as a solvent and in chemical processes.

denatured protein [L, *de,* from, *natura, proteios,* first rank], a protein that has undergone change that causes its original properties to be lost. A protein can be denatured by radiation, heat, strong acids, or alcohol.

dendr-, prefix meaning "tree or branches": *dendriceptor, dendroid, dendrophobia.*

-dendria, suffix meaning the "twiglike branching of nerve fibers": *oligodendria, telodendria, zoodendria.*

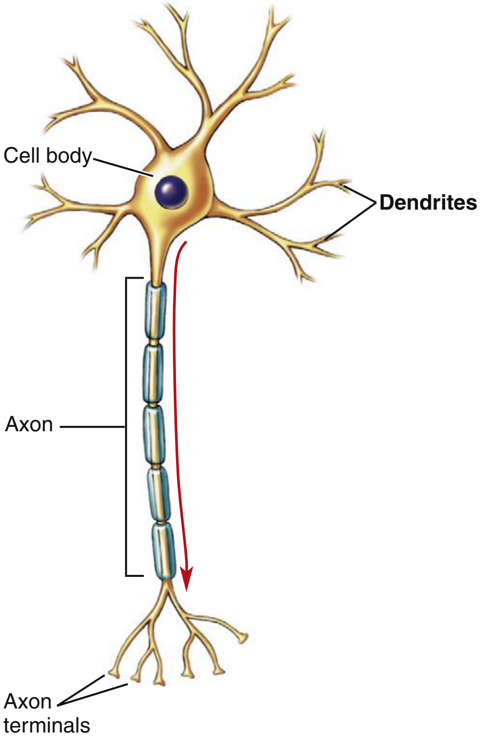
dendrite /den′drīt/ [Gk, *dendron,* tree], a slender branching process that extends from the cell body of a neuron and that is capable of being stimulated by a neurotransmitter. Each neuron usually possesses several dendrites, which receive synapses where chemical transmission occurs from axons to dendrites (or an axon, in the case of unipolar neurons). The number of dendrites and thus the number of synapses varies with the functions of a neuron. Also called **cytodendrite.** Compare **axon.**

dendritic /dendrit′ik/, **1.** treelike, with branches that spread toward or into neighboring tissues, as dendritic keratitis. **2.** pertaining to a dendrite.

dendritic calculus [Gk, *dendron,* tree, *calculus,* pebble], a large calculus lodged in the pelvis of the kidney and shaped to fit the branches of the calyx. Also called **coral calculus.**

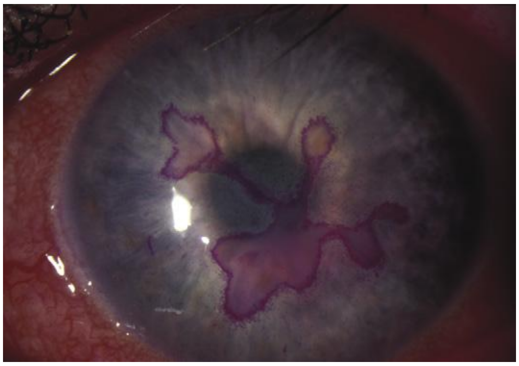
dendritic cell, a cell that captures antigens and migrates to the lymph nodes and spleen, where it presents the processed antigens to T cells.

dendritic keratitis, inflammation of the cornea and conjunctiva caused by herpesvirus type 1. It is characterized by an ulceration of the surface of the cornea resembling a tree with knobs at the ends of the branches. Photophobia, the sensation of a foreign body in the eye, pain, and conjunctivitis are usual. Treatment entails application of idoxuridine (IDU), chemical debridement with an iodine tincture, or



Dendrite *(Herlihy, 2011)*

surgical removal of the layer of corneal tissue cells affected. Untreated dendritic keratitis may cause permanent scarring of the cornea with impaired vision or blindness. Recurrent dendritic keratitis is often followed by disciform keratitis, which is characterized by clouding and deep swelling of the cornea and inflammation of the iris. Also called **herpetic keratitis.**



Dendritic keratitis with geographic ulcer
(Kanski and Bowling, 2011/Courtesy S. Tuft)

dendrodendritic synapse /den′drōdendrit′ik/ [Gk, *dendron* + *dendron* + *synaptein*, to join], a type of synapse in which a dendrite of one neuron comes in contact with a dendrite of another neuron. Compare **axodendritic synapse.**

-dendron, suffix meaning "the branching portion of a nerve cell receiving an impulse": *neurodendron, telodendron, toxicodendron*.

denervated /dēnur′vātid/ [L, *de* + *nervus*, nerve], having a nerve impulse route interrupted, as by excision or administration of a drug that blocks the pathway. The result is decreased or no transmission of impulses through this pathway.

dengue fever /deng′gē, den′gā/ [Sp, influenza; L, *febris*, fever], an acute ***Flavivirus*** infection caused by one of four antigenically distinct serotypes, which determine the severity of infection. It is transmitted to humans by the bite of an infected *Aedes aegypti* mosquito and occurs in tropic and subtropic regions. The disease usually produces a triad of symptoms: fever; rash; and severe head, back, and muscle pain. Manifestations of dengue usually occur in two phases, separated by a day of remission. In the first phase the patient experiences fever, extreme weakness, headache, sore throat, muscle pains, and edema of the hands and feet. The second phase is marked by a return of fever and by a bright-red scarlatiniform rash. Occasionally shock and hemorrhage occur, leading to fatality. Dengue is a self-limited illness, although recovery may require several weeks. Treatment is symptomatic. Analgesics may be given to relieve headache and other pains. Candidate vaccines are in development. Also called **Aden fever, bouquet fever, breakbone fever, dandy fever, dengue, solar fever.** See also ***Aedes,*** **arbovirus, dengue hemorrhagic fever shock syndrome.**

Eggs of *Aedes aegypti* mosquito, which transmits dengue virus *(Auerbach, 2012)*

dengue hemorrhagic fever shock syndrome (DHFSS), a grave form of dengue fever characterized by shock with collapse or prostration; cold, clammy extremities; a weak, thready pulse; respiratory distress; and all of the symptoms of dengue fever. Hemorrhages; bruises; small reddish spots indicating bleeding from skin capillaries; and bloody vomit, urine, and feces may be experienced and may precede circulatory collapse. This syndrome occurs when a person with immunity to one type of dengue virus becomes infected with another serotype. Treatment includes fluid and electrolyte replacement and blood, fresh frozen plasma, or platelet transfusions as needed. Oxygen and sedatives may be administered. See also **dengue fever.**

denial /dinī′əl/ [L, *denegare*, to negate], **1.** refusal or restriction of something requested, claimed, or needed, often causing physical or emotional deficiency. **2.** an unconscious defense mechanism in which emotional conflict and anxiety are avoided by refusal to acknowledge those thoughts, feelings, desires, impulses, or facts that are consciously intolerable.

denileukin diftitox, a miscellaneous antineoplastic.

- ■ INDICATIONS: It is used to treat cutaneous T cell lymphoma that expresses the CD25 component of the IL-2 receptor.
- ■ CONTRAINDICATIONS: Hypersensitivity to denileukin, diphtheria toxin, or interleukin-2 prohibits its use.
- ■ ADVERSE EFFECTS: Life-threatening effects are thrombocytopenia and leukopenia. Other serious side effects include

hematuria, albuminuria, pyuria, creatinine increase, anemia, hypoalbuminemia, edema, hypocalcemia, dehydration, hypokalemia, infection, chest pain, and flu-like symptoms. Common side effects include dizziness, paresthesia, nervousness, confusion, insomnia, hypotension, vasodilation, tachycardia, thrombosis, hypertension, dysrhythmias, nausea, anorexia, vomiting, diarrhea, constipation, dyspepsia, and dysphagia.

Denis Browne splint [Denis J.W. Browne, twentieth-century Australian surgeon], a splint for the correction of clubfoot, composed of a curved bar attached to the soles of a pair of high-topped shoes. The splint is equipped with wing nuts to allow individual abduction of each foot. The splint is commonly applied nightly in late infancy after casting and manipulation have effectively reduced the deformity.

denitrogenation /dēnī′trōjənā′shən/, the elimination of nitrogen from the lungs and body tissues during a period of breathing pure oxygen. See also **nitrogen washout curve.**

Denman's spontaneous evolution [Thomas Denman, English physician, 1733–1815; L, *sponte,* voluntarily, *evolvere,* to roll forth], a natural, unassisted turning of the fetus from the transverse presentation. The head rotates back, and, as the breech descends, the shoulder ascends in the pelvis. The back of the fetus is generally posterior. Also called *Denman's method, Denman's spontaneous version*.

dens *pl*. **dentes** /den′tēz/ [L, tooth], **1.** a tooth or toothlike structure or process. The term is sometimes modified to identify a particular tooth, such as dens caninus or dens molaris. **2.** the cone-shaped odontoid process of the axis, or second cervical vertebra. It receives the atlantal ring to act as a pivot for the atlas, or first cervical vertebra. See also **dentition, odontoid process, tooth.**

dense connective tissue, connective tissue characterized by dense groups of fibers.

dense fibrous tissue [L, *densus,* thick], a fibrous connective tissue consisting of compact, strong, inelastic bundles of mostly parallel collagenous fibers that are glistening white. Dense regular fibrous tissue comprises the tendons, the aponeuroses, and the ligaments; dense irregular fibrous tissue comprises the fascial membranes, the dermis of the skin, the periosteum, and the capsules of organs. Compare **loose fibrous tissue.**

dens evaginatus, a developmental anomaly in which an extra enamel cusp (which may include pulp tissue) develops in the central groove or lingual ridge of molars or premolars. This cone-shaped elevation of enamel is subject to occlusal trauma. Removal of the cusp also requires pulp treatment. Not to be confused with dens invaginatus.

densimeter /densim′eter/. See **densitometer.**

dens in dente /den′tə/, an anomaly of the teeth, found chiefly in the maxillary lateral incisors and characterized by invagination of the enamel. The condition causes a radiographic image suggestive of a tooth within a tooth. Also called *dens invaginatus,* **gestant odontoma.**

densitometer /den′sitom′ətər/ [L, *densus* + Gk, *metron,* measure], a device that uses a photoelectric cell to detect differences in the intensity of light transmitted through a substance, such as x-ray film.

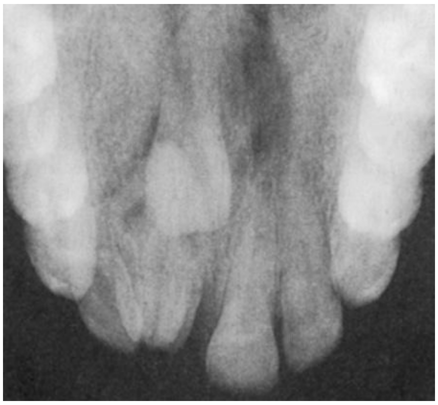
density (D) /den′sitē/ [L, *densus,* thick], **1.** the amount of mass of a substance in a given volume. The greater the mass in a given volume, the greater the density. See also **mass, volume. 2.** (in radiology) the degree of x-ray film blackening.

density gradient, a variation in the density of a solution caused by a change in concentration of a solute in a confined solution.

dens serotinus. See **wisdom tooth.**

dent-, denta-. See **dento-.**

dental [L, *dens,* tooth], pertaining to a tooth or the teeth.

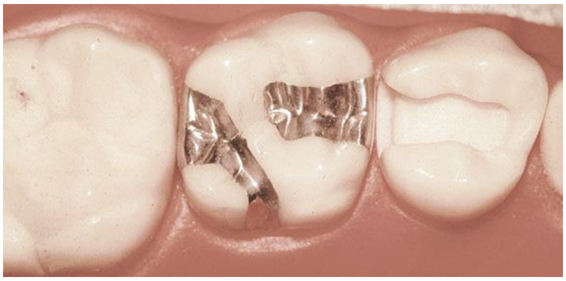


Dens in dente *(Regezi, Sciubba, and Pogrel, 2000)*

dental abscess. See **periapical abscess, periodontal abscess.**

dental alveolus /alvē′ələs/, a tooth socket in the mandible or maxilla.

dental amalgam, an alloy of silver, tin, and mercury with small amounts of zinc and sometimes copper, used for restoring tooth surfaces affected by dental caries or trauma. See **amalgam.**



Dental amalgam *(Christensen, 2002)*

dental anesthesia, any of several methods to reduce or block pain and discomfort during dental procedures. See also **awake anesthesia, inhalation anesthesia, local anesthesia, nitrous oxide, regional anesthesia, topical anesthesia, block anesthesia.**

dental ankylosis, solid fixation of a tooth resulting from fusion of the cementum and alveolar bone, with obliteration of at least a portion of the periodontal ligament.

dental anomaly, an aberration in which one or more teeth deviate from the normal in form, function, or position.

dental appliance, any device placed in or on a patient by a dentist as part of a treatment protocol. Dental appliances include orthodontic, prosthetic, retaining, snoring/airway, and habit-modification devices.

dental arch, the curving shape formed by the arrangement of a normal set of teeth in each jaw. The inferior dental arch is formed by the mandibular teeth. The superior dental arch is formed by the maxillary teeth. See also **alveolar process.**

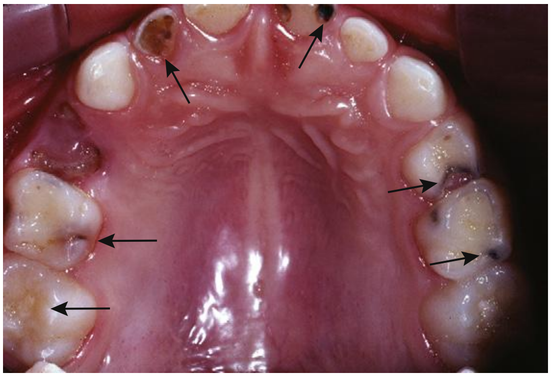
dental assistant, a person who aids a dentist in the performance of generalized tasks, including chairside aid, clerical work, reception, and some radiography, dental imaging, and dental laboratory work. See also **certified dental assistant, expanded function dental assistant**

dental biomechanics, the study and use of mechanical devices and physical forces to effect desirable changes in oral structures.

dental bur, a rotary drill bit made of steel or diamond impregnated material attached to a steel shank, available in varying degrees of sharpness, lengths, shapes, and sizes, used in the preparation of teeth to receive a dental restoration.

dental calculus, a salivary deposit of calcium phosphate and calcium carbonate with organic matter on the teeth or a dental prosthesis. See also **calculus.**

dental caries, a tooth disease caused by the complex interaction of food, especially starches and sugars, with saliva and the bacteria that form dental plaque. The term also refers to the tooth cavities that result from the disease. Plaque bacteria produce acids that cause demineralization of enamel and enzymes that attack the protein component of the tooth. This process, if untreated, ultimately leads to the formation of deep cavities and bacterial infection of the pulp chamber, which contains blood vessels and nerves. The development of dental caries in a debilitated patient is a concern because of the danger that infections of the teeth or gingival tissues may spread to the rest of the body. In addition, teeth that are decayed or painful inhibit mastication and can lead to dietary changes, which may in turn cause nutritional and digestive disorders. Dental caries may be prevented by a reduction in the frequency of sugar consumption, use of dental floss between the teeth, regular brushing of the teeth with a fluoridated toothpaste, drinking of fluoridated water, topical application of fluorides to the teeth, and removal of plaque and calculus by a dental hygienist. Treatment of dental caries includes removal of the decayed material and restoration of the surface of the affected tooth with a silver amalgam or other restorative material. If the cavity has reached the pulp chamber, it may be necessary to remove the pulp tissues to alleviate pain, prevent the spread of infection to the rest of the body, and allow the continued use of the tooth. Alternatively, the entire tooth may be extracted. Kinds of dental caries include **arrested dental caries, incipient dental caries, pit and fissure cavity, primary dental caries, secondary dental caries, smooth surface cavity.** See also **classification of caries.** —*carious, adj.*



Dental caries *(Bird and Robinson, 2005/Courtesy Dr. Frank Hodges)*

dental chart, a simplified graphic representation of the teeth on which clinical, radiological, and forensic information may be recorded. See also **FDI numbering system, Palmer notation, universal tooth coding system.**

dental crypt, the space in the alveolar process occupied by a developing tooth.

dental emergency, an acute disorder of oral health that requires dental and/or medical attention, including broken, loose, or evulsed teeth caused by traumas; infections and inflammations of the soft tissues of the mouth; and complications of oral surgery, such as dry tooth socket.

Black's system of classification of caries

Class I	Located in pits and fissures of the occlusal two thirds of posterior teeth or the lingual surface of anterior teeth
Class II	Located on the proximal surfaces of premolars and molars
Class III	Located on the proximal surfaces of central and lateral incisors and cuspids
Class IV	Located on the proximal surfaces of incisors and canines involving the incisal angle
Class V	Located in the gingival third on the labial, facial, or lingual surfaces of anterior or posterior teeth
Class VI	Located on cusp tips

dental engine, an apparatus consisting of a handpiece to which various burs (rotating drill bits) or other tools can be fitted. It is driven directly by an electric motor or by an electric motor via a continuous cordlike belt that runs over pulleys.

dental erosion, the chemical or mechanochemical destruction of tooth material that causes variously shaped depressions, generally at the cementoenamel junctions of teeth. The surfaces of these depressions, unlike those of dental caries, are hard and smooth. See also **erosion.**

dental ethics [L, *dens,* tooth; Gk, *ethos,* ethics], a system of moral principles governing the professional conduct of dentists and dental practices ascribed by the American Dental Association Council on Ethics, state dental associations, and local dental societies.

dental examination, an inspection of the teeth and surrounding soft tissues of the oral cavity. The examiner generally uses an explorer, a slender steel instrument with a flexible, sharp point, to probe the minute indentations on tooth surfaces and around dental restorations for signs of demineralization and caries development. Fillings are also inspected, and a radiographic record or imaging of the teeth is usually made. The examiner may also insert a periodontal probe into the soft-tissue sulcus around each tooth to measure the depth of each sulcus and to explore for calculus and root defects. The examination should include inspection of the floor of the mouth, all surfaces of the tongue, the salivary glands and ducts, and the lymph nodes of the neck in order to detect pathology. Also called **intraoral examination.**

dental extracting forceps, a hand instrument used for grasping teeth during their removal from the socket. Most such forceps are designed for the extraction of a particular tooth in the maxilla or mandible.

dental film, an x-ray photograph or image of the teeth, exposed either intraorally or extraorally. Intraoral films or image receptors are small, double-emulsion films without screens but with a lead foil backing to reduce patient dose, enclosed in a moisture-resistant envelope. Extraoral films are large, single-emulsion, screen films or image receptors.

dental fistula, an abnormal passage from the apical periodontal area of a tooth to the surface of the oral mucous membrane, permitting the discharge of inflammatory or suppurative material. Also called **alveolar fistula, alveolar sinus.**

dental floss, a thread used to clean interproximal tooth surfaces and spaces between the teeth. It may be waxed or unwaxed and flavored or unflavored.

dentalgia. See **toothache.**

dental granuloma, a pathological mass of lymphocytes, plasma cells, histiocytes, and polymorphonuclear leukocytes (granulation tissue) that is attached to the apex of a tooth and is surrounded by a fibrous capsule. On x-ray film or dental image it appears as a well-defined radiolucency.

dental handpiece, a dental instrument, either air driven or electrically driven, that holds various disks, cups, or burs, used to prepare a tooth to receive a restoration or to contour, clean, or polish a tooth or restoration.

Dental handpieces *(Christensen, 2002)*

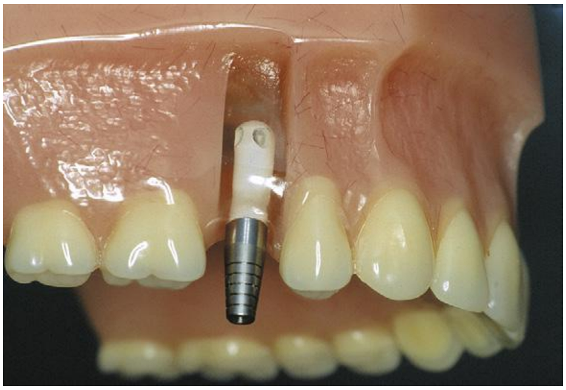
dental history, a record of a patient's oral health, general health, medical conditions, and medical care, including surgeries and medication use, allergies, childhood diseases, radiographic history, and personal dental care, both past and present.

dental hygienist, an oral health care professional authorized to provide clinical and therapeutic services under the supervision of a licensed dentist, including dental prophylaxis, radiography, administration of medications, and dental education at chairside and in the community. In some states, a dental hygienist with additional education may administer local anesthetics and nitrous oxide/oxygen analgesia, place and carve filling materials, conduct additional periodontal procedures, and function as a public health specialist. To practice as a registered dental hygienist, a person must complete at least 2 years of postsecondary education in an accredited community or dental college or university, successfully complete written and practical examinations, and be approved by a state or regional board of dental and dental hygiene examiners.

dental identification [L, *dens,* tooth, *idem,* the same, *facere,* to make], the process of establishing the unique characteristics of the teeth and dental work of an individual, thereby permitting the identification of the individual by comparison with his or her dental charts, records, plaster casts, radiographs or dental images, bite marks, and records. See also **forensic dentistry.**

dental impaction, the blocking of a tooth by a physical barrier, usually other teeth, so that it cannot erupt. See also **impacted tooth.**

dental implant, a plastic or metal anchor that is inserted into a jawbone to provide permanent support for a crown, fixed bridge, or denture when the bone itself would provide insufficient support. About 8 weeks after a tooth or teeth are removed, the anchor is screwed into a hole that has been drilled into the jaw. The gingiva is closed over the implant site, which allows the area to remain sterile, and new bone is allowed to grow around and fuse with the anchor for up to 6 months before the crown, bridge, or denture is attached. Also called a delayed load implant. Immediate load dental implants allow placement of a dental restoration or denture at the time of insertion of the dental implant.



Dental implant *(Christensen, 2002)*

dental jurisprudence [L, *dens,* tooth, *juris prudentia,* knowledge of the law], the application of the principles of law to the practice of dentistry, dental therapy, and of dental hygiene and the relations of dentists, dental therapists, and dental hygienists to patients, society, and each other.

dental laboratory technician, a person who makes dental prostheses and orthodontic appliances as prescribed by a dentist. A dental laboratory technician may have a private laboratory or work in the premises of a dentist. Also called **dental technician.**

dental lamina, the histological primordial tissues found in the developing tooth within the jaw. Also called tooth bud.

dental laser, a device utilizing laser light of a certain frequency to remove pathological dental tissue and prepare the tooth to accept a dental restoration. Also a device used to remove or recontour oral soft tissue.

dental operculum [L, *dens,* tooth, *operculum,* a covering structure], a hood or flap of gingival tissue overlying the crown of an erupting tooth. This tissue is usually chewed away as the tooth erupts. It can become inflamed because of the inability to cleanse plaque, bacteria, biofilm, and debris from under the operculum. Also called operculitis.

dental papilla [L, *dens,* tooth, *papilla,* nipple], a small mass of mesenchymal tissue in the enamel organ that differentiates into dentin and dental pulp during tooth development. The innermost layer consists of a cell-free zone of reticular fibers that form the basement membrane.

dental pathology, the branch of pathology that deals with dental changes that occur in disease.

dental plaque. See **bacterial plaque.**

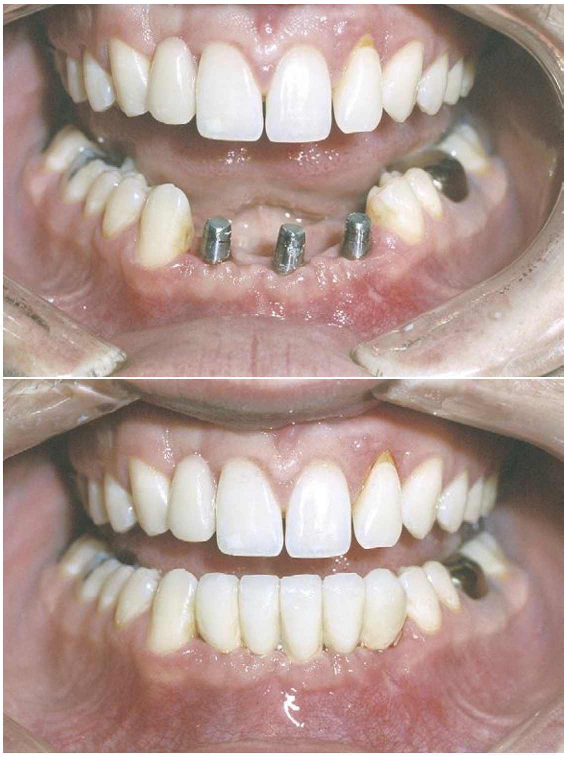
dental plate [L, *dens,* tooth; OFr, *plate,* flat structure], a dental prosthesis made to the shape of the maxilla or mandible jaw to support artificial teeth and base plate. See also **denture.**

dental porcelain, a type of high temperature fusion glass used in dental restorations, either jacket crowns or inlays, artificial teeth, or metal-ceramic crowns. It is essentially a mixture of particles of feldspar and quartz, the feldspar melting first and providing a glass matrix for the quartz. Porcelain, which comes in various shades, chemically and physically bonds to a metal coping and creates a tooth-colored restoration.

dental probe. See **periodontal probe.**

dental prophylaxis. See **oral prophylaxis.**

dental prosthesis [L, *dens,* tooth; Gk, prosthesis, an addition], a fixed or removable appliance used to replace one or more lost or missing natural teeth. See also **denture crown, fixed bridgework, removable partial denture**.



Fixed bridge prosthesis cemented over implants
(Christensen, 2002)

dental public health, a recognized specialty which is the science and art of preventing and controlling dental diseases and promoting dental health through organized community efforts. It is that form of dental practice which serves the community as a patient rather than the individual. It is concerned with the dental health education of the public, applied dental research, and the administration of group dental care programs as well as the prevention and control of dental diseases on a community basis Also called **public health dentistry.**

dental pulp, a small mass of connective tissue, blood vessels, and nerves located in a chamber within the dentin layer of a tooth. The pulp chamber is found in the crown and the root of a tooth. See also **pulp canal, pulp cavity, root canal.**

dental radiograph [L, *dens,* tooth; L, *radire,* to shine; Gk, *graphein,* to record], an intraoral and extraoral x-ray film, picture, or image capture of teeth and the bone surrounding them. See also **bite wing radiograph, periapical radiograph.**

dental restoration. See **restoration.**

dental root cyst. See **periodontal cyst.**

dental sealant /sē′lənt/, a plastic film coating that is applied to and adheres to the caries-free occlusal surfaces (chewing surfaces) of teeth to seal pits and fissures where plaque, food, and bacteria usually become trapped. The surface to be treated is isolated to ensure that it is not contaminated with saliva. It is then cleaned with a brush and pumice cleansing agent or micro-abraded, dried, and etched with a phosphoric acid solution. After the acid has been washed away and the tooth has been dried, the sealant is applied. Dental sealants are reported to reduce the incidence of caries in children's teeth by 50%. Also called **pit and fissure sealant.**

dental stone, a calcined gypsum derivative similar to but stronger than plaster of paris, used for making dental casts and dies. Also called **artificial stone.**

dental surgeon [L, *dens,* tooth; Gk, *cheirourgos,* surgeon], a dentist who is able to diagnose pathology and disease, and performs surgical procedures involving the teeth and surrounding oral tissues. There are nine recognized dental specialties. See **dentist** and **dentistry.**

dental technician. See **dental laboratory technician.**

dental therapist, a mid-level provider with distinct educational, examination, and practice requirements who may perform procedures as specified by state-specific laws. Procedures may include: oral health instruction and disease prevention education, including nutritional counseling and dietary analysis; preliminary charting of the oral cavity; making radiographs; mechanical polishing; application of topical preventive or prophylactic agents, including fluoride varnishes and pit and fissure sealants; pulp vitality testing; application of desensitizing medication or resin; fabrication of athletic mouthguards; placement of temporary restorations; fabrication of soft occlusal guards; tissue conditioning and soft reline; atraumatic restorative therapy; dressing changes; tooth reimplantation; administration of local anesthetic; and administration of nitrous oxide. Also may include emergency palliative treatment of dental pain; the placement and removal of space maintainers; cavity preparation; restoration of primary and permanent teeth; placement of temporary crowns; preparation and placement of preformed crowns; pulpotomies on primary teeth; indirect and direct pulp capping on primary and permanent teeth; stabilization of reimplanted teeth; extractions of primary teeth; suture removal; brush biopsies; repair of defective prosthetic devices; and recementing of permanent crowns.

dental trephination, surgical creation of a fistula by puncturing the soft tissue and bone overlying the root apex to provide drainage of infectious materials. Also called *apicostomy.*

dental tubules, minute channels in dentin, extending from the pulp cavity to the cementum and enamel.

-dentate, suffix meaning "possessing teeth": *edentate, multidentate, tridentate.*

dentate fracture /den′tāt/ [L, *dens*], any fracture that causes serrated bone ends that fit together like the teeth of gears.

dentate nucleus, a deep cerebellar nucleus that receives fibers from the lateral zone of the cerebellar cortex and appears to act as a trigger for the motor cortex, governing intentional movements as well as properties of ongoing movements.

dentes. See **dens.**

denti-, dentia-. See **dento-.**

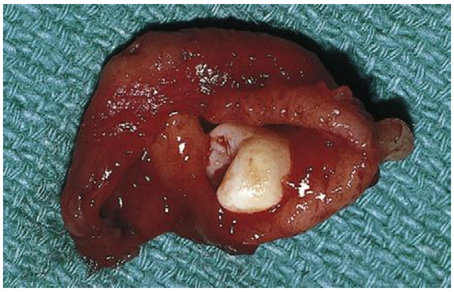
dentibuccal /den′tibuk′əl/ [L, *dens,* tooth + *bucca,* cheek], pertaining to the teeth and cheek.

denticle /den′tikəl/, a calcified body in the pulp chamber of a tooth. If it is composed of irregular dentin, it is known as a **true denticle.** Also called **endolith, pulp stone.**

denticulate /dentik′yəlit/ [L, *denticulus,* little tooth], having very small teeth or toothlike projections.

dentifrice /den′tifris/ [L, *dens* + *fricare,* to rub], a pharmaceutic compound used with a toothbrush for cleaning and polishing the teeth. It typically contains a mild abrasive, detergent, flavoring agent, fluoride, and binder. Other common ingredients are deodorants, humectants, desensitizers, and various medications to prevent dental caries. Also called **toothpaste.**

dentigerous cyst /dentij′ərəs/ [L, *dens* + *gerere,* to bear], one of three kinds of follicular cyst, consisting of an epithelium-lined sac filled with fluid or viscous material that surrounds the crown of an unerupted tooth or odontoma. It is the most common type of developmental odontogenic cyst that develops due to inflammation in contact with remnants of the enamel organ or follicular sac that surrounds an unerupted permanent tooth. Radiographically, it appears as a well-defined radiolucent lesion with a radiopaque border attached to the cervical area of an unerupted tooth. Treatment is excision. Compare **primordial cyst.**



Dentigerous cyst *(Regezi, Sciubba, and Pogrel, 2000)*

dentin /den′tin/ [L, *dens*], the chief material of teeth, consisting of calcium phosphate, surrounding the pulp and situated inside the enamel and cementum. Harder and denser than bone, it consists of solid organic substratum infiltrated with lime salts. Nerves course throughout its structure. Also spelled **dentine.**

dentin eburnation /ē′burnā′shən/, a change in carious teeth in which softened and decalcified dentin develops a hard, brown, polished appearance.

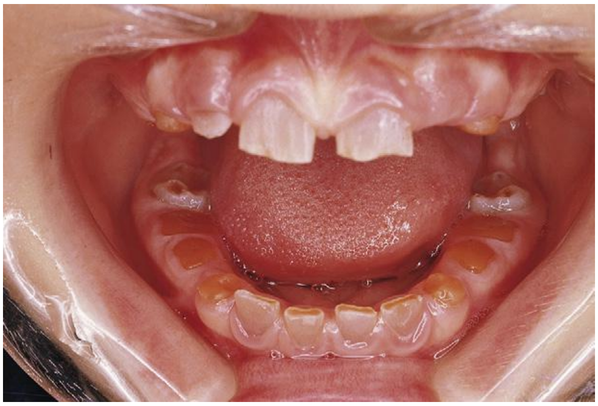
dentin globule, a small spheric body in peripheral dentin, created by early calcification.

dentinoenamel /den′tinō·inam′əl/ [L, *dens* + OFr, *enesmail,* enamel], pertaining to both the dentin and the enamel of the teeth.

dentinoenamel junction (DEJ), the interface of the enamel and the dentin of a tooth crown, generally conforming to the shape of the crown. Also called **dentoenamel junction.**

dentinogenesis /den′tinōjen′əsis/ [L, *dens* + Gk, *genein,* to produce], the formation of the dentin of the teeth. **—***dentinogenic, adj.*

dentinogenesis imperfecta, **1.** a genetic disturbance in the consistency of the dentin, characterized by early calcification of the pulp chambers, marked attrition, and an opalescent hue of the teeth. A form of dentin dysplasia. **2.** a localized form of mesodermal dysplasia affecting the dentin of the teeth. It may be hereditary and associated with osteogenesis imperfecta. **3.** a genetic condition that produces defective dentin but normal tooth enamel. Also called **hereditary opalescent dentin.**



Dentinogenesis imperfecta
(Regezi, Sciubba, and Jordan, 2008)

dentinogenic. See **dentinogenesis.**

dentist [L, *dens*], a person who is qualified by training and licensed by a state or region to diagnose and treat abnormalities of the teeth, gingiva, face, head, neck, and underlying bone, including conditions caused by disease, trauma, and heredity. Required training consists of 3 to 4 years in an undergraduate college after fulfilling the undergraduate academic requirements for admission, a satisfactory score on a Dental Admission Test, and 4 years at an American Dental Association–accredited dental college. After completing dental college, a dentist is awarded a degree of either Doctor of Dental Surgery (D.D.S.) or Doctor of Dental Medicine (D.M.D.); the two degrees are equivalent. A dentist must pass written and practical examinations to obtain a state license. Dental internships and residencies are not, as yet, required for general practice. See also **dentistry.**

dentistry /den′tistrē/ [L, *dens*], the art and science of practicing the diagnosis, prevention, and treatment of diseases and disorders of the teeth, face, head, neck, and all surrounding structures of the oral cavity. Responsibilities include the repair and restoration of teeth, the replacement of missing teeth, and the detection of diseases, such as blood dyscrasias and tumors, that require treatment by a dental specialist or physician. In addition to the general practice of dentistry, there are nine recognized specialties, each requiring additional training after graduation from a dental college: **dental public health, endodontics,** *oral and maxillofacial pathology,* oral and maxillofacial radiology, **oral and maxillofacial surgery, orthodontics, pediatric dentistry, periodontics,** and **prosthodontics.**

dentition /dentish′ən/ [L, *dentire,* to cut teeth], **1.** the development and eruption of the teeth. See also **teething.** **2.** the arrangement, number, and kind of teeth as they appear in the dental arches of the mouth. **3.** the teeth of an individual or species as determined by their form and arrangement. See also **primary dentition, mixed dentition, natural dentition, precocious dentition, predeciduous dentition, retarded dentition, secondary dentition.**

dento-, dent-, denta-, denti-, dentia-, prefix meaning “tooth or teeth”: *dentography, dentoidin, dentonomy.*

dentoalveolar abscess /den′tō·alvē′ələr/ [L, *dens* + *alveolus,* little hollow, *abscedere,* to go away], the formation and accumulation of pus in a tooth socket or the jawbone around the base of a tooth. The pus results from a bacterial infection that is usually secondary to an infection or injury to the tooth or alveolar tissues. It is polymicrobial, with an average of 4 to 6 different causative organisms. Also called **periapical abscess.**

dentoalveolar cyst. See **periodontal cyst.**

dentoenamel junction. See **dentinoenamel junction.**

dentofacial /-fā′shəl/, pertaining to the mouth or the jaw.

dentofacial anomaly, a condition in which a mouth or jaw structure deviates from the normal in form, function, or position.

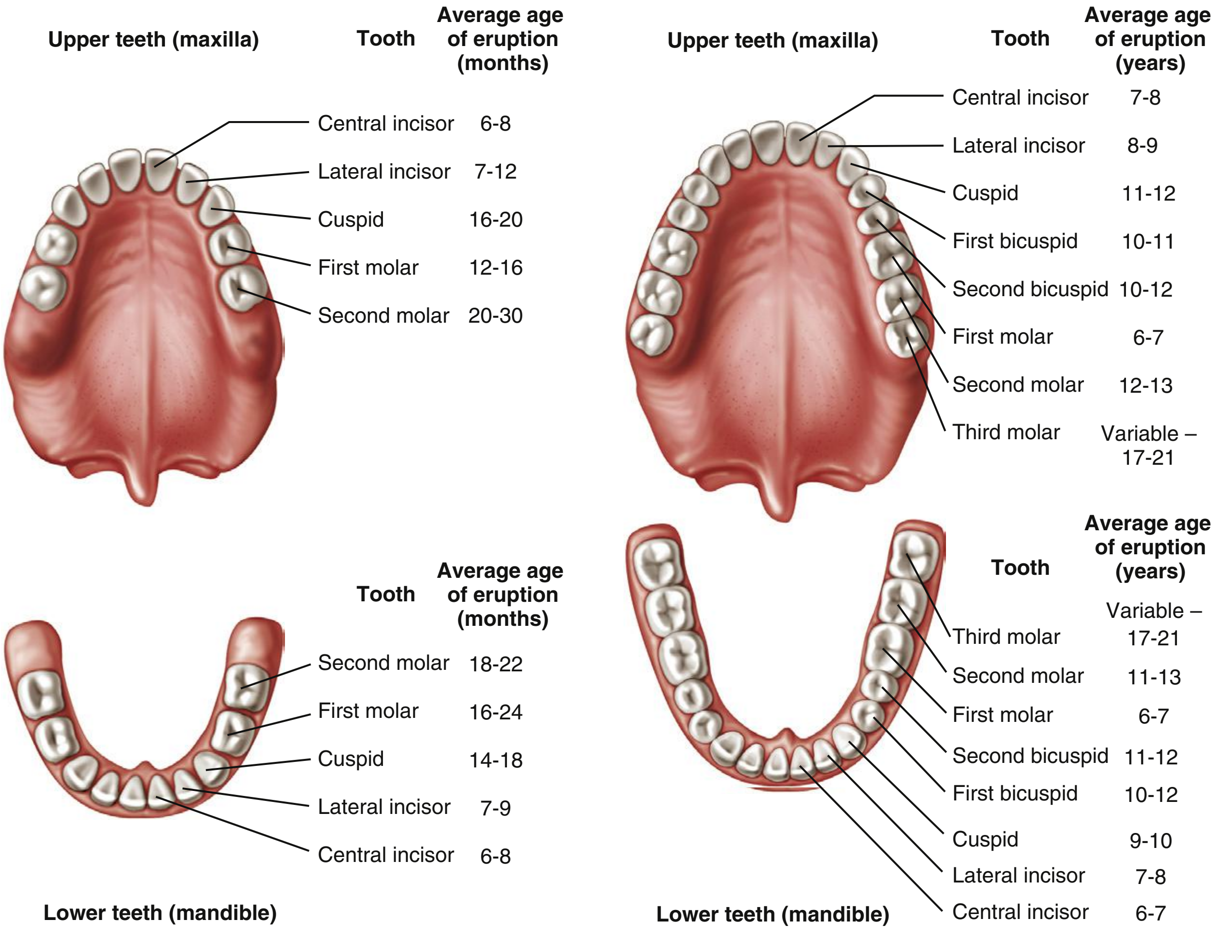
dentofacial orthopedics. See **orthodontics and dentofacial orthopedics.**

dentogenesis imperfecta. See **dentinogenesis imperfecta.**

dentogingival fiber /-jinjī′vəl/ [L, *dens* + *gingiva,* gum], any of the many peridental connective tissue fibers (periodontal fibers) that emerge from the supraalveolar part of the cementum of a tooth, spread like a fan, and terminate in the free gingiva. See also **dentoperiosteal fiber.**

dentogingival junction, the interface between the junctional epithelium and the surface of the teeth.

dentoperiosteal fiber /den′tōper′ē·os′tē·əl/ [L, *dens* + Gk, *peri,* around, *osteon* bone], any of the many peridental



Upper teeth (maxilla)
Tooth
Average age of eruption (months)
Central incisor 6-8
Lateral incisor 7-12
Cuspid 16-20
First molar 12-16
Second molar 20-30
Upper teeth (maxilla)
Tooth
Average age of eruption (years)
Central incisor 7-8
Lateral incisor 8-9
Cuspid 11-12
First bicuspid 10-11
Second bicuspid 10-12
First molar 6-7
Second molar 12-13
Third molar Variable – 17-21
Tooth
Average age of eruption (months)
Second molar 18-22
First molar 16-24
Cuspid 14-18
Lateral incisor 7-9
Central incisor 6-8
Lower teeth (mandible)
Tooth
Average age of eruption (years)
Third molar Variable – 17-21
Second molar 11-13
First molar 6-7
Second bicuspid 11-12
First bicuspid 10-12
Cuspid 9-10
Lateral incisor 7-8
Central incisor 6-7
Lower teeth (mandible)

Dentition *(Harkreader, Hogan, and Thobaben, 2007)*

connective tissue fibers that emerge from the supraalveolar part of the cementum of a tooth and extend apically beyond the alveolar crest into the mucoperiosteum of the attached gingiva.

dentulous /den′tyələs/ [L, *dens,* tooth, *-ulosus,* characterized by], possessing one or more natural teeth.

dentulous dental arch, a dental arch that contains one or more natural teeth.

denture /den′chər/ [L, *dens,* tooth], an artificial tooth or a set of artificial teeth not permanently fixed or implanted, used to replace a missing tooth or teeth. Compare **dental plate, fixed bridgework, implant denture.**

denture base, the part of a denture that covers the soft tissue of the mouth. It is commonly made of resin or a combination of resins and metal to which artificial teeth are attached. Also called **saddle.**

denture-bearing area. See **stress-bearing area.**

denture flask, a sectional metal case in which plaster of paris or artificial stone is molded and in which dentures or other resin restorations are processed.

denture packing, the laboratory procedure of filling and compressing a denture-base material into a mold in a denture flask.

denturist /den′chərist/, a person other than a dentist who engages in the practice of dentistry, usually only to the extent of providing only the construction and insertion of complete or partial dentures without the ability to diagnose a patient's dental conditions. Most states in the United States have laws restricting such activity. See also **dental laboratory technician.**

denucleated /dēnyo͞o′klē·ā′tid/ [L, *de,* from, *nucleus,* nut kernel], pertaining to a condition in which the nucleus has been removed.

denudation /den′o͞odā′shən/ [L, *denudare,* to make bare], **1.** the process of stripping bare. **2.** a condition of losing an outside layer, such as an epithelium.

Denver Articulation Screening Examination (DASE), a test for evaluating the clarity of pronunciation in children 2½ to 6 years of age. Each child's performance may be compared with a standardized norm for the age.

Denver classification, a system for identifying and classifying human chromosomes according to their size and the position of the centromere as determined during mitotic metaphase. The chromosomes are divided into seven major groups, designated A through G, which are arranged according to decreasing length. See also **chromosomal nomenclature, chromosome, karyotype.**

Denver Developmental Screening Test (DDST), a test for evaluating development in children from 1 month to 6 years of age. The developmental level of motor, social, and language skills may be discovered by comparing the child's performance with the average performance of other children. The developmental age is expressed as a ratio in which the child's age is the denominator and the age at which the norm possesses skills equal to those of the child being tested is the numerator. The Denver II, released in 1990, is a major revision and restandardization of the DDST.

deodorant /dē·ō′dərənt/ [L, *de* + *odor,* smell], **1.** *adj,* destroying or masking odors. **2.** *n,* a substance that destroys or masks odors. Underarm deodorants are available as sprays, creams, solid gels, and liquids containing an antiperspirant, such as aluminum chloride, aluminum hydroxyl, aluminum sulfate, or aluminum zirconyl hydroxychloride. These aluminum salts may suppress sweat production and also form an obstructive hydroxide gel in sweat ducts. Vaginal deodorant sprays contain a fatty ester emollient, a masking fragrance, and an antimicrobial agent, such as benzethonium chloride, chlorhexidine hydrochloride, or triacetin; they are often associated with allergic reactions. Room and breath deodorants contain masking agents, such as mint, pine, eucalyptus, lemon, lavender, rosemary, sassafras, or thyme. Ozone masks odors by decreasing olfactory sensitivity. Chlorophyll has a deodorizing action that is enhanced by crotonic acid. Also called **antibromic.**

deodorized alcohol /dē·ō′dərīzd′/, a liquid, free of organic impurities, containing 92.5% absolute alcohol.

deodorizing douche, a stream of air or liquid that masks or absorbs foul odors, applied at moderate pressure into a body cavity or onto a body surface. See also **douche.**

deontologism /dē′ontol′əgiz′əm/ [Gk, *deon,* obligation, *logos,* science], a doctrine of ethics that states that moral duty or obligation is binding even though a moral action may be different or result in painful consequences, also, that what makes acts right are nonconsequential characteristics such as fidelity, veracity, justice, and honesty. Compare **natural law, utilitarianism.**

deorsumversion. See **infraversion** (def. 3).

deossification /dē·os′ifikā′shən/, the loss of mineral matter from bones.

deoxidizer, an agent that removes oxygen. See also **reducing agent.**

deoxy-, desoxy-, prefix meaning “containing a decreased amount of oxygen”: *deoxygenation, desoxymorphine, desoxyribose.*

deoxygenation /dē·ōk′sijənā′shən/ [L, *de,* from; Gk, *oxys,* sharp, *genein,* to produce], the removal of oxygen from a chemical compound.

deoxyribonucleic acid (DNA) /dē·ok′sirī′bōno͞oklē′ik/, a large, double-stranded, helical molecule that is the carrier of genetic information. In eukaryotic cells, it is found principally in the chromosomes of the nucleus. DNA is composed of four kinds of serially repeating nucleotide bases: adenine, cytosine, guanine, and thymine. Genetic information is coded in the sequence of the nucleotides. Also called *desoxyribonucleic acid*. See also **nucleic acid, ribonucleic acid.**

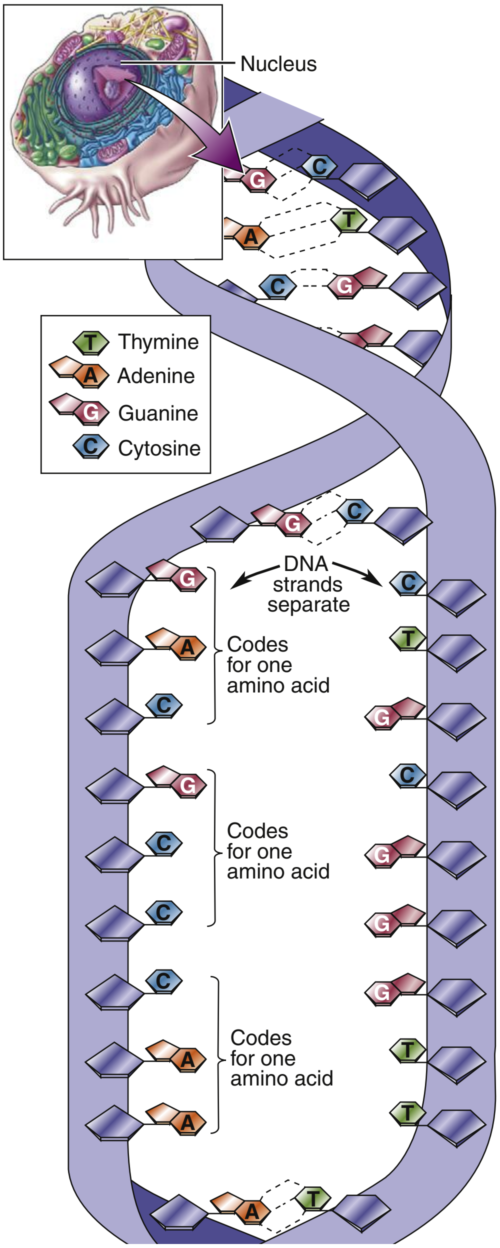
deoxyribose /dē·ok′sē·rī′bōs/, ribose that has been transformed into a deoxy sugar, found in deoxyribonucleic acids (DNA). Also known as 2-deoxyribose referring to the specific carbon atom that has been reduced. Compare **ribose.**

deoxy sugar /dē·ok′sē sho͝og′ər/, a sugar in which one or more carbon atoms have been reduced, thus losing its hydroxyl group.

Depakene, a trademark for an anticonvulsant drug **(divalproex sodium).**

Depakote, a trademark for an anticonvulsant drug **(divalproex sodium).**

Department of Health and Human Services (DHHS), a cabinet-level department of the U.S. government with responsibility for the functions of various federal social welfare and health delivery agencies, such as the Food and Drug Administration. It also directs the U.S. Office of Consumer Affairs, Office of Civil Rights, Administration on Aging, Public Health Service, Indian Health Service, Social Security Administration, and National Institutes of Health.



Genetic code and base sequencing of DNA
(Herlihy, 2011)

Department of Transportation (DOT), a cabinet-level department of the U.S. government responsible for national transportation policies, including maritime, aviation, railroad, and highway safety and regulation of the transport of hazardous materials, such as medical gases.

depend. See **dependent.**

dependence /dipen′dəns/ [L, *de* + *pendere,* to hang upon], **1.** the state of being dependent. **2.** the total psychophysical state of one addicted to drugs or alcohol who must receive an increasing amount of the substance to prevent the onset of withdrawal symptoms.

dependency needs /dipen′dənsē/, the sum of the physical and emotional requirements of an infant for survival, including parenting, love, affection, shelter, protection, food, and warmth. Reliance on others to satisfy these needs decreases with age and maturity. Continuance in later years, in overt or latent form, is indicative of a pathological emotional disorder. These needs may increase under stress, as during physical illness, in which case they do not reflect a psychopathological condition. Compare **emotional need.**

dependent, pertaining to a condition of being reliant on someone or something else for help, support, favor, and other needs, as a child is dependent on a parent, a narcotics addict is dependent on a drug, or one variable is dependent on another. **—depend,** *v.*

dependent care, health care provided for persons, particularly children and handicapped or elderly individuals, who are dependent on others for part or all of the activities of daily living.

dependent differentiation. See **correlative differentiation.**

dependent edema [L, *de,* from, *pendere,* to hand; Gk, *oidema,* swelling], a fluid accumulation in the tissues that is influenced by gravity. It is usually greater in the lower part of the body than in the part above the level of the heart.

dependent intervention, a therapeutic action based on the written or verbal orders of another health professional. See also **intervention.**

dependent personality, behavior characterized by excessive or compulsive needs for attention, acceptance, and approval from other people to maintain security and self-esteem.

dependent personality disorder, a persistent mental state characterized by a lack of self-confidence and an inability to function independently.

dependent variable, (in research) a factor that is measured to learn the effect of one or more independent variables. For example, in a study of the effect of preoperative nursing intervention on postoperative vomiting, vomiting is the dependent variable measured to determine the effect of the nursing intervention. Compare **independent variable.**

depersonalization /dēpur′sənəlīzā′shən/ [L, *de* + *persona,* mask], a feeling of strangeness or unreality concerning oneself or the environment, often resulting from anxiety, stress, or fatigue. Also called **self- alienation.** See also **alienation, depersonalization disorder.**

depersonalization disorder, an emotional disturbance characterized by depersonalization feelings in which a dreamlike atmosphere pervades the consciousness. The body may not feel like one's own, and dramatic and important events may be watched with equanimity. The reaction is commonly seen in various forms of schizophrenia and in severe depression.

de Pezzer's catheter. See **Pezzer's catheter.**

depigmentation. See **dyspigmentation.**

depilation /dep′ilā′shən/ [L, *de* + *pilum,* hair], the removal or extraction of hair from the body, either temporarily by mechanical or chemical means or permanently by electrolysis, which destroys the hair follicle. Also called **epilation.** **—***depilate, v.*

depilatory /dipil′ətôrē/, **1.** *adj,* pertaining to a substance or procedure that removes hair. **2.** *n,* a depilatory agent.

depilatory techniques [L, *depilare,* to deprive of hair; Gk, *technikos,* skillful], methods of removing unwanted body hair, such as plucking, external application of chemicals, electrolysis, application of melted wax, or laser treatments.

deplete /də·plēt′/ [L, *deplere,* to empty], to empty or unload or to cause depletion.

depletion /də·plē′shən/ [L, *deplere,* to empty], **1.** the act or process of emptying or removing, such as of fluid from a body compartment. **2.** an exhausted state resulting from excessive loss of blood.

depolarization /dēpō′lərīzā′shən/, the reduction of a membrane potential to a less negative value. It is caused by the influx of cations, such as sodium and calcium, through ion channels in the membrane. In many neurons and muscle cells, depolarization may lead to an electric impulse called an action potential.

deposit /dəpoz′it/ [L, *de,* from + *ponere* to place], **1.** sediment or dregs. **2.** extraneous inorganic matter collected in the tissues or in a viscus or cavity. **3.** hard or soft material laid down on a tooth surface, such as dental calculus or plaque.

deposition /dep′əzish′ən/ [L, *deponere,* to lay down], (in law) sworn pretrial testimony given by a witness in response to oral or written questions and cross-examination. The deposition is transcribed and may be used for further pretrial investigation. It may also be presented at the trial if the witness cannot be present. Compare **discovery, interrogatories.**

deposition/testimony, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the provision of recorded sworn testimony for legal proceedings based upon knowledge of the case. See also **Nursing Interventions Classification.**

depot /dē′pō, dep′ō/ [Fr, depository], **1.** *n,* any area of the body in which drugs or other substances such as fat are stored and from which they can be distributed. **2.** *adj,* (of a drug) injected or implanted to be slowly absorbed into the circulation.

depot injection, an intramuscular injection of a drug in an oil suspension that results in a gradual release of the medication over several days.

depressant /dipres′ənt/ [L, *deprimere,* to press down], **1.** *adj,* (of a drug) tending to decrease the function or activity of a system of the body. **2.** *n,* such a drug, for example, a cardiac depressant, central nervous system depressant, or respiratory depressant.

depressed [L, *deprimere,* to press down], **1.** pertaining to a body structure that has been forced below the surface of surrounding parts, as in a skull fracture. **2.** pertaining to a condition in which general body activity is diminished, as in depressed urine output during dehydration. **3.** pertaining to an emotional condition characterized by emotional dejection, loss of initiative, listlessness, loss of appetite, and concentration difficulty. See also **depression.**

depressed fracture, a break in the skull in which bone fragments are pushed below the normal surface of the skull.

depression /dipresh′ən/ [L, *deprimere,* to press down], **1.** a depressed area, hollow, or fossa. **2.** downward or inward displacement. **3.** a decrease of vital functional activity. **4.** a mood disturbance characterized by feelings of sadness, despair, and discouragement resulting from and normally proportionate to some personal loss or tragedy. **5.** an abnormal emotional state characterized by exaggerated feelings of sadness, melancholy, dejection, worthlessness, emptiness, and hopelessness that are inappropriate and out of proportion to reality. The overt manifestations, which are extremely variable, range from a slight lack of motivation and inability to concentrate to severe physiological alterations of body functions and may represent symptoms of a variety of mental and physical conditions, a syndrome of related symptoms associated with a particular disease, or a specific mental illness. The condition is neurotic when the precipitating cause is an intrapsychic conflict or a traumatic situation or event that is identifiable, even though the person is unable to explain the overreaction to it. The condition is psychotic when there is severe physical and mental functional impairment caused by an unidentifiable intrapsychic conflict; it is often accompanied by hallucinations, delusions, and confusion concerning time, place, and identity. Depression may be expressed in a wide spectrum of affective, physiological, cognitive, and behavioral manifestations. The varied behaviors represent the complex actions, reactions, and interactions of the depressed person to stimuli that may be either internal or external. Because the origin of depression can be genetic, pharmacological, endocrinal, infectious, nutritional, neoplastic, or neurological, the behavioral effects can appear as aggression or withdrawal, anorexia or overeating, anger or apathy, or any of myriad responses. Kinds of depression include **agitated depression, anaclitic depression, involutional melancholia, major depressive disorder, reactive depression,** and **retarded depression.** See also **bipolar disorder. —depressive,** *adj.*

depression level, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as severity of melancholic mood and loss of interest in life events. See also **Nursing Outcomes Classification.**

depression self-control, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to minimize melancholy and maintain interest in life events. See also **Nursing Outcomes Classification.**

depression with psychotic features [L, *deprimere,* to press down; Gk, *psyche,* mind, *osis,* condition], a type of depressive disorder or mood disorder in which there are psychotic features, usually of a paranoid or somatic nature.

depressive. See **depression.**

depressive personality disorder, a *DSM-IV* psychiatric disorder characterized by a persistent and pervasive pattern of depressive cognitions and behaviors, such as chronic unhappiness, low self-esteem, pessimism, critical and derogatory attitudes toward oneself and others, feelings of guilt or remorse, and an inability to relax or feel enjoyment.

depressive pseudodementia, a term whose use is discouraged as technically incorrect because the cognitive deficits are now believed to be real, if reversible. See **dementia syndrome of depression.**

depressive reaction, a condition of depressive emotional response to an external situation. The depressive state usually ends when the external situation is resolved.

depressor /dipres′ər/ [L, *deprimere,* to press down], any agent that reduces activity when applied to nerves and muscles. See also **depressant.**

depressor anguli oris, a muscle that is active during frowning, depressing the corner of the mouth.

depressor labii inferioris, a muscle that depresses the lower lip and moves it laterally.

depressor reflex [L, *deprimere,* to press down, *reflectere,* to bend back], a neural mechanism that produces an involuntary vasodilation and fall in arterial blood pressure in response to mechanical stimulation of the carotid sinus.

depressor septi /sep′tī/, one of the three muscles of the nose. Arising from the maxilla and inserting into the septum and the posterior aspect of the ala, it lies between the mucous membrane and the muscular structure of the lip and is a direct antagonist of the other muscles of the nose. It is innervated by buccal branches of the facial nerve and serves to draw down the ala, constricting the nostril. Compare **nasalis, procerus.**

deprivation /dep′rivā′shən/ [L, *deprivare,* to deprive], the loss of something considered valuable or necessary by taking it away or denying access to it. In experimental psychology, animal or human subjects may be deprived of something desired or expected for study of their reactions.

deprivation of sleep effects [L, *deprivare,* to deprive; ME, *slep* + L, *efficere,* to accomplish], the result of interference with a basic physiological urge to sleep, which appears to be governed by sleep centers in the hypothalamus and reticular activating system. The loss of sleep for 24 hours usually has no significant effect on physical or mental functioning. However, sleep deprivation results in progressive mental aberrations after 30 to 60 continuous hours. After this point, boring tasks become intolerable, speech begins to be slurred, and performance becomes increasingly poor. After a week of sleep deprivation, symptoms of psychosis may appear.

depth dose [AS, *diop* + Gk, *dosis,* giving], (in radiotherapy) the relationship between the dose at any depth from a beam of radiation and the dose at the entrance from that beam.

depth electroencephalography. See **electroencephalography.**

depth perception, the ability to judge depth or the relative distance of objects in space and to orient one's position in relation to them. Binocular vision is essential to this ability. Also called **stereopsis.**

depth psychology, any approach to psychology that emphasizes the study of personality and behavior in relation to unconscious motivation. See also **psychoanalysis.**

de Quervain's fracture /dəkərvänz′/ [Fritz de Quervain, Swiss surgeon, 1868–1940], a break in the navicular bone of the hand, with dislocation of the lunate bone.

de Quervain's thyroiditis [Fritz de Quervain; Gk, *thyreos,* shield, *itis,* inflammation], an acute inflammatory condition of the thyroid characterized by swelling and tenderness of the gland; low-grade fever; dysphagia; fatigue; and severe pain in the neck, ears, and jaw. The disorder often occurs after a viral infection of the upper respiratory tract. It tends to remit spontaneously and to recur several times. The diagnosis may be made by a radiological scan showing depressed uptake of radioactive iodine in involved areas. Occasionally a fine-needle biopsy of the thyroid is performed. Treatment may include antiinflammatory medication, such as aspirin or NSAIDs, if the condition continues for more than a few days. Corticosteroids are prescribed for prolonged or severe cases. Also called **giant cell thyroiditis, granulomatous thyroiditis, subacute thyroiditis.**

der, abbreviation for **derivative chromosome.**

der-, prefix meaning "neck": *deradelphus, deradenitis, deranencephalia.*

derailment /dirāl′mənt/, a pattern of speech in which incomprehensible, disconnected, and unrelated ideas replace logical and orderly thought.

derby hat fracture. See **dishpan fracture.**

Dercum's disease /dur′kəmz/ [Francis X. Dercum, U.S. neurologist, 1856–1931], a potentially fatal disorder characterized by painful localized fatty swellings and nerve lesions. The disease mainly affects menopausal women. Also called **adiposis dolorosa.**

dereflection /dē′rəflek′shən/ [L, *de* + *reflectere,* to bend back], a technique of logotherapeutic psychology that is directed to taking a person's mind off a certain goal through a positive redirection to another goal, with emphasis on assets and abilities rather than the problems at hand. Dereflection often results in accomplishment of the original goal.

dereistic thought /dē′rē·is′tik/ [L, *de* + *res,* thing], a type of mental activity in which fantasy is not modified by logic, experience, or reality.

derivative /dəriv′ətiv/ [L, *derivare,* to turn away], anything that originates in another substance or object. For example, organs and tissues are derivatives of the primordial germ cells. Chemical derivatives may be produced to confirm identification of a compound or to aid in the analysis of a compound.

derivative chromosome (der), a chromosomal aberration caused by translocation.

derived protein /dirīvd′/, a small protein obtained by enzymatic or chemical hydrolysis of a larger protein source.

derived quantity, any secondary quantity, such as volume, derived from a combination of base quantities, such as mass, length, and time.

-derm, suffix meaning “skin”: *angioderm, mucoderm, paraderm*.

derma-. See **dermato-.**

-derma, -dermia, -dermic, **1.** suffix meaning “skin”: *chrysderma, mycoderma, sarcoderma*. **2.** suffix meaning a “(specified) skin ailment or skin condition”: *rhinoderma, syphiloderma, vaselinoderma*. **3.** suffix meaning “related to the variety of skin”: *pachydermic*.

dermabrasion /dur′məbrā′zhən/ [Gk, *derma*, skin; L, *abradere*, to scrape], a treatment for the removal of superficial scars on the skin by the use of revolving wire brushes or sandpaper. An aerosol spray is used to freeze the skin for this procedure. Dermabrasion is performed to reduce facial scars of severe acne. Compare **microdermabrasion.**

Dermabrasion *(Fewkes, Cheney, and Pollack, 1992)*

Dermacentor /dur′məsen′tər/, a widely distributed genus of ticks, in the family Ixodidae, including a number that infest humans and other mammals. Several are vectors of diseases such as Colorado tick fever, anaplasmosis, **Rocky Mountain spotted fever, tularemia,** and **brucellosis.**

dermal. See **dermis.**

dermal graft [Gk, *derma*, skin, *graphion*, stylus], the transplantation of any living skin tissue that contains dermis and thus is capable of regenerating and secreting sweat and sebum and generating new hair growth.

dermal neurofibroma, a neurofibroma arising within the skin as a small, fleshy nodule that may become pedunculated, overlying a palpable subcutaneous lesion.

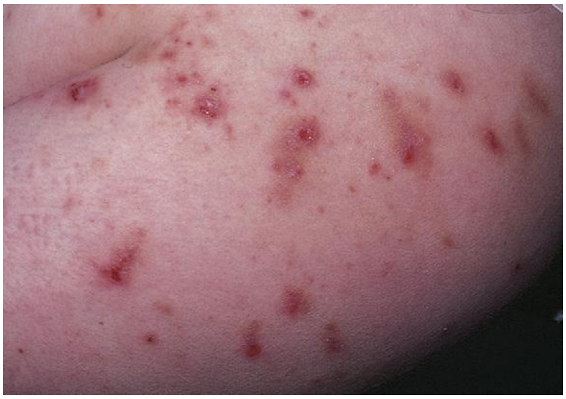
dermal papilla [Gk, *derma*, skin; L, *papilla*, nipple], any small elevation in the dermis, such as the elongated alpine papilla seen in psoriasis.

dermat-. See **dermato-.**

dermatitis /dur′mətī′tis/ [Gk, *derma* + *itis*, inflammation], an inflammatory condition of the skin. Various cutaneous eruptions occur and may be unique to a particular allergen, disease, or infection. The condition may be chronic or acute; treatment is specific to the cause. Some kinds of dermatitis are **actinic dermatitis, contact dermatitis, rhus dermatitis,** and **seborrheic dermatitis.**

dermatitis exfoliativa neonatorum. See **Ritter’s disease.**

dermatitis herpetiformis, a chronic, severely pruritic skin disease with symmetrically located groups of red papulovesicular, vesicular, bullous, or urticarial lesions. It is thought to be an immunological response to dietary gluten. Treatment may include a diet free of gluten and the administration of sulfone, dapsone, sulfapyridine, or antipruritic drugs.



Dermatitis herpetiformis *(Kumar, Abbas, and Fausto, 2005)*

dermatitis medicamentosa. See **drug rash.**

dermatitis papillaris capillitii. See **keloid acne.**

dermatitis venenata. See **contact dermatitis.**

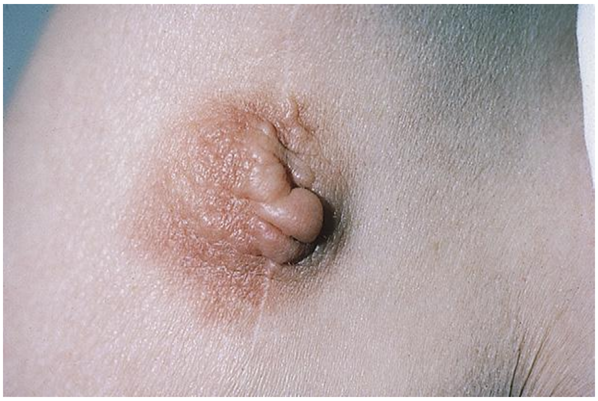
dermato-, derma-, dermat-, dermo-, prefix meaning “skin”: *dermatobiasis, dermatocele, dermatocyst*.

dermatocellulitis /dur′mətōsel′yəlī′tis/, an inflammation of the skin and subcutaneous connective tissue.

dermatocyst /dur′mətōsist′/, a cystic tumor of cutaneous tissues.

dermatofibroma /dur′mətōfībrō′mə/ *pl.* **dermatofibromas, dermatofibromata** [Gk, *derma* + L, *fibra*, fiber, *oma*, tumor], a cutaneous nodule that is painless, round, firm, gray or red, elevated, and commonly found on the extremities. No treatment is required. Also called **fibrous histiocytoma.**

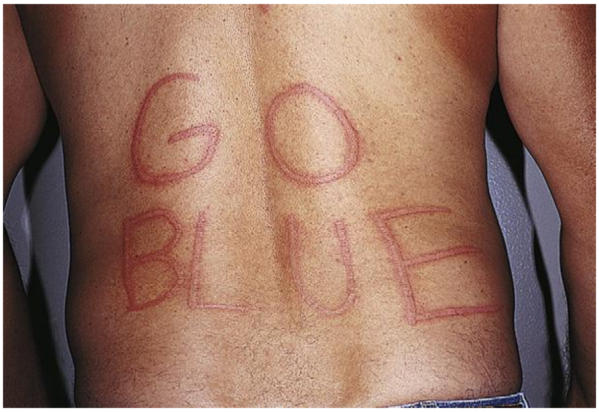
dermatofibrosarcoma /-fī′brōsärkō′mə/ [Gk, *derma*, skin; L, *fibra*, fiber; Gk, *sarx*, flesh, *oma*, tumor], a specific type of fibrous tumor of the skin beginning as an indurated nodule that grows slowly and is often ignored until it grows large. It does not metastasize.



Dermatofibrosarcoma protuberans *(Callen et al, 2000)*

dermatoglyphics /dur′mətōglif′iks/ [Gk, *derma* + *glyphe*, a carving], the study of the skin ridge patterns on fingers, toes, palms of hands, and soles of feet. The patterns are used as a basis of identification and also have diagnostic value because of associations between certain patterns and chromosomal anomalies.

dermatographia /dur′mətōgraf′ē·ə/ [Gk, *derma* + *graphein,* to record]. See **autographism.**



Dermatographia *(Callen et al, 2000)*

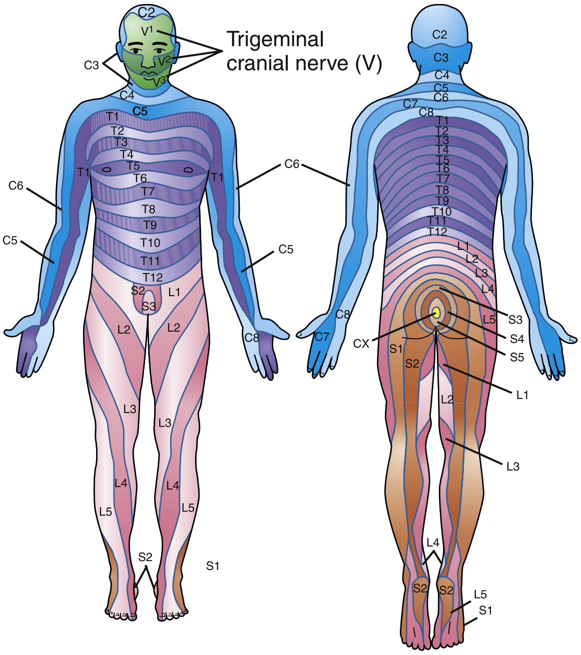
dermatological agent /dur′mətōloj′ik/, a drug used to treat reactions or disorders of the skin.

dermatologist /dur′mətol′əjist/, a physician specializing in the skin and its properties of health and disease.

dermatology /-ol′əjē/ [Gk, *derma* + *logos,* science], the study of the skin, including its anatomical, physiological, and pathological characteristics and the diagnosis and treatment of skin disorders.

dermatoma /dur′mətō′mə/, **1.** a skin tumor. **2.** a patch of abnormally thick skin.

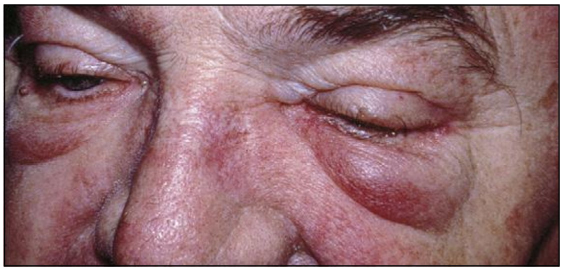
dermatome /dur′mətōm/ [Gk, *derma* + *temnein,* to cut], **1.** (in embryology) the mesodermal layer in the early developing embryo that gives rise to the dermal layers of the skin. **2.** (in surgery) an instrument used to cut thin slices of skin for grafting. **3.** an area on the surface of a body innervated by afferent fibers from one spinal root.



Dermatome distribution of spinal nerves
(Patton and Thibodeau, 2010)

dermatomycosis /dur′mətō′mīkō′sis/ [Gk, *derma* + *mykes,* fungus, *osis,* condition], a superficial fungal infection of the skin, characteristically found on parts that are moist and protected by clothing, such as the groin or feet. It is caused by a dermatophyte. See also **dermatophytosis. —***dermatomycotic, adj.*

dermatomyositis /dur′mətōmī′ōsī′tis/ [Gk, *derma* + *mys,* muscle, *itis,* inflammation], a disease of the connective tissues, characterized by pruritic or eczematous inflammation of the skin and tenderness and weakness of the muscles. Muscle tissue is destroyed, and loss is often so severe that the person may become unable to walk or to perform simple tasks. Swelling of the eyelids and face and loss of weight are common manifestations. The cause is unknown, but in 15% of cases the condition develops with an internal malignancy. Viral infection and antibacterial medication are also associated with an increased incidence of dermatomyositis. Treatment of this disease may include prescription of predniSONE; immunosuppressants may be used in cases that are unresponsive to predniSONE. In order to prevent muscle wasting and preserve muscle function, physical therapy is required. Most cases respond to therapy, although the disease is usually more severe and treatment resistant in patients with pulmonary or cardiac issues.



Dermatomyositis *(White and Cox, 2006)*

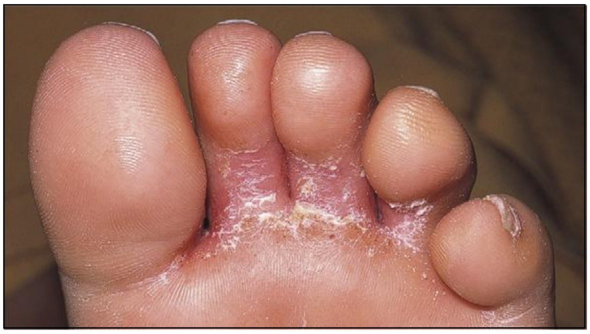
dermatopathy /dur′mətop′əthē/, any disorder of the skin.

Dermatophagoides /-fagoi′dēz/ [Gk, *derma* + *phagein,* to eat, *eidos,* form], a genus of household dust mite responsible for allergic reactions in sensitive individuals. Protection against the microscopically small mite includes minimizing dust in the home, especially in the bedroom; encasing pillows and mattresses in allergen-proof coverings; controlling temperature; and keeping humidity below 70%. The mites thrive on skin scales, hair, pet foods, carpets, and bedding, in addition to ordinary house dust.

dermatophyte /dur′mətōfīt′, dərmat′əfīt/, any of several fungi that cause parasitic skin disease in humans. See also **dermatophytid** and specific fungal infections.

dermatophytid /dur′mətof′itid, dur′mətōfī′tid/ [Gk, *derma* + *phyton,* plant], an allergic skin reaction characterized by small vesicles and associated with dermatomycosis. The lesions result from sensitization to the infection elsewhere on the skin and do not contain fungi. See also **dermatomycosis, dermatophyte.**

dermatophytosis /dur′mətō′fītō′sis/ [Gk, *derma* + *phyton,* plant, *osis,* condition], a superficial fungus infection involving the stratum corneum of the skin, hair, and nails, caused by ***Microsporum,*** *Epidermophyton,* or ***Trichophyton*** species of dermatophyte. On the trunk and upper extremities it is commonly called "ringworm" infection and is characterized by round or oval scaly patches with slightly raised borders and clearing centers. On the feet small vesicles, cracking, itching, scaling, and often secondary bacterial infections occur and are commonly called “athlete’s foot.” Treatment includes topical antifungal agents, as tolnaftate, clotrimazole, and undecylenic acid, and oral griseofulvin. Fingernails and toenails respond poorly to topical treatment. Also called **epidermomycosis.** See also **tinea.**



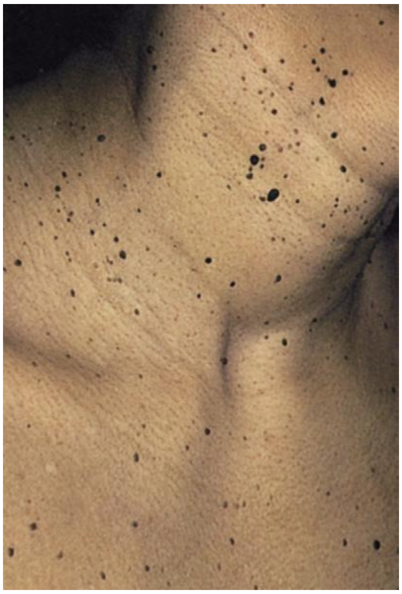
Dermatophytosis *(White and Cox, 2006)*

dermatoplasty /dur′mətōplas′tē/, a surgical procedure in which skin tissue is transplanted to a body surface damaged by disease or injury.

dermatosclerosis /-sklərō′sis/ [Gk, *derma* + *sklerosis,* hardening], a skin disease characterized by fibrous thickening of the skin. See also **scleroderma.**

dermatosis /dur′mətō′sis/ [Gk, *derma* + *osis,* condition], any disorder of the skin, especially those not associated with inflammation. Compare **dermatitis.**

dermatosis papulosa nigra, a common condition in individuals with darkly pigmented skin. It consists of multiple tiny, benign skin-colored or hyperpigmented papules on the face, neck, and cheeks. The lesions increase in number with age.



Dermatosis papulosa nigra *(Lawrence and Cox, 2002)*

dermis, the layer of the skin just below the epidermis, consisting of papillary and reticular layers and containing blood and lymphatic vessels, nerves and nerve endings, glands, and hair follicles. Formerly called **corium.** —**dermal,** *adj.*

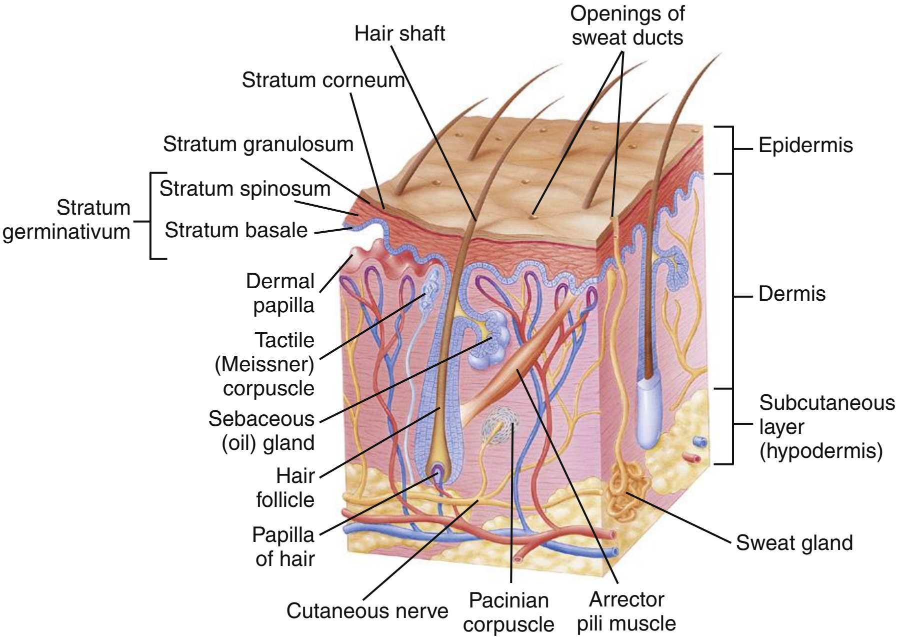
-dermis, suffix meaning “tissue or skin”: *endepidermis, hypodermis, osteodermis.*

dermo-. See **dermato-.**

dermographism. See **dermatographia.**

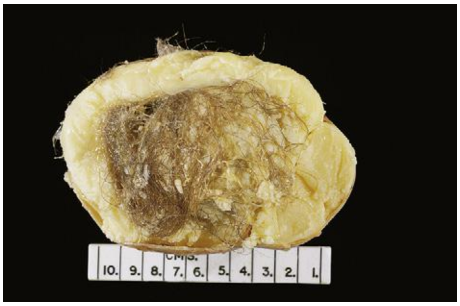
dermoid /dur′moid/ [Gk, *derma* + *eidos,* form], **1.** *adj,* pertaining to the skin. **2.** *n, (informal)* a dermoid cyst.

dermoid cyst, a tumor, derived from embryonal tissues, consisting of a fibrous wall lined with epithelium and a



Hair shaft
Openings of sweat ducts
Stratum corneum
Stratum granulosum
Stratum spinosum
Stratum germinativum
Stratum basale
Epidermis
Dermal papilla
Dermis
Tactile (Meissner) corpuscle
Sebaceous (oil) gland
Subcutaneous layer (hypodermis)
Hair follicle
Sweat gland
Papilla of hair
Cutaneous nerve
Pacinian corpuscle
Arrector pili muscle

Dermis *(Thibodeau and Patton, 2003)*



Dermoid cyst *(Greer et al, 2001)*

cavity containing fatty material, hair, teeth, bits of bone, and cartilage. Kinds of dermoid cysts are **implantation dermoid cyst, inclusion dermoid cyst, thyroid dermoid cyst,** and **tubal dermoid cyst.** Also called **organoid tumor, teratoid tumor.**

-dermoma, suffix meaning a "tumor of the skin layers": *epidermoma, monodermoma, tridermoma.*

derotation brace /dē′rōtā′shən/, a customized orthosis that provides stability at the knee joint. It consists of a single-joint hinged bar on one side and a rotating dial pad on the opposite side. The rotating pad can be placed on either the medial or the lateral side, depending on the location of the primary instability. Each brace is designed individually, based on a negative plaster cast of the knee.

DES, abbreviation for **diethylstilbestrol.**

desalination /dēsal′inā′shən/ [L, *de,* from, *sal,* salt], the process of removing salt from water or other substances.

desaturation /dēsach′ərā′shən/ [L, *de,* from, *saturare,* to fill], the formation of an unsaturated chemical compound from a saturated one.

Descemet's membrane /desemāz′/ [Jean Descemet, French physician, 1732–1810], a deep layer of the cornea, between the substantia propria externally and the endothelium internally.

descendens /disen′dənz/, **1.** the descending branch of the hypoglossal nerve. **2.** the cervicalis nerve formed by branches of the second and third cervical nerves.

descending aorta /disen′ding/ [L, *descendere,* to descend; Gk, *aerein,* to raise], the main portion of the aorta, consisting of the thoracic aorta and the abdominal aorta, which continues from the aortic arch into the trunk of the body. It supplies many structures, including the esophagus, lymph glands, ribs, stomach, liver, spleen, intestines, kidneys, reproductive organs, and, eventually, the lower limbs. See also **aorta.**

descending colon, the segment of the colon that extends from the end of the transverse colon at the splenic flexure on the left side of the abdomen down to the beginning of the sigmoid colon in the pelvis. See also **colon.**

descending current. See **centrifugal current.**

descending myelitis [L, *descendere,* to descend; Gk, *myelos,* marrow, *itis,* inflammation], a form of myelitis in which the pathological changes spread downward along the spinal cord.

descending neuritis [L, *descendere,* to descend; Gk, *neuron,* nerve, *itis,* inflammation], a form of neuritis that spreads downward from the upper part of the nervous system.

descending neuropathy [L, *descendere,* to descend; Gk, *neuron,* nerve, *pathos,* disease], a disease of the peripheral nervous system that spreads downward from the upper part of the body.

descending oblique muscle. See **external abdominal oblique muscle.**

descending tract [L, *descendere,* to descend, *tractus*], a nerve tract in the spinal cord that carries impulses away from the brain axis of the body or body part.

descending urography. See **intravenous pyelography.**

descensus /disen′səs/, the process of falling or descending. Also called **prolapse.**

descriptive anatomy /diskrip′tiv/ [L, *describere,* to write], the study of the morphological characteristics of the body by systems, such as the vascular system and the nervous system. Each system is composed of similar tissues that are essential to a particular function.

descriptive embryology, the study of the changes that occur in cells, tissues, and organs during the progressive stages of prenatal development.

descriptive epidemiology, the first stage of epidemiological investigation. It focuses on describing disease distribution by characteristics relating to time, place, and person.

descriptive psychiatry, the study of external, readily observable behavior. Compare **dynamic psychiatry.**

descriptive statistics, statistics that measure and describe characteristics of groups without drawing inferences about the population in general.

DES daughters, a group of women with increased susceptibility to cancer of the vagina and other reproductive organs because their mothers were given an estrogen medication, diethylstilbestrol (DES), from the 1940s through the 1960s to prevent miscarriage. Several other abnormalities have been reported among the DES daughters, including tissue that covers the cervix or a uterus that is too small to carry a pregnancy. Sons of women who took DES have an increased risk of undescended testes or other genital disorders.

Desenex, a trademark for various over-the-counter products containing antifungal agents.

desensitization. See **systemic desensitization.**

desensitize /dēsen′sitīz/ [L, *de* + *sentire,* to feel], **1.** (in immunology) to render an individual insensitive or less sensitive to any of the various antigens. **2.** (in psychiatry) to relieve an emotionally disturbed person of the stress of phobias and neuroses by encouraging discussion of the anxieties and the stressful experiences that cause the emotional problems involved. **3.** (in dentistry) to remove or reduce the painful response of vital exposed dentin to irritating substances and temperature changes.

desert fever, desert rheumatism. See **coccidioidomycosis.**

Desferal Mesylate, a trademark for an iron chelating agent **(deferoxamine mesylate).**

desiccant /des′ikənt/ [L, *desiccare,* to dry thoroughly], any agent or procedure that promotes drying or causes a substance to dry up. Also called **exsiccant, siccant.**

desiccate /des′ikāt/, **1.** to dry thoroughly. **2.** also **exsiccate,** to preserve by drying, especially food.

designer drugs [L, *de* + *signare,* to mark], synthetic organic compounds that are designed as analogs of illicit drugs, with the same opioid or other dangerous effects. Because designer drugs are generally not listed as controlled substances by the U.S. Drug Enforcement Agency, prosecution of manufacturers, distributors, or users is frequently difficult.

desipramine hydrochloride /desip′rəmēn/, a tricyclic antidepressant.

■ INDICATION: It is prescribed in the treatment of mental depression and as adjunctive therapy for the treatment of chronic pain.

■ CONTRAINDICATIONS: Concomitant administration of monoamine oxidase inhibitors, heart block, recent myocardial infarction, or known hypersensitivity to this drug or to tricyclic medication prohibits its use. It is used with caution in patients who have seizure disorders or cardiovascular disease.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are sedation as well as GI, cardiovascular, and neurological reactions. This drug interacts with many other drugs.

desirudin, an anticoagulant.

■ INDICATION: This drug is used in prophylaxis for deep vein thrombosis in those undergoing hip replacement.

■ CONTRAINDICATIONS: Known hypersensitivity to natural or synthetic hirudins, active bleeding, and irreversible coagulation disorders prohibit this drug's use.

■ ADVERSE EFFECTS: Adverse effects of this drug include injection site mass, nausea, deep thrombophlebitis, anemia, and hypersensitivity. Life-threatening side effects include bleeding and hemorrhage.

desloratadine /des′lärat′ädēn/, a nonsedating antihistamine (H_1 receptor antagonist) used for treatment of allergic rhinitis and chronic idiopathic urticaria. It is administered orally.

-desma, suffix meaning "something bridging or connecting": *cytodesma, mesodesma, plasmodesma.*

desmo-, prefix meaning "ligament": *desmoma, desmorrhexis, desmotomy.*

desmocyte. See **fibroblast.**

desmoid tumor /dez′moid/ [Gk, *desmos,* band, *eidos,* form], a fibrous neoplasm that may occur in the head, neck, upper arm, abdomen, or lower extremities. The tumor is usually a firm, rubbery mass.

desmopressin acetate /dez′mōpres′in/, a synthetic antidiuretic analog of arginine vasopressin, the naturally occurring human antidiuretic hormone.

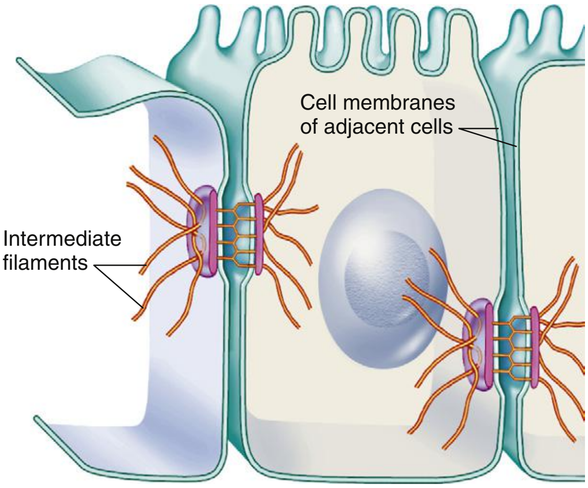
■ INDICATIONS: It is prescribed as an antidiuretic in the treatment of diabetes insipidus and primary nocturnal enuresis and is used to control bleeding in hemophilia A and mild von Wildebrand's disease.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug, hemophilia B, and severe von Wildebrand's disease (IIB) prohibit its use.

■ ADVERSE EFFECTS: Among the most serious adverse reactions are hyponatremia and water intoxication, which are seen more often when the drug is used for hemostatis. Mild effects, such as headache, cramps, and nasal congestion, also may occur.

desmosis /dezmō′sis/, any disease of the connective tissue.

desmosome /dez′məsōm/ [Gk, *desmos,* band, *soma,* body], a small, circular, dense area within the intercellular bridge that forms the site of adhesion between certain epithelial cells, especially the stratified epithelium of the epidermis. Also called **macula adherens.**



Desmosome

desogestrel /des′ojes′trel/, a progestational agent having little androgenic activity. It is used in combination with an estrogen component as an oral contraceptive.

Desonate, a trademark for **desonide.**

desonide, a rarely-used topical antiinflammatory used to treat atopic dermatitis.

desoximetasone /desok′simet′əsōn/, a topical corticosteroid.

■ INDICATION: It is prescribed for the treatment of skin inflammation.

■ CONTRAINDICATIONS: Viral and fungal diseases of the skin, impaired circulation, or known hypersensitivity to this drug or to other steroid medication prohibits its use. Caution should be used in applying occlusive dressings over topical steroid medications.

■ ADVERSE EFFECTS: Among the more serious adverse reactions, usually occurring after prolonged or excessive application, are striae, hypopigmentation, or local irritation of the skin and various systemic effects.

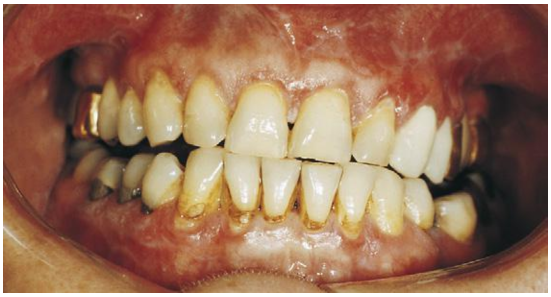
desoxy-. See **deoxy-.**

Desoxyn, a trademark for a central nervous system stimulant **(methamphetamine hydrochloride).**

despair, a feeling of hopelessness.

desquamation /des′kwəmā′shən/ [L, *desquamare,* to take off scales], a normal process in which the cornified layer of the epidermis is sloughed in fine scales. Certain conditions, injuries, and medications accelerate desquamation and may cause peeling and the loss of deeper layers of the skin. Also called **exfoliation.** —*desquamate, v., desquamative, adj.*

desquamative gingivitis /deskwam′ətiv/, a gingival inflammation characterized by peeling of the epithelium. In its chronic state it is most frequently associated with the hormonal changes of menopause. It may also be caused by biological stress, such as trauma to the epithelium, or certain reactions to medications. Compare **eruptive gingivitis.**



Desquamative gingivitis
(Ibsen and Phelan, 2009/Courtesy Dr. Edward V. Zegarelli)

desquamative interstitial pneumonia (DIP), a respiratory disease characterized by an accumulation of cellular matter in the alveoli and bronchial tubes, affecting smokers in their 30s and 40s. It leads to a fibrotic condition with symptoms of coughing, chest pain, weight loss, and dyspnea. Treatment is with corticosteroids, oxygen, and supportive medical therapy. Seventy percent of patients survive 10 years or longer.

destructive aggression /distruk′tiv/ [L, *destruere,* to destroy, *aggressio,* an attack], an act of hostility unnecessary for self-protection or self-preservation that is directed at an external object or person. See also **aggression, detachment.**

destructive interference, a phenomenon that results when propagated waves are out of phase, so that maximum molecular compression for one wave occurs at the same point as maximum rarefaction for the second wave, causing the two waves to cancel each other out.

destructive lesion [L, *destruere,* to destroy, *laesio,* a hurting], a disorder that leads to the damage or necrosis of an organ or tissue.

desudation /des′o͞odā′shən/, profuse sweating. It is sometimes followed by a skin rash.

desynchrony, a condition in which the environmental cues and patterns, such as sleeping and eating, conflict with an individual's existing pattern, as in jet lag.

Desyrel, a trademark for an antidepressant **(trazodone).**

detached retina. See **retinal detachment.**

detachment. See **destructive aggression.**

detection bias /ditek′shən/, a potential artifact in epidemiological data caused by the use of a particular diagnostic technique or type of equipment. As an example, cancer rates may vary in different regions or periods, not because of an actual difference in the incidence of the disease but because of different diagnostic technologies.

detector /detek′ter/, a device by which an object or condition can be discovered.

detergent /ditur′jənt/ [L, *detergere,* to cleanse], **1.** a cleansing agent. **2.** (in respiratory therapy) a wetting agent that is administered to mediate the removal of respiratory tract secretions from airway walls. See also **surfactant.**

deterioration /ditir′ē·ərā′shən/ [L, *deterior,* worse], a condition that is gradually worsening. Also called **retrogression**.

determinant evolution /ditur′minənt/ [L, *determinare,* to limit], the idea that evolution progresses according to a predetermined course. See also **orthogenesis.**

determinant of occlusion, one of the classifiable factors that influence proper closure of the teeth. The common fixed factors are intercondylar distance, anatomical characteristics, mandibular centricity, and the relationship of the jaws. Common changeable factors are tooth shape, tooth position, vertical dimensions of occlusion, cusp height, and fossa depth.

determinate cleavage /ditur′minit/, mitotic division of the fertilized ovum into blastomeres that are each destined to form a specific part of the embryo. Damage to or destruction of any of these cells results in malformation of an organism. Also called **mosaic cleavage.** Compare **indeterminate cleavage.** See also **mosaic development.**

detoxification /dētok′sifikā′shən/ [L, *de from* + Gk, *toxikon,* poison; L, *facere,* to make], the removal of a poison or its effects from a patient.

detoxification service, a hospital service providing treatment to diminish or remove from a patient's body the toxic effects of chemical substances, such as alcohol or drugs, usually as an initial step in the treatment of a chemical-dependent person. The service may also be used to remove poisonous substances to which a person may have been exposed. See also **alcoholism, drug addiction.**

detoxification therapy, cleansing of the body through nutritional action usually centering on GI function. It is claimed to assist in the transition to a healthier lifestyle by eliminating toxins. At the current time, there is no scientific evidence to support the efficacy of this treatment.

detoxify /dētok′sifī/ [L, *de,* from; Gk, *toxikon,* poison], to make a poisonous substance harmless or to overcome the effects of a poison.

detrition /dətrish′ən/ [L, *de,* from + *terere* to wear], a wearing away, as of the teeth, by friction. See also **abrasion, attrition, erosion, abfraction.**

detrusor areflexia, failure of the detrusor muscle to respond to stimuli, usually owing to a lesion of a lower motoneuron, resulting in failure to empty the bladder completely on urination.

detrusor hyperactivity, detrusor hyperreflexia. See **detrusor overactivity.**

detrusor leak point pressure, as the bladder fills without an increase in abdominal pressure, the level of pressure at which leakage of urine through the urethra occurs. This is a measure of both strength of the urethral sphincters and compliance of the detrusor muscle.

detrusor muscle of bladder, the bundles of smooth muscle fibers forming the muscular coat of the urinary bladder, which are arranged in a longitudinal and a circular layer and, on contraction, serve to expel urine.

detrusor overactivity, involuntary contractions of the detrusor urinae muscle from any cause. Also called **detrusor hyperactivity, detrusor hyperreflexia.**

detrusor pressure, the pressure exerted inwards by the detrusor urinae muscles of the bladder wall, one of the components of the total intravesical pressure.

detrusor-sphincter dyssynergia, contraction of the sphincter muscle of the urethra at the same time the detrusor muscle of the bladder is contracting, resulting in obstruction of normal urinary outflow.

detrusor urinae muscle /ditro͞o′zər/ [L, *detruder,* to thrust; Gk, *ouron,* urine; L, *musculus*], a complex of longitudinal fibers that form the external layer of the muscular coat of the bladder.

deuteranomaly /doo′teränom′älē/, a type of anomalous trichromatic vision in which the green-sensitive cones have decreased sensitivity. It is an X-linked trait, affecting about 5% of white males and 0.25% of females in the United States, and is the most common color vision deficiency.

deuteranopsia /doo′teränop′se·ä/, a dichromacy characterized by retention of the sensory mechanism for 2 hues only (blue and yellow).

deuterium (^{2}H) /dyo͞otir′ē·əm/ [Gk, *deuteros,* second], a stable isotope of the hydrogen atom, used as a kinetic tracer. Also called **heavy hydrogen.** See also **tritium.**

deutero-, deuto-, prefix meaning "second": *deuteroalbumose, deuteroconidium, deuteroelastose.*

deuteroplasm. See **deutoplasm.**

deuto-. See **deutero-.**

deutoplasm /do͞o′təplaz′əm/ [Gk, *deuteros* + *plasma,* something formed], the inactive elements of the cytoplasm, primarily the stored nutritive material contained in yolk. Also called **deuteroplasm.**

DEV, abbreviation for **duck embryo vaccine**. See **rabies vaccine.**

devascularization /dēvas′kyəler′īzā′shən/ [L, *de,* from, *vasculum,* small vessel], the drawing away of blood from a body part or the stoppage of blood flow to it or the traumatic disruption of vascular supply to an organ.

developer fog, a defect in a radiographic image characterized by insufficient contrast. Causes include incorrect developer temperature, concentration, and immersion time.

development [Fr, *developper,* to unfold], **1.** the gradual process of change and differentiation from a simple to a more advanced level of complexity. In humans the physical, mental, and emotional capacities that allow complex adaptation to the environment and function within society are acquired through growth, maturation, and learning. Kinds of development include **arrested development, mosaic development, psychomotor development, psychosexual development, psychosocial development,** and **regulative development.** **2.** (in biology) the series of events that occur within an organism from the time of fertilization of the ovum to the adult stage. See also **film development.** —*developmental, adj.*

developmental age (DA) /divel′əpmen′təl/, an expression of a child's maturational progress stated in age and determined by standardized measurements, as of body size and dimensions; by social and psychological functioning; by motor skills; and by mental and aptitude tests. Compare **achievement age, developmental quotient, mental age.**

developmental agraphia, a deficiency in a child's ability to learn to form letters and to write. Other learning is normal, and the child usually has no musculoskeletal or neurological problems.

developmental anatomy, the study of the differentiation and growth of an organism from one cell to birth. Also called **embryology.**

developmental anomaly, any congenital defect that results from interference with the normal growth and differentiation of the fetus. Such defects can arise at any stage of embryonic development, vary greatly in type and severity, and are caused by a wide variety of determining factors, including genetic mutations, chromosomal aberrations, teratogenic agents, and environmental factors. Developmental anomalies are classified either according to the organ system affected, such as congenital heart defects, or according to the way in which the defect occurred, such as developmental failure or arrest, failure to atrophy or subdivide, fusion, splitting, incorrect migration, and misplacement. Most developmental defects are apparent at birth, especially any structural malformation, but some, especially those involving the organ systems, do not become evident until days, weeks, or even years later.

developmental apraxia [L, *developper,* development; Gk, *a,* not, *prassein,* to do], a condition of ineffective motor planning and execution in children caused by immaturity of their central nervous system.

developmental arrest. See **arrested development.**

developmental care, **1.** a nursing intervention from the Nursing Interventions Classification (NIC) defined as structuring the environment and providing care in response to the behavioral cues and states of the preterm infant. See also **Nursing Interventions Classification.** **2.** a multidisciplinary approach to the care of children with an emphasis on assessment and individualized interventions based on clinical signs and cues.

developmental coordination disorder, disorder characterized by motor coordination that is markedly below the chronological age and intellectual ability; significantly interferes with activities of daily living.

developmental crisis, severe, usually transient, stress that occurs when a person is unable to complete the tasks of a psychosocial stage of development and is therefore unable to move on to the next stage. See also **psychosocial development.**

developmental disability (DD), a pathological condition that starts developing before 18 years of age. Most developmental disabilities persist throughout the individual's life, although many can be effectively treated. See also **congenital anomaly.**

developmental disorder, a form of mental retardation that develops in some children after they have progressed normally for the first 3 or 4 years of life. Onset of the mental deterioration usually begins with a vague viral infection or other similar disease symptoms.

developmental dysplasia of the hip (DDH), instability of the hip joint leading to dislocation in the neonatal period. Although it may be associated with various neuromuscular disorders, such as myelodysplasia, or occur in utero, it most commonly occurs in neurologically normal infants and is multifactorial in origin. Usually there is laxity of the hip ligaments. Most affected infants are firstborn children, and 30% to 50% present in the breech position. About 90% of those affected are girls. The condition was formerly called congenital dislocation of the hip, but because the dislocation is not normally present at birth but develops later, the term developmental dysplasia of the hip is preferred.

developmental dyspraxia, a disorder of sensory integration characterized by an impaired ability to plan skilled, nonhabitual coordinated movements.

developmental enhancement: adolescent, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitating optimal physical, cognitive, social, and emotional growth of individuals during the transition from childhood to adulthood. See also **Nursing Interventions Classification.**

developmental enhancement: child, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitating or teaching parents/caregivers to facilitate the optimal gross motor, fine motor, language, cognitive, social, and emotional growth of preschool and school-aged children. See also **Nursing Interventions Classification.**

developmental groove, a fine, recessed line in the enamel of a tooth that marks the union of the lobes of the crown in its development.

developmental guidance, comprehensive orthopedic control over the growth of the jaws and the eruption of the teeth. It may require precisely timed therapy with active appliances as well as supervisory examinations, including radiography and other diagnostic records. Guidance may be needed at various developmental stages throughout the entire growth and maturation of the face, beginning at the earliest detection of a developing malformation.

developmental horizon, any of 25 stages in the development of the human embryo from the one-cell stage at conception to the morphologically and physiologically complex organism at the end of the seventh week of gestation.

developmental model, **1.** a conceptual framework devised to be used as a guide in making a diagnosis, understanding a developmental process, and forming a prognosis for continued development. It has five components: The identifiable state describes the stage, level, phase, or period of the condition or process; the shift in state identifies qualities of change as progressive, sudden, abrupt, or recurrent; and the form of progression describes patterns of development as linear, spiral, or oscillating. The force that triggers the change or the step in development may be self-actualization or any form of stress. Development is ultimately constrained by the fifth component, potentiality, the genetic and environmental possibility of growth. **2.** (in nursing) a conceptual framework describing four stages, or processes, of development in the patient during therapy. In the first stage, called *orientation,* the patient begins a relationship with the nurse or other therapist and begins to clarify the problem with his or her help. In the second stage, called *identification,* the patient develops a sense of closeness and attachment to the therapist. During this period the patient and the therapist work comfortably together. In the third stage, called *exploitation,* the patient makes full use of the nursing services offered, begins to assume some control of the interactions, and becomes more independent. During the last stage, called *resolution,* the therapeutic relationship is terminated; the patient is independent and no longer needs the nurse or therapist. With this model the nurse therapist may plan nursing interventions appropriate to the patient's developmental level. The developmental model is one of the earliest nursing models to be developed. It views the person as a psychobiological being whose needs are expressed in behavior and who is unique and capable of learning and changing. Health is viewed as a forward movement of personality development and other ongoing processes, reflected by the person's creative, constructive, and productive community living. Thus the focus of nursing is to promote this forward movement by assisting the patient in self-repair and self-renewal.

developmental physiology, the study of the physiological processes as they relate to embryonic development.

developmental quotient (DQ), the numeric expression of a child's developmental level as measured by dividing the developmental age by the chronological age and multiplying by 100. Compare **intelligence quotient.** See also **developmental age.**

developmental sequence [Fr, *developper;* L, *sequi,* to follow], the order in which structure and function change during the process of growth and development of an organism. See also **ontogeny, phylogeny.**

developmental task, a physical or cognitive skill that a person must accomplish during a particular age period to continue development. An example is walking, which precedes the development of a sense of autonomy in the toddler period. The nurse may also outline developmental tasks for families.

developmental theories of aging, concepts based on the identification of traits and characteristics that may be developed early in life or may change emphasis at different stages of development. Examples are theories of Jung, Erikson, and Havighurst.

development: late adulthood, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the cognitive, psychosocial, and moral progression from 65 years of age and older. See also **Nursing Outcomes Classification.**

development: middle adulthood, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the cognitive, psychosocial, and moral progression from 40 through 64 years of age. See also **Nursing Outcomes Classification.**

development: young adulthood, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the cognitive, psychosocial, and moral progression from 18 through 39 years of age. See also **Nursing Outcomes Classification.**

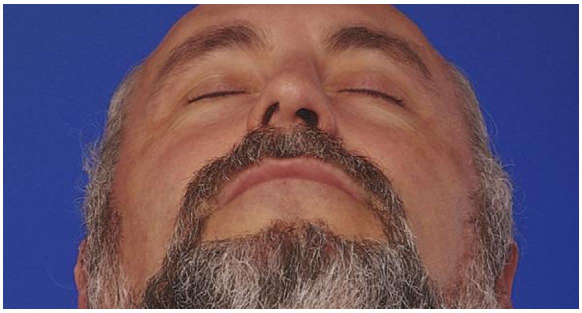
deviance /dē′vē·əns/ [L, *deviare,* to turn aside], behavior that is contrary to the accepted standards of a community or culture.

deviant /dē′vē·ənt/ [L, *deviare,* to turn aside], pertaining to a person or object that departs from what is considered normal or standard.

deviant behavior, actions that exceed the usual limits of accepted behavior and involve failure to comply with the social norm of the group.

deviate /dē′vē·it/ [L, *deviare,* to turn aside], **1.** *n,* a person or an act that varies from that which is considered standard, such as a social or sexual deviate, or that which is within a statistic norm. **2.** *v,* to vary from that which is considered standard or within a statistic norm. **—deviant,** *adj.,* *deviation, n.*

deviated septum, a shifted medial partition of the nasal cavity, a condition affecting many adults. The nasal septum more commonly shifts to the left during normal growth, but this deflection may be aggravated by a blow to the nose or by other trauma. A severe deflection of the septum may significantly obstruct the nasal passages and result in infection, sinusitis, shortness of breath, headache, or recurring nosebleeds. Severe septal deviation may be corrected by various surgical procedures, such as rhinoplasty or septoplasty. Postoperative care in such cases usually includes such measures as the maintenance of nasal packing, the administration of sedatives, and the placement of ice packs around the affected area to reduce swelling.



Deviated septum *(Monahan and Neighbors, 1998)*

deviational nystagmus. See **end-positional nystagmus.**

deviation from normal, a quality, characteristic, symptom, or clinical finding that is different from what is commonly regarded as normal, such as an elevated temperature, multiple gestation, or an extra digit.

deviation of tongue [L, *deviare,* to turn aside; AS, *tunge*], a tendency of the tongue to turn away from the midline when extended or protruded. The condition is associated with a hypoglossal nerve defect, and the tongue deviates to the side of the injured nerve. Also called **tongue deviation**.

device /divīs′/ [OFr, *deviser,* to divide], an item other than a drug that has application in the healing arts. The term is sometimes restricted to items used directly by, on, or in the patient, as opposed to surgical instruments or other equipment used for diagnosis and treatment. Devices include orthopedic appliances, crutches, artificial heart valves, pacemakers, prostheses, wheelchairs, cervical collars, hearing aids, and eyeglasses.

Devic's disease /dəvēks′/ [Eugène Devic, French physician, 1869–1930], combined, but not usually clinically simultaneous, demyelination of the optic nerve and the spinal cord, marked by diminution of vision and sometimes blindness, flaccid paralysis of the extremities, and sensory and genitourinary disturbances. See also **multiple sclerosis.**

devil's claw, a perennial herb, *Harpagophytum procumbens,* native to southern Africa. Its dried tubular secondary roots and lateral tubers are used for dyspepsia, loss of appetite, and generalized pain. It is also used in homeopathy for arthritic disorders and in folk medicine for a wide variety of disorders.

devil's grip. See **epidemic pleurodynia.**

devitalized /dēvī′təlīzd/, pertaining to tissues with a reduced oxygen supply and blood flow.

devital tooth (devitalized tooth). See **pulpless tooth.**

dewar /dyo͞o′ər/, a double chamber used to maintain the temperature of superconducting magnet coils near absolute zero. The outer chamber is filled with liquid nitrogen at a temperature of about −196° C (−321° F), and the inner chamber is filled with liquid helium at a temperature of −270° C (−454° F). A dewar is part of magnetic resonance imaging equipment.

dew point /dyo͞o/, the temperature at which air becomes saturated with water vapor and the water vapor condenses to liquid. In aerosol therapy, water may condense on containers, tubing, and other surfaces when the dew point is reached.

DEXA, abbreviation for **dual-energy x-ray absorptiometry.**

dexamethasone /dek′səmeth′əsōn/, a long-acting synthetic adrenocorticoid with intense antiinflammatory activity and mineralocorticoid activity.

■ INDICATIONS: It is prescribed topically and systemically in the treatment of inflammatory conditions.

■ CONTRAINDICATIONS: Systemic fungal infections or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are GI, endocrine, neurological, fluid, and electrolyte disturbances.

dexamethasone (DST) suppression test, a test of the blood or urine after administration of dexamethasone, a synthetic steroid similar to cortisol, that is used to diagnose Cushing's syndrome.

dexchlorpheniramine maleate /deks′klôrfənir′əmēn mal′ē·it/, an antihistamine.

■ INDICATIONS: It is prescribed in the treatment of hypersensitivity reactions, including rhinitis, skin rash, and pruritus.

■ CONTRAINDICATIONS: Asthma or known hypersensitivity to this drug prohibits its use. It should not be given to newborns or lactating mothers.

■ ADVERSE EFFECTS: Drowsiness, skin rash, hypersensitivity reactions, dry mouth, and tachycardia may occur.

Dexedrine, a trademark for a central nervous system stimulant with indications for narcolepsy and attention deficit disorder with hyperactivity **(dextroamphetamine sulfate).**

dexmedetomidine, an alpha$_2$ adrenoceptor agonist sedative.

■ INDICATIONS: It is used to sedate mechanically ventilated and intubated patients in the intensive care unit.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug contraindicates its use.

■ ADVERSE EFFECTS: Life-threatening effects are atrial fibrillation and infarction. Other serious adverse effects include oliguria, hypertension, pulmonary edema, pleural effusion, hypoxia, leukocytosis, and anemia. Common side effects include nausea, bradycardia, and hypotension.

dexmethylphenidate, a central nervous system stimulant used to treat attention deficit hyperactivity disorder.

dexrazoxane, a cardioprotective agent.

■ INDICATIONS: It is prescribed in the protection of women from heart problems caused by doxorubicin treatment of breast cancer.

■ CONTRAINDICATIONS: It should not be given to patients with an allergy to dexrazoxane or any of its components or who are receiving chemotherapy that does not contain an anthracycline drug.

■ ADVERSE EFFECTS: The side effects most often reported include pain on or at the injection site, flushing, bruising, rash, numbness, or general body discomfort.

dexter (D) /deks′tər/ [L, *dexter,* right], right side; right.

dexterity /dekster′itē/ [L, *dexteritas*], skillfulness in the use of one's hands or body.

dextrad /deks′trad/ [L, *dexter,* right], toward the right side.

dextrad writing /deks′trad/ [L, *dexter,* right; ME, *writen*], writing that moves from left to right.

dextrality. See **right-handedness.**

dextran fermentation /dek′strən/ [L, *dexter,* right; *fermentare,* to cause to rise], the conversion of dextrose to dextran by the action of *Leuconostoc mesenteroides* dextran bacteria.

dextran preparation, any of a group of solutions containing polysaccharides, water, and, in some preparations, electrolytes. These solutions are used as plasma volume extenders in cases of hypovolemia from hemorrhage, dehydration, or another cause and are available for IV administration in several concentrations.

dextrin, a glucose polymer formed by the hydrolysis of starch. It is a tasteless, colorless, gummy substance, soluble in water. Dextrin is an intermediate during the conversion of starch into monosaccharides, such as glucose. It is used in a number of pharmaceutic products.

dextro-, dextr-, prefix meaning "right": *dextrocardia, dextrocerebral, dextrogastria.*

dextroamphetamine sulfate /deks′trō·amfet′əmēn/, a central nervous system stimulant.

■ INDICATIONS: It is prescribed in the treatment of narcolepsy, hyperkinetic disorders, and attention deficit disorder in children and as an anorexiant in treating exogenous obesity.

■ CONTRAINDICATIONS: Cardiovascular disease, glaucoma, hypertension, hyperthyroidism, agitation, history of drug abuse, concomitant administration of a monoamine oxidase inhibitor within 14 days, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are manifestations of central nervous system excitation, increased blood pressure, arrhythmias and other cardiovascular effects, nausea, anorexia, and drug dependence.

dextrocardia /-kär′dē·ə/, the location of the heart in the right hemithorax, either as a result of displacement by disease or as a congenital defect.

dextrocardiogram /-kär′dē·ōgram′/ [L, *dexter,* right; Gk, *kardia,* heart, *gramma,* record], an electrocardiogram made from a unipolar electrode facing the right ventricle, producing a small R wave and a large S wave.

dextromethorphan hydrobromide /-methôr′fən/, an antitussive derived from morphine but lacking opioid effects.

■ INDICATION: It is prescribed for the suppression of nonproductive cough.

■ CONTRAINDICATIONS: Use of a monoamine oxidase inhibitor within the past 14 days or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: The most serious adverse reaction is respiratory depression resulting from large doses.

dextrose /dek′strōs/ [L, *dexter,* right], glucose available in various solutions for IV administration.

■ INDICATIONS: It is prescribed for the treatment of calorie deficit, for hypoglycemia, and in solution for fluid deficit.

■ CONTRAINDICATIONS: Diabetic coma, intracranial or intraspinal hemorrhage, or delirium tremens prohibit its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are hyperglycemia, glycosuria, and phlebitis.

dextrose and sodium chloride injection, a fluid, nutrient, and electrolyte replenisher. It is available for parenteral use in a variety of concentrations.

df, abbreviation for **degrees of freedom.**

DFA-TP test, abbreviation for **direct fluorescent antibody–*Treponema pallidum* test**.

dg, abbreviation for **decigram.**

D gene, one of a set of genes lying between the V and J genes, which code for the D region of heavy-chain or for the beta or delta chain of the T cell receptor.

D.H.E.-45, a trademark for a vasconstrictor that works primarily by stimulating alpha-adrenergic receptors **(dihydroergotamine mesylate).**

DHFSS, abbreviation for **dengue hemorrhagic fever shock syndrome.**

DHHS, abbreviation for **Department of Health and Human Services.**

dhobie itch /dō′bē/ [Hindi, *dhobie,* laundryman; AS, *giccan*], a fungal infection, such as jock itch or athlete's foot, that attacks moist parts of the body. Risk factors for infection include close fitting or wet clothing or undergarments.

DHT, abbreviation for **dihydrotestosterone**.

di-, dia-, **1.** prefix meaning "two, twice": *diacid, diamide, dimorphic*. **2.** prefix meaning "apart, through": *diactinism, diuresia*. **3.** prefix meaning "apart, away from": *diffraction, divergent*.

di-, dis-, **1.** prefix meaning "reversal, apart, or to separate": *disacidify, dischronation, disinfect*. **2.** prefix meaning "two or duplication": *diplegia, dioxide, dissogeny*. **3.** prefix meaning "opposite": *disease*.

DiaBeta, a trademark for an oral antidiabetic drug **(glyBURIDE).**

diabetes /dī′əbē′tēz/ [Gk, *diabainein,* to pass through], a clinical condition characterized by the excessive excretion of urine. The excess may be caused by a deficiency of antidiuretic hormone, as in diabetes insipidus, or it may be the polyuria resulting from the hyperglycemia that occurs in diabetes mellitus. See also **diabetes insipidus, diabetes mellitus.**

diabetes insipidus /insip′idəs/, a metabolic disorder caused by injury of the neurohypophyseal system. It is characterized by copious excretion of urine and excessive thirst, caused by deficient production or secretion of the antidiuretic hormone (ADH) or inability of the kidney tubules to respond to ADH. Rarely the symptoms are self-induced by an excessive water intake. The condition may be acquired, familial, idiopathic, neurogenic, nephrogenic, or psychogenic.

■ OBSERVATIONS: The onset may be dramatic and sudden, and urinary output may exceed 10 L in 24 hours. Diagnosis is established by a water deprivation test in which urine volume increases and urine osmolality decreases. A person with diabetes insipidus who is unconscious as result of trauma or surgery continues to produce massive quantities of urine. If fluids are not administered in adequate amounts, the patient becomes severely dehydrated and hypernatremic.

■ INTERVENTIONS: In mild cases, no treatment is necessary. Vasopressin in an intramuscular injection or nasal spray is effective. Thiazide diuretics, by inducing a state of salt depletion, sometimes decrease the diuresis of water by as much as 50%.

■ NURSING CONSIDERATIONS: Infants, small children, and the elderly are particularly vulnerable to serious circulatory disturbances when dehydrated. Therefore exceedingly careful monitoring is essential when the condition is suspected, especially after head surgery or trauma.

diabetes mellitus (DM) /məlī′təs/, a complex disorder of carbohydrate, fat, and protein metabolism that is primarily a result of a deficiency or complete lack of insulin secretion by the beta cells of the pancreas or resistance to insulin. The disease is often familial but may be acquired, as in Cushing's syndrome, as a result of the administration of excessive glucocorticoid. The various forms of diabetes have been organized into categories developed by the Expert Committee on the Diagnosis and Classification of Diabetes Mellitus of the American Diabetes Association. **Type 1 diabetes mellitus** in this classification scheme includes patients with diabetes caused by an autoimmune process, dependent on insulin to prevent ketosis. This group was previously called type I, insulin-dependent diabetes mellitus, juvenile-onset diabetes, brittle diabetes, or ketosis-prone diabetes. Patients with **type 2 diabetes mellitus** are those previously designated as having type II, non-insulin-dependent diabetes mellitus, maturity-onset diabetes, adult-onset diabetes, ketosis-resistant diabetes, or stable diabetes. Those with **gestational diabetes mellitus** are women in whom glucose intolerance develops during pregnancy. Other types of diabetes are associated with a pancreatic disease, hormonal changes, adverse effects of drugs, or genetic or other anomalies. A fourth subclass, the impaired glucose tolerance group, also called prediabetes, includes persons whose blood glucose levels are abnormal although not sufficiently above the normal range to be diagnosed as having diabetes. Approximately 95% of the 18 million diabetes patients in the United States are classified as type 2, and more than 70% of those patients are obese. About 1.3 million new cases of diabetes mellitus are diagnosed in the United States each year. Contributing factors to the development of diabetes are heredity; obesity; sedentary life-style; high-fat, low-fiber diets; hypertension; and aging. See also **impaired glucose tolerance, potential abnormality of glucose tolerance, previous abnormality of glucose tolerance.**

■ OBSERVATIONS: The onset of type 1 diabetes mellitus is sudden in children. Type 2 diabetes often begins insidiously. Characteristically the course is progressive and includes polyuria, polydipsia, weight loss, polyphagia, hyperglycemia, and glycosuria. The eyes, kidneys, nervous system, skin, and circulatory system may be affected by the long-term complications of either type of diabetes; infections are common; and atherosclerosis often develops. In type 1 diabetes mellitus, when no endogenous insulin is being secreted, ketoacidosis is a constant danger. The diagnosis is confirmed by fasting plasma glucose and history.

■ INTERVENTIONS: The goal of treatment is to maintain insulin glucose homeostasis. Type 1 diabetes is controlled by insulin, meal planning, and exercise. The Diabetes Control and Complications Trial (DCCT), completed in mid-1993, demonstrated that tight control of blood glucose levels (i.e., frequent monitoring and maintenance at as close to normal as possible to the level of nondiabetics) significantly reduces complications such as eye disease, kidney disease, and nerve damage. Type 2 diabetes is controlled by meal planning; exercise; one or more oral agents, in combination with oral agents; and insulin. The results of the United Kingdom Prospective Diabetes Study, which involved more than 5000 people with newly diagnosed type 2 diabetes in the United Kingdom, were comparable to those of the DCCT where a relationship in microvascular complications. Stress of any kind may require medication adjustment in both type 1 and type 2 diabetes.

diabetes mellitus autoantibody panel, a blood test to screen for diabetes in relatives of insulin-dependent diabetes mellitus patients.

diabetes self-management, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to manage diabetes mellitus, its treatment, and prevent disease progression. See also **Nursing Outcomes Classification.**

diabetic /dī′əbet′ik/, **1.** *adj,* pertaining to diabetes. **2.** *adj,* affected with diabetes. **3.** *n,* a person who has diabetes mellitus.

diabetic acidosis [Gk, *diabainein,* to pass through; L, *acidus,* acid; Gk, *osis,* condition], a type of acidosis that may occur in diabetes mellitus as a result of excessive production of ketone bodies during oxidation of fatty acids. See also **diabetic ketoacidosis.**

diabetic amaurosis [Gk, *diabainein,* to pass through, *amauroein,* to darken], blindness associated with diabetes mellitus, caused by a proliferative hemorrhagic form of retinopathy that is characterized by capillary microaneurysms and hard or waxy exudates. Cataracts are also common in type 2 diabetes; in type 1 diabetes, snowflake cataract may progress until the entire lens is milky white.

diabetic coma, a life-threatening condition occurring in persons with diabetes mellitus. It is caused by undiagnosed diabetes; inadequate treatment; failure to take prescribed insulin; excessive food intake; or, most frequently, infection, surgery, trauma, or other stressors that increase the body's need for insulin. Without insulin to metabolize glucose, fats are used for energy, resulting in ketone waste accumulation and metabolic acidosis. The body's effort to counteract acidosis depletes the alkali reserve; causes a loss of sodium, chloride, potassium, and water; increases respiratory exhalation of carbon dioxide (Kussmaul breathing) and urinary excretion; and leads to dehydration and generalized hypoxia. Warning signs of diabetic coma include a dull headache, fatigue, inordinate thirst, epigastric pain, nausea, vomiting, parched lips, flushed face, and sunken eyes. The temperature usually rises and then falls, the systolic blood pressure drops, and circulatory collapse may occur. Immediate treatment consists of administering short-acting insulin and replacing electrolytes and fluids to correct the acidosis and dehydration. Nonketotic coma may occur in patients with poorly controlled type 2 diabetes mellitus and high levels of blood glucose but no fatty acid breakdown. The plasma hyperosmolarity causes water to leave cells, and the dehydration of cerebral cells results in coma. See also **diabetic ketoacidosis, insulin shock.**

diabetic diet, a diet prescribed in the treatment of type 2 diabetes mellitus. It usually contains limited amounts of simple sugars or readily digestible carbohydrates and amounts of proteins, complex carbohydrates, fiber, and unsaturated fats similar to those recommended for the general public. Dietary regulation depends on the severity of the disease and on the type and extent of insulin therapy. The diet should be designed to prevent wide fluctuation in the amount of glucose in the blood, to preserve pancreatic function, and to prevent chronic diabetic complications. See also **diabetes mellitus, Exchange Lists for Meal Planning, insulin.**

diabetic foot and leg care, the special attention given to prevent the circulatory disorders and infections that frequently occur in the lower extremities of diabetic patients.

■ METHOD: The patient's legs and feet are examined daily for signs of dry, scaly, red, itching, or cracked skin; blisters; corns; calluses; abrasions; infection; blueness and swelling around varicosities; and thickened, discolored nails. The feet are bathed daily in tepid water with mild or superfatted soap and are dried gently but thoroughly with a soft towel. A lanolin-based lotion is then applied, although not between the toes; excess lotion is removed with a dry towel; vigorous rubbing and use of alcohol preparations are avoided because of drying and irritation of skin which can lead to skin breakdown. The toenails are cut straight across above the level of soft tissue after the feet are soaked for 3 to 5 minutes in tepid water. The feet are also soaked in tepid water for several minutes before hardened areas are treated by applying soft soap and rubbing the area with a washcloth. Calluses and corns are removed, and thickened, deformed nails are cut by a podiatrist. Commercial remedies for removing calluses and corns should not be used.

■ INTERVENTIONS: The nurse provides foot and leg care while the diabetic patient is hospitalized. Before discharge the patient is instructed to examine and bathe the feet daily according to the recommended method, to report abnormalities, to keep the feet dry at all times, to wear cotton socks or stockings with cotton feet, and to place clean lamb's wool or cotton between the toes if they perspire. The patient is cautioned to avoid sustaining foot or leg trauma, walking barefoot, scratching insect bites, using a hot-water bottle or heating pad on the lower extremities, getting sunburned, wearing constricting garments, remaining in the same position for long periods, sitting at more than a right-angle bend,

Characteristics of types 1 and 2 diabetes mellitus

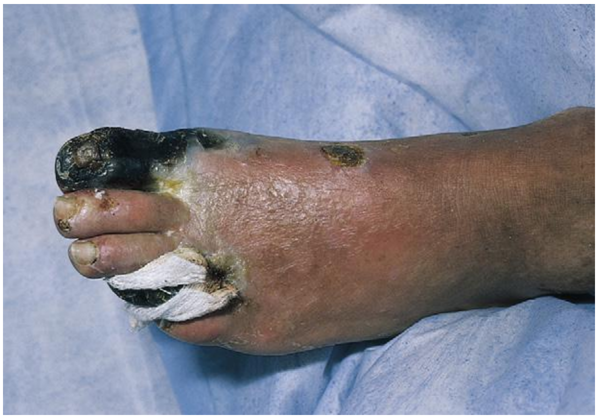
Characteristic	*Type 1*	*Type 2*
Age at onset	<20 yr	Increasingly occurring in younger children
Type of onset	Abrupt	Gradual
Sex ratio	Affects males slightly more than females	Females outnumber males
Percentage of diabetic population	5%-8%	85%-90%
Heredity:		
Family history	Sometimes	Frequently
Human leukocyte antigen	Associations	No association
Twin concordance	25%-50%	90%-100%
Ethnic distribution	Primarily Caucasians	Increased incidence in Native Americans, Hispanics, African-Americans
Presenting symptoms	3 Ps common: polyuria, polydipsia, polyphagia	May be related to long-term complications
Nutritional status	Underweight	Overweight
Insulin (natural):		
Pancreatic content	Usually none	>50% normal
Serum insulin	Low to absent	High or low
Primary resistance	Minimum	Marked
Islet cell antibodies	80%-85%	<5%
Therapy:		
Insulin	Always	20%-30% of patients
Oral agents	Ineffective	Often effective
Diet only	Ineffective	Often effective
Chronic complications	>80%	Variable
Ketoacidosis	Common	Infrequent

From Hockenberry MJ, Wilson D: *Wong's nursing care of infants and children*, ed 9, St Louis, 2011, Mosby.

and crossing the knees. The diabetic individual is advised to alternate the wearing of two pairs of rubber-soled, well-fitted shoes wide enough to prevent pressure and rubbing; to air each pair of shoes between use; and to break in new shoes gradually. The patient is urged to walk to tolerance daily, to plan exercise periods after meals, to bend and straighten the knees and rotate the ankles occasionally when sitting, and, when standing, to shift weight from time to time and walk in place. Patients may be referred to a certified diabetic educator for initial instruction about care.

■ OUTCOME CRITERIA: Meticulous care of the feet and legs can prevent serious complications, including local infection, skin ulcers, cellulitis, and gangrene.

diabetic gangrene [Gk, *diabainein,* to pass through, *gaggraina*], gangrene, usually involving the lower extremities, that develops secondary to sensory peripheral neuropathy and peripheral vascular disease complications related to the diabetic disease process.



Diabetic gangrene *(Swartz, 2009)*

diabetic glycosuria [Gk, *diabainein,* to pass through, *glykys,* sweet, *ouron,* urine], excessive excretion of glucose into the urine as an effect of poorly controlled diabetes mellitus.

diabetic ketoacidosis (DKA), an acute, life-threatening complication of uncontrolled diabetes mellitus. In this condition urinary loss of water, potassium, ammonium, and sodium results in hypovolemia, electrolyte imbalance, extremely high blood glucose levels, and breakdown of free fatty acids, causing acidosis, often with coma. Compare **insulin shock.**

Target nutritional goals for patients with diabetes mellitus

Calories

Sufficient to achieve and maintain weight as close to desirable body weight as possible

Carbohydrate

Varies in relation to assessment and protein and fat intake; usually 40% to 60% of total calories
Liberalized, individualized emphasis on total carbohydrate intake versus eliminating simple sugars only
Carbohydrate consistency at meals
Modest amounts of sucrose and other refined sugars acceptable contingent on metabolic control and body weight

Protein

Usual dietary intake of protein double the amount needed
Exact ideal percentage of total calories debatable; usually 12% to 20% of total calories
Recommended dietary allowance (RDA): 0.8 g/kg body weight for adults; RDA modified for children, pregnant and lactating women, older adults, and those with special medical conditions
Avoidance of excess dietary protein intake in renal disease

Fat

Usually 30% or less of total calories, but may be as high as 40%
Polyunsaturated fats, 6% to 8%
Saturated fats, less than 10%
Monounsaturated fats, remaining percentage
Cholesterol, less than 300 mg/day
May need to be further modified, depending on lipid profile

Fiber

Up to 40 g/day
25 g/1000 kcal for low-calorie intakes

Alternative Sweeteners

Use of various nutritive and nonnutritive sweeteners

Sodium

3000 mg/day or less
Modified for special medical conditions (e.g., hypertension, edema)

Alcohol

Two or less equivalents per day (1 equivalent = 1.5 ounces distilled liquor, 4-ounce glass of wine, or 12-ounce glass of beer)

Vitamins and Minerals

Despite a lack of scientific evidence that individuals with diabetes mellitus (DM) who eat a well-balanced diet require vitamin or mineral supplementation, the RDAs were developed based on a healthy population. Also, given that many vitamins and minerals are excreted in excess in the urine of individuals with DM, supplementation with a general multivitamin is prudent and rarely harmful.

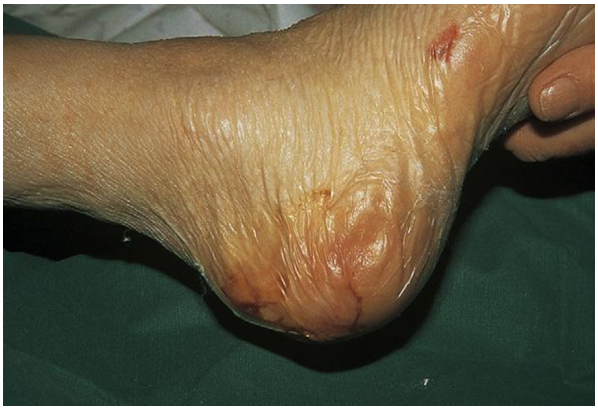
From Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives,* ed 8, St Louis, 2007, Mosby.

■ OBSERVATIONS: The person appears flushed; has hot, dry skin; is restless, uncomfortable, agitated, and diaphoretic; and has a fruity odor to the breath. Nausea, confusion, and coma are often noted. Persons with diabetes mellitus who produce no natural (endogenous) insulin are most often affected (type 1). Untreated, the condition invariably proceeds to coma and death.

■ INTERVENTIONS: IV insulin and hypotonic saline solution are administered immediately. Nasogastric intubation and bladder catheterization may be indicated. Blood glucose and ketone levels are determined hourly, and electrolyte and acid-base balance are monitored frequently. Bicarbonate may be given in dosages dependent on the degree of acidosis. Potassium is usually given because of intracellular potassium depletion. Plasma or a plasma expander may be necessary to prevent or correct shock resulting from hypovolemia.

■ NURSING CONSIDERATIONS: The cause of the episode of ketoacidosis is sought. The most common precipitating factors are undiagnosed type 1 diabetes mellitus, infection, GI upset, alcohol consumption, and failure to take insulin. Type 1 diabetes mellitus in childhood characteristically begins suddenly and progresses rapidly. Therefore, the diagnosis of type 1 diabetes is usually made when the child arrives at the hospital in diabetic ketoacidosis. Inpatient care after an episode of ketoacidosis is the same as for diabetes mellitus.

diabetic neuropathy, a noninflammatory disease process associated with diabetes mellitus and characterized by sensory and/or motor disturbances in the peripheral nervous system. Patients commonly experience degeneration of sensory nerves and pathways. Early symptoms, which include pain and loss of reflexes in the legs, may occur in patients with only mild hyperglycemia. Diabetes is associated with a wide range of neuropathies, including mononeuritis multiplex, compression and entrapment mononeuropathies, cranial neuropathies, and autonomic and small fiber neuropathies. Differential diagnosis is difficult because not all sensorimotor neuropathies are caused by diabetes.

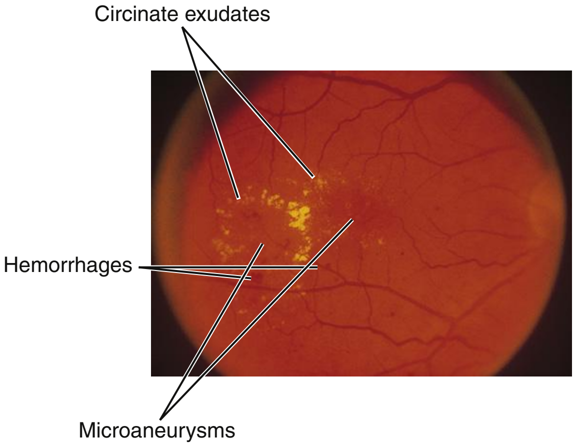


Diabetic neuropathy: early pressure damage to the heel *(Belchetz and Hammond, 2003)*

diabetic polyneuritis, an inflammation involving many nerves. It usually occurs as a complication in long-term cases of diabetes mellitus.

diabetic polyneuropathy, a disorder involving a number of nerves, a long-term complication of diabetes mellitus. Central nervous system, autonomic, and peripheral nerves may be affected. Neuropathic ulcers commonly develop on the feet.

diabetic retinopathy, a disorder of retinal blood vessels. It is characterized by capillary microaneurysms, cotton-wool spots, hemorrhage, exudates, and the formation of highly permeable new vessels. The disorder occurs most frequently in patients with long-standing poorly controlled diabetes mellitus. Repeated hemorrhage may cause permanent opacity of the vitreous humor, and blindness may eventually result. Photocoagulation of damaged retinal blood vessels by a laser beam may be performed to decrease retinal ischemia and to prevent hemorrhage from the vessels.



Diabetic retinopathy *(Belchetz and Hammond, 2003)*

diabetic tabes, a wasting condition associated with diabetic peripheral neuropathy. It may be accompanied by sharp pain, muscle weakness, atrophy of intrinsic foot muscles, and weakness of the toes' extensors and flexors. It may lead to foot drop because of ankle weakness. When these manifestations coexist with decreased proprioception in the feet, "pseudotabetic" gait may occur.

diabetic treatment, management of diabetes mellitus by means of a controlled carbohydrate low–fat meal plan, insulin injections, exercise/activity, blood glucose level monitoring, and oral agents such as insulin secretagogues, alpha-glucosiderase inhibitors, meglitinides, bigriemdis, and insulin sensitizers (for patients with type 2 diabetes mellitus).

diabetic vulvovaginitis [Gk, *diabainein,* to pass through; L, *vulva,* wrapper, *vagina,* sheath; Gk, *itis,* inflammation], a form of mycotic inflammation of the vulva and vagina that is associated with diabetes.

diabetic xanthoma, an eruption of yellow papules or plaques on the skin in uncontrolled diabetes mellitus. The lesion disappears as the metabolic functions are stabilized and the disease is controlled.

diabetogenic state /dī′əbet′ōjen′ik/, a health condition manifested by signs and symptoms of diabetes.

Diabinese, a trademark for an oral antidiabetic **(chlorproPAMIDE).**

diacet, abbreviation for a *diacetate anion.*

diacetic acid. See **acetoacetic acid.**

diacetylmorphine. See **heroin.**

diacondylar fracture /dī′əkon′dilər/ [Gk, *dia,* through, *kondylos,* knuckle; L, *fractura,* break], any fracture that runs across the line of a condyle.

diadochokinesia /dī·ad′əkōkīnē′zhə/ [Gk, *diadochos,* successor, *kinesis,* motion], the normal ability of the muscles to move a limb alternately in opposite directions by flexion and extension.

diagnose /dīʹagnōs/, to determine the type and cause of a health condition on the basis of signs and symptoms of the patient; data obtained from laboratory analysis of fluid, tissue specimens, and other tests; and family and occupational background information, such as recent injuries or exposure to toxic substances. See also **diagnosis.**

diagnosis /dīʹagnōʹsis/ *pl. diagnoses* [Gk, *dia* + *gnosis,* knowledge], **1.** identification of a disease or condition by a scientific evaluation of physical signs, symptoms, history, laboratory test results, and procedures. Kinds of diagnoses are **clinical diagnosis, differential diagnosis, laboratory diagnosis, nursing diagnosis,** and **physical diagnosis. 2.** the art of naming a disease or condition. **—diagnose,** *v.,* **diagnostic,** *adj.*

diagnosis by exclusion [Gk, *dia,* through, *gnosis,* knowledge; L, *excludere,* to shut out], diagnosis made by eliminating other possible causes of disease symptoms.

diagnosis-related group (DRG), a group of patients classified for measuring a medical facility's delivery of care. The classifications, used to determine Medicare payments for inpatient care, are based on primary and secondary diagnosis, primary and secondary procedures, age, and length of hospitalization. See also **prospective payment system.**

diagnostic /dīʹagnosʹtik/, pertaining to a diagnosis.

Diagnostic and Statistical Manual of Mental Disorders (DSM), a manual, published by the American Psychiatric Association, listing the official diagnostic classifications of mental disorders. The *DSM* recommends the use of a multiaxial evaluation system as a holistic diagnostic approach. It consists of five axes, each of which refers to a different class of information, including mental and physical data. Axes I and II include all of the mental disorders, classified broadly as clinical syndromes and personality disorders; axis III contains physical disorders and conditions; and axes IV and V provide a coded outline of supplemental information on psychosocial stressors and adaptive functioning, which is useful for planning individual treatment and predicting outcomes. Each of the classifications of the mental disorders contains a code that provides a reference to the WHO *International Classification of Diseases* and offers such useful diagnostic criteria as essential and associated features of the disorder, age at onset, course, impairment, complications, predisposing factors, prevalence, sex ratio, familial patterns, and differential diagnoses. *DSM-IV* is the fourth edition of the manual, published in 1994.

diagnostic anesthesia, a procedure in which analgesia is induced to a depth adequate to permit comfortable performance of moderately painful diagnostic procedures of short duration. Awake anesthesia is often used for this purpose. See also **awake anesthesia.**

diagnostician /dīʹagnostishʹən/, a person skilled and trained in making diagnoses.

diagnostic medical sonographer, an allied health professional who provides patient services, using diagnostic ultrasound under the supervision of a doctor of medicine or osteopathy responsible for the use and interpretation of ultrasound procedures. The sonographer assists the physician in gathering sonographic data necessary to reach diagnostic decisions.

diagnostic molecular scientist, an allied health professional who performs diagnostic tests on various specimen types after determining how the specimens will be handled. A baccalaureate degree is required, and a master's degree is usually completed.

diagnostic peritoneal lavage (DPL), a procedure used to detect intraabdominal bleeding or viscus perforation after abdominal trauma. The open or operative approach allows direct visual examination of the peritoneum when the catheter is inserted. Gastric and bladder decompression must precede performance of DPL.

diagnostic position of gaze. See **cardinal position of gaze.**

diagnostic process, the act of determining a patient's health status and evaluating the factors influencing that status.

diagnostic radiology, medical imaging using external sources of radiation.

diagnostic radiopharmaceutical, a radioactive drug administered to a patient as a diagnostical tracer to differentiate normal from abnormal anatomical structures or biochemical or physiological functions. Most diagnostic radiopharmaceuticals emit gamma rays. A collimated external gamma-ray detector can determine the concentration of the drug in different organs and produce low-resolution images of the organs. Some radiopharmaceuticals, such as those prepared with tritium, carbon-14, or phosphorus-32, do not emit gamma rays. Their diagnostic use involves analyzing the concentration of the isotope in a metabolic end product in the patient's blood, urine, breath, or biopsy samples. For example, when glucose containing ^{14}C is administered, the subsequent monitoring of $^{14}CO_2$ in the patient's breath can indicate the absorption of glucose, its metabolism, and its elimination as a metabolic end product.

diagnostic sensitivity, the conditional probability that a person having a disease will be correctly identified by a clinical test, i.e., the number of true positive results divided by the total number with the disease (which is the sum of the numbers of true positive plus false negative results).

diagnostic services, activities related to the diagnosis made by a physician or nurse practitioner, which may also be performed by nurses or other health professionals.

diagnostic specificity, the conditional probability that a person not having a disease will be correctly identified by a clinical test, i.e., the number of true negative results divided by the total number of those without the disease (which is the sum of the numbers of true negative plus false positive results).

diagonal artery, an inconstant artery, occasionally duplicated, arising from the trunk of the left anterior descending coronary artery and crossing the anterior aspect of the left ventricle diagonally, toward the left margin.

diagonal conjugate /dī·agʹənəl/, a radiographic measurement of the distance from the inferior border of the symphysis pubis to the sacral promontory. The measurement, which averages around 12.5 to 13.0 cm in adult women, may also be determined by vaginal examination. See also **conjugate, true conjugate.**

diakinesis /dīʹəkinēʹsis, dīʹəkī-/ [Gk, *dia* + *kinesis,* motion], the final stage in the first meiotic prophase in gametogenesis, in which the chromosomes achieve their maximum thickness. The chiasmata and nucleolus disappear, the nuclear membrane degenerates, and the spindle fibers form in preparation for the formation of dyads. See also **diplotene, leptotene, pachytene, zygotene.**

dial, a circular diagram with black lines radiating outward across a white background from the center, as is used in tests of astigmatism.

dialect /dīʹəlekt/, a variation of spoken language different from other forms of the same language in pronunciation, syntax, and word meanings. A particular dialect is usually shared by members of an ethnic group, socioeconomic group, or people living together in a geographic area.

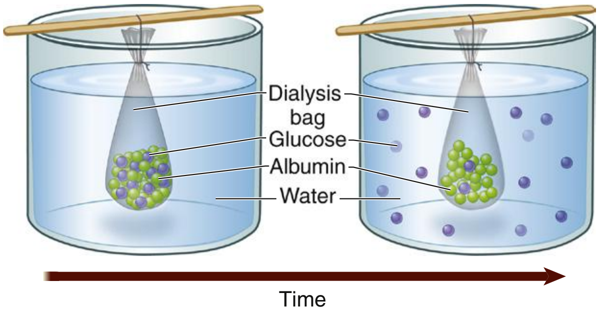
dialogue /dīʹəlog/ [L, *dialogus,* philosophic conversation], a complex form of computer-assisted instruction in which the student is actively engaged in "true conversation" with a computer.

Dialose, a trademark for a fixed-combination GI drug containing a stool softener **(docusate)** and a laxative (sodium carboxymethylcellulose).

dialy-, prefix meaning "dialysis or dissolution": *dialysate, dialytic*.

dialysate, the material that passes through the membrane in dialysis.

dialysis /dī·al′isis/ [Gk *dia* + *lysis* a loosening], **1.** the process of separating colloids and crystalline substances in solution by the difference in their rate of diffusion through a semipermeable membrane. **2.** a medical procedure for the removal of certain elements from the blood or lymph by virtue of the difference in their rates of diffusion through an external semipermeable membrane or, in the case of peritoneal dialysis, through the peritoneum. Dialysis may be used to remove poisons and excessive amounts of drugs, to correct serious electrolyte and acid-base imbalances, and to remove urea, uric acid, and creatinine in cases of chronic end-stage renal disease. Dialysis involves diffusion of particles from an area of high to lower concentration, osmosis of fluid across the membrane from an area of lesser to one of greater concentration of particles, and ultrafiltration or movement of fluid across the membrane as a result of an artificially created pressure differential. See also **hemodialysis, peritoneal dialysis.**



Dialysis *(Patton and Thibodeau, 2010)*

dialysis access maintenance, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the preservation of vascular (arterial-venous) access sites. See also **Nursing Interventions Classification.**

dialysis dementia, a neurological disorder that occurs in some patients undergoing dialysis. The precise cause is unknown, but the effect is believed to be related to chemicals in the dialyzing fluid, drugs administered to the dialysis patient, or both.

dialysis disequilibrium syndrome, a disorder caused by a rapid change in extracellular fluid composition during dialysis. It may be marked by cerebral or neurological disturbances, cardiac arrhythmias, and pulmonary edema.

dialysis fluid. See **dialysate.**

dialysis shunt [Gk, *dia,* through, *lysis,* loosening; ME, *shunten*], an external artificial link between a peripheral artery and a vein, in an arm or leg, for use in hemodialysis.

dialysis technician [Gk, *dia,* through, *lysis,* loosening, *technikos,* skillful], an allied health professional who operates and maintains dialysis equipment for patients with kidney diseases.

dialyzer /dī′əlī′zər/ [Gk, *dia* + *lysis,* loosening], **1.** a machine used in dialysis. **2.** a semipermeable membrane or porous diaphragm in a dialysis machine. See also **dialysis, hemodialysis, peritoneal dialysis.**

diameter (D) /dī·am′ə·tər/ [Gk, *diametros*], **1.** the length of a straight line passing through the center of a circle and connecting opposite points on its circumference. **2.** the distance between two specified opposite points on the periphery of a structure such as the cranium or pelvis.

Diameter-Index Safety System (DISS), a system of standardized connections between cylinders of medical gases and flowmeters or pressure regulators. Each gas has connections of a specific size to prevent accidental hookup of the wrong gas. Each type of gas and connector is assigned a DISS number, such as 1040 for nitrous oxide and 1240 for oxygen. See also **Pin-Index Safety System.**

diameter of fetal skull [Gk, *diametros* + L, *fetus* + AS, *skulle,* bowl], the average distances between certain landmarks of the fetal skull as measured at term. These measurements include the following: biparietal, the fetal head between the two parietal eminences, 9.25 cm; occipitofrontal, from the external occipital protuberance to the most prominent point of the frontal midline, 11 cm; occipitomental, from the external occipital protuberance to the midpoint of the chin, 13 cm; and suboccipitobregmatic, from the lowest posterior point of the occipital bone to the center of the anterior fontanel, 9.5 cm.

diamine oxidase. See **histaminase.**

diaminovaleric acid. See **ornithine.**

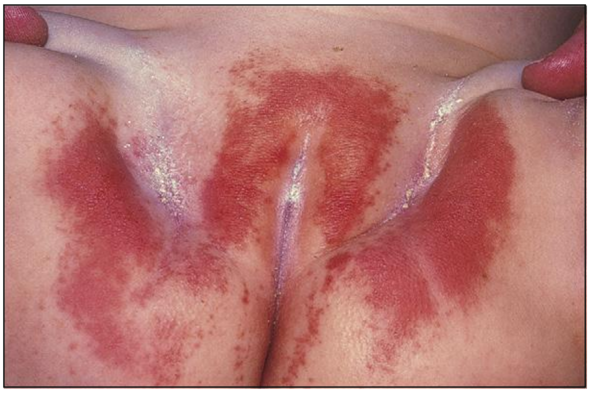
Diamond-Blackfan syndrome, a rare congenital disorder evident in the first 3 months of life, characterized by severe anemia and a very low reticulocyte count but normal numbers of platelets and white cells. It is caused by a deficiency of erythrocyte precursors. Also called **congenital hypoplastic anemia.** See also **anemia.**

diamond bur /dī′(ə)mənd/, a rotary device of differing shapes and sizes to shape and prepare teeth for restoration or extraction. It contains diamond particles and is used as an abrasive in dentistry.

Diamox, trademark for a carbonic anhydrase inhibitor **(acetaZOLAMIDE),** a diuretic.

diapedesis /dī′əpidē′sis/ [Gk, *dia* + *pedesis,* an oozing], the passage of white blood cells through the walls of the blood vessels without damage to the vessels. See also **ameboid movement.**

diaper rash [ME, *diapre,* patterned fabric], an erythematous, papular, or scaly eruption in the diaper area of infants, caused by irritation from feces, moisture, heat, or ammonia produced by the bacterial decomposition of urine. Secondary infection by ***Candida albicans*** is common. Principles of treatment include frequent diaper changes, dryness, cleanliness, coolness, and ventilation of the affected area. Specific topical antimicrobial medication may be prescribed for secondary infection. Also called *diaper dermatitis*.



Diaper dermatitis *(White and Cox, 2006)*

diaper restraint, a therapeutic device used for countertraction with lower extremity traction when other methods of countertraction are not effective. One device is used in treating children with orthopedic diseases and abnormalities. It is designed to fit over the pelvic area like diapers, with rings at each of four corners. A webbing strap is threaded through the rings and attached to the top side of the bedspring frame. Diaper restraints are used with Russell traction and with split Russell traction if additional countertraction is required but are not generally used with other kinds of traction. Compare **jacket restraint, sling restraint.**

diaphanography /dī·af′ənog′rəfē/ [Gk, *diaphanes,* shining through, *graphein,* to record], a type of transillumination used to examine the breast that uses selected wavelengths of light and special imaging equipment. The images are still recordings, as in conventional radiography. See also **diaphanoscopy.**

diaphanoscope /dī·af’ənəskōp’/, an instrument that transilluminates body tissues. It is sometimes used in the diagnosis of breast tumors.

diaphanoscopy /dī·af′ənos′kəpē/, examination of an internal structure with a diaphanoscope.

diaphoresis /dī′əfərē′sis/ [Gk, *dia* + *pherein,* to carry], the secretion of sweat, especially the profuse secretion associated with an elevated body temperature, physical exertion, exposure to heat, and mental or emotional stress. **Sweating** is centrally controlled by the sympathetic nervous system and is primarily a thermoregulatory mechanism. However, the sweat glands on the palms and soles respond to emotional stimuli and do not always participate in thermal sweating. The rate of sweating is generally not affected by water deficiency, but it may be reduced by severe dehydration; it also diminishes when salt intake exceeds salt loss. See also **sudorific.**

diaphoretic. See **sudorific.**

diaphragm /dī′əfram/ [Gk, *diaphragma,* partition], **1.** (in anatomy) a dome-shaped musculofibrous partition that separates the thoracic and abdominal cavities. The convex cranial surface of the diaphragm forms the floor of the thoracic cavity; the concave surface forms the roof of the abdominal cavity. This partition is pierced by various openings through which pass the esophagus and inferior vena cava. The diaphragm aids respiration by moving up and down. During inspiration it moves down and increases the volume of the thoracic cavity. During expiration it moves up, decreasing the volume. During deep inspiration and expiration the range of diaphragmatic movement in the adult is about 30 mm on the right side and about 28 mm on the left side. The height of this structure also varies with the degree of distension of the stomach and the intestines and with the size of the liver. It is innervated by the phrenic nerve from the cervical plexus. **2.** See **contraceptive diaphragm. 3.** (in optics) an opening that controls the amount of light passing through an optical network. **4.** a thin, membranous partition, as that used in dialysis. **5.** (in radiography) a metal plate with a small opening that limits the diameter of the radiographic beam. —*diaphragmatic, adj.*

diaphragma sellae. See **sellar diaphragm.**

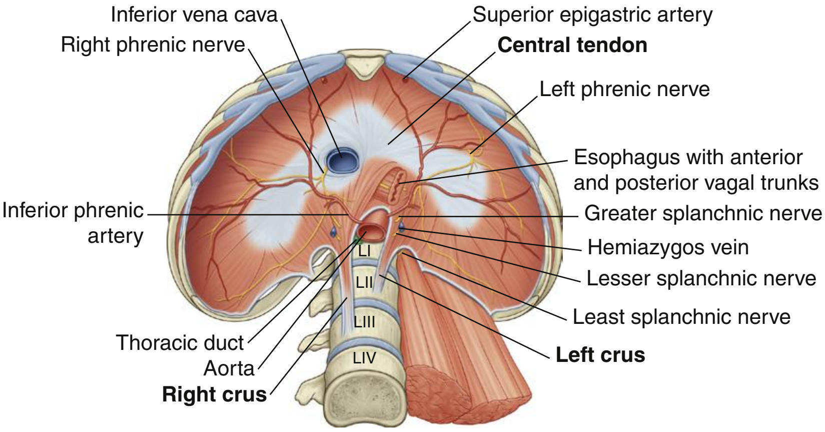
diaphragmatic breathing /dī·əfragmat′ik/ [Gk, *diaphragma,* partition], a pattern of expiration and inspiration in which most of the ventilatory work is done with the diaphragm. Many males normally breathe diaphragmatically, whereas few females do. The technique is taught to patients with chronic obstructive pulmonary disease to facilitate respiration. The patient is trained to strengthen the contractile force of the abdominal wall muscles to elevate the diaphragm and empty the lungs. The patient places a hand on the epigastrium during training to focus attention on that portion of the body. Also called **diaphragmatic respiration.** Compare **abdominal breathing.**

diaphragmatic constriction, the narrowing in the esophagus where it crosses the diaphragm at the esophageal hiatus.

diaphragmatic flutter, rapid, rhythmic contractions of the diaphragm. The condition may simulate atrial flutter.

diaphragmatic hernia [Gk, *diaphragma,* partition; L, rupture], the protrusion of part of the stomach through an opening in the diaphragm, most commonly an abnormally enlarged esophageal hiatus. In some cases the intestines may also herniate into the chest. The enlargement of the normal opening for the esophagus may be caused by trauma, congenital weakness, increased abdominal pressure, or relaxation of ligaments of skeletal muscles, and it permits part of the stomach to slide into the thorax. A sliding hiatal hernia, one of the most common pathological conditions of the upper GI tract, may occur at any age but is most prevalent in elderly and middle-aged people. A kind of diaphragmatic hernia is **hiatal hernia.**

■ OBSERVATIONS: Symptoms of diaphragmatic hernia vary but usually include heartburn after meals, when the patient is in a supine position, and on exertion, especially when bending forward. Regurgitation of food, dysphagia, abdominal distention after eating, belching, intestinal rumbling, rapid breathing, and a dull epigastric pain radiating to the shoulder may occur. The similarity of some of the symptoms to those



Diaphragm *(Drake, Vogl, and Mitchell, 2010)* of myocardial infarction may make the patient fearful and anxious. Continued reflux of gastric juice into the esophagus may lead to ulceration with bleeding and the formation of fibrous tissue. Gastric contents regurgitated during sleep may be aspirated into the lungs.

■ INTERVENTIONS: The patient is placed in bed in a semi-Fowler's position and raised to a high Fowler's position during and after small, frequent meals of a bland diet. The individual is encouraged to chew slowly and thoroughly, to drink one or two glasses of water with a meal (unless contraindicated), and to avoid smoking. The blood pressure, pulse, respirations, and temperature are monitored. Medication for pain, an antacid such as aluminum hydroxide gel, and diagnostic endoscopy and x-ray films may be ordered. To facilitate visualization of the hernia, the patient may be placed in a Trendelenburg position during studies of barium swallowing. If symptoms are severe, persistent, and unrelieved by conservative measures, the hernia may be repaired surgically.

■ NURSING CONSIDERATIONS: The patient is instructed, before discharge, to eat frequent, small bland meals; not to recline after eating; to lose weight (if indicated); not to smoke; and to avoid constipation. The patient may need to sleep with the head of the bed raised on blocks. Recurrence of symptoms may usually be prevented by observing these instructions.

diaphragmatic node, a node in one of three groups of thoracic parietal lymph nodes, situated on the thoracic side of the diaphragm and consisting of the anterior set, the middle set, and the posterior set. The anterior set includes about three nodes dorsal to the base of the xiphoid process. The middle set of about three nodes on each side is close to the diaphragmatic entry of the phrenic nerves. The posterior set of diaphragmatic nodes consists of a few nodes on the crura of the diaphragm, connecting with the lumbar nodes and the posterior mediastinal nodes. Compare **intercostal node, sternal node.** See also **lymphatic system, lymph node.**

diaphragmatic peritonitis, an inflammation of the lower surface of the diaphragm.

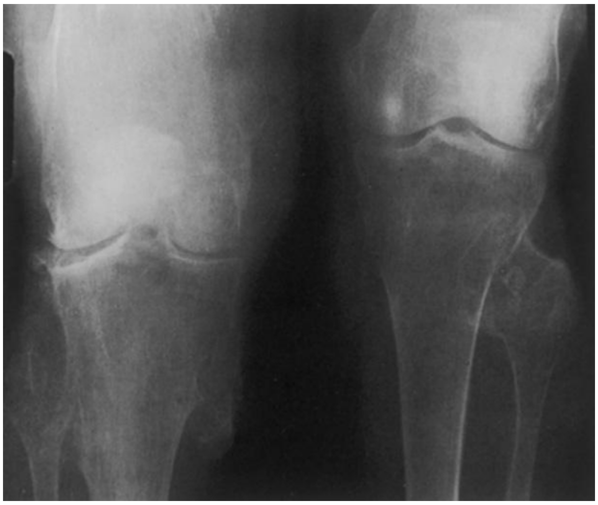
diaphragmatic pleurisy, inflammation of the pleural covering of the diaphragm, which produces severe pain in the epigastric and hypochondrial regions and, occasionally, referred pain via the phrenic nerve to the shoulder.

diaphragmatic respiration. See **diaphragmatic breathing.**

diaphragm pessary. See **pessary.**

diaphragm stethoscope, an instrument for auscultation of bodily sounds. Originally designed by René Laënnec (1781–1826), it consists of a vibrating disk, or diaphragm, which transmits sound waves through tubing to two earpieces. Also called **binaural stethoscope.** See also **stethoscope.**

diaphyseal aclasis /dī′əfiz′ē·əl ak′ləsis/ [Gk, *dia* + *phyein*, to grow, *a*, *klasis*, not breaking], a relatively rare abnormal condition that affects the skeletal system. Characterized by multiple exostoses or bony protrusions, it is inherited as a dominant trait. Approximately half of the children of an individual with diaphyseal aclasis display varying degrees of its symptoms. The characteristic exostoses are radiographically and microscopically similar to osteochondromas. Evident involvement is diffuse, with the long bones usually affected more severely and more frequently than the short bones. Depending on the specific area involved, various angular or rotational deformities may result. Diaphyseal aclasis is usually bilateral and occurs more frequently in boys than in girls. Although this disease is hereditary, its signs and symptoms are not usually evident until the affected individual is 2 years of age or older. Children of a parent who has the disease are often routinely examined for symptoms. The major signs of the disease are the noticeable protrusions in the areas of the exostoses. Pain is not usually associated with the exostoses and, if present, is usually minimal. Deformities of the extremities may be evident, depending on the severity and location of the exostoses. Radiographic examination reveals a broadened metaphyseal area, and the specific lesion is identified by abnormal continuity and decreased density. Asymptomatic lesions characteristic of diaphyseal aclasis usually require little or no treatment other than continued observation. The lesions located near the joints that interfere with joint motion or impair neurovascular function may be surgically excised. Angular and rotational deformities caused by the lesions may require surgical correction to facilitate function. Inequalities in the length of lower extremities resulting from unilateral involvement may require epiphysiodesis. A relatively small number of these lesions may become malignant. One form of the disorder, dyschondroplasia, results in dwarfism. Also called **hereditary deforming chondroplasia, multiple cartilaginous exostoses, multiple exostoses.**



Diaphyseal aclasis: massive exostoses at muscle attachments of both knee joints *(Moll, 1997)*

diaphyseal dysplasia. See **Camurati-Engelmann disease.**

diaphyseal-epiphyseal fusion, a surgical procedure to eliminate the epiphyseal line and unite the epiphyseal and diaphyseal bones.

diaphysis /dī·af′isis/ [Gk, *dia* + *phyein*, to grow], the shaft of a long bone, consisting of a tube of compact bone enclosing the medullary cavity.

diapositive. See **reversal film.**

diarrhea /dī′ərē′ə/ [Gk, *dia* + *rhein*, to flow], the frequent passage of loose, watery stools. The stool may also contain mucus, pus, blood, or excessive amounts of fat. Diarrhea is usually a symptom of some underlying disorder. Conditions in which diarrhea is an important symptom are dysenteric disorders, malabsorption syndrome, lactose intolerance, irritable bowel syndrome, GI tumors, and inflammatory bowel disease. In addition to stool frequency, patients may complain of abdominal cramps and generalized weakness. Untreated, severe diarrhea may lead to rapid dehydration and electrolyte imbalance. It should be treated symptomatically until proper diagnosis can be made. Anti-diarrheal preparations, such as diphenoxylate and paregoric, are helpful. If diarrhea is accompanied by vomiting, IV fluids may be necessary to prevent fluid depletion. Also spelled **diarrhoea.** See also **dehydration.** —*diarrheal, diarrheic, adj.*

diarrhea management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as management and alleviation of diarrhea. See also **Nursing Interventions Classification.**

diarrhoea. See **diarrhea.**

diarthric. See **diarticular.**

diarthrosis. See **synovial joint.**

diarticular /dī′artik′yələr/ [Gk, *di,* twice; L, *articulare,* to divide into joints], having two joints. Also **biarticular.**

Diasone Sodium Enterab, a trademark for a leprostatic antibacterial (sulfoxone sodium).

diastalsis /dī′əstal′sis/, a wave of alternating relaxation and contraction of the smooth muscles lining the walls of the small intestine in response to distension of the intestine.

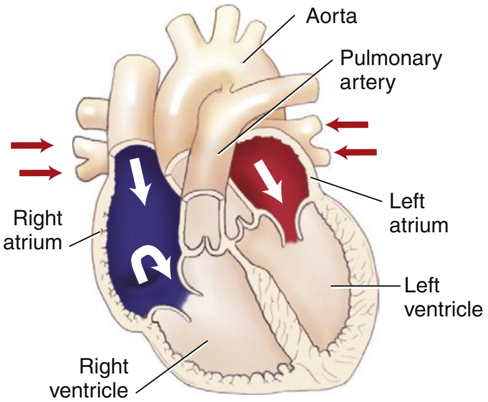
diastasis /dī·as′təsis/ [Gk, separation], the forcible separation of two parts that are normally joined, such as parts of a bone at an epiphysis, two bones that lack a synovial joint, or two muscles, as in diastasis recti abdominis.

diastasis recti abdominis, the separation of the two rectus muscles along the median line of the abdominal wall. In a newborn the condition is the result of incomplete development. In an adult woman the abnormality is often caused by repeated pregnancies or multiple birth, such as the delivery of triplets.

diastatic fermentation /dī′əstat′ik/ [Gk, *diastasis,* separation; L, *fermentare,* to cause to rise], the conversion of starch to glucose by the enzyme ptyalin.

diastema /dī′əstē′mə/ [Gk, interval], a space between two teeth in the same dental arch not caused by the loss of a tooth between them. It occurs most commonly between the maxillary central incisors in adults.

diastole /dī·as′təlē/ [Gk, *dia* + *stellein,* to set], the period between contractions of the atria or the ventricles during which blood enters the relaxed chambers from the systemic circulation and the lungs. Ventricular diastole begins with the onset of the second heart sound and ends with the first heart sound. Compare **systole.** See also **adiastole.**



Diastole: during diastole, the blood fills the relaxed chambers of the heart *(Leonard, 2009)*

-diastole, suffix meaning "the period of dilation of the heart shown as the lower blood pressure measurement": *adiastole, hyperdiastole, prediastole.*

diastolic /dī′əstol′ik/, pertaining to diastole, or the blood pressure at the instant of maximum cardiac relaxation.

diastolic augmentation, an increase in arterial diastolic blood pressure produced by a counterpulsation device such as an intraaortic balloon pump. A balloon-tipped catheter positioned in the aorta inflates during ventricular diastole, forcing blood back toward the heart, augmenting diastolic pressure, and assisting coronary artery filling. Balloon deflation at the onset of ventricular systole creates suction in the aorta, thereby assisting ventricular ejection and reducing systolic pressure.

diastolic blood pressure, the minimum level of blood pressure measured between contractions of the heart. It may vary with age, gender, body weight, emotional state, and other factors.

diastolic filling pressure, the blood pressure in a ventricle during diastole, resulting from venous return.

diastolic murmur [Gk, *dia,* between, *stellein,* to set; L, *murmur,* humming], a noise caused by turbulence of blood flow during ventricular relaxation. With few exceptions, diastolic murmurs are caused by organic heart disease.

diastolic pressure. See **diastolic blood pressure.**

diastolic thrill, a vibration felt over the heart during ventricular diastole. It may be caused by mitral valve stenosis, a patent ductus arteriosus, or severe aortic insufficiency.

diastrophic /dī′əstrof′ik/ [Gk, *diastrephein,* to distort], pertaining to a bent or curved condition of bones or distortion of other structures.

diastrophic dwarf, a person in whom short stature is caused by osteochondrodysplasia and is associated with various deformities of the bones and joints, including scoliosis, clubfoot, micromelia, hand defects, multiple joint contractures and subluxations, ear deformities, and cleft palate. The condition may be genetically related and transmitted as an autosomal-recessive trait.

diataxia /dī′ətak′sē·ə/, ataxia affecting both sides of the body.

diathermal /dī′əthur′məl/, pertaining to the use of elevated local temperature in the treatment of a disorder. The raised temperature may be produced by high-frequency electric current, ultrasound, or microwave radiation.

diathermy /dī′əthur′mē/ [Gk, *dia* + *therme,* heat], the production of heat in body tissues for therapeutic purposes by high-frequency currents that are insufficiently intense to destroy tissues or to impair their vitality. Diathermy is used in treating chronic arthritis, bursitis, fractures, gynecological diseases, sinusitis, and other conditions.

diathesis /dī·əthē′sis/ *pl. diatheses* [Gk, arrangement], an inherited physical constitution predisposing to certain diseases or conditions, many of which are believed associated with the Y chromosome because males appear to be more susceptible than females. A diathesis may be bilious, indicating a familial tendency to development of GI distress, or gouty, indicating a predisposition to accumulation of urates in the tissues, particularly in mature males.

diazepam /dī·az′əpam/, a benzodiazepine sedative and antianxiety agent.

■ INDICATIONS: It is prescribed in the treatment of anxiety, nervous tension, and muscle spasm and as an anticonvulsant.

■ CONTRAINDICATIONS: Acute narrow-angle glaucoma, psychosis, or known hypersensitivity to this drug or to any benzodiazepine medication prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are withdrawal symptoms resulting from discontinuation of treatment. Hypotonia, respiratory depression, drowsiness, and fatigue commonly occur.

diazo-, prefix indicating a chemical compound containing the group, $-N=N-$; *diazole, diazine.*

diazoxide /dī′əzok′sīd/, a vasodilator used as an antihypertensive. It also inhibits insulin release from the pancreas.

■ INDICATIONS: It is prescribed parenterally for emergency reduction of blood pressure in malignant hypertension and orally in some cases of hypoglycemia.

■ CONTRAINDICATIONS: Compensatory hypertension (e.g., coarctation of the aorta), cerebral bleeding, or known hypersensitivity to this drug or other thiazides prohibits its use. Caution is advised in heart disease, pregnancy, and impaired kidney function.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are tachycardia, sodium and water retention, hyperglycemia, and severe hypotension.

■ NOTE: This drug is for IV use in hospitalized patients only. Severe hypotension may result from its use.

dibasic potassium phosphate, the dipotassium salt K_2HPO_4, used alone or in combination with other phosphate compounds as an electrolyte replenisher.

dibasic sodium phosphate, a salt of phosphoric acid. Used alone or in combination with other phosphate compounds, it is given intravenously as an electrolyte replenisher, orally or rectally as a laxative, and orally as a urinary acidifier and for prevention of kidney stones.

dibenzazepine /dī′benzaz′epēn/, any of a group of structurally related drugs, including the tricyclic antidepressants cloMIPRAMINE, desipramine, imipramine, and trimipramine.

Dibenzyline, a trademark for an alpha$_1$ receptor blocker **(phenoxybenzamine hydrochloride).**

dibucaine /dī′bəkān/, a topical anesthetic ointment often used to treat pain and itch of hemorrhoids.

dic, abbreviation for **dicentric.**

DIC, abbreviation for **disseminated intravascular coagulation.**

dicalcium phosphate and calcium gluconate with vitamin D /dīkal′sē·əm/, a source of calcium and phosphorus.

■ INDICATIONS: It is prescribed for hypocalcemia, especially in pregnancy and lactation.

■ CONTRAINDICATIONS: Hypoparathyroidism or known hypersensitivity to the ingredients of this drug prohibits its use.

■ ADVERSE EFFECT: There are no known adverse reactions.

dicarboxylic acid /dī′kär·bok·sil′ik as′id/, any of various organic acids that contain two carboxyl (COOH) groups, such as oxalic acid and tartaric acid.

dicentric (dic) /desen′trik/ [Gk, *di,* twice, *kentron,* center], (in genetics) pertaining to a structurally abnormal chromosome with two centromeres.

dicephalus, a fetus or twin with two heads.

dicephaly /dīsef′əlē/ [Gk, *di,* twice, *kephale,* head], a developmental anomaly in which a fetus has two heads. —*dicephalic, dicephalous, adj.*

dichlorodiphenyltrichloroethane. See **DDT.**

dichlorphenamide /dī′klôrfen′əmīd/, a carbonic anhydrase inhibitor.

■ INDICATIONS: It is prescribed in the treatment of chronic open-angle glaucoma and before surgery for angle-closure glaucoma.

■ CONTRAINDICATIONS: Liver and adrenocortical insufficiency, kidney failure, hyperchloremic acidosis, depressed sodium or potassium level, pulmonary obstruction, Addison's disease, known or suspected pregnancy, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are anorexia, GI disturbances, acidosis, ureteral calculus formation, and aplastic anemia.

dichorial twins, dichorionic twins. See **dizygotic twins.**

dichotomy /dīkot′əmē/ [Gk, *dicha,* in two, *temnein,* to cut], a division or separation into two equal parts.

dichroic stain /dīkrō′ik/, a radiographic film artifact caused by a colored chemical stain. The color may range from yellow to purple and is usually the result of improper processing. See also **curtain effect.**

dichromatic vision /dī′kromat′ik/ [Gk, *di,* twice, *chroma,* color; L, *visio*], a form of color vision in which only two of the three primary colors are perceived. Also called *dichromasia, dichromatopsia.*

dichromic /di-kro′mik/, having, or pertaining to, two colors.

dichuchwa. See **bejel.**

Dick-Read method. See **Read method.**

Dick test [George F. Dick, 1881–1967; Gladys R.H. Dick, 1881–1963; American physicians], a skin test formerly used for determining sensitivity to an erythrotoxin produced by the group A streptococci that cause scarlet fever. A skin test dose of the toxin is injected intradermally. An area of inflammation 3 to 5 cm in diameter indicates that the person is not immune, has no antitoxin, and therefore is susceptible to the toxin. Larger doses may then be given to induce immunity. Compare **Schultz-Charlton phenomenon.**

diclofenac /diklo′fenak/, a nonsteroidal antiinflammatory drug used systemically as the potassium or sodium salt in the treatment of rheumatic and nonrheumatic inflammatory conditions and as the potassium salt to relieve pain and dysmenorrhea. It is also applied topically to the conjunctiva as a sodium salt to reduce ocular inflammation or photophobia after certain kinds of surgery and to the skin to treat actinic keratoses.

diclofenac potassium, the potassium salt of diclofenac, administered orally in the treatment of rheumatoid arthritis, osteoarthritis, ankylosing spondylitis, a variety of nonrheumatic inflammatory conditions, pain, and dysmenorrhea.

dicloxacillin sodium /dī′kloksəsil′in/, a penicillinase-resistant penicillin.

■ INDICATIONS: It is prescribed in the treatment of bacterial infections, especially those caused by penicillinase-producing strains of staphylococci.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to any penicillin medication prohibits its use.

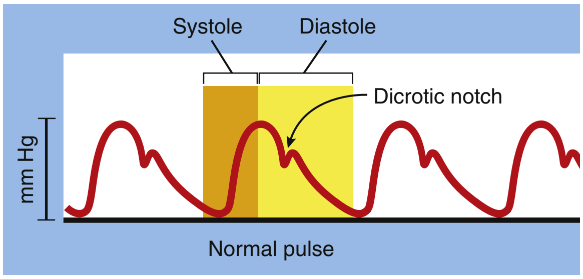
■ ADVERSE EFFECTS: The most serious adverse effect is hypersensitivity reaction. Other side effects include nausea, vomiting, diarrhea, and epigastric distress.

DICOM, abbreviation for *digital imaging and communications in medicine*, the standard used for the electronic transferring of digital image data, developed by a joint committee of the American College of Radiology and the National Electronics Manufacturers' Association.

Dicor, a trademark for a castable ceramic dental material.

dicrotic /dīkrot′ik/ [Gk, *dikrotos* double beating], pertaining to a waveform that has two separate peaks. A dicrotic notch in a normal arterial waveform indicates aortic valve closure.

dicrotic notch /dīkrot′ik/, a small, downward deflection observed on the downstroke of an arterial pressure waveform. It represents closure of the aortic or pulmonic valve at the onset of ventricular diastole.



Dicrotic notch

dicrotic pulse, a pulse with two separate peaks, the second usually weaker than the first. Compare **bisferious pulse.**

dicrotic wave, in an arterial pulse recording, the portion of the descending limb following the aortic notch, including a second, smaller peak attributed to the reflected impulse of closure of the aortic valve.

dicumarol /dīkyo͞o′mərol/, an anticoagulant coumarin derivative.

■ INDICATIONS: It is prescribed for the prophylaxis and treatment of thrombosis and embolism.

■ CONTRAINDICATIONS: Risk of hemorrhage, peptic ulcer, ulcerative colitis, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are GI disturbances, nausea, bleeding, and diarrhea.

dicyclomine hydrochloride /dīsī′kləmīn/, an anticholinergic/antispasmodic.

■ INDICATIONS: It is prescribed as an adjunct to ulcer therapy and as a treatment for functional/irritable bowel syndrome.

■ CONTRAINDICATIONS: Narrow-angle glaucoma, asthma, myasthenia gravis, obstruction of the genitourinary or GI tract, ulcerative colitis, or known hypersensitivity to this drug prohibits its use. It should not be used in infants.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are blurred vision, central nervous system effects, tachycardia, dry mouth, decreased sweating, and hypersensitivity reactions.

didactic /dīdak′tik/ [Gr, *didaskein,* to teach], pertaining to classroom teaching or instruction.

didanosine. See **dideoxyinosine.**

dideoxycytidine /dī′dē·ok′sēsī′tidēn/. See **zalcitabine.**

dideoxyinosine (ddI) /dī′dē·oksē·in′ōsēn/, an antiretroviral drug used in the treatment of human immunodeficiency virus infections. ddI inhibits the enzyme reverse transcriptase, thereby restricting viral replication activity. Inside the body, ddI is converted to dideoxyadenosine, which becomes incorporated into the deoxyribonucleic acid chain, interrupting its normal sequence and making viral replication impossible. Also called **didanosine.**

DIDMOAD syndrome, abbreviation for *diabetes insipidus, diabetes mellitus, optic atrophy, deafness syndrome.* See **Wolfram syndrome.**

Didrex, a trademark for an anorexiant (benzphetamine hydrochloride).

Didronel, a trademark for a calcium regulator **(etidronate disodium).**

didym-, **1.** prefix meaning "testis": *didymalgia, didymitis, didymodynia.* **2.** prefix meaning "paired or twin": *didymous.*

-didymis, -didymus, **1.** suffix meaning "testicles": *epididymis.* **2.** suffix meaning "twins": *atlodidymus, pygodidymus.*

didymitis /did′əmī′tis/. See **orchitis.**

didymus /did′iməs/, a testis.

-didymus, **1.** suffix meaning a "pair of twins joined at a (specified) part of the body": *gastrodidymus, thoracodidymus, vertebrodidymus.* **2.** suffix meaning a "teratic fetus with supernumerary organ(s)": *atlodidymus, opodidymus, pygodidymus.*

die^{1}, to cease living.

die^{2}, a model of a prepared tooth made from a hard substance, usually dental stone.

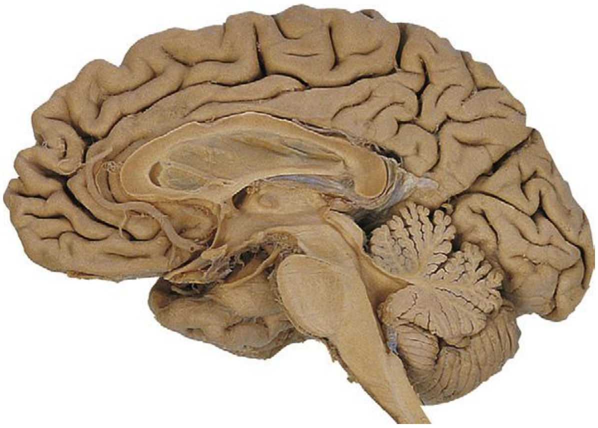
diecious /dī·ē′shəs/ [Gk, *di* + *oikos,* house], pertaining to an organism that has either male or female reproductive organs. Also spelled **dioecious.**

dieldrin /dī·el′drin/, a highly toxic pesticide that is poisonous to humans and animals if ingested, inhaled, or absorbed through the skin. It causes dysfunction of the central nervous system and may be a carcinogen.

dielectric /di′elek′trik/, **1.** *adj,* transmitting electric effects by induction, but not by conduction. The term is applied to an insulating substance through or across which electric force is acting or may act by induction without conduction. **2.** *n,* an insulating substance that transmits in this way, i.e., through or across which electric force is acting or may act by induction without conduction.

diencephalic syndrome /dis′ensəfal′ik/, failure to thrive and emaciation, sometimes with wartlike nevi.

diencephalon /dī′ənsef′əlon/ [Gk, *di* + *enkephalon,* brain], the portion of the brain between the cerebrum and the mesencephalon. It consists of the hypothalamus, thalamus, metathalamus, and the epithalamus and includes most of the third ventricle.



Diencephalon *(Nolte and Angevine, 2007)*

diener /dē′nər/ [Ger, man-servant], an individual who maintains the hospital laboratory or equipment and facilities. The morgue diener may also assist the pathologist in performing autopsies.

dieresis /dī·er′əsis/, separation of a structure's parts by surgery or other means.

diet /dī′it/ [Gk, *diaita,* way of living], **1.** food and drink considered with regard to their nutritional qualities, composition, and effects on health. **2.** nutrients prescribed, regulated, or restricted as to kind and amount for therapeutic or other purposes. **3.** the customary allowance of food and drink regularly provided or consumed. Compare **nutrition.** See also specific diets. —*dietetic, adj.*

dietary /dī′əter′ē/, pertaining to diet.

dietary allowances. See **recommended dietary allowances.**

dietary amenorrhea [Gk, *diaita,* way of living, *a,* absence, *men,* month, *rhoia,* to flow], an interruption of menstruation caused by malnutrition, starvation, or excessive voluntary dieting.

Dietary Approach to Stop Hypertension (DASH) diet, a diet high in fruits, vegetables, and low-fat dairy products; low in saturated and total fats; low in cholesterol; and high in fiber. Research studies support the hypothesis that this diet reduces blood pressure and may play a role in prevention of high blood pressure.

dietary fiber, a generic term for nondigestible carbohydrate substances found in plant cell walls and surrounding cellular material, each with a different effect on the various GI functions, such as colon transit time, water absorption, and lipid metabolism. Dietary fiber may be water soluble or insoluble. The soluble fibers include pectins, gums, mucilages, and algal products. They affect nutrient absorption and regulation. The insoluble fibers include cellulose, hemicellulose, and lignin and promote stool bulk and caloric motility. The main dietary fiber components are cellulose, lignin, hemicellulose, pectin, and plant gums. Foods high in dietary fiber are fruits; green, leafy vegetables, such as lettuce, spinach, celery, and cabbage; root vegetables, such as carrots, turnips, and potatoes; legumes; and whole-grain cereals and breads. The risk of development of constipation, hemorrhoids, diverticular disease, and colon cancer may be decreased by regular consumption of sufficient amounts of fiber. Most experts recommend intake of 20 to 30 g per day. Also called **bulk, roughage.**

dietetic. See **diet.**

dietetic food, **1.** a specially prepared low-calorie food, often containing natural or artificial sweeteners. **2.** a food prepared for any specific dietary need or restriction, such as salt-free or vegetarian food. See also **dietetics.**

dietetic food diarrhea. See **osmotic diarrhea.**

dietetics /dī′itet′iks/, the science of applying nutritional principles to the planning and preparation of foods and regulation of the diet in relation to both health and disease.

dietetic technician, a person trained in food and nutrition who may work independently or in a team with a registered dietitian. Dietetic technicians often screen patients to identify nutrition problems, provide patient education and counseling, develop menus and recipes, supervise food service personnel, purchase food, and monitor inventory and food quality. A 2-year associate degree program is usually required. Those who complete the associate degree program and pass a registration exam become a Dietetic Technician, Registered (DTR).

diethyl ether. See **ether.**

diethylpropion hydrochloride /dī·eth′ilprō′pē·on/, an appetite suppressant; a central nervous system stimulant.

■ INDICATION: It is prescribed as a short-term adjunct in the treatment of exogenous obesity.

■ CONTRAINDICATIONS: Arteriosclerosis, hyperthyroidism, glaucoma, history of drug dependence or drug abuse, hypertension, concomitant administration of a monoamine oxidase inhibitor within 14 days, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are restlessness and insomnia, increased blood pressure, arrhythmias, cardiovascular effects, nausea, dry mouth, and drug dependence.

diethylstilbestrol (DES) /-stilbes′trol/, a synthetic hormone with estrogenic properties. This agent was used extensively from 1948 to 1971 to decrease miscarriages, but it is now contraindicated because it is known to increase the risk of vaginal clear cell carcinoma in the women exposed to it in utero (i.e., daughters of mothers who used the drug). Also called **stilbestrol.**

dieting syndrome. See **chronic dieting syndrome.**

dietitian. See **nutritionist, registered dietitian.**

Dietl's crisis /dē′təlz/ [Joseph Dietl, Polish physician, 1804–1878; Gk, *krisis,* turning point], a sudden excruciating pain in the kidney caused by distension of the renal pelvis, rapid ingestion of large amounts of liquid, or kinking of a ureter that produces temporary occlusion of the flow of urine from the kidney. The pain may be accompanied by nausea, vomiting, hematuria, and general collapse. See also **hydronephrosis.**

diet staging, a nursing intervention from the Nursing Interventions Classification (NIC) defined as instituting required diet restrictions with subsequent progression of diet as tolerated. See also **Nursing Interventions Classification.**

diet therapy, the branch of dietetics concerned with the use of foods for therapeutic purposes. Compare **medical nutrition therapy.**

difenoxin /di′fĕnok′sin/, an agent used as the hydrochloride salt for its antiperistaltic action in treatment of diarrhea.

differential /dif′əren′shəl/, pertaining to or creating a difference.

differential absorption [L, *differentia,* difference], the difference in absorption of x-rays by different body tissues. In a radiograph of a body part, such as an arm, the image of the bone is produced because more x-rays are absorbed by bone than by the surrounding soft tissue. Lowering the kilovolt peak of an x-ray beam increases differential absorption, but it also increases the patient dose. Also called **selective absorption.**

differential blood count. See **differential white blood cell count.**

differential diagnosis, the distinguishing between two or more diseases with similar symptoms by systematically comparing their signs and symptoms. See also **diagnosis.**

differential growth, a difference in the size or rate of growth of dissimilar organisms, tissues, or structures.

differential leukocyte count. See **differential white blood cell count.**

differential threshold, the lowest limit at which two stimuli can be differentiated or distinguished.

differential white blood cell count, enumeration and classification of the leukocytes in a Wright-stained blood film. The different categories of white blood cells are counted and reported as percentages of the total examined. Differential white blood cell count provides specific information related to infections and hematologic diseases. Also called **differential leukocyte count.** Compare **complete blood count.** See also **leukocyte.**

differentiating agent, a substance, such as a retinoid, that induces a cell to stop dividing and to differentiate. Such agents may be capable of halting the proliferation of cancer cells.

differentiation /dif′əren′shē·ā′shən/ [L, *differentia,* difference], **1.** (in embryology) a process in development in which unspecialized cells or tissues are systemically modified and altered to achieve specific and characteristic physical forms, physiological functions, and chemical properties. Kinds of differentiation are **correlative differentiation, functional differentiation, invisible differentiation,** and **self-differentiation.** **2.** progressive diversification leading to complexity. **3.** acquisition of functions and forms different from those of the original. **4.** distinguishing of one thing or disease from another, as in differential diagnosis. **5.** (in psychology) mental autonomy or separation of intellect and emotions so that one is not dominated by reactive anxiety of a family or group emotional system. **6.** the first subphase of the separation-individuation phase in Mahler's system of preoedipal development. It generally occurs between 5 and 9 months of age, coinciding with the maturation of partial locomotor functioning and the beginning of the child's viewing the mother as a separate being. **—***differentiate, v.*

differentiation therapy, a cancer therapy technique in which the malignant cell is regarded as having escaped the normal controls of cell growth and differentiation. The cancer cell is regarded as pathologically arrested at an early stage of differentiation, retaining the ability to proliferate. It is treated with agents that remove this block and allow the cells to differentiate along more normal lines until they eventually lose their ability to divide and replicate.

diffraction /difrak′shən/ [L, *dis,* opposite of, *frangere,* to break], the bending and scattering of wavelengths of light or other radiation as the radiation passes around obstacles or through narrow slits. X-ray diffraction is used in the study of the internal structure of cells. See also **refraction.**

diffuse /difyo͞oz′/ [L, *diffundere,* to spread out], becoming widely spread, such as through a membrane or fluid.

diffuse abscess, an abscess that spreads into neighboring tissues beyond fibrous walls.

diffuse angiokeratoma. See **angiokeratoma corporis diffusum.**

diffuse axonal injury (DAI), a type of brain injury caused by shearing forces that occur between different parts of the brain as a result of rotational acceleration. The corpus callosum and the brainstem are often affected. DAI most commonly occurs in motor vehicle crashes when the vehicle suddenly stops.

diffused light, light in which the precise source cannot be seen while the apparent area of the source is increased.

diffuse emphysema. See **panacinar emphysema.**

diffuse erythema, skin redness or inflammation that is spread over a large body surface.

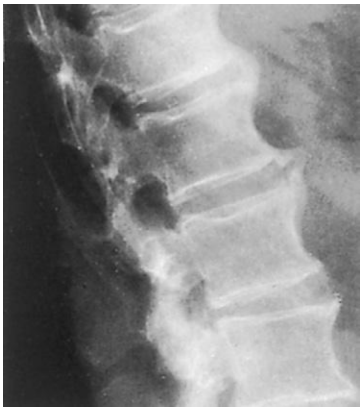
diffuse esophageal spasm, abnormal contractions of the esophagus leading to difficult or painful swallowing and chest pain.

diffuse fibrosing alveolitis. See **interstitial pneumonia.**

diffuse goiter, an enlargement of all parts of the thyroid gland. Symptoms are those of hyperthyroidism.

diffuse hypersensitivity pneumonia, an immunologically mediated inflammatory reaction in the lungs induced by exposure to an allergen or a drug. Allergens that trigger the reaction may be derived from fungi, bird excreta, porcine or bovine proteins, wood dust, and fur. Drugs that induce hypersensity pneumonia include chlorproPAMIDE, hydrochlorothiazide, mecamylamine, mephenesin, methotrexate, nitrofurantoin, paraaminosalicylic acid, and penicillin. The disorder is characterized by cough, fever, dyspnea, malaise, pulmonary edema, and infiltration of the alveoli with eosinophils and large mononuclear cells. Also called **allergic alveolitis, allergic interstitial pneumonitis, extrinsic allergic pneumonia.** See also **bagassosis, pulmonary infiltrate with eosinophilia.**

diffuse idiopathic skeletal hyperostosis, a form of degenerative joint disease in which the ligaments along the spinal column become calcified and lose their flexibility.



Diffuse idiopathic skeletal hyperostosis *(Moll, 1997)*

diffuse lipoma, diffuse lipomatosis. See **multiple lipomatosis.**

diffuse myelitis. See **disseminated myelitis.**

diffuse myocardial fibrosis, a type of heart disease characterized by a generalized distribution of fibrous tissue that replaces normal heart muscle cells.

diffuse peritonitis [L, *diffundere,* to spread out; Gk, *peri,* near, *teinein,* to stretch, *itis,* inflammation], widespread peritonitis affecting most of the peritoneum, usually caused by a ruptured stomach or appendix. See also **generalized peritonitis, peritonitis.**

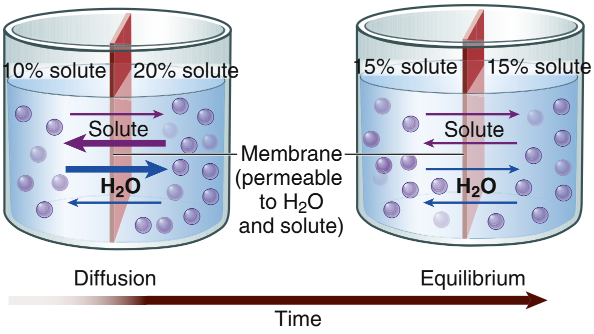
diffuse scleroderma. See **scleroderma.**

diffuse sclerosis [L, *diffundere,* to spread out; Gk, *sklerosis,* hardening], a form of sclerosis that extends through much of the central nervous system.

diffusing capacity (D) /difyo͞o′sing/, the rate of gas transfer through a unit area of a permeable membrane per unit of gas pressure difference across it. It is affected by specific chemical reactions that may occur in the blood. Also called **diffusion factor, transfer factor of lungs.**

diffusing capacity of lungs (D_L), the volume of a gas that diffuses from the lung across the alveolar-capillary membrane into the bloodstream per minute per mm Hg difference in pressure across the membrane. The normal D_L for oxygen averages 20 mL/min/mm Hg. Also called **transfer factor of lungs.**

diffusion /difyo͞o′zhən/ [L, *diffundere,* to spread out], the process in which particles in a fluid move from an area of higher concentration to an area of lower concentration, resulting in an even distribution of the particles in the fluid. Little or no energy is required.



Diffusion *(Patton and Thibodeau, 2010)*

diffusion coefficient. See **coefficient.**

diffusion constant, a mathematical constant relating to the ability of a substance to spread widely.

diffusion defect, any impairment in the diffusion of oxygen across the alveolar-capillary membrane caused by pathological changes in any of the structures of the membrane. Specific causes may include fibrosis, granuloma, interstitial edema, and proliferation of connective tissue.

diffusion deposition, the adsorption of an aerosol particle on the surface of an alveolar membrane or other airway structure.

diffusion factor. See **diffusing capacity.**

diffusion of gases, a natural process, essential in respiration, in which molecules of a gas pass from an area of high concentration to one of lower concentration.

diflorasone diacetate /dīflôr′əsōn dī·as′ətāt/, a topical corticosteroid with high potency.

■ INDICATION: It is prescribed for the treatment of skin inflammation.

■ CONTRAINDICATIONS: Viral and fungal diseases of the skin, impaired circulation, or known hypersensitivity to this drug or to other steroidal medication prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions, usually occurring after prolonged or excessive application, are striae, hypopigmentation, local irritation of the skin, and various systemic effects.

Diflucan, a trademark for a broad-spectrum antifungal agent (fluconazole).

diflucortolone /diflo͞okor′tählōn/, a synthetic corticosteroid used as the valerate salt and applied topically in treatment of inflammation and pruritus of dermatoses.

diflunisal /dīflo͞o′nisal/, a nonsteroidal antiinflammatory drug.

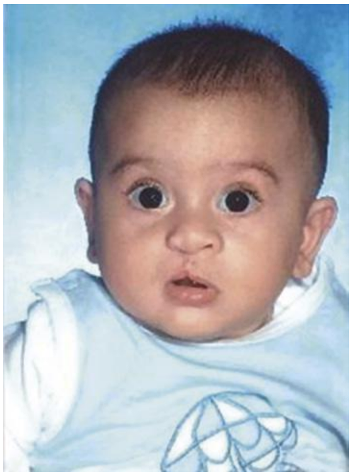
■ INDICATIONS: It is prescribed for the treatment of mild to moderate pain and inflammation in osteoarthritis and other musculoskeletal disorders.

■ CONTRAINDICATIONS: Hypersensitivity to aspirin and other nonsteroidal antiinflammatory drugs or known sensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: The most serious adverse reactions are GI pain, diarrhea, peptic ulcer, anorexia, anaphylactoid reactions with bronchospasm, and edema.

digastricus /dīgas′trikəs/ [Gk, *di,* twice, *gaster,* stomach], one of four suprahyoid muscles having two parts, an anterior belly and a posterior belly. The anterior belly acts to open the jaw and to draw the hyoid bone forward. The posterior belly acts to draw back and to raise the hyoid bone. Also called *digastric muscle*. Compare **geniohyoideus, mylohyoideus, stylohyoideus.**

DiGeorge's syndrome /dijôrj′əz/ [Angelo M. DiGeorge, American physician, b. 1921], a congenital disorder characterized by severe immunodeficiency and structural abnormalities, including hypertelorism; notched, low-set ears; small mouth; downward slanting eyes; cardiovascular defects; and absence of the thymus and parathyroid glands. Death, often as a result of infection, usually occurs before 2 years of age. Rarely transplantation of a human fetal thymus is performed. Also called **thymic hypoplasia, thymic parathyroid aplasia.**



Typical appearance of child with DiGeorge's Syndrome *(© 2009 Fernández et al; licensee BioMed Central Ltd.)*

digest /dijest′, dijest′, dī′jəst,/ [L, *digerere,* to break down], **1.** *v,* to soften by heat and moisture. **2.** *v,* to break into smaller parts and simpler compounds by mastication, hydrolysis, and action of intestinal secretions and enzymes, especially in the way the body digests food for the absorption of nutrients required in metabolism. The small intestine digests food by enzymatic actions that produce absorbable amino acids, emulsified fat particles, and monosaccharides. **3.** *n,* any material that results from digestion or hydrolysis.

digestant /dijes′tənt/, a substance, such as pepsin, that is added to the diet as an aid to the digestion of food.

digestible /dijes′tibəl/, capable of being digested.

digestion /dijes′chən/ [L, *digerere,* to break down], the conversion of food into absorbable substances in the GI tract. Digestion is accomplished through the mechanical and chemical breakdown of food into smaller and smaller molecules, with the help of glands located both inside and outside the gut. —*digestive, adj.*

digestive enzyme /dijes′tiv/ [L, *digerere,* to break down; Gk, *en* + *zyme,* ferment], any digestive system enzyme that hydrolyzes fats, proteins, or carbohydrates for absorption.

digestive fever, a slight rise in body temperature that normally accompanies the digestive process.

digestive gland, any one of the many structures that secrete agents involved in the breaking down of food into the constituent absorbable substances needed for metabolism. Some kinds of digestive glands are the salivary glands, gastric glands, intestinal glands, liver, and pancreas. Among important secretions produced by different digestive glands are hydrochloric acid, bile, mucus, and various enzymes.

digestive juice, thin, colorless secretion of the glands of the human stomach, composed mainly of hydrochloric acid, chymosin, pepsinogen, intrinsic factor, and mucus. Also called *digestive secretion*.

digestive system, the organs, structures, and accessory glands of the digestive tube of the body through which food passes from the mouth to the esophagus, stomach, and intestines. The accessory glands secrete the digestive enzymes, which break down food substances in preparation for absorption into the bloodstream. See also the **Color Atlas of Human Anatomy,** pp. A32-A34.

digestive tract, a musculomembranous tube, about 9 m long, extending from the mouth to the anus and lined with mucous membrane. Its various portions are the mouth, pharynx, esophagus, stomach, small intestine, and large intestine. The tube, which is part of the digestive system, includes numerous accessory organs. Also called **alimentary canal,** *alimentary tract,* **digestive tube, gastrointestinal tract, intestinal tract, intestinal tubes.** See also **digestive system.**

Digibind™, a trademark for the antibody used in the treatment of digoxin toxicity **(digoxin immune Fab, ovine).**

digit /dij′it/ [L, *digitus*], a finger or a toe. Also called **dactylus.**

digit-, prefix meaning "finger or toe": *digitate, digitigrade, digitoplantar.*

digital¹ /dij′itəl/ [L, *digitus,* finger], **1.** pertaining to a digit, that is, a finger or toe. **2.** resembling a finger or toe. See also **digitate. 3.** an electronic device that gives its reading/values in numbers, e.g., digital clock.

digital², **1.** the characterization or measurement of a signal in terms of a series of numbers rather than some continuously varying value. **2.** use of the binary system in computer technology, or computerized communications, such as digital telephone, pagers, and cellular telephones.

digital angiography, a technique of producing computer-enhanced radiographic images of the heart and great vessels. Before injection of contrast material through a large vein, a mask image is digitized and stored in the computer. Successive digitized images made after injection are electronically subtracted from the mask image, and the result is amplified and displayed on a video monitor. The displayed images can be recorded on videotape and stored on disk.

digital compression [L, *digitus,* finger, *comprimere,* to press together], the act of pressing with the fingers, as when arresting the blood flow from a wound.

digital computer, a computer that processes information in numeric form. Compare **analog computer, hybrid computer.**

digital fluoroscopy, the projection of a radiographic image on an image-intensifying fluorescent screen coupled to a digital video image processor. The screen has an input surface coated with a phosphor that is twice as sensitive to x-rays as conventional x-ray film. The visible light from the energized phosphor is electronically amplified and directed into a video camera. The video image is divided into pixels, which are in turn converted or digitized for storage or reproduction through an image processor.

digital image, a depiction recorded electronically to allow viewing or transmission on a computer.

digitalis /dij′ital′is/ [L, *digitus,* finger or toe], a general term for cardiac glycoside. See also **digitoxin, digoxin.**

■ INDICATIONS: It is prescribed in the treatment of congestive heart failure and certain cardiac arrhythmias.

■ CONTRAINDICATIONS: Ventricular fibrillation, ventricular tachycardia, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: The most serious reactions are cardiac arrhythmias that are more common with concomitant diuretics, disorientation, and visual disturbances.

digitalis glycoside. See **digitalis.**

digitalis poisoning [L, *digitalis,* of the fingers, *potio,* drink], the toxic effects of digitalis medications prescribed for heart disorders such as heart failure and atrial fibrillation. Toxicity may result from the cumulative effect of the drug or from hypokalemia. Symptoms include vomiting, headache, heartbeat abnormalities, disorientation, and visual color distortions.

digitalis therapy, the administration of a digitalis preparation to a person with a heart disorder to increase the force of myocardial contractions; produce a slower, more regular apical rate; and slow the transmission of impulses through the conduction system. It may be used in treating many cardiac disorders, including atrial fibrillation, atrial septal defect, coarctation of the aorta, congenital heart block, congestive heart failure, endocardial fibroelastosis, great vessel transposition, malformation of the tricuspid valve, myocarditis, paroxysmal atrial tachycardia, and patent ductus arteriosus.

■ METHOD: Complete prescriptions include the name of the digitalis preparation, the dosage in milligrams, the route and intervals of administration, and the pulse rate under which the drug is to be withheld. It is administered before feeding and is never mixed with the formula or food. Before each administration the person's resting apical pulse is checked for rate and rhythm for a full minute. If the rate is slower than desired; if it is irregular or shows a rapid rise or fall; if there are any signs of toxicity, such as anorexia, nausea, or vomiting; or if there are visual disturbances, the drug is withheld and the problem is reported.

■ INTERVENTIONS: The nurse participates in calculating the dosage volume ordered, administers the drug, and observes for and reports any undesirable effects. Once the dosage is stabilized and before discharge, the nurse or pharmacist ensures that the patient understands the proper method, time, and purpose of administering the drug, as well as the need and the time to give the complete dose, when to withhold medication, and how to recognize and report signs of toxicity to the drug.

■ OUTCOME CRITERIA: In addition to promoting more forceful myocardial contractions and a slower, more regular apical beat, digitalis therapy can reduce venous pressure, improve pulmonary and systemic circulation, increase urinary output, reduce edema, and stop paroxysmal atrial tachycardia and atrial fibrillation.

digitalization /dij′ətal′īzā′shən/, the administration of digitalis in doses sufficient to achieve maximum pharmacological effects without producing toxic symptoms.

digitalized /dij′ətəlīzd′/, having a therapeutic total body level of digitalis, a cardiac glycoside.

digitalizing dose, the amount of digitalis needed to achieve a desired therapeutic effect.

digital radiography (DR) /dij′itəl/, any method of radiographic image formation that uses a computer to store and manipulate data. See also **digital angiography, digital fluoroscopy, digital tomosynthesis.**

digital reflex, **1.** a finger-jerk reaction produced by tapping the palmar aspect of the terminal phalanges of the fingers when they are slightly flexed. **2.** sudden flexion of the terminal phalanx of the thumb produced by tapping the terminal phalanx of the middle finger.

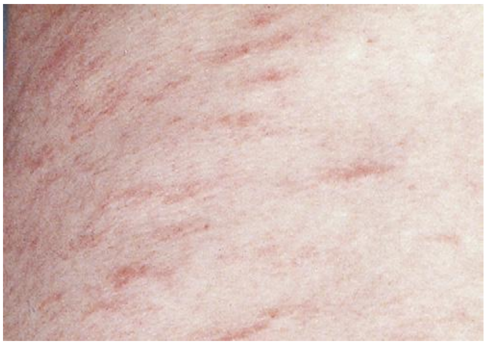
digital subtraction angiography (DSA), a method in which radiographic images of blood vessels filled with contrast material are digitized and then subtracted from images obtained before administration of the material. The method increases the contrast between the vessels and the background.

digital thermometer. See **thermometer.**

digital-to-analog converter, a device for translating digital information into a continuous form, as from an ohmmeter or thermometer. They are widely used in CD players, digital audio and videotape players, and digital signal processing audio and video equipment. Also called **D/A converter.**

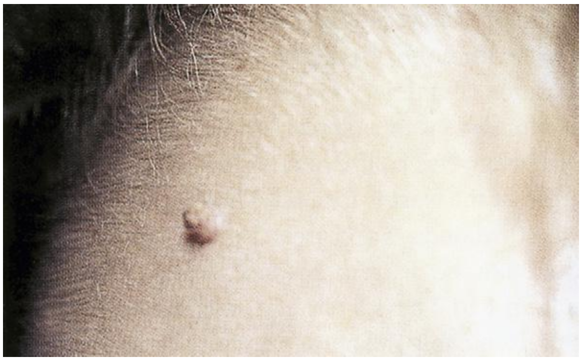
digital tomosynthesis, a system of tomography, using a computer and a digital fluoroscopy unit, that can synthesize any tomographic plane from a single tomographic pass. As only one tomographic pass is required, patient radiation exposure is reduced. Patient time in examination is also reduced as the recorded images can be synthesized and manipulated at a later time. See also **digital fluoroscopy.**

digitate /dij′itāt/ [L, *digitatus,* having fingers], having fingers or fingerlike projections. See also **digital^{1},** def 2.



Digitate dermatosis *(du Vivier, 2002)*

digitate wart, a fingerlike horny projection that arises from a pea-shaped base. It is a benign viral infection of the skin and the adjacent mucous membrane. It may disappear spontaneously as an immune response develops in the host, or it may require treatment, such as by electrodesiccation and curettage. Also called **filiform wart.**



Digitate wart *(Weston, Lane, and Morrelli, 2007)*

digitoxin /dij′itok′sin/, a cardiac glycoside obtained from leaves of *Digitalis purpurea*. Digitoxin differs in many ways from digoxin, including having a far greater half-life and a different route of elimination.

■ INDICATIONS: It is prescribed in the treatment of congestive heart failure and certain cardiac arrhythmias.

■ CONTRAINDICATIONS: Ventricular fibrillation, ventricular tachycardia, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: The most serious adverse reactions are cardiac arrhythmias and heart block, disorientation, and visual disturbances.

digit span test, an examination of the ability of a child to recall a sequence of numbers just spoken.

diglyceride /dīglis′ərīd/, a chemical compound, a diester ester of glycerol in which the hydrogen in two of the hydroxyl groups is replaced by an acyl radical.

dignathus /dīnath′əs, dignā′thəs/, **1.** a fetus with a double lower jaw. **2.** a person with a cleft of the mandible.

dignified life closure, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to maintain control during approaching end of life. See also **Nursing Outcomes Classification.**

digoxin /digok′sin/, a cardiac glycoside obtained from leaves of *Digitalis lanata*.

■ INDICATIONS: It is prescribed in the treatment of congestive heart failure and certain cardiac arrhythmias.

■ CONTRAINDICATIONS: Ventricular fibrillation, ventricular tachycardia, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: The most serious adverse reactions are cardiac arrhythmia and heart block, disorientation, and visual disturbances.

digoxin immune FAB, ovine, a preparation of antigen-binding fragments derived from specific antidigoxin antibodies produced in sheep that have been immunized with digoxin coupled as a hapten to human serum albumin. It is used as an antidote to life-threatening digoxin and digitoxin overdose and is administered intravenously.

■ INDICATIONS: It is prescribed for the treatment of life-threatening digoxin or digitoxin toxicity.

■ CONTRAINDICATIONS: Use of this product should be restricted to patients who are in shock or cardiac arrest or show signs of severe ventricular arrhythmias, progressive bradycardia, or potassium concentrations exceeding 5 mEq/L.

■ ADVERSE EFFECTS: Among reported adverse reactions are low cardiac output, congestive heart failure exacerbated by withdrawal of the inotropic effect of digoxin, rapid ventricular response caused by withdrawal of the digitalis effect, and possible hypokalemia.

Di Guglielmo's disease. See **erythroleukemia.**

Di Guglielmo's syndrome. See **erythroleukemia.**

dihybrid /dī′hī′brid/ [Gk, *di*, twice; L, *hybrida*, mongrel offspring], pertaining to an individual, an organism, or a strain that is heterozygous for two specific traits, that is the offspring of parents differing in two specific gene pairs, or that is heterozygous for two particular traits or gene loci being followed.

dihybrid cross, the mating of two individuals, organisms, or strains that have different gene pairs that determine two specific traits or that have two particular characteristics or gene loci being followed.

dihydric alcohol /dīhī′drik/, an alcohol containing two hydroxyl groups. Also called **diol.**

dihydroergotamine mesylate /dīhī′drō·ərgot′əmēn me′si lāt/, an ergot alkaloid causing vasoconstriction through stimulation of several types of receptors, including alpha-adrenergic receptors and serotonin receptors.

■ INDICATIONS: It is prescribed for the treatment of migraine and vascular headache.

■ CONTRAINDICATIONS: Cardiovascular disease, hypertension, liver or kidney dysfunction, sepsis, pregnancy, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are gangrene and the toxicity of the ergot alkaloids.

dihydrotachysterol /dīhī′drōtəkis′tərol/, a rapid-acting form of vitamin D.

■ INDICATIONS: It is prescribed in the treatment of hypocalcemia resulting from hypoparathyroidism and pseudohypoparathyroidism.

■ CONTRAINDICATIONS: Hypercalcemia, hypocalcemia with kidney insufficiency, hyperphosphatemia, or known hypersensitivity to this drug or to vitamin D prohibits its use. Caution is advised for lactating mothers.

■ ADVERSE EFFECTS: The most serious adverse reaction is hypercalcemia. With overdosage, calcification of soft tissues, including those of the heart, or cardiovascular or kidney failure may occur.

dihydrotestosterone (DHT) /di-hi′drōtestos′terōn/, an androgenic hormone formed in peripheral tissue from testosterone. It is thought to be the androgen responsible for development of the male primary sex characters during embryogenesis and of male secondary sex characters at puberty and for adult male sexual function.

diiodohydroxyquin. See **iodoquinol.**

dil-, -dil, combining form for the name of a vasodilator.

dilaceration /dī·las′ərā′shən/ [L. *di-*, apart or through + *lacerare*, to tear], **1.** a tearing apart, as of a cataract. **2.** (in dentistry) a condition resulting from injury to a tooth during its developmental period or as a result of insufficient space for a tooth to develop, with a crease or band at the junction of the crown and root, or with tortuous roots having abnormal curvatures. Not to be confused with normal root curvature.

Dilantin™, a trademark for an anticonvulsant used to control tonic-clonic and psychomotor seizures **(phenytoin).**

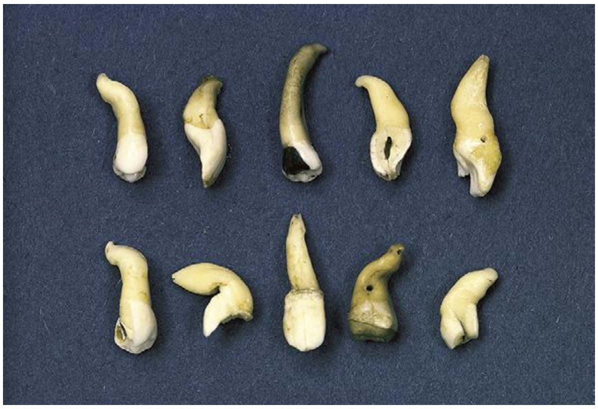
dilatancy /dīlā′tənsē/ [L, *dilatare*, to widen], an unusual behavior observed in cytoplasm (and in some physical systems) during which its viscosity and applied force both increase.

dilatant, one exhibiting **dilatancy.**

dilatation. See **dilation.**

dilate /dī′lāt/, to cause a physiological increase in the diameter of a body opening, blood vessel, or tube, such as the widening of the pupil of the eye in response to decreased light or the widening of the uterine cervix during labor.

dilation /dīlā′shən/ [L, *dilatare*, to widen], **1.** the condition of being dilated or stretched. **2.** the process of causing a physiological increase in the diameter of a body opening,



Dilaceration *(Regezi, Sciubba, and Jordan, 2008)*

blood vessel, or tube. Examples include the widening of the pupil of the eye by the use of cycloplegic eyedrops for examination of the retina and opening of the uterine cervix to facilitate curettage by the use of a dilator. Also called **dilatation.**

Dilation of the pupils may indicate fear, shock, or cardiac arrest *(Stoy, Platt, and Lejeune, 2005)*

dilation and curettage (D&C), widening of the uterine cervix and scraping of the endometrium of the uterus. It is done to diagnose disease of the uterus, to correct heavy or prolonged vaginal bleeding, or to empty the uterus of the products of conception. It is also performed to remove tumors, to rule out carcinoma of the uterus, and to remove retained placental fragments after delivery or after an incomplete abortion. The cervix is dilated with a series of dilators of increasing size to allow the insertion of a curet into the uterus. A perineal pad is applied. Postoperative care requires emotional support appropriate to the clinical situation and close observation for hemorrhage, infection, or dysuria. See also **abortion, fractional dilation and curettage.**

dilation and evacuation (D&E) [L, *dilatare,* to widen, *evacuare,* to empty], the removal of the products of conception, using suction curettage and forceps, during the second trimester of pregnancy; a type of abortion.

dilation of the heart [L, *dilatare,* to widen; AS, *heorte*], an enlargement of the heart caused by stretching of a weakened myocardium. The condition is associated with acute pulmonary embolism and heart failure.

dilator /dī′lātər/ [L, *dilatare,* to widen], a device for expanding a body opening or cavity. Examples include a tent dilator, consisting of a sponge or bundle of seaweed that expands the cervical os, and a Barnes' bag (dilator), a rubber bag that can be inserted into a body cavity and filled with water to produce pressure on the cavity walls.

dilator naris, the alar portion of the nasalis muscle that dilates the nostril.

dilator pupillae, a muscle of the iris of the eye that dilates the pupil. It is composed of radial fibers, like spokes of a wheel, that converge from the circumference of the iris toward the center and blend with fibers of the sphincter pupillae near the margin of the pupil. The dilator pupillae is innervated primarily by nerve fibers from the sympathetic system (T_2 sympathetic chain ganglia) through axons along the ciliary arteries. Compare **sphincter pupillae.**

Dilaudid, a trademark for an opioid analgesic **(hydromorphone hydrochloride).**

Dilor, a trademark for a bronchodilator **(dyphylline).**

diltiazem /diltī′əzam/, a calcium channel blocker or calcium antagonist.

■ INDICATIONS: It is prescribed for the treatment of vasospastic and effort-associated angina, in addition to hypertension.

■ CONTRAINDICATIONS: Sick sinus syndrome, second- or third-degree atrioventricular block, or hypotension prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are edema, arrhythmia, bradycardia, hypotension, syncope, rash, headache, and dizziness.

diluent /dil′o͞o·ənt, dil′yo͞o·ənt/ [L, *diluere,* to wash], a substance, generally a fluid, that makes a solution or mixture less concentrated, less viscous, or more liquid.

dilute /dilo͞ot′, dī′lo͞ot/ [L, *diluere,* to wash], **1.** *adj,* pertaining to a solution that contains a relatively small amount of solute in proportion to solvent. **2.** *v,* to make a more concentrated solution less concentrated.

diluting agent /dilo͞o′ting/, a substance used to reduce the viscosity of respiratory tract secretions so they can be removed easily. Examples include water and hypotonic saline solution, which can be aerosolized or nebulized.

dimenhydrinate /dim′ənhī′drināt/, an antiemetic.

■ INDICATIONS: It is prescribed in the treatment of nausea and motion sickness.

■ CONTRAINDICATIONS: Asthma or known hypersensitivity to this drug prohibits its use. It is not given to newborns or lactating mothers.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are skin rash, hypersensitivity reactions, and tachycardia. Drowsiness and dry mouth are common.

dimension, a measure of the width, length, or height of a space, usually described in units of a linear scale.

dimensional stability /dimen′shənəl/, the resistance of radiographic film to image distortion from warping or changing size or shape during processing.

dimer /dī′mər/ [Gk, *di,* twice, *meros,* parts], a compound formed by the union of two radicals or two molecules of a single simpler compound.

dimercaprol /dī′mərkap′rol/, a heavy-metal antagonist. Formerly called **British antilewisite (BAL).**

■ INDICATIONS: It is prescribed in the treatment of Wilson's disease and in the treatment of acute arsenic, mercury, or gold poisoning, as from an overdosage with mercurial diuretics, arsenics, or gold salts.

■ CONTRAINDICATIONS: Hepatic or renal insufficiency; poisoning with cadmium, iron, or selenium; or known hypersensitivity to the drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse reactions are nephrotoxicity, acidosis, convulsions, and abnormal cardiovascular functions. Mild reactions include pain at the injection site, nausea, excessive salivation, and paresthesia.

Dimetane™, a trademark for an antihistamine **(brompheniramine maleate).**

Dimetapp™, a trademark for a fixed-combination drug containing a decongestant (pseudoephedrine) and an antihistamine **(brompheniramine maleate).** It may also contain the antitussive dextromethorphan.

dimethoxymethylamphetamine (DOM) /dī′məthok′sēme th′iləmfet′əmēn/, a psychoactive or hallucinogenic agent.

dimethylamine [$(CH_3)_2NH$], a secondary amine found in guano and decomposing fish.

dimethylaniline. See **auramine.**

dimethyl carbinol. See **isopropyl alcohol.**

dimethyl sulfoxide (DMSO) /dīmeth′il/, an organic solvent used as an antiinflammatory agent.

■ INDICATIONS: It is instilled into the bladder for the treatment of interstitial cystitis.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse reactions are GI disturbances, photophobia, disturbance of color vision, and headache. A garliclike body odor and taste in the mouth may occur. When applied topically, it can cause local irritations and carry toxins into the systemic circulation.

Dimitri's disease. See **Sturge-Weber syndrome.**

dimorphous /dīmôr′fəs/ [Gk, *di,* twice, *morphe,* form], pertaining to an organism or substance that exists in two distinct forms.

dimple, **1.** a slight natural indentation or depression on a body surface, such as on the cheek. **2.** a depression on a body surface resulting from contracting scar tissue or trauma.

dimpled sign, a physical diagnostic test to differentiate between a benign dermatofibroma lesion and a nodular melanoma. On pressure of the examiner's thumb and index finger benign tumors dimple, but malignant growths do not.

dimpling [ME, *dympull*], small, abnormal indentations or depressions on the surface of a body or organ.

dinitrochlorobenzene (DNCB) /dīnī′trōklôr′ōben′zēn/, a substance applied topically as a test for delayed hypersensitivity reactions. The compound has also been used as an immunotherapeutic agent to treat skin tumors.

2,4-dinitrophenol (DNP), **1.** a dye used in biochemical research into oxidative processes. **2.** a hapten commonly used to induce immune response.

dinucleotide, a compound containing two nucleotides.

dioctyl calcium sulfosuccinate, dioctyl potassium sulfosuccinate, dioctyl sodium sulfosuccinate. See **docusate.**

diode /dī′ōd/, **1.** an electron tube or x-ray tube having a cathode and an anode. **2.** an electrical device that has a higher conductance for current flowing in one direction than for current flowing in the opposite direction.

diode laser, a solid-state semiconductor used as a lasering medium.

dioecious. See **diecious.**

diol. See **dihydric alcohol.**

diolamine /dī·ol′əmēn/, abbreviation for *diethanolamine*.

Dionysian /dē·onis′ē·ən/ [Gk, *Dionysos,* Greek god of wine], the personal attitude of one who is uninhibited, mystic, sensual, emotional, and irrational and who may seek to escape from the boundaries imposed by the limits of the senses.

diopter (D) /dī·op′tər/ [Gk, *dioptra,* optical measuring instrument], a metric measure of the refractive power of a lens. It is equal to the reciprocal of the focal length of the lens in meters. For example, a lens with a focal length of 0.5 m has a diopter measure of 2.0 (1/0.5) and when prescribed as a corrective lens for the eye should make printed matter most clearly focused when it is held 0.5 m from the eyes.

dioptric power /dī·op′trik/, the refractive power of an optic lens as measured in diopters.

diovular. See **binovular.**

diovulatory /dī·ov′yələtôr′ē/ [Gk, *di,* twice; L, *ovum,* egg], routinely releasing two ova during each ovarian cycle. Compare **monovulatory.**

dioxide /dī·ok′sīd/ [Gk, *di,* twice, *oxys,* sharp, *genein,* to produce], an oxide that contains two oxygen atoms.

dioxin /dī·ok′sin/, a contaminant of the herbicide 2,4,5-trichlorophenoxyacetic acid, widely used throughout the world in forestry, on grassland, against woody shrubs and trees on industrial sites, and for rice and sugarcane weed control. Because of its toxicity it is no longer manufactured in the United States. Exposure to dioxin is associated with chloracne and porphyria cutanea tarda. Dioxin was a contaminant of the jungle defoliant Agent Orange sprayed by the U.S. military aircraft over areas of Southeast Asia from 1965 to 1970. Also called *2,3,7,8-tetrachlorodibenzo*-para-*dioxin*.

DIP, abbreviation for **desquamative interstitial pneumonia.**

dipeptidases /dīpep′tidāzəs/, the final enzymes in the protein splitting system of digestion. They complete the task of breaking two-amino-acid dipeptides into single amino acids.

dipeptide, an organic compound formed by the union of two amino acids, with the link provided by the carboxyl group of one molecule and the amine group of the other.

diphallus, a rare congenital anomaly that occurs when two genital tubercles develop. The penis is partly or completely duplicated and may or may not be symmetrical. It is often associated with urogenital or other anomalies. Also called **double penis.**

diphasic /dīfā′zik/ [Gk, *di,* twice, *phasis,* appearance], pertaining to something that occurs in two stages or phases.

diphenhydrAMINE hydrochloride, an antihistamine.

■ INDICATIONS: It is prescribed in the treatment of hypersensitivity reactions, including rhinitis, skin rash, and pruritus, and in the treatment of motion sickness and insomnia.

■ CONTRAINDICATIONS: Asthma or known hypersensitivity to this drug prohibits its use. It is not given to newborns or lactating mothers.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are skin rash, hypersensitivity reactions, and tachycardia. Drowsiness and dry mouth commonly occur.

diphenoxylate hydrochloride /dī′fənok′silāt/, an opioid antidiarrheal that contains subclinical amounts of atropine sulfate to limit abuse.

■ INDICATIONS: It is prescribed in the treatment of noninfectious diarrhea and intestinal cramping.

■ CONTRAINDICATIONS: Liver disease, antibiotic-associated diarrhea, or known hypersensitivity to this drug prohibits its use. It is not given to children less than 2 years of age.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are abdominal discomfort, intestinal obstruction, skin rash, tachycardia, urinary retention, nausea, and addiction.

diphenylhydantoin. See **phenytoin.**

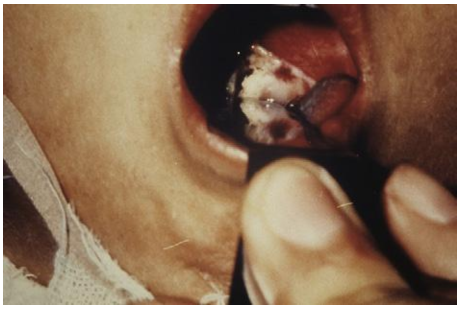
2,3-diphosphoglycerate test, a blood test used in the evaluation of nonspherocytic anemia.

2,3-diphosphoglyceric acid (DPG) /dīfos′fōgliser′ik/, a substance in the erythrocyte that affects the affinity of hemoglobin for oxygen. It is a chief end product of glucose metabolism and a link in the biochemical feedback control system that regulates the release of oxygen to the tissues.

diphosphonate /difos′fonāt/, any of a group of related phosphorus-containing compounds that are structurally similar to pyrophosphate but have enhanced stability to enzymatic and chemical hydrolysis and have affinity for sites of osteoid mineralization. They are used as sodium salts to inhibit bone resorption and are complexed with technetium

Tc 99m for bone imaging. The group includes alendronate, etidronate, and pamidronate. Also called **bisphosphonate.**

diphtheria /difthir′ē·ə, dipthir′ē·ə/ [Gk, *diphthera,* leather membrane], an acute contagious disease caused by the bacterium *Corynebacterium diphtheriae*. It is characterized by the production of a systemic toxin and an adherent false membrane lining of the mucous membrane of the throat. The toxin is particularly damaging to the tissues of the heart and central nervous system, and the dense pseudomembrane in the throat may interfere with eating, drinking, and breathing. The membrane may also be present in other body tissues. Lymph glands in the neck swell, and the neck becomes edematous. Untreated, the disease is often fatal from respiratory obstruction or heart and kidney failure. Patients are usually hospitalized in isolation rooms. Treatment of the isolated patient may include administration of diphtheria antitoxin, antibiotics, bed rest, fluids, and an adequate diet. Tracheostomy is sometimes necessary. Recovery is slow, but it is usually complete. Immunization against diphtheria is available to all children in the United States and is usually given in conjunction with pertussis and tetanus immunization early in infancy. See also **Schick test.**



Diphtheria: false membrane lining

(Conlon and Snydman, 2000)

diphtheria and tetanus toxoids (DT), an active immunizing agent.

■ INDICATIONS: It is prescribed for immunization against diphtheria and tetanus when pertussis vaccination is contraindicated.

■ CONTRAINDICATIONS: Immunosuppression, acute infection, or concomitant use of corticosteroids prohibits its use.

■ ADVERSE EFFECT: The most serious adverse reaction is anaphylaxis.

diphtheria and tetanus toxoids and pertussis vaccine (DPT), an active immunizing agent.

■ INDICATIONS: It is prescribed for the routine immunization of children less than 6 years of age against diphtheria, tetanus, and pertussis.

■ CONTRAINDICATIONS: Immunosuppressive therapy, active infection, or neurological disorders prohibit its use.

■ ADVERSE EFFECT: The most serious adverse reaction is anaphylaxis.

diphtheria and tetanus toxoids and pertussis vaccine adsorbed and Haemophilus b conjugate vaccine, a combination of diphtheria toxoid, tetanus toxoid, pertussis vaccine, and *Haemophilus* b conjugate vaccine, administered intramuscularly to children 18 months to 5 years of age for simultaneous immunization against diphtheria, tetanus, whooping cough, and infection by ***Haemophilus influenzae*** type b.

diphtheria antitoxin [Gk, *diphtheria,* leather membrane, *anti,* against, *toxikon,* poison], an antitoxin prepared by immunizing horses with diphtheria toxoid and extracting serum from the animal. The serum is standardized for strength and quality.

diphtherial cough /difthir′ē·əl/, a brassy, noisy, crouplike cough accompanied by stridor, observed mainly in children with laryngeal diphtheria.

diphtheria toxin [Gk, *diphtheria* + *toxikon,* poison], the filtrate of a broth culture used to prepare an intradermal injectable form of toxin for Schick tests. A positive test result is characterized by an inflammatory reaction at the point of injection, whereas circulating antibodies in the blood cause a negative test result, indicating immunity.

diphtheritic croup /dif′thirit′ik/ [Gk, *diphtheria* + Scot, *croak,* to speak hoarsely], a diphtheritic inflammation of the larynx. Also called **laryngeal diphtheria.** See **diphtheritic laryngitis.**

diphtheritic laryngitis [Gk, *diphtheria, larynx, itis,* inflammation], inflammation of the larynx caused by the bacterium *Corynebacterium diphtheriae*. A serious complication is the formation of a false membrane. Also called **diphtheritic croup, laryngeal diphtheria.** See also **diphtheria.**

diphtheritic membrane, a membrane of coagulated fiber with bacteria and leukocytes. It is usually white or grayish yellow with well-defined margins.

diphtheritic pharyngitis [Gk, *diphtheria* + *pharynx,* throat, *itis,* inflammation], an inflammation of the pharynx caused by the bacterium *Corynebacterium diphtheriae* and associated with the formation of a false membrane. See also **diphtheria.**

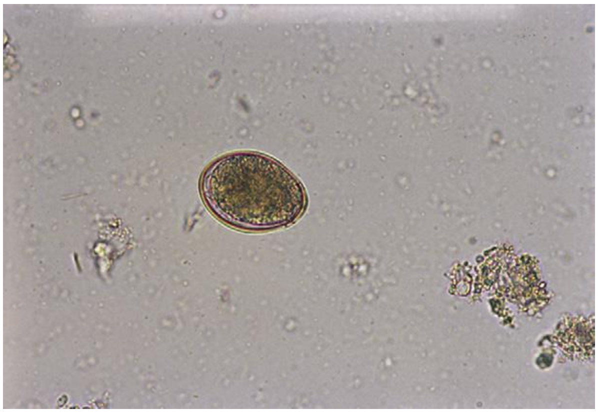
diphtheritic sore throat, an inflammation of the pharynx or larynx caused by an infection of *Corynebacterium diphtheriae*.

diphtheritic stomatitis, an inflammation of the mucous membrane of the mouth, caused by *Corynebacterium diphtheriae*.

diphtheroid /dif′thəroid′/ [Gk, *diphthera,* leather membrane, *eidos,* form], **1.** pertaining to diphtheria. **2.** resembling the bacillus *Corynebacterium diphtheriae*.

diphyllobothriasis, A genus of tapeworm containing several species which is found in the intestine of fish, birds, and mammals including man. Infection in humans is usually by eating uncooked fish. The larval stage is known as Sparganum. The species that most often infects humans is *Diphyllobothrium latum,* a giant freshwater fish tapeworm of North America and Europe. See **fish tapeworm infection.**

Diphyllobothrium /dəfil′ōboth′rē·əm/ [Gk, *di,* twice, *phyllon,* leaf, *bothrion,* pit], a genus of large parasitic intestinal flatworms having a scolex with two slitlike grooves. The species that most often infects humans is *Diphyllobothrium latum,* a giant freshwater fish tapeworm of North America and Europe. See also **fish tapeworm infection.**



***Diphyllobothrium latum* egg**

(Mahon, Lehman, and Manuselis, 2011)

-dipine, suffix for the name of a phenylpyridine vasodilator.

dipivefrin /dīpivef′rin/, an ophthalmic sympathomimetic agent.

■ INDICATION: It is prescribed in the treatment of open-angle glaucoma.

■ CONTRAINDICATIONS: Narrow-angle glaucoma or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are reactive hyperemia, conjunctivitis, allergic reactions, macular edema, tachycardia, arrhythmia, and hypertension.

diplegia /dīplē′jē·ə/ [Gk, *di,* twice, *plege,* stroke], paralysis of both sides of any body part or of like parts on the opposite sides of the body. A kind of diplegia is **facial diplegia.** Compare **hemiplegia.** **—***diplegic, adj.*

diplo-, prefix meaning "double": *diplobacilli, diplococcus, diplokaryon.*

diplococcus /dip′lōkok′əs/ *pl,* diplococci [Gk, *diploos,* double, *kokkos,* berry], **1.** *n,* a member of the Coccaceae family that occurs in pairs because of incomplete cell division. Diplococci are often found as parasites or saprophytes. **2.** *adj,* describing bacteria of the Coccaceae family, which occur as pairs of cocci. Examples include ***Streptococcus pneumoniae,*** *Neisseria gonorrheae,* and *N. meningitidis.*

diploë /dip′lō·ē/, the loose tissue filled with red bone marrow between the two layers of the cranial bones.

diploid (2n) /dip′loid/ [Gk, *diploos* + *eidos,* form], having two complete sets of homologous chromosomes, such as are normally found in somatic cells and primordial germ cells before maturation. In humans the normal diploid number is 46. Also called *diploidic.* Compare **haploid, tetraploid, triploid.**

diploid nucleus, a nucleus having two sets of chromosomes, as normally found in the somatic cells of higher organisms.

diploidy /dip′loidē/, the state or condition of having two complete sets of homologous chromosomes.

diplokaryon /dip′lōker′ē·on/ [Gk, *diploos* + *karyon,* nut], a nucleus that contains twice the diploid number of chromosomes.

diploma program in nursing, a basic educational program that is designed to prepare nursing students for entry into practice, usually in 2 or 3 years. The recipient of a diploma is eligible to take the national certifying registration examination to become a registered nurse. In the United States, most diploma programs are conducted in hospitals, although some are located in community colleges. In Canada, diploma programs are conducted in community colleges or Collège d'Enseignement Général et Professionnel (in Quebec), as well as in a few hospital schools of nursing in the western provinces. These schools are negotiating collaboration with university schools of nursing. Many diploma programs are closing.

diplomate /dip′ləmāt/, an individual who has earned a diploma or certificate, especially a physician who has been certified by a specialty board. See also **board certified.**

diplonema /dip′lənē′mə/ [Gk, *diploos,* + *nema,* thread], the looplike formation of the chromosomes in the diplotene stage of the first meiotic prophase in gametogenesis.

diplopagus /diplop′əgəs/ [Gk, *diploos* + *pagos,* something fixed], conjoined twins that are more or less equally developed, although one or several internal organs may be shared.

diplopia /diplō′pē·ə/ [Gk, *diploos* + *opsis,* vision], **double vision** caused by defective function of the extraocular muscles or a disorder of the nerves that innervate the muscles. It occurs when the object of fixation falls on the fovea in one eye and a nonfoveal point in the other eye or when the object of fixation falls on two noncorresponding points. Also called **ambiopia.** Compare **binocular vision.**

-diplopia, suffix meaning "(condition of) double vision": *amphodiplopia, amphoterodiplopia, monodiplopia.*

diplornavirus /dī′plôrnəvī′rəs/, a double-stranded ribonucleic acid virus that is the cause of Colorado tick fever. It is related to the reoviruses that are associated with various respiratory infections.

diplosomatia /dip′lōsōmā′shə/ [Gk, *diploos* + *soma,* body], a congenital anomaly in which fully formed twins are joined at one or more areas of their bodies. Also called *diplosomia.*

diplotene /dip′lətēn/ [Gk, *diploos* + *tainia,* ribbon], the fourth stage in the first meiotic prophase in gametogenesis, in which chiasmata form between the chromatids of paired homologous chromosomes and crossing over occurs. The chromosomes then begin to repel each other and separate longitudinally, forming loops. See also **diakinesis, leptotene, pachytene, zygotene.**

dipodial symmelia /dīpō′dē·əl/ [Gk, *di,* twice, *pous,* foot, *syn,* together, *melosi* limb], a developmental anomaly characterized by the fusion of the limbs and the presence of two feet. Compare **monopodial symmelia, sirenomelia, tripodial symmelia.** See also **sympus dipus.**

dipolar ion. See **zwitterion.**

dipole /dī′pōl/, **1.** a molecule whose ends carry opposite partial charges. **2.** a molecule with areas of opposing electrical charges, such as hydrogen chloride, which has a predominance of electrons and a partial negative charge about the chloride portion and a partial positive charge on the hydrogen side.

diprop, abbreviation for a *dipropionate anion.*

diprosopus /dīpros′əpəs, dī′prəsō′pəs/ [Gk, *di,* twice, *prosopon,* face], a malformed fetus that has a double face showing varying degrees of development.

dipsesis /dipsē′sis/, extreme thirst.

-dipsia, -dipsy, suffix meaning "(condition of) thirst": *hydroadipsia, oligodipsia, polydipsia.*

dipsomania /dip′sōmā′nē·ə/ [Gk, *dipsa,* thirst, *mania,* madness], an uncontrollable, often periodic craving for and indulgence in alcoholic beverages. Also called **alcoholism.**

dipstick, a chemically treated strip of paper used in the analysis of urine or other fluids.

-dipsy. See **-dipsia.**

dipus /dī′pəs/, conjoined twins who have only two feet.

dipygus /dīpī′gəs, dip′əgəs/ [Gk, *di,* twice, *pyge,* rump], a malformed fetus that has a double pelvis, one of which is usually not fully developed.

dipyridamole /dī′pirid′əmōl/, an antiplatelet agent.

■ INDICATION: When used in combination with coumarin anticoagulants, it is used to prevent postoperative thromboembolic complications of cardiac valve replacement.

■ CONTRAINDICATIONS: It should be used with caution in hypotension.

■ ADVERSE EFFECTS: The adverse reactions are mild and transient, such as headache, dizziness, rash, nausea, and flushing.

direct-access memory, access to computerized data independent of previously obtained data. The data transfer occurs directly between the computer memory and peripheral devices. See also **random-access memory.**

direct agglutination test, a test for the presence of antibodies to a specific antigen in which a dilute antiserum is mixed with the antigen in question.

direct amplification test, a method used to rapidly identify pathogenic organisms found in patient specimens. The RNA of an organism is copied (amplified) and then detected by using a nucleic acid probe. A small number of viruses and bacteria can be identified in a few hours in comparison to days or weeks needed for culturing.

direct antagonist [L, *diregere,* to direct; Gk, *antagonisma,* struggle], one of a pair or a group of muscles that pull in opposite directions, whose combined action prevents the part from moving.

direct blood donation, the donation of a unit of blood for transfusion into a specific individual.

direct bone conduction, the conduction of sound to the inner ear from a hearing aid implanted into the skull.

direct calorimetry, the measurement of the amount of heat directly generated by reaction. Compare **indirect calorimetry.**

direct causal association, a cause-and-effect relationship between a causative factor and a disease with no other factors intervening in the process.

direct contact, mutual touching of two individuals or organisms. Many communicable diseases may be spread by direct contact between an infected and a healthy person.

direct Coombs' test, a blood test performed to identify hemolysis or to investigate hemolytic transfusion reactions. This test demonstrates whether the patient's red blood cells have been attacked by antibodies in the patient's own bloodstream.

direct costs, in managed care, the costs of labor, supplies, and equipment to provide direct patient care services.

direct current (DC), an electric current that flows in one direction only and is substantially constant in value. Compare **alternating current.**

directed donation donor, Specific donor who makes a blood donation designated for transfusion to a specific recipient. The directed donor blood must meet the same criteria and undergo the same tests as any volunteer allogenic blood donor.

direct-exposure film, a type of radiograph film that is directly exposed by x-rays. It is used most often in dental radiography.

direct fluorescent antibody-*Treponema pallidum* test (DFA-TP test), a treponemal antibody test for syphilis using direct immunofluorescence to detect antibodies against ***Treponema pallidum*** in the serum.

direct fracture, any fracture occurring at a specific point of injury that is a direct result of that injury.

direct generation. See **asexual reproduction.**

direct gold, any form of pure gold that may be compacted or condensed directly into a prepared tooth cavity to form a restoration. See also **gold foil.**

direct illumination. See **illumination.**

direct intervention, hands-on therapy to increase the potential for new motor learning when there are deficits in movement and postural control.

direct intraperitoneal insemination (DIPI), a method of assisted reproductive technology in which semen is injected into the pouch of Douglas.

directional atherectomy, atherectomy done with a directional atherectomy catheter.

directional atherectomy catheter, a type of atherectomy catheter whose direction can be shifted to shave off additional plaque.

directive therapy [L, *diregere,* to direct, *therapeia,* treatment], a psychotherapeutic approach in which the psychotherapist directs the course of therapy by intervening to ask questions and offer interpretations. Compare **nondirective therapy.** See also **psychoanalysis.**

direct laryngoscopy [L, *diregere,* to direct, Gk, *larynx* + *skopein,* to watch], an examination of the larynx by means of a lighted instrument inserted through the mouth.

direct lead /lēd/, **1.** an electrocardiographic conductor in which the exploring electrode is placed directly onto the surface of the exposed heart. **2.** *(informal)* a tracing produced by such a lead on an electrocardiograph.

direct light reflex, the constriction of a pupil receiving increased illumination, as by a light source during an ophthalmological examination. Also called **direct reaction to light.** Compare **consensual reaction to light.**

direct measurement of blood pressure [L, *diregere,* to direct, *mensura,* to measure; ME, *blod* + L, *premere,* to press], measurement of blood pressure by means of a catheter inserted into an artery. The catheter is connected to a pressure transducer.

direct nursing care functions, liaison nursing activities that are focused on a particular patient, a patient's family, or a group for whom the nurse is directly responsible and accountable.

directory /direk′tərē/, a listing of the files in a computer storage device, such as an area of a hard drive or other storage device. A device may contain many directories to facilitate organization of files.

direct patient care, (in nursing) care of a patient provided personally by a staff member. Direct patient care may involve any aspects of the health care of a patient, including treatments, counseling, self-care, patient education, and administration of medication.

direct percussion. See **percussion.**

direct provider reimbursement, a method of direct payment for health care services, as fee-for-service.

direct-question interview, an inquiry that usually requires simple one- or two-word responses.

direct reaction to light. See **direct light reflex.**

direct reflex, a response that occurs on the same side of the body as the stimulus.

direct relationship. See **positive relationship.**

direct retainer, a clasp, attachment, or assembly fastened to an abutment tooth for the purpose of maintaining a removable restoration in its planned position in relation to oral structures. See also **precision rest.**

direct self-destructive behavior (DSDB), any form of suicidal activity such as suicide threats, attempts, or gestures and the act of suicide itself. The person is aware that death is the desired outcome of his or her act.

direct transfusion [L, *dirigere,* to direct, *transfundere,* to pour through], the transfer of whole blood directly from a vein of the donor to a vein of the recipient.

dirithromycin, an antiinfective.

■ INDICATIONS: It is used to treat infections of the respiratory tract caused by ***Moraxella catarrhalis, Streptococcus*** spp. *(S. pneumoniae, S. agalactiae, S. viridans), Legionella pneumophila, Mycoplasma pneumoniae,* ***S. pyogenes, Staphylococcus aureus,*** *Bordetella pertussis,* and *Propionibacterium acnes.*

■ CONTRAINDICATIONS: Factors that prohibit its use are bacteremia and known hypersensitivity to erythromycin or to dirithromycin or any other macrolide.

■ ADVERSE EFFECTS: Pseudomembranous colitis is a life-threatening effect of this drug. Other adverse effects are GI disorders, flatulence, abnormal stools, anorexia, constipation, increased platelet count, increased eosinophils, cough, dyspnea, pruritus, and urticaria. Common side effects are abdominal pain, nausea, diarrhea, vomiting, dyspepsia, headache, dizziness, and insomnia.

dirofilariasis /dī′rōfil′ərī′əsis/, a human infestation of the dog heartworm, *Dirofilaria immitis,* and the closely related *D. (Nochtiella) repens,* both of which may be transmitted through the bite of any of several species of mosquitoes.

The filaria migrate through the bloodstream to the lung, producing pulmonary nodules and causing chest pain, coughing, and hemoptysis. The disease is rare among humans, but some species have been found to infect subcutaneous tissue and the eyes. Human disease is independent of dog ownership. Humans are deadend hosts for the parasites. Also called **zoonotic filariasis.**

dirty bomb, an explosive device that disperses radioactive material over a wide area, contaminating land, buildings, and people. Its purpose is to cause fear and to make an area unusable for a long time.

dis-. See **di-, dis-.**

disability /dis′əbil′itē/ [L, *dis,* opposite of, *habilis,* fit], the loss, absence, or impairment of physical or mental fitness. Compare **handicapped.**

disablement model /disā′bəlmənt/, an evaluation and treatment model based on specific impairment, functional loss, and attainable quality of life rather than a medical diagnosis.

disaccharidase /disak′äridās′/, in humans, the enzyme that hydrolyzes disaccharides. The disaccharidases are located in the brush border membrane of the small intestine and hydrolyze the oligosaccharides and disaccharides produced after luminal digestion of starches and other carbohydrates. See also **disaccharide intolerance**.

disaccharidase deficiency. See **lactase deficiency.**

disaccharide /dīsak′ərīd/ [Gk, *di, sakcharon,* sugar], a general term for simple carbohydrates formed by the union of two monosaccharide molecules.

disaccharide intolerance, the inability to properly metabolize one or more disaccharides, usually resulting from deficiency of the corresponding disaccharidases, although it may have other causes such as impaired absorption. After ingestion of the disaccharide, there may be abdominal symptoms such as diarrhea, flatulence, borborygmus, distension, and pain. One common type is lactose intolerance.

disadvantaged /dis′ədvan′tijd/ [L, *dis* + *abante,* superior position], **1.** any group of people who lack money, education, literacy, or another status advantage. **2.** a euphemism for “poor.”

disarticulation /dis′ärtik′yəlā′shən/ [L, *dis, articulare,* to divide into joints], separation of a joint without cutting through a bone.

disaster [L, *dis,* apart, *astrum,* a star], any mishap or misfortune that is ruinous, distressing, or calamitous.

disaster-preparedness plan [L, *dis* + *astrum,* favorable stars, *praeparare,* to prepare], a formal plan of action, usually prepared in written form, for coordinating the response of a hospital staff in the event of a disaster within the hospital or the surrounding community.

disc. See **disk.**

discectomy. See **diskectomy.**

discernment, insight related to a patient problem or dilemma; the ability to analyze and understand a patient situation.

discharge (d/c) /dis′chärj/ [OFr, *deschargier,* to expel], **1.** *v,* to release a substance or object. See also **evacuate, excrete, secrete.** **2.** *v,* to release a patient from a hospital. **3.** *v,* to release an electric charge, which may be manifested by a spark or surge of electricity, from a storage battery, condenser, or other source. **4.** *v,* to release a burst of energy from or through a neuron. **5.** *n,* also called *affective discharge,* (in psychology) a release of emotions, often accompanied by a wide range of voluntary and involuntary reflexes, weeping, rage, or other emotional displays. **6.** *n,* a substance or object discharged. **7.** *n,* the flow of a secretion or an excretion.

discharge abstract, items of information compiled from medical records of patients discharged from a hospital, organized and recorded in a uniform format to provide data for statistical studies, reports, or research.

discharge coordinator, an individual who arranges with community agencies and institutions for the continuing care of patients after their discharge from a hospital or another health care facility.

discharge planning^1, the activities that facilitate a patient’s movement from one health care setting to another, or to home. It is a multidisciplinary process involving physicians, nurses, social workers, and possibly other health professionals; its goal is to enhance continuity of care. It begins on admission.

discharge planning^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparation for moving a patient from one level of care to another within or outside the current health care agency. See also **Nursing Interventions Classification.**

discharge readiness: independent living, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the readiness of a patient to relocate from a health care institution to living independently. See also **Nursing Outcomes Classification.**

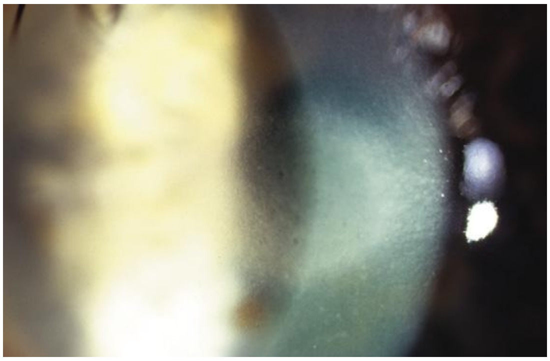
discharge readiness: supported living, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the readiness of a patient to relocate from a health care institution to a lower level of supported living. See also **Nursing Outcomes Classification.**

discharge summary, a clinical report prepared by a physician or other health professional at the conclusion of a hospital stay or series of treatments. It outlines the patient’s chief complaint, the diagnostic findings, the therapy administered and the patient’s response to it, and recommendations on discharge.

discharging lesion [OFr, *deschargier* + L, *laesio,* hurting], an injury or infection of the central nervous system that causes sudden abnormal episodes of discharging nerve impulses.

dischronation /dis′krōnā′shən/, a disorder of time awareness. Also called **time agnosia.**

disciform keratitis /dis′ifôrm/ [Gk, *diskos,* flat plate; L, *forma,* form; Gk, *keras,* horn, *itis,* inflammation], an inflammatory condition of the eye that often follows an attack of dendritic keratitis, believed to be an immunological response to an ocular herpes simplex infection. The condition is characterized by disclike opacities in the cornea, usually with inflammation of the iris. See also **herpes simplex.**



Disciform keratitis *(Kanski and Bowling, 2011)*

disclosing solution [L, *dis* + *claudere,* to close, *solutus,* dissolved], a topically applied dye solution used to stain and reveal plaque and other deposits on teeth.

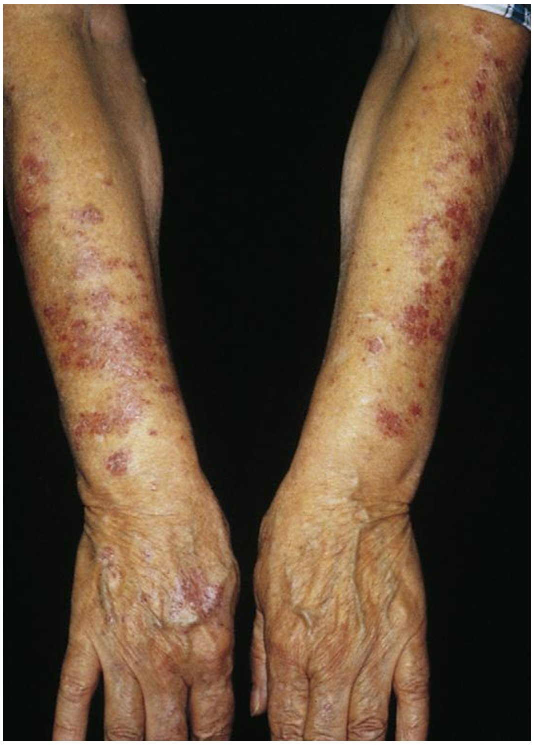
disco-, prefix meaning "disk, disk-shaped": *discopathy, discophorous, discoplacenta.*

discoblastula /dis′kōblas′tyələ/ [Gk, *diskos,* flat plate, *blastos,* germ], a blastula formed from the partial cleavage that occurs in a fertilized ovum containing a large amount of yolk. It develops from the blastodisc and consists of a cellular cap, or blastoderm, separated from the uncleaved yolk mass by a small cavity, the blastocele.

discocyte /dis′kəsīt/ [Gk, *diskos* + *kytos,* cell], a mature normal erythrocyte in the form of a biconcave disk without a nucleus.

discoid /dis′koid/ [Gk, *diskos,* flat plate, *eidos,* form], having a flat, round shape.

discoid lupus erythematosus (DLE) [Gk, *diskos* + *eidos,* form; L, *lupus,* wolf; Gk, *erythema,* redness, *osis,* condition], a chronic, recurrent disease, primarily of the skin, characterized by lesions that are covered with scales and extend into follicles. The lesions are typically distributed on the face but may also be present on other parts of the body. On healing the lesions often leave atrophic, hyperpigmented, or hypopigmented scars. If hairy areas are involved, alopecia may result. The cause of the disease is not established, but there is evidence that it may be an autoimmune disorder, and some cases seem to be induced by certain drugs. It is at least five times more common in women than in men and occurs most frequently in the third and fourth decades of life. Treatment includes use of a sunblock when exposure to sunlight cannot be avoided, application of steroids to the lesions, and use of systemic antimalarial drugs such as hydroxychloroquine; systemic corticosteroid agents may be used in severe cases. See also **systemic lupus erythematosus.**



Discoid lupus erythematosus *(Huether and McCance, 2008/Courtesy Department of Dermatology, School of Medicine, University of Utah)*

discoid meniscus, an abnormal condition characterized by a discoid rather than a semilunar shape of the cartilaginous meniscus of the knee. The lateral meniscus is usually affected, although the medial meniscus may also become involved. The condition is a developmental anomaly that is asymptomatic in infants and young children; it appears most often between 6 and 8 years of age. Common complaints are that the knee joint clicks or gives way. These characteristics are often but not always associated with an injury to the knee. Examination demonstrates the clicking, usually during the last 15 to 20 degrees, when the knee is moved from flexion to extension. Surgical excision of the meniscus is seldom warranted in treating this benign condition.

discoid placenta [Gk, *diskos,* quoit, *eidos,* form; L, *placenta,* flat cake], a round placenta.

discomfort level, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of observed or reported mental or physical discomfort. See also **Nursing Outcomes Classification.**

disconfirmation /diskon′fərmā′shən/, a dysfunctional communication that negates, discounts, or ignores information received from another person.

discordance /diskôr′dəns/ [L, *discordare,* to disagree], the expression of one or more specific traits in only one member of a pair of twins. Compare **concordance.** **—discordant,** *adj.*

discordant twins, twins showing a marked difference in size (greater than 10% in weight) at birth. The condition is usually caused by overperfusion of one twin and underperfusion of the other. It is fairly common in identical twins but may also occur in dizygotic twins.

Discordant twins *(Clark, Thompson, and Barkemeyer, 2000)*

discovery /diskov′ərē/ [L, *dis* + *coopiere,* to cover], (in law) a pretrial procedure that allows one party to examine vital witnesses and documents held exclusively by the adverse party. Discovery is limited to materials, facts, and other resources that could not otherwise be reasonably expected to be discovered and that are necessary to the preparation of the case for trial. Also called **pretrial discovery.** Compare **deposition, interrogatories.**

discrete /diskrēt′/ [L, *discretus,* separated], **1.** individually distinct. **2.** composed of distinct parts.

discrete x-rays. See **x-ray.**

discrimination /diskrim′inā′shən/ [L, *discrimen,* division], the act of distinguishing or differentiating. The ability to distinguish between touch or pressure at two nearby points on the body is known as two-point discrimination.

discriminator /diskrim′inā′tər/, an electronic device capable of accepting or rejecting a pulse of energy on the basis of the pulse's amplitude. It is used to separate low-energy from high-energy radionuclides.

discus interpubicus. See **interpubic disk.**

discus nervi optici. See **optic disc.**

disease [L, *dis* + Fr, *aise,* ease], **1.** a condition of abnormal vital function involving any structure, part, or system of an organism. **2.** a specific illness or disorder characterized by a recognizable set of signs and symptoms attributable to heredity, infection, diet, or environment. Compare **condition, diathesis.**

disease-modifying antirheumatic drug (DMARD), a classification of antirheumatic agents referring to their ability to modify the course of disease, as opposed to simply treating symptoms such as inflammation and pain. Agents in this group include auranofin, azathioprine, cycloSPORINE, gold salts, hydroxychloroquine, leflunomide, methotrexate, D-penicillamine, and sulfasalazine.

disease prevention, activities designed to protect patients or other members of the public from actual or potential health threats and their harmful consequences.

disengagement /dis′engāj′mənt/ [Fr, *disengager,* to release from engagement], **1.** an obstetric manipulation in which the presenting part of the baby is dislodged from the maternal pelvis as part of an operative delivery. See also **Kielland's rotation, version and extraction. 2.** the release or detachment of oneself from other persons or responsibilities. **3.** (in transactional family therapy) a role assumed by a nurse or other therapist in observing and restructuring intervention without becoming actively and directly involved in the problem.

disengagement theory, the psychosocial concept that normally aging individuals and society mutually withdraw from normal interaction. The theory also assumes that older adults are a homogenous group whose members prefer the company of others of their own age. See also **activity theory.**

disequilibrium /disē′kwilib′rē·əm/ [L, *dis,* apart, *aequilibrium*], the loss of balance or adjustment, particularly mental or psychological balance.

dishpan fracture [AS, *disc,* plate; L, *patina,* dish; *fractura,* break], a fracture that depresses the skull. Also called **derby hat fracture.**

disinfect /dis′infekt′/ [L, *dis,* apart, *inficere,* to infect], to eliminate many or all pathogenic microorganisms with the exception of bacterial spores.

disinfectant /dis′infek′tənt/, a liquid chemical that can be applied to objects to eliminate many or all pathogenic microorganisms with the exception of bacterial spores. See also **antiseptic.**

disinfection /dis′infek′shən/, the process of killing pathogenic organisms or rendering them inert.

disinfestation /dis′infestā′shən/ [L, *dis,* apart, *infestare,* to infest], elimination of a threat of infestation by vermin, rodents, lice, or other noxious organisms.

disinhibition /dis′inhibish′ən/ [L, *dis,* apart, *inhibere,* to restrain], the removal of inhibition. See also **inhibition.**

disintegrative psychosis /disin′təgrā′tiv/, a mental disorder of childhood that usually has an onset after 3 years of age and after normal development of speech, social behavior, and other traits. After a vague illness the child becomes irritable and undergoes mental deterioration, eventually reaching a stage of severe mental retardation. The cause may be a viral infection. There is no specific treatment.

disjunction /disjungk′shən/ [L, *disjungere,* to disjoint], the separation of paired homologous chromosomes during anaphase of the first meiotic division, or the separation of the chromatids of a chromosome during anaphase of mitosis and the second meiotic division. Compare **nondisjunction.**

disk [Gk, *diskos,* flat plate], **1.** (chiefly in ophthalmology) a flat, circular platelike structure, such as an articular disk or an optic disc. Also spelled **disc. 2.** *(informal)* an intervertebral disk. **3.** media used to store data in a computerized format.

disk drive, a computer device containing a disk that spins at high speeds that allows magnetic impulses to be written onto and read from the electromagnetic surface. Most computers contain a hard disk drive, a compact disk–read only memory (CD-ROM) drive, a CD-R, CD-RW and DVD, DVD-R or DVD-RW, and one or more diskette drives.

diskectomy /dis·kek′tə·me/ [Gk, *diskos,* flat plate + *ektome,* incision], excision of an intervertebral disk. Also spelled **discectomy.**

diskette, a semiflexible plastic, oxide-coated disk contained in a special flat plastic box or jacket that is used in a computer disk drive. Diskettes have been largely replaced by higher capacity storage devices.

diskography /diskog′rəfē/, the radiographic examination of individual intervertebral disks after introduction of a radiopaque contrast medium into the center of the disk. It is used in the investigation of ruptured disks but has largely been replaced by MRI and CT myelography.

dislocation /dis′lōkā′shən/ [L, *dis* + *locare,* to place], the displacement of any part of the body from its normal position, particularly a bone from its normal articulation with a joint. See also **incomplete dislocation.** —*dislocate, v.*

dislocation fracture, a fracture of the bony components of a joint associated with a displacement of a bone from its normal articulation with the joint.

dislocation of the clavicle [L, *dis,* apart, *locare,* to place, *clavicula,* little key], displacement of the collarbone. It may occur either at the sternal end or at the acromial or scapular extremity.

dislocation of the finger [L, *dis,* apart, *locare,* to place; AS, *finger*], displacement of a finger at a joint as a result of trauma. In the absence of an accompanying fracture the dislocated finger can usually be reduced by steadying the hand at the wrist and maneuvering the dislocated bone back into place. After reduction, a splint is applied from the fingertip to the palm of the hand, and an x-ray film is obtained.

dislocation of the hip [L, *dis,* apart, *locare,* to place; AS, *hype*], displacement of the femoral head out of the hip joint, usually accompanied by pain, edema, rigidity, shortening of the leg, and loss of function. It may be congenital or acquired. Types of hip dislocation include **obturator dislocation,** in which the femoral head lies in the obturator foramen; **perineal dislocation,** in which the femoral head is displaced into the perineum; **sciatic dislocation,** in which the femoral head lies in the sciatic notch; and **subpubic dislocation,** in which the femoral head is displaced anteriorly.

dislocation of the jaw [L, *dis,* apart, *locare,* to place; ME, *jowe*], unilateral or bilateral displacement of the mandibular condyle(s) from the mandibular fossa(e) over the articular tubercle(s) of the temporal bone, typically as a result of a blow, a fall, intubation, or yawning, accompanied by severe muscle spasms. The mandible is fixed in an open position. If the mandible appears deviated to one side, the dislocation involves only one side. The dislocation is reduced manually, with or without anesthetic sedation, and the possible use of a short-acting skeletal muscle relaxant. This is an extremely stressful and painful condition.

dislocation of the knee [L, *dis,* apart, *locare,* to place; AS, *cneow*], displacement of one of the bones of the knee joint. First aid treatment for the dislocation is the same as for a fracture: the joint is immobilized with splints, and the patient is moved quickly to a health care facility.

dislocation of the shoulder [L, *dis* + *locare* + AS, *sculder*], any of several kinds of displacement of the bones of the shoulder joint, including acromial joint disruption and separation and dislocation of the glenohumeral joint with the humeral head displaced anteriorly and inferiorly.

dislocation of the toe, displacement of a metatarsal bone at a joint.

dismembered pyeloplasty, a pyeloplasty procedure for redundancy of the renal pelvis, consisting of excision of the ureteropelvic junction and part of the pelvis and reattachment of the spatulated end of the ureter to the remaining pelvis. Also called **Anderson-Hynes pyeloplasty.**

dismiss [L, *dis* + *mittere,* to send], (in law) to discharge or dispose of an action, suit, or motion trial. **—***dismissal, n.*

disobliterative endarterectomy, surgical opening of a narrowed or blocked blood vessel by removing plaque from arterial wall. See **endarterectomy.**

disodium edetate. See **edetate disodium.**

disopyramide phosphate /dī′sōpir′əmīd/, a cardiac antiarrhythmic.

■ INDICATIONS: It is prescribed in the treatment of atrial fibrillation, atrial flutter, ventricular premature complexes, and coupled ventricular tachycardias.

■ CONTRAINDICATIONS: Cardiogenic shock, heart failure, preexisting second- or third-degree heart block in the absence of a pacemaker, sick sinus syndrome, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are severe hypotension, precipitation of heart failure, and aggravation of heart block. Urinary retention, dry mouth, and constipation commonly occur.

disorder [L, *dis,* apart, *ordo,* rank], a disruption of or interference with normal functions or established systems, as a mental disorder or nutritional disorder.

disordered metabolism, changes in metabolism that result from disease and medications administered to control diseases. Acquired immunodeficiency syndrome patients, for example, may experience severe malnutrition, wasting, weight loss, hypermetabolism, and altered energy metabolism. Human immunodeficiency virus causes blunting of intestinal villi and secretion of abnormal intestinal enzymes, resulting in severe diarrhea and malabsorption.

disorder of movement [L, *dis,* apart, *ordo,* rank, *movere,* to move], any perverse or abnormal function of muscular action that may result from infection, injury, or congenital disability, such as ataxia, involuntary grimacing, and chorea.

disorder of sleep [L, *dis* + *ordo* + AS, *slaep*], any condition that interferes with normal sleep patterns, such as sleep apnea, phase shift, use of alcohol and certain drugs, excessive sleepiness, sleep walking, nightmares, sleep paralysis, restless leg syndrome, and narcolepsy. Treatment may include medications, relaxation, avoidance of stimulants, and referral to sleep disorder clinics.

disorder of written expression, a learning disorder in which the affected skill is written communication, characterized by errors in spelling, grammar, or punctuation; by poor paragraph organization; or by poor story composition or thematic development.

disorganized schizophrenia /disôr′gənīzd/ [L, *dis* + Gk, *organon,* organ], a subtype of schizophrenia characterized by an earlier age of onset, usually at puberty, and a more severe disintegration of the personality than occurs in other forms of the disease. The essential features include incoherence, loose associations, gross disorganization of behavior, and flat or inappropriate affect. See also **schizophrenia.**

disorient /disôr′ē·ənt/, to cause to lose awareness or perception of space, time, or personal identity and relationships.

disorientation /-ā′shən/ [L, *dis* + *orienter,* to proceed from], a state of mental confusion characterized by inadequate or incorrect perceptions of place, time, or identity. Disorientation may occur in organic mental disorders, in drug and alcohol intoxication, and, less commonly, after severe stress.

disparate twins /dis′pərāt, disper′it/, twins who are distinctly different from each other in weight and other features.

dispense /dispens′/ [L, *dis,* apart, *pensare,* to weigh], to prepare and issue medications or medication mixtures from a pharmaceutical outlet or department.

disperse /dispərs′/ [L, *dis* + *spargere* to scatter], to scatter the component parts, as of a tumor or of the fine particles in a colloid system; also the particles so scattered.

dispersing agent /dispur′sing/ [L, *dis* + *spargere,* to scatter, *agere,* to do], a chemical additive used in pharmaceutics to cause the even distribution of the ingredients throughout the product, such as in dermatological emulsions containing both oil and water. Dispersing agents commonly used in skin creams, lotions, and ointments include glyceryl monostearate, sodium lauryl sulfate, and polyethylene glycol derivatives. A dispersing agent may cause an allergic reaction or adverse effect in a hypersensitive person.

dispersion /dispur′shən/, the scattering or dissipation of finely divided material, as when particles of a substance are scattered throughout the volume of a fluid. Examples include colloids and gels, such as egg white, soap, and gelatin, which consist of large molecules or clumps of molecules that are able to attract and hold large numbers of water molecules.

dispersion forces. See **van der Waals forces.**

dispersion medium. See **continuous phase, medium.**

displaced fracture /displāst/ [Fr, *deplacement,* to remove], a traumatic bone break in which two ends of a fractured bone are separated and out of their normal positions. The ends may pierce surrounding skin, as in a compound fracture, or may be contained within the skin, as in a closed fracture.

100% displaced fracture. See **complete fracture.**

displaced testis [Fr, *deplacement* + L, *testis,* testicle], a testis that is located in the pelvis, inguinal canal, or elsewhere after it normally would have descended into the scrotum.

displacement /displās′mənt/ [Fr, *deplacement,* to remove], **1.** the state of being displaced or the act of displacing. **2.** (in chemistry) a reaction in which an atom, molecule, or radical is removed from combination and replaced by another. **3.** (in physics) the displacing in space of one mass by another, as when the weight or volume of a fluid is displaced by a floating or submerged body. **4.** (in psychiatry) an unconscious defense mechanism for avoiding emotional conflict and anxiety by transferring emotions, ideas, or wishes from one object to a substitute that is less anxiety-producing. Compare **sublimation.** See also **percolation.**

displacement chromatography. See **chromatography.**

display /displā′/, something presented for viewing, such as on a computer screen.

DISS, abbreviation for **Diameter-Index Safety System.**

dissect /disekt′/ [L, *dissecare,* to cut apart], **1.** to cut apart tissues for visual or microscopic study using a scalpel, a probe, or scissors. Compare **bisect. 2.** to tear away the intima of an artery, creating a false lumen that allows blood to flow into the wall of the artery. Branching vessels can be obstructed. An aortic dissection that spreads to the coronary arteries can cause sudden death. **—dissection,** *n.*

dissecting aneurysm [L, *dissecare,* to cut apart; Gk, *aneurysma,* a widening], a localized dilation of an artery, most commonly the aorta, characterized by a longitudinal separation of the outer and middle layers of the vascular wall. Aortic dissecting aneurysms occur most frequently in men between 40 and 60 years of age and are preceded by hypertension in more than 90% of cases. Blood entering a tear in the intimal lining of the vessel causes a separation of weakened elastic and fibromuscular elements in the medial layer and leads to the formation of cystic spaces filled with matrix. Dissecting aneurysms in the thoracic aorta may extend into blood vessels of the neck. Rupture of a dissecting aneurysm may be fatal in less than 1 hour. Treatment consists of resection and replacement of the excised section of aorta with a synthetic prosthesis. See also **aortic aneurysm.**

dissection. See **dissect.**

disseminated /disem′inā′tid/, dispersed or spread throughout, as in an organ or the whole body.

disseminated intravascular coagulation (DIC) [L, *dis* + *seminare,* to sow, *intra,* within, *vasculum,* little vessel, *coagulare,* to curdle], a grave coagulopathy resulting from the activation of clotting and anticlotting processes in response to disease or injury, such as septicemia, acute shock, poisonous snakebites, neoplasms, obstetric emergencies, severe trauma, extensive surgery, and hemorrhage. The primary disorder initiates generalized intravascular clotting, which in turn activates fibrinolytic mechanisms. As a result, the initial hypercoagulability is succeeded by a deficiency in clotting factors with coagulopathy and hemorrhaging. Also called **consumption coagulopathy, defibrination syndrome.**

■ OBSERVATIONS: Purpura on the lower extremities and abdomen, reflecting fibrin deposits in capillaries, is a common first sign of DIC. Hemorrhagic bullae, cyanosis of the extremities, and focal gangrene in the skin and mucous membranes may follow. Hemorrhages from incisions or catheter or injection sites, GI bleeding, hematuria, pulmonary edema, pulmonary embolism, progressive hypotension, tachycardia, absence of peripheral pulses, restlessness, convulsions, or coma may occur. Laboratory studies generally show a marked deficiency of blood platelets, low levels of fibrinogen and other clotting factors, prolonged prothrombin and partial thromboplastin times, and abnormal erythrocyte morphological characteristics.

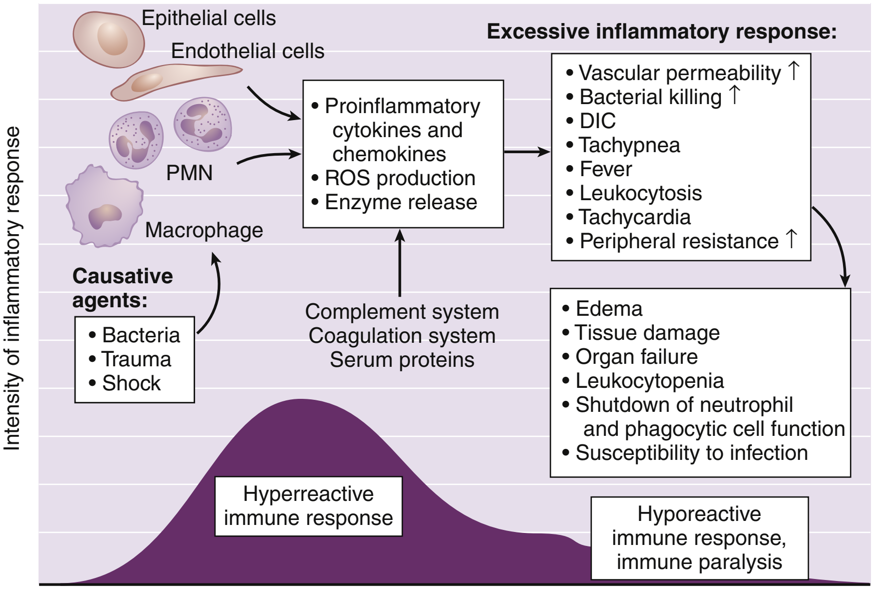
■ NURSING CONSIDERATIONS: The management of acute and chronic forms of disseminated intravascular coagulation (DIC) should primarily be directed at treatment of the underlying disorder. The care of a patient with life-threatening DIC requires careful monitoring, observation for evidence of bleeding, extremely gentle handling, maintenance of a safe environment, and emotional support.

disseminated myelitis, an inflammation of the spinal cord. Also called **diffuse myelitis.**

disseminated neuritis, inflammation of peripheral nerves, with pain, tenderness, and loss of function. Lesions may affect the parenchyma of peripheral sensory and motor tracts. The condition may be caused by alcohol, infectious agents, or exposure to heavy metals. Compare **multifocal motor neuropathy.**

dissent /disent′/ [L, *dis* + *sentire,* to feel], **1.** *v,* to differ in belief or opinion; to disagree. **2.** *n,* (in law) a statement written by a judge who disagrees with the decision of the majority of the court. The dissent states explicit reasons for the contrary opinion. **—***dissenting, adj.*

dissociation /disō′shē·ā′shən/ [L, *dis* + *sociare,* to unite], **1.** the act of separating into parts or sections. **2.** an unconscious defense mechanism by which an idea, thought, emotion, or other mental process is separated from the consciousness and thereby loses emotional significance. See also **dissociative disorder. —***dissociative* /disō'shē·ətiv/, *adj.*



Epithelial cells
Endothelial cells
PMN
Macrophage
Causative agents:
• Bacteria
• Trauma
• Shock
• Proinflammatory cytokines and chemokines
• ROS production
• Enzyme release
Complement system
Coagulation system
Serum proteins
Excessive inflammatory response:
• Vascular permeability ↑
• Bacterial killing ↑
• DIC
• Tachypnea
• Fever
• Leukocytosis
• Tachycardia
• Peripheral resistance ↑
• Edema
• Tissue damage
• Organ failure
• Leukocytopenia
• Shutdown of neutrophil and phagocytic cell function
• Susceptibility to infection
Hyperreactive immune response
Hyporeactive immune response, immune paralysis
Intensity of inflammatory response

Dynamic time-course of the inflammatory response during sepsis

Disseminated intravascular coagulation *(Walsh, 2009)*

dissociation syndrome, a loss of the ability to sense painful and thermal stimuli while retaining the sense of touch, tactile discrimination, and position sense. The disorder occurs in syringomyelia and may also result from spinal tract lesions.

dissociative anesthesia /disō′shē·ətiv/, a unique anesthesia characterized by analgesia and amnesia with minimal effect on respiratory function. The patient does not appear to be anesthetized and can swallow and open eyes but does not process information. This form of anesthesia may be used to provide analgesia during brief, superficial operative procedures or diagnostic processes. Ketamine hydrochloride is a phencyclidine derivative used to induce dissociative anesthesia. Ketamine is used for trauma patients with very unstable, low blood pressure or for elderly patients. Emergence may be accompanied by delirium, excitement, disorientation, and confusion.

dissociative disorder, a category of *DSM-IV* disorder in which emotional conflicts are so repressed that a separation or split in the personality occurs, resulting in an altered state of consciousness or a confusion in identity. Symptoms may include amnesia, somnambulism, fugue, dream state, and dissociative identity disorder. It is caused by an inability to cope with severe stress or conflict and usually occurs suddenly, after a situation catastrophic to the person. Treatment may include hypnosis, especially when amnesia is the primary symptom; psychotherapy; and use of antianxiety medication. Also called **dissociative reaction.** Compare **conversion disorder.** See also **dissociation.**

dissociative identity disorder, a psychiatric disorder characterized by the existence of two or more distinct, clearly differentiated personality structures within the same individual, any of which may dominate at a particular time. Each personality is a complex unit with separate well-developed emotional and thought processes, behavior patterns, and social relationships. The various subpersonalities are usually dramatically different and may or may not be aware of the existence of the others. Formerly called **multiple personality disorder.**

dissociative reaction. See **dissociative disorder.**

dissolution /dis′əlo͞o′shən/ [L, *dis* + *solvere,* to loosen], **1.** the separation of a complex chemical compound into simpler molecules. **2.** the dissolving of chemical substances into a homogenous solution. **3.** the loss of mental powers.

dissolve, to disperse the molecules or ions of one substance throughout the bulk of another substance.

dissolved gas /disolvd′/ [L, *dis* + *solvere,* to loosen], gas in a simple physical solution, as distinguished from gas that has reacted chemically with a solvent or other solutes and is chemically combined.

dissonance, the interference between sound waves of different pitches.

distal /dis′təl/ [L, *distare,* to be distant], **1.** away from or the farthest from a point of origin or attachment. **2.** away from or the farthest from the midline or a central point, as a distal phalanx. Compare **proximal.**

distal acinar emphysema, one of the principal types of emphysema, limited to the distal ends of the alveoli along the interlobular septa and beneath the pleura, forming bullae. Also called **interlobular emphysema, paraseptal emphysema.** See also **bullous emphysema.**

distal convoluted tubule. See **distal tubule.**

distal latency, (in electroneuromyography) the interval between the stimulation of a compound muscle and the observed response. Normal nerve conduction velocity is above 40 m/sec in the lower extremities and above 50 m/sec in the upper extremities, but age, muscle disease, temperature, and other factors can influence the velocity.

distal muscular dystrophy, a rare form of muscular dystrophy that usually affects adults. It is characterized by moderate weakness and by wasting that begins in the arms and legs and then extends gradually to the proximal and facial muscles. Also called **Gowers' muscular dystrophy.**

distal myopathy, an autosomal-dominant form of muscular dystrophy, appearing in two types. The first has onset in infancy, does not progress past adolescence, and is not incapacitating. The second has onset in adulthood and is called late distal hereditary myopathy. Also called **distal muscular dystrophy**.

distal part of prostatic urethra, the segment of the urethra that extends through the penis from the end of the membranous urethra to the navicular fossa.

distal phalanx, any one of the small distal bones in the third row of phalanges of the hand or the foot (second phalanx in the thumb and great toe). Each one at the end of the finger has a convex dorsal surface and a flat palmar surface, with a rough elevation at the end of the palmar surface that supports a fingernail and its sensitive pulp. The distal phalanx of each of the toes is smaller and more flattened than that of a finger; it also has a rough elevation to support the toenail and its pulp. Also called **ungual phalanx.**

distal radioulnar articulation, the pivotlike articulation of the head of the ulna and the ulnar notch on the lower end of the radius, involving two ligaments. The joint allows rotation of the distal end of the radius around an axis that passes through the center of the head of the ulna. Also called **inferior radioulnar joint.** Compare **proximal radioulnar articulation.**

distal renal tubular acidosis (RTA), an abnormal condition characterized by excessive acid accumulation and bicarbonate excretion. It is caused by the inability of the kidney's distal tubules to secrete hydrogen ions, thus decreasing the excretion of titratable acids and ammonium and increasing the urinary loss of potassium and bicarbonate. The condition may cause hypercalciuria and the formation of kidney stones. Treatment is the same as for renal tubular acidosis. **Primary distal RTA** occurs mostly in females, adolescents, older children, and young adults. It may occur sporadically or result from hereditary defects. **Secondary distal RTA** is associated with numerous disorders, such as cirrhosis of the liver, malnutrition, starvation, and various genetic abnormalities. Compare **proximal renal tubular acidosis.**

distal sparing, a condition in which the spinal cord remains intact below a lesion. The reflex arc remains but is not modified by supraspinal influences. As a result, spastic movements distal to the level of the lesion may occur.

distal tubule, the portion of the nephron lying between the nephric (Henle's) loop and the collecting duct in the kidney. Also called **distal convoluted tubule.**

distance regulation [L, *distantia* + *regula,* rule], behavior that is related to the control of personal space. Most humans establish a quantum of space between themselves and others that offers security from either psychological or physical threat while not creating a feeling of isolation. The amount of social distance thus maintained varies with different individuals and in different cultures. A wild animal generally maintains a flight distance, the minimum it will allow between itself and a potential enemy before fleeing. Animals of the same species also maintain a personal distance from each other.

distance vision, the ability to see objects clearly from a distance, usually from 20 feet (6 m) or more.

distemper /distem′pər/ [L, *dis,* apart, *temperare,* to regulate], **1.** any mental or physical disorder or indisposition.

2. a potentially fatal viral disease of animals, characterized by rhinitis, fever, and a loss of appetite.

distend /distend′/ [L, *distendere,* to stretch], to enlarge or dilate something.

distensibility /disten′sibil′itē/ [L, *distendere,* to stretch], the ability of something to become stretched, dilated, or enlarged.

distension /disten′shən/, the state of being distended or swollen. Also spelled *distention.*

distillate /distil′it/ [L, *distillare,* to drop down], the liquid vaporized, condensed, and collected in a distillation.

distillation /dis′tilā′shən/ [L, *distillare,* to drop down], the process of vaporization followed by condensation in another part of the system.

distilled water /distild′/ [L, *distillare,* to drop down; AS, *waeter*], water that has been purified by being heated to a vapor form and then condensed into another container as liquid water free of nonvolatile solutes.

distoclusion /dis′tə·kl͞oo′zhən/ [L, *distare,* to be distant + *occludere,* to close up], malocclusion in which the mandibular arch is in a posterior position in relation to the maxillary arch, generally considered identical with Class II in Angle's classification of malocclusion. Also called **disto-occlusion, posterior occlusion.** See also **Angle's Classification of Malocclusion (modified).**

distogingival /dis′tōjinjī′vəl/, pertaining to the surfaces of an anterior or a posterior tooth nearest the gum away from the midline and towards the back of the mouth.

distolabial /dis′tōlā′bē·əl/, pertaining to the surfaces of an anterior tooth away from the midline nearest the lips and toward the back of the mouth.

disto-occlusion. See **distoclusion.**

distorted thought self-control, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as self-restraint of disruptions in perception, thought processes, and thought content. See also **Nursing Outcomes Classification.**

distortion /distôr′shən/ [L, *dis* + *torquere,* to twist], **1.** (in psychology) the process of shifting experience in one's perceptions. Distortions represent personal constructs of truth, validity, and right and wrong. The distortions of patients tend to influence their views of the world and themselves, as by altering a negative perception to one more favorable. **2.** (in radiology) radiographic image artifacts that may be caused by variations in the size and shape or position of the object. Thick or curved objects cause greater distortion than thin, flat objects because of unequal magnification.

distoversion /dis′tō·vər′zhən/ [L, *distare,* to be distant + *vertere,* to turn], the position of a tooth that is farther than normal from the median line of the face along the dental arch. Compare **mesioversion.**

distractibility /distrak′tibil′itē/ [L, *dis* + *trahere,* to draw apart], a mental state in which attention does not remain fixed on any one subject but wavers or wanders.

distraction^{1} /distrak′shən/ [L, *dis* + *trahere,* to draw apart], **1.** a procedure that prevents or lessens the perception of pain by focusing attention on sensations unrelated to pain. **2.** a method of straightening a spinal column by the forces of axial tension pulling on the joint surfaces, such as applied by a Milwaukee brace.

distraction^{2}**,** a nursing intervention from the Nursing Interventions Classification (NIC) defined as purposeful focusing of attention away from undesirable sensations. See also **Nursing Interventions Classification.**

distraught /distrôt′/ [OFr, *destrait,* inattentive], pertaining to a mental state of confusion, distraction, or absentmindedness.

distress /distres′/ [ME, *distressen,* to cause sorrow], an emotional or physical state of pain, sorrow, misery, suffering, or discomfort.

distributed processing /distrib′yətid/ [L, *distribuere,* to distribute], a combination of local and remote computer terminals in a network connected to a central computer to divide the workload.

distributing artery, an artery with a tunica media composed of circularly arranged smooth muscle. It receives blood from conducting arteries and distributes the blood to organs and tissues. Also called **muscular artery.**

distribution, the location of medications in various organs and tissues after administration. The concentration of highly water-soluble drugs may be greater in persons who are elderly, dehydrated, or febrile because they have less total body water for dilution of the substance. As the lean muscle mass decreases and body fat increases, drugs that are distributed primarily in body fat have a more prolonged effect.

distributive analysis and synthesis /distrib′yətiv/, the system of psychotherapy used by the psychobiological school of psychiatry. It involves an extensive and systematic investigation and analysis of a person's total past experiences to discover the emotional factors underlying personality problems and ways they can be synthesized into constructive behavioral patterns.

distributive care, a pattern of health care that is concerned with environment, heredity, living conditions, life-style, and early detection of pathological effects. The system is usually directed to continuous care of persons not confined to hospitals or other health care facilities.

district [L, *distringere,* to compel], **1.** (in hospital nursing) a group of patients in an area of the unit, usually a subdivision of a ward, for whom a nurse manager or primary nurse is responsible. Patients are customarily assigned to a district on the basis of certain shared needs for nursing care. **2.** the area of a city or town assigned to a public health nurse.

district nurse. See **public health nursing.**

disulfiram /dīsul′firam/, an alcohol-use deterrent.

■ INDICATIONS: It is prescribed as a deterrent to drinking alcohol in the treatment of chronic alcoholism. It causes severe intestinal cramping, diaphoresis, and nausea and vomiting if alcohol is ingested. It requires that the patient explicitly know that, when combined with alcohol intake, death may occur.

■ CONTRAINDICATIONS: Alcoholic intoxication; recent or concomitant administration of metronidazole, paraldehyde, or alcohol; severe myocardial disease; coronary occlusion; psychosis; or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: The most serious adverse reactions, which include optic neuritis, psychotic reaction, and polyneuritis, result from alcohol ingestion. Drowsiness, headache, and skin rash may occur. This drug interacts with several other drugs, such as metronidazole and warfarin.

disuse phenomena /disyo͞os′/ [L, *dis* + *usus,* to make use of; Gk, *phainein,* to show], the physical and psychological changes, usually degenerative, that result from the lack of use of a body part or system. Disuse phenomena are associated with confinement and immobility, especially in orthopedics. Individuals treated for fractures and other orthopedic disorders must often be immobilized in traction for long periods. They are often deprived of sufficient interaction with the world around them and lose motivation, expectation, and even acquired abilities because of lack of practice. This disorientation is compounded by pain and therapeutic narcotic drugs commonly associated with the treatment of many illnesses and abnormal conditions. The physical changes often induced by continued bed rest constitute problems that affect many key areas and systems of the body, such as the skin, the musculoskeletal system, the GI tract, the cardiovascular system, and the respiratory system. Prolonged bed rest commonly subjects the patient's skin to abnormal pressure, moisture, and friction. Pressure exerted on the skin by the bed is slightly higher than capillary hydrostatic pressure and may cause collapse of the superficial capillaries and lead to ischemia and eventual tissue necrosis. A burning pain or absence of feeling may be the first sign of ischemia, followed by a rapid breakdown of the skin. Some indications of skin ischemia are redness, pain, edema, and skin breakdown. Unused muscles lose size and strength, often wasting until they are unable to perform their functions of support and contraction. Contractures are usually caused by flexion, because patients flex knees and hips whenever possible to relax muscles, especially when cold or in pain. The immobilized patient may experience bone demineralization caused by a restricted diet and decreased motility. Calcium and phosphorus are dependent on vitamin D for absorption from the gut and movement into the bones, and some nutrition experts describe calcium loss as a natural disuse phenomenon of bed rest. Muscle action is required to maintain blood flow to the bones, and the immobilized patient may not be capable of sufficient muscular activity to assure such blood flow, with its attendant delivery of critical nutrients and oxygen. The pooling of respiratory secretions is another disuse phenomenon caused by immobility and the horizontal position of the bed-rest patient. Some common therapeutic measures to deal with disuse phenomena are improvement of diet and nutrition, proper positioning and regular movement of the patient, meticulous hygiene, scrupulous skin care, and positive social interaction with the patient. Special alternating pressurized beds and range of motion machines for extremities may be used to improve circulation and muscle strength. See also **hypostatic pneumonia.**

Ditropan, a trademark for an antispasmodic **(oxybutynin chloride).**

Diucardin, a trademark for a diuretic **(hydroflumethiazide).**

Diupres, a trademark for a fixed-combination drug containing a diuretic **(chlorothiazide)** and an antihypertensive **(reserpine).**

diurese /dī′yo͝orēs/, the act of effecting diuresis.

diuresis /dī′yo͝orē′sis/ [Gk, *dia,* through, *ouron,* urine], increased formation and secretion of urine. Diuresis occurs in conditions such as diabetes mellitus, diabetes insipidus, and acute renal failure. It is normal in the first 48 hours after giving birth. Coffee, tea, certain foods, diuretic drugs, anxiety, fear, and some steroids cause diuresis. Water is considered the least expensive diuretic.

diuresis renography, the administration to a well-hydrated patient with an empty bladder of a radiopharmaceutical agent and 20 minutes later a diuretic, such as furosemide. The pattern of washout of the radiopharmaceutical is monitored to assess first the functioning of the collecting system and then the transport capacity of the upper urinary tract.

diuretic /dī′yo͝oret′ik/, **1.** *adj,* (of a drug or other substance) tending to promote the formation and excretion of urine. **2.** *n,* a drug that promotes the formation and excretion of urine. The more than 50 diuretic drugs available in the United States and Canada are classified by chemical structure and pharmacological activity into groups: carbonic anhydrase inhibitors, loop diuretics, mercurials, osmotics, potassium-sparing diuretics, and thiazides. A diuretic medication may contain drugs from one or more of these groups. Diuretics are prescribed to reduce the volume of extracellular fluid in the treatment of many disorders, including hypertension, congestive heart failure, and edema. The specific drug to be prescribed is selected according to the action desired and the patient's physical status. Hypersensitivity to sulfonamides prohibits use of many diuretic drugs, and diabetes mellitus may be aggravated by thiazide medications. Thus the presence of a particular condition may prohibit the use of a particular agent. Several adverse reactions, including hypovolemia and electrolyte imbalance, are common to all diuretics. Mercurial diuretics are rarely used because of their nephrotoxicity, and carbonic anhydrase inhibitors have only weak diuretic activity.

diuretic ceiling effect, the effect of possible increased drug toxicity without additional clinical benefit with the administration of more than a certain amount of diuretic drugs in a 24-hour period. Different diuretic drugs have different ceilings.

Diuril, a trademark for a thiazide diuretic **(chlorothiazide).**

diurnal /dīyo͞or′nəl/ [L, *diurnalis,* of a day], happening daily, as sleeping and eating.

diurnal enuresis [L, *diurnalis,* of a day; Gk, *enourein,* to urinate], involuntary voiding of urine during daylight hours.

diurnal mood variation, a change in mood that is related to the time of day. Examples are commonly found in differences between "night people" and "morning people."

diurnal rhythm [L, *diurnalis,* of a day; Gk, *rhythmos*], patterns of activity or behavior that follow day-night cycles, such as breakfast-lunch-dinner schedules.

diurnal variation, **1.** the variability of output or excretion of a substance during the day versus the night or over a 12-hour interval. **2.** expected high and low levels of a substance during a 24-hour period. For example, blood cortisol is highest in the morning and lowest in the early evening.

divalent, (in chemistry) an atom with two additional or two missing electrons producing a dianion (e.g. O2-) or a dication (Ca2+), respectively. See **valence.**

divalproex sodium, an anticonvulsant drug used to treat epilepsy and seizures, controlling simple and complex absence seizures alone or in combination with other anticonvulsant drugs. It is also approved for the treatment of migraines.

■ INDICATIONS: It is prescribed to prevent or reduce the number of seizures by decreasing the activity of nerve impulses in the brain and central nervous system. It is converted to valproic acid in the body.

■ CONTRAINDICATIONS: It should not be given to patients with an allergy to valproic acid, sodium valproate, or divalproex or to those with liver disease.

■ ADVERSE EFFECTS: The side effects most often reported include changes in appetite, nausea, vomiting, stomach cramps, diarrhea, constipation, weakness, tiredness, clumsiness, drowsiness, or behavioral changes.

divergence /divur′jəns/ [L, *di* + *vergere,* to incline], a separation or movement of objects away from each other, as in the simultaneous turning of the eyes outward as a result of an extraocular muscle defect.

divergent dislocation /divur′jənt/, the temporary displacement of two bones, such as the radius and ulna.

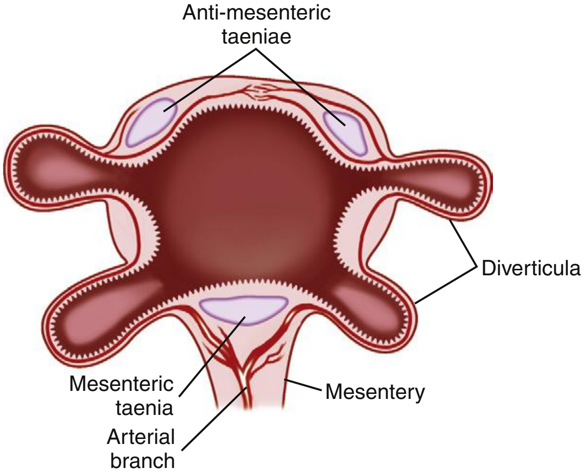
divergent squint. See **exotropia.**

divergent strabismus. See **exotropia.**

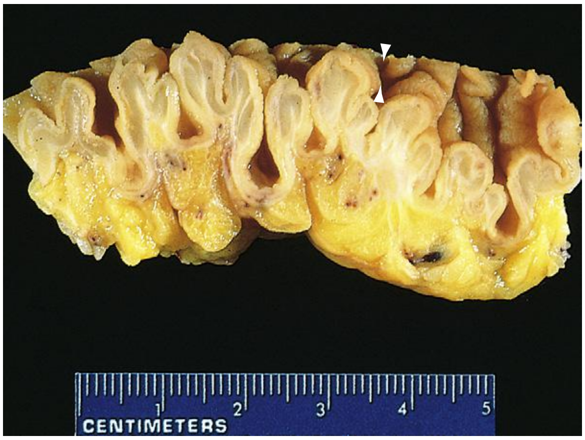
diverging lens, concave lens.

diver's palsy, diver's paralysis. See **decompression sickness.**

diverticula, diverticular. See **diverticulum.**



Colonic diverticula *(Feldman, Friedman, and Brandt, 2010)*



Diverticulosis *(Kumar et al, 2007)*

diverticular disease. See **diverticulitis, diverticulosis.**

diverticular hernia /dīvurtik′yo͝olər/, the protrusion of a congenital intestinal diverticulum through an opening in the abdominal cavity.

diverticulectomy /dī′vurtik′yo͝olek′təmē/, surgical removal of a diverticulum.

diverticulitis /dī′vurtik′yo͝olī′tis/ [L, *diverticulare,* to turn aside; Gk, *itis,* inflammation], inflammation of one or more diverticula. The penetration of fecal matter through the thin-walled diverticula causes inflammation and abscess formation in the tissues surrounding the colon. With repeated inflammation the lumen of the colon narrows and may become obstructed. During periods of inflammation the patient experiences crampy pain, particularly over the sigmoid colon; fever; and leukocytosis. Barium enemas and proctoscopy are used to rule out carcinoma of the colon, which exhibits some of the same symptoms. Conservative treatment includes bed rest, IV fluids, antibiotics, and abstaining from eating and drinking. In acute cases bowel resection of the affected part greatly reduces mortality and morbidity rates. Compare **diverticulosis.**

diverticulosis /dī′vurtik′yo͝olō′sis/ [L, *diverticulare,* to turn aside; Gk, *osis,* condition], the presence of pouchlike herniations through the muscular layer of the colon, particularly the sigmoid colon. Diverticulosis affects increasing numbers of people over 50 years of age and may be the result of the modern highly refined low-residue diet. Most patients with this condition have few symptoms except occasional bleeding from the rectum. Other reasons for bleeding, such as hemorrhoids, carcinoma, and inflammatory bowel disease, must be ruled out. Barium enemas and proctoscopic examination are used in establishing diagnosis. An increase in dietary fiber intake can aid in propelling the feces through the colon. Avoidance of foods with seeds and nuts decreases the risk of fecal material lodging in the diverticula. Hemorrhage from bleeding diverticula can become quite severe, and the patient may require surgery. Diverticulosis may lead to diverticulitis. See also **diverticulitis.**

diverticulum /dī′vurtik′yo͝oləm/ *pl.* **diverticula** [L, *diverticulare,* to turn aside], a pouchlike herniation through the muscular wall of a tubular organ. A diverticulum may be present in the stomach, the small intestine, or, most commonly, the colon. It is typically detected by radiography after the ingestion of a radiopaque substance. See also **diverticulitis, diverticulosis, Meckel's diverticulum. —diverticular,** *adj.*

divided dose, a measured fraction of a full dose of a medication, given at short intervals so that the full dose is eventually taken within a specified period.

diving, the act of work or recreation in an underwater environment. The main health effects are related to the increased pressure to which the person is subjected as the ambient pressure generally increases by 1 atm (14.7 pounds per square inch) for each 33 feet of descent below the water surface. Conditions that warrant caution about diving include obesity, diabetes, alcoholism, epilepsy, drug abuse, and respiratory disorders, including allergic rhinitis. See also **decompression sickness, diving reflex.**

diving goiter [AS, *dyypan,* to dip; L, *guttur,* throat], a large movable thyroid goiter located at times above the sternal notch and at other times below the notch. Also called **plunging goiter, wandering goiter.**

diving reflex, a neural mechanism that produces an automatic change in the cardiovascular system when the face and nose are immersed in cold water. The heart rate decreases and the blood pressure remains stable or increases slightly, while blood flow to all parts of the body except the brain is reduced, thereby helping the body to conserve oxygen. The reflex occurs in humans and other mammals. It is sometimes used in the treatment of paroxysmal tachycardias. The reflex extends the duration of the viability of brain cells during apnea beyond the usual period of 5 to 10 minutes. For this reason, cardiopulmonary resuscitation should always be attempted in drowning victims regardless of their time under water.

division [L, *dividere,* to divide], **1.** an administrative subunit in a hospital, such as a division of medical nursing or a division of surgical nursing. **2.** (in public health nursing) an area that encompasses several geographic districts. **3.** the separation of something into two or more parts or sections, such as **cell division.**

divorce therapy, a type of counseling that attempts to help divorced couples disengage from their former relationship and malicious behavior toward each other or their children.

Dix, Dorothea Lynde, an American humanitarian who achieved fame as a social reformer, primarily for her work in improving prison conditions and care of the mentally ill. During her lifetime she helped to establish mental institutions in 30 states and in Canada. During the U.S. Civil War she was appointed superintendent of army nurses for government hospitals.

Dix-Hallpike test /hôl′pīk/, a method for evaluating the function of the vestibule of the ear in patients with vertigo or hearing loss. The patient's position is quickly changed from sitting to lying down with the neck hyperextended, and then returned to sitting. Nystagmus can then be evaluated, and specific disorders of the vestibule may be diagnosed. See also **caloric test, electronystagmography, nystagmus.**

dizygotic /dī′zīgot′ik/ [Gk, *di,* twice, *zygotos,* yolked together], pertaining to twins from two fertilized ova. Compare **monozygotic.** See also **twinning.**

dizygotic twins, two offspring born of the same pregnancy and developed from two ova that were released from the ovary simultaneously and fertilized at the same time. They may be of the same or opposite sex, differ both physically and genetically, and have two separate and distinct placentas and membranes, both amnion and chorion. The frequency of dizygotic twinning varies according to ethnic origin (the highest incidence occurs in African-Americans, the lowest in Asian-Americans, with Caucasians intermediate), maternal age (the highest rate occurs when the mother is 35 to 39 years of age), and heredity (showing an increase in the female genetic line rather than the male, although fathers may transmit the disposition to double ovulation to their daughters). In general the overall ratio is two thirds dizygotic twinning to one third monozygotic. Also called **binovular twins,** *dissimilar twins,* **false twins, fraternal twins, heterologous twins.**

dizziness [AS, *dysig,* stupid], a sensation of faintness and whirling or an inability to maintain normal balance in a standing or seated position, sometimes associated with giddiness, mental confusion, nausea, and weakness. Sometimes the room seems to spin, sometimes the individual (a sensation known as vertigo). A person who experiences dizziness should be carefully lowered to a safe position on a bed, chair, or floor because of the danger of injury from falling. Compare **syncope.**

DKA, abbreviation for **diabetic ketoacidosis.**

dL, abbreviation for **deciliter.**

DLE, abbreviation for **discoid lupus erythematosus.**

DLEK, abbreviation for **deep lamellar endothelial keratoplasty.**

D log E curve. See **characteristic curve.**

DM, abbreviation for **diabetes mellitus.**

DMARD, abbreviation for **disease-modifying antirheumatic drug.**

D.M.D., abbreviation for *Doctor of Dental Medicine*. It is equivalent to a **D.D.S.** degree.

DMSO, abbreviation for **dimethyl sulfoxide.**

DNA, abbreviation for **deoxyribonucleic acid.**

DNA amplification, artificial increase in the number of copies of a particular DNA fragment into millions of copies through replication of the segment into which it has been cloned, a type of nucleic acid amplification.

DNA blotting, the transfer of separated DNA fragments from an electrophoretic gel to a nitrocellulose. Also called Southern blotting.

DNA chimera /kīmē′rə/, a recombinant molecule of DNA composed of segments from more than one source.

DNA-DNA hybridization, the formation of double-helical DNA from two complementary single strands. It is used to compare genome relationships between different species.

DNA fingerprint, the highly specific hybridization pattern generated by tandem repeats and other patterns of the DNA in an individual's genome.

DNA fingerprinting, a technique for comparing the nucleotide sequences of fragments of DNA from different sources. The fragments are obtained by treating the DNA with various endonucleases, enzymes that break DNA strands at specific sites. There is a chance of 1 in 30 billion that two persons who are not monozygotic twins would have identical DNA fingerprints. To resolve the complexities of the process, short, tandemly repeated, highly specific "minisatellite" genomic sequences are used. A wild-type M13 bacteriophage that identifies the differences is confined to two clusters of 15-base-pair repeats in the protein III gene of the bacteriophage. The specificity of the probe makes it applicable to questions of forensic science.

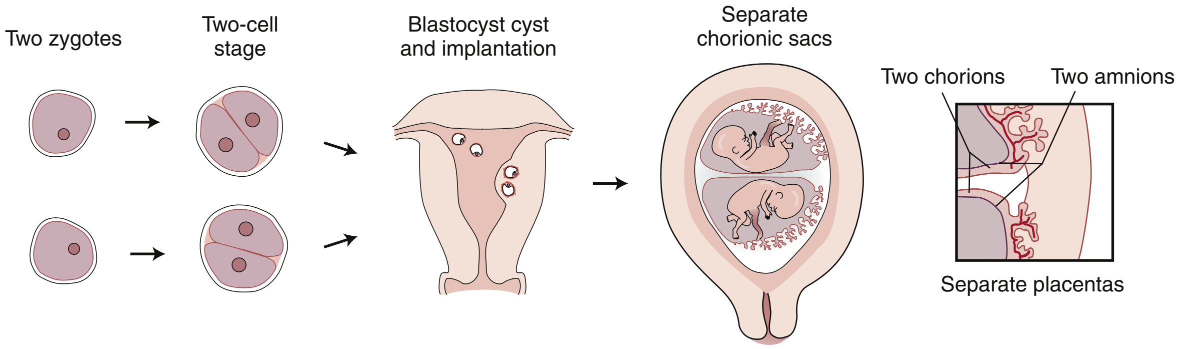
DNA gyrase, an enzyme that nicks and seals the DNA and relieves supercoiling.

DNA helicase, an enzyme that catalyzes the energy-dependent unwinding of the DNA double helix during DNA replication.

DNA library, a collection of DNA fragments of one organism, each carried by a plasmid or virus and cloned in an appropriate host. A DNA probe is used to locate a specific DNA sequence in the library. A collection representing the entire genome is called a genomic library. An assortment of DNA copies of messenger RNA produced by a cell is known as a complimentary DNA (cDNA) library. Also called **gene library.** See also **DNA probe.**

DNA ligase, an enzyme that can repair breaks in a strand of deoxyribonucleic acid (DNA) by synthesizing a bond between adjoining nucleotides. Under some circumstances the enzyme can join together loose ends of DNA strands, and in some cases it can repair breaks in ribonucleic acid (RNA). It serves as a catalyst.

DNA polymerase, (in molecular genetics) an enzyme that catalyzes the assembly of deoxyribonucleoside triphosphates into deoxyribonucleic acid, with single-stranded DNA



Development of dizygotic twins *(Hagen-Ansert, 2006)* serving as the template. The enzyme is often found in tumor cells. Also called *DNA nucleotidyltransferase*.

DNA probe, a labeled segment of DNA or RNA used to find a specific sequence of nucleotides in a DNA molecule. Probes may be synthesized in the laboratory, with a sequence complementary to the target DNA sequence.

DNAR, abbreviation for **do not attempt resuscitation.**

DNCB, abbreviation for **2,4-dinitrochlorobenzene.**

DNP, abbreviation for **2,4-dinitrophenol** or *2, 4-dinitrophenyl*.

DNR, abbreviation for **do not resuscitate.** See **no code.**

D.O., abbreviation for *Doctor of Osteopathy*.

DOA, abbreviation for *dead on arrival*.

Dobie's globule /dō′bēz/ [William M. Dobie, English physician, 1828–1915], a very small stainable body in the transparent disk of a striated muscle fiber.

DOBUTamine hydrochloride /dōbyo͞o′təmēn/, a beta-adrenergic stimulating agent, acting primarily on beta-1 receptors.

■ INDICATIONS: It is prescribed to increase cardiac output in severe chronic congestive heart failure and to provide adjunct in cardiac surgery.

■ CONTRAINDICATIONS: Idiopathic hypertrophic subaortic stenosis or known hypersensitivity to this drug prohibits its use. It is not recommended for use in pregnancy.

■ ADVERSE EFFECTS: Among the most serious adverse reactions are cardiovascular effects, including tachycardia, hypertension, arrhythmias, and precipitation of angina. Nausea, vomiting, and headache may also occur.

Dobutrex, a trademark for a synthetic catecholamine **(DOBUTamine hydrochloride),** which stimulates beta-adrenergic receptors. It has many drug interactions.

Dock, Lavinia Lloyd, an American public health nurse. A graduate of the Bellevue Hospital Training School for Nurses in New York in 1886, she started a visiting nurse service in Norwalk, Connecticut. She then joined the New York City Mission before becoming an assistant to Isabel Hampton Robb at Johns Hopkins Hospital in Baltimore. She returned to public health nursing when she joined the Henry Street Settlement in New York to work with Lillian Wald. She advocated an international public health movement and the improvement of education for nurses. With M. Adelaide Nutting, she wrote *History of Nursing,* a classic in nursing literature.

docosanol /doko′sänol/, an antiviral agent effective against activity viruses with a lipid envelope, including herpes simplex virus. It is used topically in the treatment of recurrent herpes labialis.

doctoral program in nursing, an educational program that offers preparation for a doctoral degree in the field of nursing designed to prepare nurses for advanced practice, academia, and research. On satisfactory completion of the course of study, the Ph.D. with a major in nursing, D.N.Sc. (Doctor of Nursing Science), or D.S.N. (Doctor of Science in Nursing) degree is awarded.

Doctor of Medicine, Doctor of Osteopathy. See **physician.**

documentation¹ /dok′yəmentā′shən/ [L, *documentum,* proof], written material associated with a computer or a program. Kinds of documentation include **user documentation,** an instruction manual that provides enough information to allow an individual to use the system; **system documentation,** a complete description of the hardware and software that make up a system; and **program documentation,** a general and specific description of what a program does and how it does it.

documentation², a nursing intervention from the Nursing Interventions Classification (NIC) defined as recording of pertinent patient data in a clinical record. See also **Nursing Interventions Classification.**

docusate /dok′yo͞osāt/, a stool softener. Also called **dioctyl calcium sulfosuccinate, dioctyl potassium sulfosuccinate, dioctyl sodium sulfosuccinate.**

■ INDICATION: It is prescribed in the treatment of constipation.

■ CONTRAINDICATIONS: Signs or symptoms of appendicitis, concomitant administration of mineral oil, or known hypersensitivity to the drug prohibits its use.

■ ADVERSE EFFECTS: No serious adverse reactions are known.

Dodd, Marylin J., a nursing theorist who, with Carolyn L. Wiener, developed the Theory of Illness Trajectory, which involves not only the patient but the family and caregivers. The theory helps elucidate how patients and families tolerate the states of uncertainty caused by the illness and manage the illness.

Döderlein's bacillus /dā′dərlīnz, dō′dərlēnz/ [Albert S. Döderlein, German physician, 1860–1941], a gram-positive bacterium present in normal vaginal secretions.

dofetilide, a class III antidysrhythmic.

■ INDICATIONS: It is used to treat atrial fibrillation and flutter.

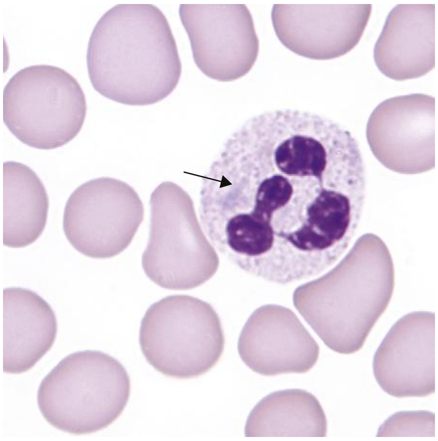
■ CONTRAINDICATIONS: Known hypersensitivity to this drug, digitalis toxicity, aortic stenosis, pulmonary hypertension, QT syndromes, and severe renal disease prohibit its use. It is also contraindicated in children.

■ ADVERSE EFFECTS: Serious adverse effects include severe diarrhea, anorexia, angina, premature ventricular contractions, substernal pressure, transient hypertension, and precipitation of angina. Common side effects include syncope, dizziness, nausea, vomiting, hypotension, postural hypotension, and bradycardia.

doff /dôf/ [ME, contraction of *do off,* take off], to take off (clothing).

Döhle-Heller disease. See **syphilitic aortitis.**

Döhle's inclusion bodies /dā′les, dōls/ [Karl G.P. Döhle, German pathologist, 1855–1928], blue inclusions in the cytoplasm of some leukocytes in May-Hegglin anomaly and in blood smears from patients with acute viral infections.



Döhle's bodies *(Carr and Rodak, 2008)*

dolasetron, an antiemetic.

■ INDICATIONS: It is used to prevent the nausea and vomiting associated with cancer chemotherapy and radiotherapy, and to prevent postoperative nausea and vomiting.

■ CONTRAINDICATION: Known hypersensitivity prohibits its use.

■ ADVERSE EFFECTS: Bronchospasm and arrhythmias are life-threatening effects of this drug. Other adverse reactions include constipation, increased AST and ALT, abdominal pain, anorexia, dizziness, fatigue, drowsiness, rash, urinary retention, oliguria, electrocardiogram changes, hypotension, tachycardia, and hypertension. Common side effects include diarrhea and headache.

Dolene, a trademark for an analgesic **(propoxyphene hydrochloride).**

dolicho-, prefix meaning "long": *dolichocephaly, dolichocolon, dolichomorphic.*

dolichocephaly. See **scaphocephaly.**

doll's-eye reflex, a normal response in newborns to keep the eyes stationary as the head is moved to the right or left. The reflex disappears as ocular fixation develops. It is also evaluated in comatose children for assessment of cranial nerve (III, IV, VI) function.

doll's head maneuver, a test for central nervous system brainstem damage in a comatose patient. The head is quickly rotated from side to side. Normally the eyes deviate to the opposite direction. Failure of the eyes to make the movement is an indication of severe brainstem damage.

Dolobid, a trademark for a nonsteroidal antiinflammatory agent **(diflunisal).**

Dolophine Hydrochloride, a trademark for an opioid agonist analgesic **(methadone hydrochloride).**

dolor /dō′lôr/ [L, pain], any condition of physical pain, mental anguish, or suffering from heat. It is one of the four signs of inflammation. The others are calor (heat), rubor (redness), and tumor (swelling).

DOM, abbreviation for **dimethoxymethylamphetamine.**

domain, a region of a protein or polypeptide whose three-dimensional configuration enables it to interact specifically with particular receptors, enzymes, or other proteins.

dome fracture [L, *domus,* house, *fractura,* break], a break in the acetabulum, specifically one involving a weight-bearing surface.

dome of pleura. See **cervical pleura.**

domestic abuse, abuse or violence commonly describing spouse or partner abuse, including physical and/or sexual violence (use of physical force) or threats of such violence or psychological and/or emotional abuse and/or coercive tactics. Also called **intimate partner violence.**

■ OBSERVATIONS: The individual may have no obvious signs of physical injury, but may present with vague complaints, such as sleep and appetite disturbances, fatigue, dizziness, weight change, and symptoms associated with depression, anxiety, or posttraumatic stress. Illnesses, such as gastrointestinal and autoimmune disorders, have also been associated with abuse. Women also seek help for problems that are seemingly unrelated to abuse (e.g., a blood pressure check, a routine physical, treatment of allergies, or an upper respiratory infection). Physical abuse signs include bruising (face, neck, arms, legs, abdomen, or back), cuts, broken bones, black eyes, burns, marks of strangulation, wounds or bruises at different stages of healing, and swelling or puffiness in the face or around the eyes. Other signs include a history that does not match the presenting injuries and reports of being hit or injured. Signs of sexual abuse include bruising around the breasts or genitalia; genitalia, vaginal, or rectal swelling or lacerations; torn, stained, or bloody underclothing; and reports of being assaulted or raped. Manifestations of emotional abuse include reports of intimidation (such as looks, gestures, yelling, and throwing objects), threats to harm children, isolation from family and friends, and economic domination. The Abuse Assessment Screen is used for initial screening and is used for all high-risk individuals. Further definitive diagnosis is typically made by social service, health care, and legal experts after a more detailed history, investigation, and physical examination. Severe injury, disfigurement, and death are all complications of chronic and/or severe physical abuse.

■ INTERVENTIONS: Obvious signs of abuse should be reported immediately to appropriate local authorities for prompt investigation and victim protection. If the individual is perceived to be in immediate danger, protection should be sought through local Adult Protective Services or county Department of Social Services. Vague or inconsistent manifestations should be documented and referred for further evaluation and investigation.

■ NURSING CONSIDERATIONS: Nurses serve as a frontline resource for the detection, intervention, and prevention of domestic abuse. This includes the identification of high-risk dependent domestic relationships, such as previous history of abuse or violence, feelings of worthlessness, inability to trust, high index of suspicion, substance abuse, depression, social isolation, financial dependence, poverty, homelessness, unemployment, intense family responsibilities, and inappropriate or fearful interaction patterns with spouse. The nurse needs to do a thorough assessment for signs of physical, emotional, or sexual abuse. All evidence should be carefully documented and reported to appropriate sources. The nurse is also instrumental in helping the victim to establish a "safety plan" for escape. Referrals for counseling to prevent or halt abuse and placement for safe haven are needed. Social agency referrals should be made for financial assistance, food, clothing, and shelter needs. Prevention activities center on raising individual and community awareness through education about the incidence and causes of domestic violence, provision of empowerment and assertiveness training, and screening of all women ages 14 and older as required of all health care settings by The Family Violence Prevention Fund and The Joint Commission on Healthcare.

dominance /dom′inəns/ [L, *dominari,* to rule], the property of an allele in which the allele is fully expressed in the phenotype, even when only one copy of the allele is present. See also **autosomal-dominant inheritance, recessive allele, segregation. —dominant,** *adj.*

dominant /dom′inənt/ [L, *dominari,* to rule], **1.** exerting a ruling or controlling influence. **2.** in genetics, capable of expression when carried by only one of a pair of homologous chromosomes. **3.** in coronary artery anatomy, supplying the posterior diaphragmatic part of the interventricular septum and the diaphragmatic surface of the left ventricle; said of the right and left coronary arteries.

dominant allele [L, *dominari,* to rule; Gk, *genein* to produce], one of two or more alternative forms of a gene that is fully expressed in a heterozygote. Compare **recessive allele.**

dominant eye /dom′inənt/, the eye that is customarily used for monocular tasks. It may or may not be related to hand preference.

dominant group, a social group that controls the value system and rewards in a particular society.

dominant idiotype, a segment of an immunoglobulin molecule that is present on a large proportion of the immunoglobulins generated in response to a particular antigen. See also **idiotype.**

dominant trait, an inherited characteristic that is determined by a dominant allele. Polydactyly is an example of a dominant trait; individuals with either one or two copies of the polydactyly allele have extra fingers or toes.

don /don/ [ME, contraction of *do on,* put on], to put on (clothing).

Donath-Landsteiner syndrome /dō′not land′stīnər/ [Julius Donath, Austrian physician, 1870–1960; Karl Landsteiner, Austrian-American pathologist, 1868–1943], a rare blood disorder marked by hemolysis minutes or hours after exposure to cold. Systemic symptoms include the passage of dark urine, severe pain in the back and legs, headache, vomiting, diarrhea, and moderate reticulocytosis. Temporary hepatosplenomegaly and mild hyperbilirubinemia may follow the onset of an attack. The condition may occur with congenital or acquired syphilis, in which case antisyphilitic treatment is used. Also called **paroxysmal cold hemoglobinuria.**

donation /dōna′shun/, **1.** a gift. **2.** the act of giving.

Done nomogram, a graph on which a number of variables are plotted so that the value of a dependent variable can be read on the appropriate line when the values of the other variables are given.

donepezil, a reversible cholinesterase.

■ INDICATION: It is used to treat mild to moderate dementia in Alzheimer's disease.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to piperidine derivatives prohibits its use.

■ ADVERSE EFFECTS: Life-threatening effects include seizures and atrial fibrillation. Other adverse effects are dizziness, somnolence, fatigue, abnormal dreams, syncope, hypotension or hypertension, anorexia, urinary frequency, urinary tract infection, incontinence, rash, flushing, rhinitis, upper respiratory infection, cough, pharyngitis, cramps, and arthritis. Common side effects include insomnia, headache, nausea, vomiting, and diarrhea.

dong quai, a perennial herb found in Japan, China, and Korea.

■ USES: It is used to restore vitality in tired women; for a variety of gynecological, menstrual, and menopausal symptoms; and to treat cirrhosis of the liver. Current research suggests it is ineffective for treating menopausal symptoms, and there are insufficient data to gauge its effectiveness for other indications.

■ CONTRAINDICATIONS: It should not be used during pregnancy, in children, or in those with known hypersensitivity. It is contraindicated in people with bleeding disorders, excessive menstrual flow, or acute illness.

Don Juan, a legendary Spanish libertine cited in many works of literature as a seductive and sexually promiscuous man. See also **satyriasis.**

Donnatal, a trademark for a GI fixed-combination drug containing a sedative **(phenobarbital)** and three anticholinergics (hyoscyamine sulfate, **atropine sulfate,** and **hyoscine hydrobromide),** used to decrease the motility of the GI tract.

Donohue's syndrome. See **leprechaunism.**

donor /dō′nər/ [L, *donare,* to give], **1.** a human or other organism that gives living tissue to be used in another body, for example, blood for transfusion or a kidney for transplantation. **2.** a substance or compound that gives part of itself to another substance. Compare **acceptor.** See also **universal donor.**

donor card [L, *donare,* to give, *charta*], a document in which a person offers to make an anatomical gift of body parts, at the time of death, for transplantation to recipients needing replacement of vital organs or tissues. The information can also be found on a state driver's license. Consent for organ donation generally requires consent from family of the organ donor.

do not attempt resuscitation (DNAR), an advisory that resuscitation of a patient should not even be attempted. The order is more strictly defined than the **DNR** (do not resuscitate), which may be interpreted as authorizing an attempt at resuscitation.

do not resuscitate (DNR), a legal directive indicating that the patient should not receive CPR in the event of a cardiac arrest. See **no code.**

Donovan bodies /don′əvan/ [Charles Donovan, Irish physician, 1863–1951], encapsulated gram-negative rods of the species *Calymmatobacterium granulomatis,* present in the cytoplasm of mononuclear phagocytes obtained from the lesions of granuloma inguinale. They may be seen under the microscope in a Wright-stained smear of infected tissue. See also **granuloma inguinale.**

Donovanosis. See **granuloma inguinale.**

donut pad /dō′nut/, a pad designed to protect an injured joint. Cut to fit over the site of the injury, it causes the force on the body part to be transferred to surrounding areas. It is most effective for protecting small areas, such as heels or elbows.

DOOR syndrome, a rare syndrome of congenital *d*eafness, *o*nycho-*o*steodystrophy, and mental *r*etardation, existing in autosomal-dominant and -recessive forms.

dopa /dō′pə/, an amino acid, produced by oxidation of tyrosine, that occurs naturally in plants and animals. It is a precursor of dopamine, epinephrine, norepinephrine, and melanin. See also **dopamine hydrochloride, levodopa.**

dopamine /dō′pəmin/, a naturally occurring sympathetic nervous system neurotransmitter that is the precursor of norepinephrine. It is produced in the substantia nigra and transmitted to the putamen and caudate nucleus. It has an inhibitory effect on movement. A depletion of dopamine produces the symptoms of rigidity, tremors, and bradykinesia that are characteristic of Parkinson's disease. It is available as an intravenously injectable drug. Dopamine has potent dopaminergic, beta-adrenergic, and alpha-adrenergic receptor activity. See also **dopamine hydrochloride.**

dopamine hydrochloride, a sympathomimetic catecholamine. Lower doses preferentially stimulate peripheral dopamine receptors to cause primarily renal mesenteric vasodilation while higher doses also stimulate beta-1 and alpha adrenergic receptors and act to increase blood pressure.

■ INDICATIONS: It is prescribed in the treatment of shock, hypotension, and low cardiac output to reduce the risk of renal failure.

■ CONTRAINDICATIONS: Pheochromocytoma, tachyarrhythmias, ventricular fibrillation, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are arrhythmias, hypotension, hypertension, and tachycardia. These adverse reactions can be potentiated if DOPamine is used concurrently with other drugs such as beta blockers, MAO inhibitors, tricyclic antidepressants, or cocaine.

dopaminergic /dō′pəminur′jik/, having the effect of dopamine.

dopaminergic receptor, a protein on the surfaces of certain cells that binds specifically to the neurotransmitter dopamine. Such receptors on vascular epithelial cells, when stimulated by dopamine, cause the renal mesenteric, coronary, and cerebral arteries to dilate and the flow of blood to increase.

dopant /do′pant/, an impurity purposely added, as to a laser crystal or a semiconductor, during manufacturing to create a desired characteristic.

dope [AS, *dyppan,* to dip], *slang,* morphine, heroin, or another opioid; marijuana; or another substance illicitly bought or sold and often self-administered for sedative, hypnotic, euphoric, or other mood-altering purposes.

doped /dōpt/, having impurities (dopants) added purposely during manufacturing.

Doppler color flow /dop′lər/ [Christian J. Doppler, Austrian physicist and mathematician, 1803–1853], an ultrasonic technique for detecting anatomical details by color coding of velocity shifts. In cardiography blood flowing in one direction appears red, and blood flowing in the opposite direction appears blue. The technique can also indicate the velocity of red blood corpuscles moving through the circulatory system, which makes it possible to quantify the flow, measure the pressures within the heart chambers, and calculate the stroke volume. In laparoscopy, Doppler color flow allows for rapid identification and differentiation of ducts and valves in the viscera, particularly in detection and diagnosis of pancreatic and liver tumors and colorectal liver metastases. See also **Doppler ultrasonography.**

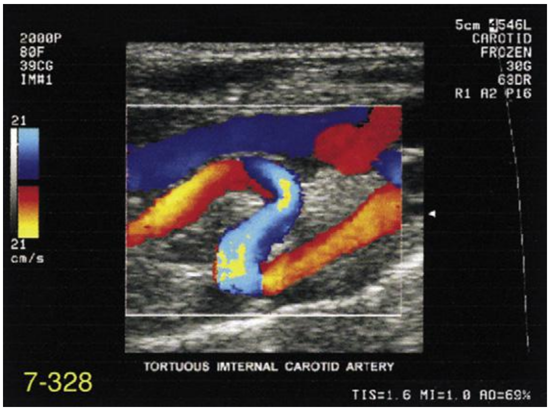


Image produced by Doppler color flow *(Hagen-Ansert, 2006)*

Doppler echocardiography [Christian J. Doppler], a technique in which Doppler ultrasonography is used to evaluate the direction and pattern of blood flow within the heart.

Doppler effect [Christian J. Doppler; L, *effectus*], the apparent change in frequency of sound or light waves emitted by a source as it moves away from or toward an observer. The frequency increases as the source moves toward the observer and decreases as it moves away, as the rising pitch of the whistle of an approaching train and the falling pitch of a departing train. The Doppler effect is also observed in electromagnetic radiation, such as light and radio waves. Also called **Doppler shift.** See also **electromagnetic radiation, ultrasonography, wavelength.**

Doppler-guided injection [Christian J. Doppler], the use of a handheld ultrasound detector in sclerotherapy to guide a needle or syringe for injecting sclerosing fluid.

Doppler probe [Christian J. Doppler], a handheld diagnostic device that emits ultrasonic waves into the body. Reflection of the waves by a moving structure causes a change in their frequency. The Doppler probe has been used as a diagnostic tool since 1960 to study changes in blood flow in arteries and veins.

MINI-DOPPLER
Doppler jelly

Doppler flow detector *(Seidel et al, 2011)*

Doppler scanning. See **Doppler ultrasonography.**

Doppler shift. See **Doppler effect.**

Doppler ultrasonography [Christian J. Doppler], a technique used in ultrasound imaging to monitor moving substances or structures, such as flowing blood or a beating heart. The frequency of ultrasonic waves reflected by a moving surface is slightly different from that of the incident waves. The detected frequency shift yields information about the moving surface. The technique can be used to locate vessel obstructions, observe fetal heart sounds, localize the placenta, and image heart functions. Also called **Doppler scanning.**

Doribax, a trademark for **doripenem.**

doripenem, a miscellaneous antiinfective.

- ■ INDICATIONS: This drug is used to treat serious infections caused by *Acinetobacter baumannii, Bacteroides caccae, B. fragilis, B. thetaiotaomicron, B. uniformis, B. vulgates, Escherichia coli, Klebsiella pneumoniae, Peptostreptococcus micros, Proteus mirabilis, Pseudomonas aeruginosa, Streptococcus contellatus, S. intermedius;* complicated urinary tract infections; pyelonephritis; and complicated intraabdominal infections.
- ■ CONTRAINDICATIONS: Viral infection and known hypersensitivity to this drug or to meropenem, imipenem, penicillin, or beta-lactam prohibit the use of this drug.
- ■ ADVERSE EFFECTS: Adverse effects of this drug include headache, diarrhea, nausea, vomiting, urticaria, phlebitis, erythema at the injection site, and pruritis. Life-threatening side effects include seizures, pseudomembranous colitis, hepatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis, and anaphylaxis. A common side effect is rash.

Dormia basket, a tiny apparatus consisting of four wires that can be advanced through an endoscope into a body cavity or tube, manipulated to trap a calculus or other object, and withdrawn.

dornase alfa /dôr′nās/, a natural enzyme that depolymerizes DNA molecules. Because as much as 70% of the solid matter of purulent material consists of viscous DNA derived from the nuclei of neutrophils, dornase is used in respiratory therapy of disease such as cystic fibrosis to help break down purulent secretions in the airways. Dornase is produced with recombinant DNA technology in Chinese hamster ovary cells.

dorsal /dôr′səl/ [L, *dorsum,* the back], pertaining to the back or posterior. Compare **ventral.** See also **dorsiflect.** **—dorsum,** *n.*

-dorsal, suffix meaning “the back of something” or “the back”: *predorsal, thoracodorsal, ventrodorsal.*

dorsal column. See **posterior horn.**

dorsal decubitus position. See **supine.**

dorsal digital expansion, a triangular aponeurotic extension of the digital extensor tendon on the dorsum of the proximal phalanx of each digit, to which the tendons of the lumbrical and interosseous muscles are also attached. It forms a movable hood around the metacarpophalangeal joint. Also called *extensor aponeurosis, hood.*

dorsal digital vein, one of the communicating veins along the sides of the fingers. The veins from the adjacent sides of the fingers unite to form three dorsal metacarpal veins, which end in a dorsal venous network on the back of the hand. Compare **basilic vein, cephalic vein, median antebrachial vein.**

dorsal flexure [L, *dorsalis,* back, *flectere,* to bend], the dorsal convexity of the thoracic region of the spine.

dorsalgia. See **dorsodynia.**

dorsal horn [L, *dorsalis,* back; AS, horn]. See **posterior horn.**

dorsal impaction syndrome, dorsal wrist pain after weight-bearing activities involving hyperextension, as may occur in weight lifting and gymnastics. Treatment includes rest, ice, antiinflammatory drugs, and technique modification.

dorsal inertia posture, a tendency of a debilitated or weak person to slip downward in bed when the head of the bed is raised. Because of loss of muscular strength or mental apathy, the person seems unable to adjust to a new position in bed.

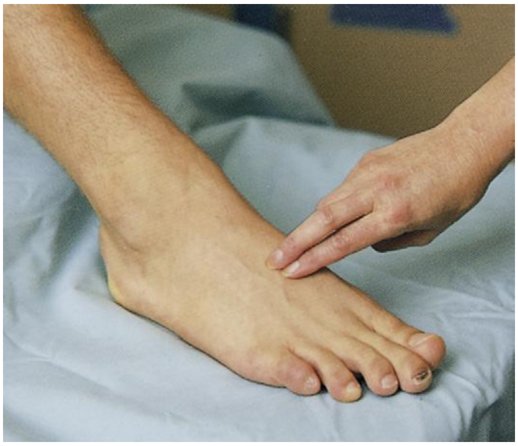
dorsal interossei of the foot, the most superior muscles in the sole of the foot that abduct the second to fourth toes. These four muscles also act through the dorsal expansions to resist extension of the metatarsophalangeal joints and flexion of the interphalangeal joints.

dorsal interossei of the hand, four muscles between and attached to the shafts of the metacarpals.

dorsal interventricular artery, the arterial branch of the right coronary artery, branching to supply both ventricles. It runs down the dorsal sulcus two thirds of the way to the apex of the heart. Also called **right interventricular artery.**

dorsalis pedis artery, the continuation of the anterior tibial artery, starting at the ankle joint, dividing into five branches, and supplying various muscles of the foot and toes. Its branches are the lateral tarsal, medial tarsal, arcuate, first dorsal metatarsal, and deep plantar.

dorsalis pedis pulse, the pulse of the dorsalis pedis artery, palpable at the prominent arch of the top of the foot between the first and second metatarsal bones. It can be felt in approximately 90% of people.



Palpation of the dorsalis pedis pulse *(Potter et al, 2011)*

dorsal lip, the marginal fold of the blastopore during gastrulation in the early stages of embryonic development of many animals. It marks the dorsal limit of the developing embryo, constitutes the primary organizer, gives rise to neural tissue, and corresponds to the primitive node in humans and higher animals.

dorsal nasal artery, a terminal branch of the ophthalmic artery that exits the orbit in the medial corner and supplies the dorsum of the nose.

dorsal position, lying on the back. See **supine position.**

dorsal recumbent [L, *dorsalis,* back; *recumbere,* to lie down], lying on the back, as in a supine position.

dorsal recumbent position [L, *dorsalis,* back, *positio*], the supine position with the person resting on the back, head, and shoulders.

dorsal reflex. See **erector spinae reflex.**

dorsal rigid posture, a position in which a patient lying in bed holds one or both legs drawn up to the chest. It often involves only the right leg and is intended to relieve the pain of appendicitis, peritonitis, kidney stones, or pelvic inflammation.

dorsal root [L, *dorsalis,* back; AS, *rot*], the sensory component or posterior root of a spinal nerve, attached centrally to the spinal cord.

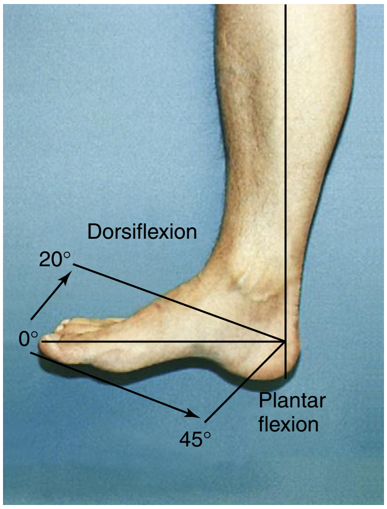
dorsal root ganglion [L, *dorsalis* + AS, *rot* + Gk, *ganglion,* knot], a swelling consisting of sensory neuron cell bodies whose axons constitute the dorsal root of a spinal nerve.

dorsal scapular nerve, one of a pair of supraclavicular branches from the roots of the brachial plexus. It supplies the rhomboideus major and the rhomboideus minor and sends a branch to the **levator scapulae.**

dorsi-. See **dorso-.**

dorsiflect /dôr′siflekt/ [L, *dorsum* + *flectere,* to bend], to bend or flex backward, as in the upward bending of the fingers, wrist, foot, or toes.

dorsiflexion /dôr′siflek′shən/, upward or backward flexion of a part of the body. See also **dorsiflexor.** —*dorsiflex, v.*



Dorsiflexion and plantar flexion of the foot
(Seidel et al, 2011/Courtesy Patrick Watson)

dorsiflexor /dôr′siflek′sər/, a muscle causing backward flexion of a part of the body, as the hand or foot.

dorsiflexor gait, an abnormal gait caused by the weakness of the dorsiflexors of the ankle, characterized by footdrop during the entire gait cycle and excessive knee and hip flexion to allow clearance of the involved extremity during the swing phase. The sole of the affected foot also slaps forcibly against the ground at the moment of heel strike because of the inability of the dorsiflexor to decelerate the body weight as the heel strikes the ground. Compare **Trendelenburg gait.**

dorso-, dorsi-, prefix meaning “dorsum or back”: *dorsocephalad, dorsomesial, dorsoscapular.*

dorsocuboidal reflex. See **Mendel’s reflex.**

dorsodynia /dôr′sōdin′ē·ə/, back pain, particularly in the muscles of the upper back area. Also called **dorsalgia.**

dorsolateral /dôr′sōlat′ərəl/, pertaining to the back of the body and to the side.

dorsolumbar /dôr′sōlum′bər/, pertaining to the back of the body and the lumbar region.

dorsosacral /dôr′sōsā′krəl/, pertaining to the back of the body and the sacrum.

dorsosacral position. See **lithotomy position.**

dorsoventral /dôr′sōven′trəl/ [L, *dorsum,* back, *venter,* belly], pertaining to the axis that passes through the back of the body and the abdomen.

dorsum /dôr′səm/ [L, *dorsum,* back], the back of the body or the posterior or upper surface of a body part.

dorsum sellae /sel′ē/, the posterior boundary of the sella turcica of the sphenoid bone. It bears the posterior clinoid process and is an anatomical marker for the location of the pituitary gland at the base of the skull.

dorzolamide hydrochloride /dorzo′lämīd/, a carbonic acid anhydrase inhibitor used in treatment of open-angle glaucoma and ocular hypertension, administered topically to the conjunctiva as the hydrochloride salt.

■ INDICATIONS: It is prescribed in the treatment of glaucoma. It reduces intraocular pressure by decreasing the rate of fluid production.

■ CONTRAINDICATIONS: It should not be given to patients wearing soft contact lenses or those with allergy to dorzolamide or its components or related substances.

■ ADVERSE EFFECTS: The side effects most often reported include ocular burning, stinging or discomfort following use; tearing; blurred vision; or light sensitivity.

DOS /dos/, abbreviation for *disk operating system*. A generic term describing an operating system loaded from disk devices, the hard drive in modern computers, when the system is started or rebooted.

dosage /dō′sij/ [Gk, *didonai,* to give], the regimen governing the size, amount, frequency, and number of doses of a therapeutic agent to be administered to a patient. Compare **dose.**

dosage compensation, a mechanism by which the expression of X-linked traits is equalized in males, which have one X chromosome, and females, which have two. In mammals it is accomplished by the inactivation of one of the X chromosomes in the somatic cells of females. See also **Lyon hypothesis.**

dose /dōs/ [GK, *didonai,* to give], the amount of a drug or other substance to be administered at one time. See also **absorbed dose.** Compare **dosage.**

dose area product (DAP), the product of the entrance skin dose and the cross-sectional area of the x-ray beam.

dose calculations, formulas for adjusting drug dosages for children, elderly adults, or other patients who may lack mechanisms for metabolizing and excreting average adult levels of medications. Infants, for example, have skin that is thin and permeable, a stomach that lacks gastric acid, body temperature that is poorly regulated, and immature liver and kidney function. See also **pediatric dosage.**

dose calibrator, an ionization chamber used in nuclear medicine to measure the amount of radioactivity of a radionuclide before injection into a patient.

dose equivalent (DE), a quantity used in radiation-safety work that expresses the amount of radiation dose and the physical damage that it may produce. It is the product of the dose (in rad or gray) and a quality factor specific to the type and energy of the radiation delivering that dose. The unit of dose equivalent is the sievert (Sv) or the rem.

dose fractionation. See **fractionation,** def. 5.

dose-limiting recommendations, the absorbed dose equivalent limit of radiation exposure, which may vary for different body or organ exposures. For example, the absorbed dose equivalent limit for the skin or forearms of a radiation worker is much higher than the whole-body exposure.

dose-limiting side effects, drug effects that prevent a drug from being administered in higher doses.

dose rate, the amount of delivered radiation absorbed per unit time.

dose ratemeter /rāt′mētər/, an instrument for measuring the dose rate of radiation.

dose response, a range of doses over which response occurs. Doses lower than the threshold produce no response while those in excess of the threshold exert no additional response. The shape of the curve is usually hyperbolic when plotted with linear axes and gives a sigmoidal curve when response is plotted versus the log of the dose. Beneficial drug responses are typically plotted on separate dose response curves. Because the dose response and the chemotherapeutic index can overlap to some degree and may have different slopes, the margin of safety is often considered to be a better index.

dose-response relationship, a mathematic relationship between the dose of a drug or radiation and the body's reaction to it. In a linear dose-response relationship, the response is proportional to the dose. Thus, if the dose is doubled, the response is also doubled. In a linear nonthreshold relationship, any dose, regardless of size, can theoretically cause a response.

dose threshold, the minimum amount of a drug or absorbed radiation that produces a detectable effect.

dose to skin, the amount of absorbed radiation at the center of the irradiation field on the skin. It is the sum of the dose in the air and the scatter from body parts.

dosimeter /dōsim′ətər/ [L, *dosis* + Gk, *metron,* measure], an instrument used to detect and measure accumulated radiation exposure. It consists of a pencil-sized ionization chamber with a self-reading electrometer.

dosimetry /dōsim′ətrē/ [Gk, *dosis,* giving, *metron,* measure], **1.** the determination of the amount, rate, and distribution of radiation or radioactivity from a source of ionizing radiation. **2.** the accurate determination of medicinal doses based on body size, sex, age, and other factors.

DOT, **1.** abbreviation for **Department of Transportation.** **2.** abbreviation for *direct observation therapy.*

dot-matrix printer, a printer that imprints a character by creating it from a pattern of dots, each of which is produced by activating selected wires in a set so that their ends strike the paper through an inked ribbon. Compare **character printer, laser printer.**

double [L, *duplus*], twice as much in strength, size, or amount.

double-approach conflict. See **approach-approach conflict.**

double-avoidance conflict. See **avoidance-avoidance conflict.**

double-barrel colostomy. See **loop colostomy.**

double bind /bīnd/ [L, *duplus,* double; AS, *bindan,* to bind], a "no win" situation resulting from two conflicting messages from a person who is crucial to one's survival, such as a verbal message that differs from a nonverbal message. An example is the insistence of a mother that she is not angry about a child's behavior although she is perceived as being obviously angry and hostile.

double-blind study, an experiment designed to test the effect of a treatment or substance by using groups of experimental and control subjects in which neither the subjects nor the investigators know which treatment or substance is being administered to which group. In a double-blind test of a new drug, the substance may be identified to the investigators by only a code. The purpose of a double-blind study is to eliminate the risk of prejudgment by the participants, which could distort the results. A double-blind study may be augmented by a cross-over experiment, in which experimental subjects unknowingly become control subjects, and vice versa, at some point in the study. See also **placebo.**

double-channel catheter [L, *duplus,* double; ME, *chanel* + Gk, *katheter,* a thing lowered into], a catheter with two lumens (channels) used to irrigate an internal cavity, with fluid entering one lumen and draining through the other. Also called **two-way catheter.**

double chin. See **buccula.**

double collecting system, a collecting system involving a double ureter. There may be either a duplex kidney or an ectopic kidney. Also called **duplicated collecting system.**

double-contrast arthrography, a method of making a radiographic image of a joint by injecting two contrast agents, usually a gaseous medium and a water-soluble iodinated agent, into the capsular space. The technique is most commonly used in radiography of the knee.

double-contrast barium enema [L, *duplus,* double, *contra,* against, *stare,* to stand; Gk, *barys,* heavy, *enienai,* to inject], an enema of radiopaque barium followed by evacuation and injection of air. The purpose is to detail radiographically the mucosal lining of the large intestine. Also called *double-contrast enema*.

double-emulsion film, x-ray film that is coated with emulsion on both sides.

double-flap amputation [L, *duplus,* double; ME, *flappe,* flap; L, *amputare*], an amputation in which two flaps are made from the soft tissues to cover an area that has lost its integument from surgery or accident.

double fracture, a fracture consisting of breaks or cracks in two places in a bone, producing more than two bone segments.

double gel diffusion. See **immunodiffusion.**

double innervation, innervation of effector organs by fibers of the sympathetic and parasympathetic divisions of the autonomic nervous system. The pelvic viscera, bronchioles, heart, eyes, and digestive system are all doubly innervated. The fibers of the two divisions operate at cross-purposes to achieve a state of balance and maintain constancy in the body's internal environment. The mode of action of each division varies. In some structures one division is stimulating and the other inhibiting; in others, separate fibers from each division act to stimulate and inhibit complementary function.

double-lumen drain, a drain, such as a sump drain, consisting of two tubes, one inside the other.

double-needle entry, a technique for injecting a contrast medium or other agent with two needles, one with a larger bore. In diskography a 20-gauge needle is used to perform a spinal puncture and reach the anulus fibrosus of the disk, after which a longer 26-gauge needle is passed through the guide needle to the injection target area.

double penis. See **diphallus.**

double personality [L, *duplus,* double, *personalis,* of a person], a state of dissociation in which the individual presents personas to others at different times as two different persons, each with a different name and different personality traits. The two personalities are generally independent, contrasting, and unaware of the existence of the other. Also called **dual personality.** See also **dissociative identity disorder.**

double pneumonia, acute lobar pneumonia affecting both lungs.

double quartan fever, a form of malaria in which paroxysms of fever occur in a repeating pattern of 2 consecutive days followed by 1 day of remission. The pattern is usually the result of concurrent infections by two species of the genus *Plasmodium,* one causing paroxysms every 72 hours and the other every 48 hours. Compare **biduotertian fever.** See also **malaria.**

double setup, a nursing procedure in which an obstetric operating room is prepared for both vaginal delivery and cesarean section. The circulating and scrub nurses lay out the equipment required for both procedures, which may include a vacuum extractor, forceps, and cesarean section packs. The scrub nurse remains scrubbed until the infant is delivered but does not participate unless a cesarean section is performed.

double system ureterocele, a ureterocele involving a double collecting system, seen most often in girls in an ectopic ureter.

double ureter, existence of a second ureter on one side that may be a complete connection from the kidney to the bladder or a partial tube forming a blind pouch. Most are asymptomatic, but some are accompanied by ectopic ureterocele. Also called **ureteral duplication.**

double vision. See **diplopia.**

double-void, a urinalysis procedure in which the first specimen is discarded and a second, obtained 30 to 45 minutes later, is tested. This method gives a more accurate measure of the amount of glucose in the urine at that particular time.

doubling dose, that dose of radiation expected to double the number of genetic mutations in a generation.

douche /do͞osh/ [Fr, shower-bath], **1.** *n*, a procedure in which a liter or more of a solution of a medication or cleansing agent in warm water is introduced into the vagina under low pressure. The woman often performs the procedure herself. Sitting on a toilet seat or semisitting in a bathtub, she introduces the douche tip into the vagina and releases a clamp on the tubing connected to the douche bag, which is suspended 2 feet above the introitus. She allows the solution to flow in, while holding the lips of the vagina closed to retain the fluid. As the accumulation of fluid distends the vagina, she clamps the tubing and, after a few minutes, allows the fluid to flow out. The process is repeated until the entire quantity of solution in the douche bag has been used. Douches also are administered via prepackaged preparations in flexible plastic bottles. Douching may be recommended in the treatment of various pelvic and vaginal infections. **2.** *v*, to perform a douche.

doughnut pessary. See **pessary.**

Douglas's cul-de-sac [James Douglas, Scottish anatomist, 1675–1742; Fr, bottom of the bag], a rectouterine pouch or recess formed by a fold of peritoneum that extends between the rectum and the uterus. Also called **excavatio rectouterina.**

doula. See **labor coach.**

dowager's hump /dow′ijərz/, an abnormal backward curvature of the cervical spine as a result of compression fractures of osteoporosis. Though it may occur at any age, it is most common in elderly women.

dowel /dow′əl/ [ME, *doule,* part of a wheel], a small rod or pin, usually metal, fitted into a prepared hole within the root canal and cemented in place, serving to retain a dental restoration or a core, such as a crown. Also called *post and core*.

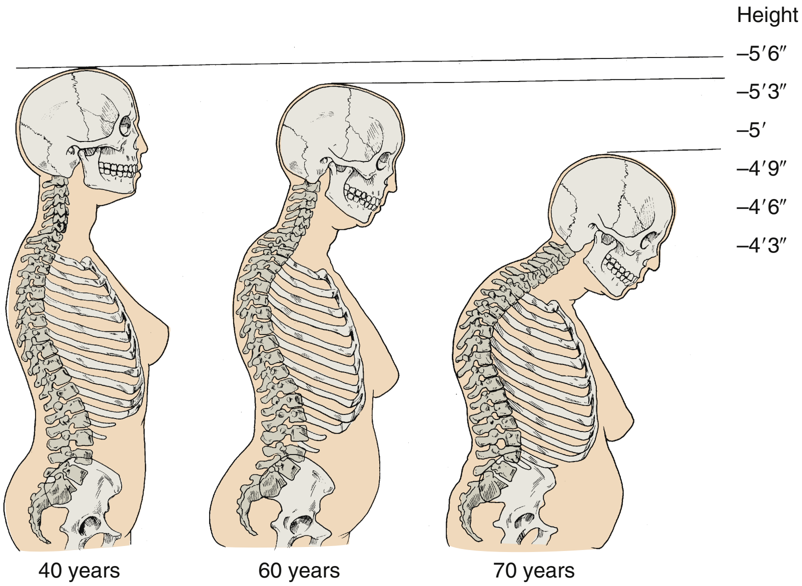
dowel graft, a cylindrical plug of bone used to immobilize adjacent vertebrae in anterior spinal fusion.

down [AS, *adune,* off hill], (of a computer) not operating as a result of malfunction or maintenance or for other reasons.

Downey cells [Hal Downey, American hematologist, 1877–1959], atypical lymphocytes found in patients with infectious mononucleosis and hepatitis. The cells are designated as Downey I, II, or III lymphocytes.

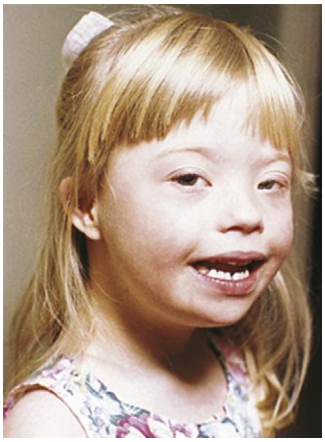
download, to transfer data or programs from a central computer to a peripheral unit.

down-regulation /doun reg-u-la′shun/, a decrease in the number of receptors for a chemical or drug on cell surfaces in a given area, usually caused by long-term exposure to the agent. See also **up-regulation**.



Dowager's hump *(Black and Hawks, 2009)*

Down syndrome [John L. Down, English physician, 1828–1896], a congenital condition characterized by varying degrees of mental retardation and multiple defects. It is the most common chromosomal abnormality of a generalized syndrome and is caused by the presence of an extra chromosome 21 in the G group or, in a small percentage of cases, by the translocation of chromosome 14 or 15 in the D group and chromosome 21 or 22. Down syndrome occurs in approximately 1 in 600 to 650 live births and is associated with advanced maternal age, particularly over 35 years of age. The incidence is as high as 1 in 80 for offspring of women above 40 years of age. In cases caused by translocation, which is a genetic aberration that is hereditary rather than a chromosomal aberration caused by nondisjunction during cell division, the incidence is not associated with maternal age, and the risk is low, about 1 in 5 if the mother is the carrier and 1 in 20 if the father is the carrier. The condition can be diagnosed prenatally by amniocentesis. A mosaic variant, in which there is a mixture of trisomy 21 and normal cells, causes fewer physical defects and less severe retardation, depending on the degree of mosaicism. Infants with the syndrome are small and hypotonic, with characteristic microcephaly, brachycephaly, a flattened occiput, and typical facies with a mongoloid slant to the eyes, depressed nasal bridge, low-set ears, and a large, protruding tongue that is furrowed and lacks a central fissure. The hands are short and broad with a transverse palmar or simian crease; the fingers are stubby and show clinodactyly, primarily of the fifth finger. The feet are broad and stubby with a wide space between the first and second toes and a prominent plantar crease. Other anomalies associated with the disorder are bowel defects, congenital heart disease (primarily septal defects), chronic respiratory infections, visual problems, abnormalities in tooth development, and susceptibility to acute leukemia. The most significant feature of the syndrome is mental retardation, which varies considerably. The average IQ is in the range of 50 to 60, so that the child is generally trainable and in most instances can be reared at home. The mortality rate is high within the first few years, especially in children with cardiac anomalies. Those who survive tend to be shorter than average and stocky in build; they show delayed or incomplete sexual development and can live to middle or old age, although adults with Down syndrome are prone to respiratory infections, pneumonia, and lung disease. Formerly called **mongolism.** Also called **trisomy 21.** See also **nondisjunction.**



Typical face seen in Down syndrome *(Huether and McCance, 2008/Courtesy Drs. A. Olney and M. MacDonald, University of Nebraska Medical Center, Omaha, Nebraska)*

down-time, a period during which a computer system is inoperable, for maintenance, as a result of malfunction, or for other reasons.

doxacurium, a nondepolarizing neuromuscular blocker.

■ INDICATIONS: This drug is used to facilitate endotracheal intubation and skeletal muscle relaxation during mechanical ventilation, surgery, or general anesthesia.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. This drug must not be used in neonates.

doxapram hydrochloride /dok′səpram/, a respiratory stimulant.

■ INDICATIONS: It is prescribed to improve respiratory function after anesthesia, in drug-induced central nervous system depression, and for chronic pulmonary disease associated with acute hypercapnia.

■ CONTRAINDICATIONS: Seizure disorder, pulmonary disease, coronary artery disease, uncompensated heart failure, hypertension, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are convulsions, bronchospasm, cardiovascular symptoms, and phlebitis.

doxepin hydrochloride /dok′səpin/, a tricyclic antidepressant.

■ INDICATIONS: It is prescribed in the treatment of depression. A topical preparation is also available for treating atopic dermatitis, and unlabeled uses include the treatment of neuropathic pain.

■ CONTRAINDICATIONS: Concomitant administration of monoamine oxidase inhibitors, recent myocardial infarction, seizure disorders, or known hypersensitivity to tricyclic medication prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are GI, cardiovascular, and neurological disturbances. Sedation, dry mouth, and many drug interactions may occur.

doxercalciferol, a parathyroid agent (calcium regulator).

■ INDICATIONS: It is used to lower high parathyroid hormone levels in patients undergoing chronic kidney dialysis.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug, hyperphosphatemia, hypercalcemia, and vitamin D toxicity prohibit its use.

■ ADVERSE EFFECTS: Adverse effects include drowsiness, headache, lethargy, nausea, diarrhea, vomiting, anorexia, dry mouth, constipation, cramps, metallic taste, myalgia, arthralgia, decreased bone development, polyuria, hypercalciuria, hyperphosphatemia, hematuria, and shortness of breath.

DOXOrubicin hydrochloride /dok′səro͞o′bisin/, an anthracycline antibiotic.

■ INDICATIONS: It is prescribed in the treatment of a wide variety of malignant neoplastic diseases, including leukemias, lymphomas, sarcomas, germ cell tumors, and carcinomas (e.g., lung, breast, prostate, ovary).

■ CONTRAINDICATIONS: Myelosuppression, heart disease, concurrent administration of DAUNOrubicin, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are myelosuppression and cardiomyopathy. Stomatitis, GI disturbances, and alopecia commonly occur.

doxycycline /dok′sisī′klēn/, a tetracycline antibiotic.

■ INDICATIONS: It is prescribed in the treatment of infections caused by susceptible bacterial strains, especially ***Chlamydia, Rickettsia,*** and ***Mycoplasma.***

■ CONTRAINDICATIONS: Renal or liver dysfunction or known hypersensitivity to this drug or to other tetracycline medication prohibits its use. It is not given during pregnancy or to children less than 8 years of age.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are GI disturbances, phototoxicity, potentially serious superinfections, and hypersensitivity reactions. Discoloration of teeth may occur in children exposed to the drug in utero or under 8 years of age.

doxylamine succinate /dok′silam′ēn/, an antihistamine.

■ INDICATIONS: It is prescribed for the treatment of acute allergic symptoms produced by the release of histamine.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. It is not recommended for use during pregnancy or lactation and is not given to children less than 6 years of age.

■ ADVERSE EFFECTS: Among the more serious reactions are sedation, ataxia, tachycardia, hemolytic anemia, and thrombocytopenia.

dP/dt, the rate of change of pressure with respect to time.

DPG, abbreviation for **2,3-diphosphoglyceric acid.**

D.P.H., abbreviation for *Diploma in Public Health.*

DPL, abbreviation for **diagnostic peritoneal lavage.**

D.P.M., abbreviation for *Doctor of Podiatric Medicine.* See **podiatrist.**

DPT vaccine, abbreviation for **diphtheria and tetanus toxoids and pertussis vaccine.**

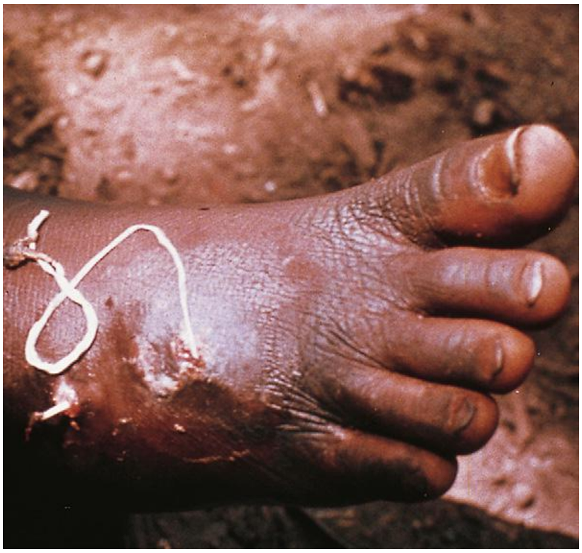
DQ, abbreviation for **developmental quotient.**

dr., **1.** abbreviation for **drachm.** See **dram. 2.** abbreviation for **dram.**

Dr., abbreviation for *doctor.*

drachm. See **dram.**

dracunculiasis /drakun′kyo͝olī′əsis/ [Gk, *drakontion,* little dragon, *osis,* condition], a parasitic infection caused by infestation by the nematode ***Dracunculus medinensis.*** It is characterized by ulcerative skin lesions on the legs and feet that are produced by the emergence of one or more gravid female worms, which may be visible. People are infected by drinking contaminated water or eating contaminated shellfish. It is common in densely populated tropic and subtropic areas of the world. Treatment involves slow, progressive, mechanical removal of the worm over several days. Metronidazole may reduce inflammation and facilitate removal of the worm. Also called *dracontiasis, dracunculosis,* **Guinea worm infection.**



Dracunculiasis *(du Vivier, 2002/Courtesy Dr. R. Muller)*

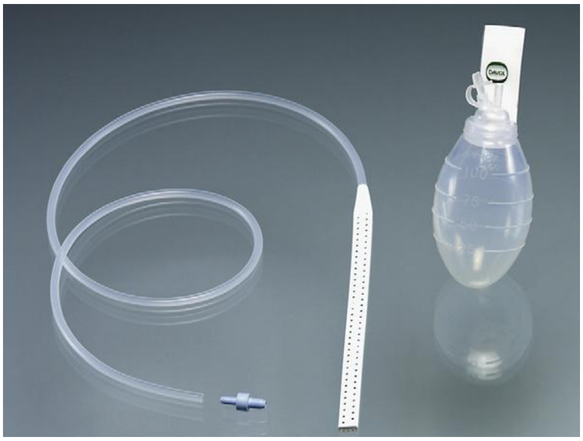
Dracunculus medinensis /drakun′kyo͝oləs/, a parasitic nematode of the Mediterranean area that causes dracunculiasis. An American species is *Dracunculus insignis.* Also called **dragon worm, fiery serpent, guinea worm.**

dragon worm. See ***Dracunculus medinensis.***

drag-to gait [ME, *dragen* + *gate,* path], a method of walking with crutches in which the feet are dragged rather than lifted with each step. See also **crutch gait.**

drain, a tube or other device used to remove air or a fluid from a body cavity or wound. The drain may be a closed system, designed to provide complete protection against contamination, or an open system in which there is a continual exchange of material.

drainage /drā′nij/ [AS, *drachen,* teardrop], the removal of fluids from a body cavity, wound, or other source of discharge by one or more methods. **Closed drainage** is a system of tubing and other apparatus attached to the body to remove fluid in an airtight circuit that prevents environmental contaminants from entering the wound or cavity. **Continuous bladder irrigation** is drainage in which a body area is washed out by alternately flooding and then emptying it with the aid of gravity, a technique that may be used in treating a urinary bladder disorder. **Open drainage** is drainage in which discharge passes through an open-ended tube into a receptacle. **Suction drainage** uses a pump or other mechanical device to assist in extracting a fluid. See also **postural drainage, tidal drainage.**



Jackson-Pratt silicone suction drain *(Ignatavicius and Workman, 2010/Courtesy C.R. Bard, Inc., Covington, Georgia)*

drainage tube, a heavy-gauge catheter used for the evacuation of air or a fluid from a cavity or wound in the body. The tube may be attached to a suction device or may allow flow by gravity into a receptacle.

draining sinus [AS, *drachen,* teardrop; L, *sinus,* hollow], an abnormal channel or fistula permitting the escape of exudate to the outside of the body.

Draize test /drāz/, a controversial method of testing the toxicity of pharmaceutic and other products to be used by humans by placing a small amount of the substance in the eyes of rabbits. The eye-irritancy potential of a substance is considered a measure of the possible effect of the product on similar human tissues. The Draize in vivo test is recognized by the U.S. Food and Drug Administration as a reliable method of predicting the risk of new products to human eyesight, although alternative testing methods are being sought.

-dralazine, suffix for the name of an antihypertensive.

dram (dr.) /dram/ [Gk, *drachme,* weight of the same value], a unit of mass equivalent to an apothecary's measure of 60 grains or $^{1}/_{8}$ ounce and to $^{1}/_{16}$ ounce or 27.34 grains avoirdupois. Also spelled **drachm.**

Dramamine, a trademark now used for two different antiemetics, **dimenhyDRINATE,** and more recently meclizine (causes less sedation).

dramatic play /dramat′ik/ [Gk, *drama,* deed; AS, *plegan,* game], an imitative activity in which a child fantasizes and acts out various domestic and social roles and situations, such as rocking a doll, pretending to be a doctor or nurse, or teaching school. It is the predominant form of play among preschool children.

drape [ME, *drap,* cloth], a sheet of fabric or paper, usually the size of a small bed sheet, for covering all or a part of a person's body during a physical examination or treatment. **—drape,** *v.*

Types of wound drainage

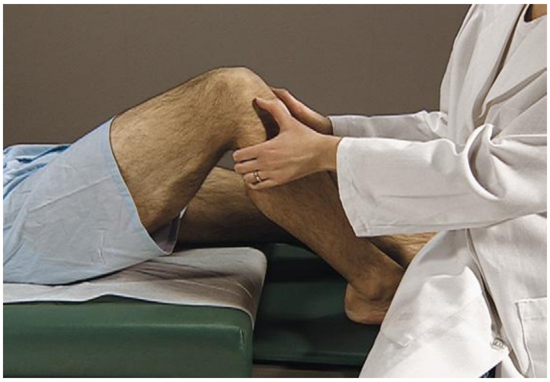
Type	*Appearance*
A. Serous 	Clear, watery plasma
B. Purulent 	Thick, yellow, green, tan, or brown
C. Serosanguineous 	Pale, red, watery: mixture of serous and sanguineous
D. Sanguineous 	Bright red: indicates active bleeding

From Elkin MK, Perry AG, Potter PA: *Nursing interventions & clinical skills,* ed 5, St Louis, 2012, Mosby.

Drash's syndrome /drashəs/ [Allan Lee Drash, American pediatrician, b. 1931], a syndrome of male pseudohermaphroditism, nephropathy leading to renal failure, and, in most cases, Wilms' tumor, caused by a genetic abnormality in chromosome 11.

Draw-a-Person (DAP) Test [AS, *dragan* + L, *personalis* + *testum,* crucible], a test developed by Karen Machover [American psychologist, b. 1902] based on the interpretation of drawings of human figures of both sexes. Interpretation depends on the subject's verbalizations, self-image, anxiety, and sexual conflicts and other factors. Also called **Machover Draw-a-Person Test.**

drawer sign [AS, *dragan,* to drag], a diagnostic sign of a ruptured or torn anterior cruciate or posterior cruciate ligament of the knee. Testing involves having the patient flex the knee at a right angle while the lower leg is grasped just below the knee and moved first toward, then away from the examiner. The test result is positive for the knee injury if the head of the tibia can be moved more than a half inch from the joint. See also **anterior drawer sign or test.**



Drawer test *(Seidel et al, 2011)*

drawing, *(informal)* a vague sensation of muscle tension.

drawsheet, a sheet that is smaller than a bottom or top sheet of a bed and is usually placed over the middle of the bottom sheet to keep the mattress and bottom linens dry. The draw-sheet can also be used to turn or move a patient in bed. Also called *pull sheet, turning sheet*.

dream [ME, *dreem,* joyful noise], **1.** a sequence of ideas, thoughts, emotions, or images that pass through the mind during the rapid-eye-movement stage of sleep. **2.** the sleeping state in which this process occurs. **3.** a visionary creation of the imagination experienced during wakefulness. **4.** (in psychoanalysis) the expression of thoughts, emotions, memories, or impulses repressed from the consciousness. **5.** (in analytic psychology) the wishes, emotions, and impulses that reflect the personal unconscious and the archetypes that originate in the collective unconscious. See also **dream analysis, dream state.**

dream analysis, a process of gaining access to the unconscious mind by means of examining the content of dreams, usually through the method of free association.

dream association, a relationship of thoughts or emotions discovered or experienced when a dream is remembered or analyzed. See also **dream analysis.**

dream state, a condition of altered consciousness in which a person does not recognize the environment and reacts in a manner opposed to his or her usual behavior, as by flight or an act of violence. The state is seen in epilepsy and certain disorders. See also **automatism, fugue.**

dress code [OFr, *dresser,* to arrange; L, *codex,* book], the standards set by an institution for the appropriate attire of its members.

dressing^{1} [OFr, *dresser,* to arrange], a clean or sterile covering applied directly to wounded or diseased tissue to absorb secretions, protect from trauma, administer medications, maintain wound cleanliness, or stop bleeding. Kinds of dressings include **absorbent dressing, antiseptic dressing, occlusive dressing, pressure dressing,** and **wet dressing.**

dressing^{2}**,** a nursing intervention from the Nursing Interventions Classification (NIC) defined as choosing, putting on, and removing clothes for a person who cannot do this for self. See also **Nursing Interventions Classification.**

dressing forceps, a kind of forceps that has narrow blades and blunt or notched teeth, designed for dressing wounds, removing drainage tubes, or extracting fragments of necrotic tissue.

Gauze dressings *(Perry, Potter, and Elkin, 2012)*

Dressler's syndrome /dres′lərz/ [William Dressler, American physician, 1890–1969], an autoimmune disorder that may occur several days to several months after acute coronary infarction, characterized by fever, pericarditis, pleurisy, pleural effusions, and joint pain. It results from the body's immunological response to a damaged myocardium and pericardium. Treatment usually includes intensive aspirin therapy and, in severe cases, use of corticosteroids. A similar syndrome may occur after cardiac surgery. See also **post-myocardial infarction syndrome.**

DRG, abbreviation for **diagnosis-related group.**

DRI, abbreviation for *Dietary Reference Intake*.

drift [AS, *drifan,* to move forward], a gradual movement away from the original position. See also **antigenic drift, genetic drift.**

drifting tooth, a tooth that migrates from its normal position. Causes include a loss of proximal support or functional antagonists, occlusal traumatic tooth relationships, inflammatory and retrograde changes in the attachment apparatus, and oral habits, such as thumb-sucking and bruxism.

drill /dril/ [Dutch *drillen,* to bore], **1.** a rotating cutting instrument for making holes in hard substances, such as bones or teeth. **2.** See **burr.**

Drinker respirator [Philip Drinker, American engineer, 1894–1972], an airtight respirator consisting of a metal tank that encloses the entire body, except the head. Used for long-term therapy, it alternates positive and negative air pressure within the tank, providing artificial respiration by contracting and expanding the walls of the chest. Also called **artificial lung, iron lung.**

drip [AS, *dryppan,* to fall in drops], **1.** *n*, the process in which a liquid or moisture forms and falls in drops. Kinds of drip include **nasal drip** and **postnasal drip. 2.** *n*, the slow but continuous infusion of a liquid into the body, as into the stomach peritoneum or a vein. **3.** *v*, to infuse a liquid continuously into the body.

drip gavage, a method of feeding a liquid formula diet through a tube inserted through the nostrils to the stomach. The formula may be heated to about 100° F (37.8° C) or administered at room temperature and is contained in a bag suspended from a stand. It may also be administered with a feeding pump. See also **enteral tube feeding, tube feeding.**

drip system, (in IV therapy) an apparatus for delivering specific volumes of IV solutions within predetermined periods and at a specific flow rate. See also **macrodrip, microdrip.**

drive [AS, *drifan,* to move forward], **1.** a basic, compelling urge. A **primary drive** is one that is innate and in close contact with physiological processes. A **secondary drive** is one that evolves during the process of growth and that incites and directs behavior. **2.** an electromechanical device that holds a secondary storage medium and allows for the transfer of data to and from the computer, such as a disk drive or tape drive.

Drixoral, a trademark for a fixed-combination drug containing an antihistamine (dexbrompheniramine maleate) and a vasoconstrictor (pseudoephedrine sulfate), used for the relief of congestion of the upper respiratory tract.

-drome, suffix meaning "that which runs or moves together" in a specified way: *dermadrome, heterodrome, syndrome*.

dromedary hump, a bulge on the lateral surface of a kidney (usually the left), resembling the hump of a dromedary camel, seen in persons whose spleen or liver presses down.

dromo-, prefix meaning "running or conduction": *dromomania, dromophobic, dromotropic*.

dromostanolone propionate /drō′mostan′əlōn/, a synthetic androgen.

■ INDICATION: It is prescribed for the treatment of female breast cancer.

■ CONTRAINDICATIONS: It is not used for male breast cancer or in premenopausal women.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are masculinization, edema, and hypercalcemia.

dromotropic, an agent that influences the conduction of electrical impulses. A positive dromotropic agent enhances the conduction of electrical impulses to the heart.

dronabinol /drōnab′inol/, an oral antiemetic that is a synthetic derivative of THC, the principal psychotropic constituent of marijuana.

■ INDICATIONS: It is prescribed for the treatment of refractory nausea and vomiting caused by cancer chemotherapy.

■ CONTRAINDICATIONS: It should not be given to persons with known hypersensitivity to the drug or to tetrahydrocannabinol, its active ingredient.

■ ADVERSE EFFECTS: Among adverse effects reported are drowsiness, dizziness, impaired coordination, and hallucinations. Dronabinol is a Schedule III controlled substance with a high potential for abuse. It can produce both physical and psychological dependence. It is not recommended for patients who are using a central nervous system depressant or other psychoactive drugs.

drooping eyelid. See **ptosis.**

drooping lily sign, a deformity seen on IV urography of a duplex kidney, with the forcing of the lower collecting system and ureter outward and downward to resemble the shape of a drooping lily. It is caused by obstruction and dilation of the upper collecting system.

drop (gtt) [AS, *dropa*], a small spherical mass of liquid. A drop may vary in size with differences in temperature, viscosity, and other factors. For therapeutic purpose, a drop is regarded as having a volume of 0.06 to 0.1 mL, or 1 to 1.5 minims. 1.5 drops = 1 mL.

drop arm test, a diagnostic test for a tear in the supraspinatus tendon. The result is positive if the patient is unable to lower the affected arm slowly and smoothly from a position of 90 degrees of abduction.

drop attack, a form of transient ischemic attack in which a brief interruption of cerebral blood flow causes a person to fall to the floor without losing consciousness. The fall may be caused by a disrupted sense of balance or decreased leg muscle tone. Weakness of the leg muscles or a hip or knee joint dysfunction may be a contributing factor.

droperidol /drəper′ədol/, an antipsychotic, sedative drug of the butyrophenone group, used most commonly with an opioid analgesic (fentanyl) in neuroleptanesthesia.

drop foot. See **footdrop.**

droplet infection [AS, *dropa* + L, *inficere,* to infect], an infection acquired by the inhalation of pathogenic microorganisms suspended in particles of liquid exhaled, sneezed, or coughed by another infected person or animal. Some diseases spread by droplets are chickenpox, common cold, influenza, measles, and mumps.

Droplet Precautions, guidelines recommended by the Centers for Disease Control and Prevention for reducing the risk of droplet transmission of infectious agents. Droplet transmission involves contact of the conjunctivae or the mucous membranes of the nose or mouth of a susceptible person with large-particle droplets (larger than 5 µm in size) containing microorganisms generated from a person who has a clinical disease or is a carrier of the disease. Droplets are generated from the source person primarily during coughing, sneezing, talking, and performance of certain procedures such as suctioning and bronchoscopy. Transmission of large-particle droplets requires close contact between source and recipient persons because droplets do not remain suspended in the air and generally travel only short distances (usually 3 feet or less). Special air handling and ventilation are not required to prevent droplet transmission because droplets do not remain suspended in the air. Droplet Precautions apply to any patient known or suspected to be infected with epidemiologically important pathogens that can be transmitted by infectious droplets. See also **Standard Precautions, transmission-based precautions.**

dropped-beat pulse. See **intermittent pulse.**

dropped wrist. See **radial paralysis.**

dropper, a glass or plastic tube narrowed at one end with a rubber bulb at the other end to dispense a liquid medication one drop at a time.

dropsy. See **hydrops.**

Drosophila /drōsof′ilə/ [Gk, *drosos,* dew, *philein,* to love], a genus of fly, which includes *Drosophila melanogaster,* the Mediterranean fruit fly. It is useful in genetic experiments because of the large chromosomes found in its salivary glands and its sensitivity to environmental effects, such as exposure to radiation.

drospirenone /drospi′rĕnōn/, a spironolactone analog that acts as a progestational agent, used in combination with an estrogen component as an oral contraceptive.

drotrecogin alfa, a thrombolytic agent used to treat severe sepsis associated with organ dysfunction.

drowning [ME, *drounen*], asphyxiation caused by submersion in a liquid. See also **near drowning.**

drowsiness, a decreased level of consciousness characterized by sleepiness and difficulty in remaining alert but easy arousal by stimuli. It may be caused by a lack of sleep, medications, substance abuse, or a cerebral disorder.

drox, abbreviation for *hydroxide anion*.

Dr. P.H., abbreviation for *Doctor of Public Health*.

DRS, abbreviation for *Dementia Rating Scale*.

DRSP, abbreviation for **drug-resistant *Streptococcus pneumoniae*.**

drug [Fr, *drogue*], **1.** also called **medicine,** any substance taken by mouth; injected into a muscle, the skin, a blood vessel, or a cavity of the body; or applied topically to treat or prevent a disease or condition. **2.** *(informal)* any substance that can be abused for its stimulant, depressant, euphoric, or hallucinogenic effects.

drug absorption, the process whereby a drug moves from the muscle, digestive tract, or other site of entry into the body toward the circulatory system.

drug abuse, the use of a drug for a nontherapeutic effect. Some of the most commonly abused drugs are alcohol; nicotine; marijuana; amphetamines; barbiturates; cocaine;

methaqualone; opium alkaloids; synthetic opioids; benzodiazepines, including flunitrazepam (Rohypnol); gamma-hydroxybutyrate; 3,4-methylenedioxymethamphetamine (MDMA, ecstasy); phencyclidine; ketamine; and anabolic steroids. Drug abuse may lead to organ damage, addiction, and disturbed patterns of behavior. Some illicit drugs, such as heroin, lysergic acid diethylamide, and phencyclidine hydrochloride, have no recognized therapeutic effect in humans. Use of these drugs often incurs criminal penalty in addition to the potential for physical, social, and psychological harm. See also **drug addiction.**

drug abuse cessation behavior, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to eliminate drug use that poses a threat to health. See also **Nursing Outcomes Classification.**

Drug Abuse Warning Network (DAWN), a system of collecting information about admissions to emergency treatment facilities for drug abuse.

drug action, the means by which a drug exerts a desired effect. Drugs are usually classified by their actions; for example, a vasodilator, prescribed to decrease the blood pressure, acts by dilating the blood vessels.

drug addiction, a condition characterized by an overwhelming desire to continue taking a drug to which one has become habituated through repeated consumption because it produces a particular effect, usually an alteration of mental status. Addiction is usually accompanied by a compulsion to obtain the drug, a tendency to increase the dose, a psychological or physical dependence, and detrimental consequences for the individual and society. Common addictive drugs are barbiturates, alcohol, and morphine and other opioids, especially heroin, which has slightly greater euphorigenic properties than other opium derivatives. See also **alcoholism, drug abuse.**

drug agonist, a drug that is capable of binding to a neurotransmitter or hormone receptor and causing a response similar to the endogenous hormone or neurotransmitter. Compare **antagonist.**

drug allergy, hypersensitivity to a pharmacological agent. Manifestions range from a mild rash to anaphylactic shock, depending on the dose, and the allergen sensitivity of the individual. The primary drug that produces allergy is penicillin. Others include aspirin, phenylbutazone, novobiocin, other antibiotics, and radiopaque contrast media containing iodine. See also **anaphylactic shock.**

drug clearance, the elimination of a drug from the body. Drugs and their metabolites are excreted primarily by the kidneys into the urine, but other routes for elimination include bile, sweat, saliva, breast milk, and expired air. The rate of clearance helps determine the size and frequency of a dosage of a particular medication.

drug compliance, the reliability of the patient in using a prescribed medication exactly as ordered by the physician. Noncompliance occurs when a patient forgets or neglects to take the prescribed dosages at the recommended times or decides to discontinue the drug without consulting the physician.

drug concentration, the amount of drug in a given volume of plasma (e.g., number of micrograms per milliliter). Toxic drug levels may be observed when the body's normal mechanisms for metabolizing and excreting drugs are impaired, as commonly occurs in patients with liver or kidney disorders and in infants with immature organs. Dosage adjustments should be made in such individuals to accommodate their impaired metabolism and excretion.

drug dependence, a psychological craving for, habituation to, abuse of, or physiological reliance on a chemical substance. See also **drug abuse, drug addiction.**

drug dispensing, the preparation, packaging, labeling, record keeping, and transfer of a prescription drug to a patient or an intermediary, who is responsible for administration of the drug.

drug disposition, general term for the absorption, distribution, metabolism, and excretion of a drug that has been administered.

drug distribution, the pattern of distribution of drug molecules by various tissues after the chemical enters the circulatory system. Because of differences in pH, lipid content, cell membrane functions, and other individual tissue factors, most drugs are not distributed equally in all parts of the body. For example, the acidity of aspirin influences a distribution pattern that is different from that of an alkaline product such as amphetamine.

drug-drug interaction, a modification of the effect of a drug when administered with another drug. The effect may be an increase or a decrease in the action of either substance, or it may be an adverse effect that is not normally associated with either drug. The particular interaction may be the result of a chemical-physical incompatibility of the two drugs or a change in the rate of absorption or the quantity absorbed in the body, the binding ability of either drug, or an alteration in the ability of receptor sites and cell membranes to bind either drug. Most adverse drug-drug interactions are either pharmacodynamic or pharmacokinetic in nature.

Drug Enforcement Agency (DEA), an agency of the Drug Enforcement Administration of the federal government, empowered to enforce regulations that control the import or export of narcotic drugs and certain other substances or the traffic of these substances across state lines.

drug eruption. See **drug rash.**

drug fever, a fever caused by the pharmacological action of a medication, its thermoregulatory action, a local complication of parenteral administration, or, most commonly, an immunological reaction mediated by drug-induced antibodies. The onset of fever occurs usually between 7 and 10 days after the medication is begun. A return to normal is ordinarily seen within 2 or 3 days of discontinuance of the drug. The correct diagnosis of drug fever and the discontinuance of the medication are important to prevent further adverse reactions and possibly dangerous and expensive diagnostic and therapeutic interventions. See also **Jarisch-Herxheimer reaction.**

drug-food interaction, the effect produced when some drugs and certain foods or beverages are taken at the same time. For example, grapefruit juice blocks the metabolism of some drugs in the GI tract, an action that can cause normal dosages of a drug to reach toxic levels in the plasma.

drug holiday, a period of drug withdrawal to reverse ineffectiveness of a drug resulting from receptor desensitization or adverse effects that may result from chronic treatment. For example, after a 7- to 10-day drug holiday, levodopa responsiveness appears to be enhanced, and lower doses are required to produce a therapeutic effect.

drug-induced acne. See **acne medicamentosa.**

drug-induced cystitis, allergic cystitis occurring in reaction to a medication.

drug-induced hepatopathy, toxic hepatopathy in which the hepatotoxin is a drug.

drug-induced parkinsonism, a reversible syndrome with the clinical features of Parkinson's disease but caused by the acetylcholine-dopamine imbalance of antipsychotic drugs. See also **parkinsonism.**

drug-induced teratogenesis, congenital anomalies that reflect toxic effects of drugs on the developing fetus. See also **fetal alcohol syndrome, thalidomide.**

drug interaction, alteration of the effects of a drug by reaction with another drug or drugs, with foods or beverages, or with a preexisting medical condition.

drug metabolism, the transformation of a drug by the body tissues, primarily those of the liver, into a more water-soluble metabolite that can be eliminated. This process inactivates many drugs, but some drugs have metabolites that are also biologically active and others are administered as pro-drugs that must undergo drug metabolism to become biologically active.

drug monograph, a statement that specifies the kinds and amounts of ingredients a drug or class of drugs may contain, the directions for the drug's use, the conditions in which it may be used, and the contraindications to its use.

drug overdose (OD) [Fr, *drogue,* drug; AS, *ofer;* Gk, *dosis,* giving], an accidental or purposeful dose of a drug large enough to cause severe adverse reactions.

drug potency, the amount of drug required to produce a given percentage of its maximal effect, irrespective of the size of maximal effect. A drug can have high potency but poor efficacy, meaning that response is seen at very low doses and remains small even at high doses. Drug potency is seldom an important clinical consideration.

drug profile, an outline or summary of the characteristics of a drug or drug family, listing dosage types, pregnancy category, prescription or over-the-counter forms, generics if available, contraindications, and classification if covered by controlled-substance laws.

drug psychosis [Fr, *drogue,* drug; Gk, *psyche,* mind, *osis,* condition], a psychotic state induced by excessive dosage of certain therapeutic drugs as well as drugs of abuse. Therapeutic drugs often associated with drug-induced psychosis include atropine-like drugs, chloral hydrate, steroids, and isoniazid.

drug rash, a skin eruption, usually an allergic reaction, that is caused by a particular drug. Nearly any drug can produce a skin reaction as a result of gradual accumulation of the drug or development of antibodies that reject a component of the medication. A drug rash that is a sensitivity reaction does not occur the first time the drug is taken; the effect is observed with subsequent uses. Also called **dermatitis medicamentosa.** See also **fixed drug eruption.**

drug reaction. See **adverse drug reaction.**

drug receptor, any part of a cell, usually a large protein molecule, on the cell surface or in the cytoplasm with which a drug molecule interacts to trigger a response or effect.

drug rehabilitation center, an agency that provides treatment for a person with a chemical or drug dependency.

drug resistance, the ability of disease organisms to resist effects of drugs that previously were toxic to them. Bacterial resistance to an antibiotic can result from mutation of a strain that has been exposed to an antibiotic or similar agent. Such acquired resistance may result from a chromosomal disruption or acquisition of a stray bit of deoxyribonucleic acid (DNA) on a resistant plasmid. It can also be caused by extrachromosomal pieces of DNA that carry codes for antibiotic-resistant genes from a transposon, a DNA segment capable of insertion into a bacterial chromosome-resistant plasmid, or both. Decreased permeability to an antimicrobial is a common form of intrinsic resistance. Alteration or inactivation of the antibiotic is perhaps the most common mechanism of drug resistance. Acquired resistance to beta-lactam antibiotics is determined by the production of enzymes that inactivate the antibiotic. Drug resistance may also result from a change in the target site on which it acts.

drug-resistant *Streptococcus pneumoniae* (DRSP), a widespread strain of respiratory pathogen that is drug resistant. Until the 1960s *S. pneumoniae* was almost uniformly susceptible to penicillin alone. In 1967 resistance to penicillin and other microbial drugs was first reported in Australia. It has since spread worldwide. The introduction of pneumococcal conjugate vaccines has reduced the number of these infections substantially.

drug-seeking behavior (DSB), a pattern of seeking narcotic pain medication or tranquilizers with forged prescriptions, false identification, repeated requests for replacement of "lost" drugs or prescriptions, complaints of severe pain without an organic basis, and abusive or threatening behavior manifested when denied drugs.

drug sequestration, the process by which certain drugs are stored in the body tissues. Examples include tetracycline, which may be stored in bone tissue, and chloroquine, which is stored in the liver. Certain vitamins and other substances are stored in fat deposits.

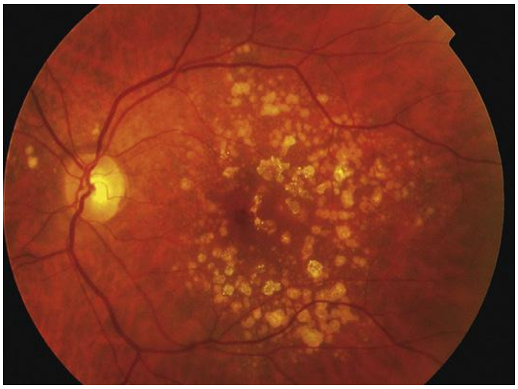
drug tolerance, a condition of cellular adaptation to a pharmacologically active substance so that increasingly larger doses are required to produce the same physiological or psychological effect obtained earlier with smaller doses. Also called **metabolic tolerance**. See also **tachyphylaxis.**

drug trial, the process of determining an adequate and effective therapeutic dose or duration of treatment of a specific drug for a particular disease state. The trial culminates with (1) an acceptable clinical result, (2) intolerable adverse effects, (3) a poor response after an appropriate blood level is reached, or (4) administration of the drug for a specific time.

drum cartridge catheter technique, a method used in central vein cannulation. The vein is cannulated with an introducer cannula. The needle is removed and is replaced by the drum cartridge catheter, which is left in place.

drum electrode, an induction electrode that produces a strong magnetic field, used primarily with pulsed short-wave diathermy.

drusen /dro͞o′zən/ [Ger, *Drüse,* stony granule], small yellowish hyaline deposits that develop beneath the retinal pigment epithelium, sometimes appearing as nodules within the optic nerve head. They tend to occur most frequently in persons older than 60 years of age and are commonly associated with age-related macular degeneration.



Retinal drusen *(Kanski and Bowling, 2011)*

DRVs, abbreviation for **Daily Reference Values.**

dry abscess, **1.** a collection of pus that disperses without reaching a point of bursting. **2.** the remains of an abscess after the pus is absorbed.

dry catarrh [AS, *dryge* + Gk, *kata,* down, *rhoia,* flow], a dry cough, accompanied by almost no expectoration, that occurs in severe coughing spells. It is associated with asthma and emphysema in older people.

dry cholera. See **cholera sicca.**

dry cough, a cough that does not produce sputum.

dry crackle, an abnormal chest sound produced by air passing through fibrotic alveolar sacs.

dry dressing, a plain dressing containing no medication, applied directly to an incision or a wound to prevent contamination or trauma or to absorb secretions.

dry eye syndrome, a dryness of the cornea and conjunctiva caused by a deficiency in tear production or altered tear film composition. It results in a sensation of a foreign body in the eye, burning eyes, keratitis, and erosion of the epithelial layers of the cornea and conjunctiva. See also **Sjögren's syndrome.**

dry gangrene. See **gangrene.**

dry gas (D), a gas that contains no water vapor.

dry heat, a thermal effect produced by adding dry air or reducing the humidity of the environment.

dry heat sterilization [AS, *dryge* + *haetu* + L, *sterilis*], a method of sterilization that uses heated dry air at a temperature of 320° to 356° F (160° to 180° C) for 90 minutes to 3 hours.

dry heaves, retching.

dry ice, solid carbon dioxide, with a temperature of about −140° F (−78° C). It is used in cryotherapy of various skin disorders, such as the removal of warts.

dry labor, *(informal)* labor in which amniotic fluid has already escaped. As amniotic fluid is continually produced, no labor is really dry.

dry mouth. See **xerostomia.**

dry pleurisy [AS, *dryge,* dry; Gk, *pleuritis*], inflammation of the pleura without effusion of serum. The cause may be a localized injury. Dry pleurisy may also be an early sign of tuberculosis.

dry rale, a fine sound associated with any of various interstitial lung diseases, such as idiopathic pulmonary fibrosis.

Drysdale's corpuscle /drīz′dālz/ [Thomas M. Drysdale, American gynecologist, 1831–1904], one of a number of transparent cells in the fluid of some ovarian cysts. Also called **Bennet's small corpuscle.**

dry skin, epidermis that lacks moisture or sebum, often characterized by a pattern of fine lines, scaling, and itching. Causes include too frequent bathing, low humidity, and decreased production of sebum in aging skin. Treatment includes decreased frequency of bathing, increased humidity, bath oils, emollients such as lanolin and glycerin, and hydrophilic ointments. Also called **xerosis** /zērō′sis/.

dry socket, an inflamed condition of a tooth socket (alveolus) after a tooth extraction. The socket is not actually dry but is filled with a degenerating, infective blood clot. Normally a blood clot forms over the alveolar bone at the base of the socket after an extraction. If the clot fails to form properly or becomes dislodged, bone tissue and nerve endings are exposed to the oral environment and can become infected, a usually painful condition. Analgesics, applied topical sedatives, and drainage are required, in addition to treatment with local or systemic antibiotic therapy to cure the infection. See also **alveolitis.**

dry vomiting [AS, *dryge* + L, *vomere,* to vomit], nausea with retching that does not produce vomitus.

DSA, abbreviation for **digital subtraction angiography.**

DSB, abbreviation for **drug-seeking behavior.**

DSDB, abbreviation for **direct self-destructive behavior.**

DSM, abbreviation for ***Diagnostic and Statistical Manual of Mental Disorders.***

DSM-IV-TR, a text revision of the *DSM-IV* published in 2000, incorporating changes in diagnostic criteria for Tourette's syndrome, Alzheimer-type dementia, dementia caused by other medical conditions, personality change as a result of a general medical condition, exhibitionism, frotteurism, pedophilia, sexual sadism, and voyeurism.

DSN, abbreviation for *Doctor of Science in Nursing*.

DSR, abbreviation for **dynamic spatial reconstructor.**

DST, abbreviation for **dexamethasone.**

DT, abbreviation for **diphtheria and tetanus toxoids.**

DTaP, abbreviation for *diphtheria and tetanus toxoids and pertussis vaccine* in which the pertussis vaccine component is in the acellular rather than whole-cell form.

dTc, abbreviation for the muscle-relaxant drug *d-tubocurarine*.

DTH, abbreviation for **delayed-type hypersensitivity.**

DTIC-Dome, a trademark for an antineoplastic **(dacarbazine).**

DTP vaccine, a combination of diphtheria and tetanus toxoids and acellular pertussis, administered intramuscularly for active immunization against these diseases.

DTR, abbreviation for **deep tendon reflex.**

DTs, abbreviation for **delirium tremens.**

dual-energy absorptiometry (DEXA), an imaging technique that uses two low-dose x-ray beams with different levels of energy to produce a detailed image of body components, used primarily to measure bone mineral density.

dual-energy imaging /dyo͞o′əl/, a radiographic imaging technique in which two radiographs using two different kilovoltages are taken of the same target area. Because the radiographic image of soft tissue and bone varies with the kilovoltage, one radiograph isolates bone contrast and the other isolates soft tissue contrast. The combined x-ray films can facilitate a more precise identification of an abnormality, such as a lung nodule calcification.

dual-energy x-ray absorptiometry (DEXA), an imaging technique for quantifying bone density, used in the diagnosis and management of osteoporosis.

dual-focus tube, an x-ray tube used for diagnostic imaging. It has one large and one small focal spot. The large focal spot is used when techniques that produce high heat are required; the small focal spot is used to produce fine, detailed images.

duality of central nervous system control /dyo͞o·al′itē/, a theory that the normal central nervous system is regulated by a check-and-balance feedback program. The theory is based on studies of posture-movement, mobility-stability, flexion-extension synergies, and similar action-reaction examples related to laws of basic physics. Duality theorists suggest that central nervous system disorders result from imbalances in the feedback system.

dual personality. See **double personality.**

Duane's syndrome /dwānz/ [Alexander Duane, American ophthalmologist, 1858–1926], an autosomal-dominant syndrome in which the affected eye shows limitation or absence of abduction, restriction of adduction, retraction of the globe on adduction, narrowing of the palpebral fissure on adduction and widening on abduction, and deficient convergence. It can be either unilateral or bilateral. It is caused by abnormal innervation of the third and sixth cranial nerves.

DUB, **1.** abbreviation for **dysfunctional uterine bleeding.** **2.** a genetically determined human blood factor that is associated with immunity to certain diseases.

Dubin-Johnson syndrome /do͞o′bin jon′sən/ [Isadore N. Dubin, American pathologist, 1913–1980; Frank B. Johnson, American pathologist, b. 1919], a rare chronic hereditary hyperbilirubinemia, characterized by nonhemolytic jaundice, abnormal liver pigmentation, and abnormal function of the gallbladder. It is caused by inability of the liver to excrete several organic anions. See also **hyperbilirubinemia of the newborn, Rotor's syndrome.**

dubnium (Db) [Joint Institute for Nuclear Research at Dubna, Russia], a transuranic element. Its atomic number is 105; the mass of its best-known isotope is 260. It is produced by an induced nuclear reaction. Also called **element 105.** Formerly called *hahnium*.

DuBois formula /do͞oboiz′/, a logarithmic method of calculating the number of square meters of body surface area of an individual from the height in centimeters, the weight in kilograms, and a constant, 0.007184.

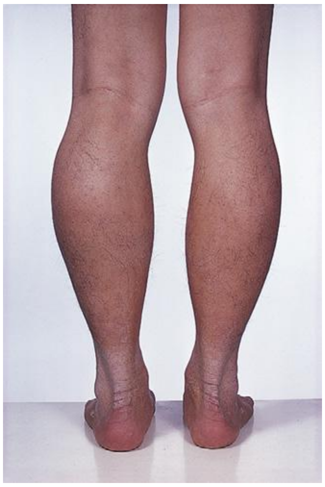
Dubowitz assessment [Victor Dubowitz, South African-English pediatrician, b. 1931], a system of estimating the gestational age of a newborn according to such factors as posture, ankle dorsiflexion, and arm and leg recoil.

Duchenne-Aran disease /do͞oshen′äräN′/ [Guillaume B.A. Duchenne, French neurologist, 1806–1875; François A. Aran, French physician, 1817–1861], muscular atrophy caused by degeneration of the anterior horn cells of the spinal cord, primarily affecting the upper extremities. Chronic muscle wasting and weakness first appear in the hands and advance progressively to the arms and shoulders, eventually affecting the legs and other body areas. Several conditions may lead to this disease, such as the injection of toxins.

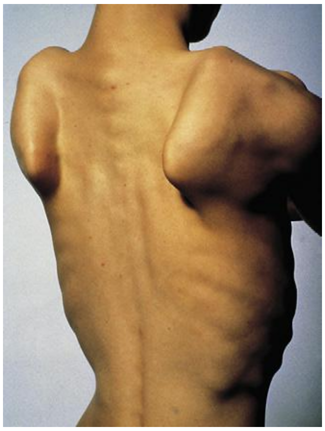
Duchenne-Erb paralysis. See **Erb's palsy.**

Duchenne's disease /do͞oshenz′/ [Guillaume B.A. Duchenne, French neurologist, 1806–1875], a series of three different neurological conditions: **spinal muscular atrophy, bulbar paralysis,** and **tabes dorsalis.** See also **muscular dystrophy.**

Duchenne's muscular dystrophy [Guillaume B.A. Duchenne], an abnormal congenital condition characterized by progressive symmetric wasting of the leg and pelvic muscles. This disease predominantly affects males and accounts for 50% of all muscular dystrophy diseases. It is an X-linked recessive disease that appears insidiously between 3 and 5 years of age and spreads from the leg and pelvic muscles to the involuntary muscles. Associated muscle weakness produces a waddling gait and pronounced lordosis. Muscles rapidly deteriorate, and calf muscles become firm and enlarged as a result of fatty deposits. Affected children experience contractures, have difficulty climbing stairs, often stumble and fall, and display winged scapulae when they raise their arms. Such persons are usually confined to wheelchairs by 12 years of age, and progressive weakening of cardiac muscle causes tachycardia and pulmonary problems. The patients affected may also have cardiac murmurs, faint heart sounds, and chest pain and may suffer arrhythmias or infections that produce overt heart failure. Such complications, especially in the later stages of this disease, can cause sudden death. Duchenne's muscular dystrophy usually causes death within 10 to 15 years of symptom onset. There is no successful treatment of the disease. Orthopedic appliances, exercise, physical therapy, and surgery to correct contractures can help preserve mobility. Nursing care involves psychological support of the patient and family and encouragement of the patient to prevent long periods of bed rest and inactivity and ensure maximum physical activity. Splints, braces, grab bars, and overhead slings help the patient exercise. A wheelchair helps preserve mobility. Other devices that can increase comfort and help prevent footdrop include footboards, high-topped sneakers, and foot cradles. Also called **pseudohypertrophic muscular dystrophy.**



Duchenne's muscular dystrophy: enlargement of calves *(Perkin, 2002)*



Duchenne's muscular dystrophy: winged scapulae *(Mir, 2003)*

Duchenne's paralysis [Guillaume B.A. Duchenne; Gk, *paralyein,* to be palsied], a form of motor neuron disease characterized by wasting and weakness in the laryngeal, pharyngeal, tongue, and facial muscles, leading to dysarthria and dysphagia. There may also be pyramidal tract involvement. Also called *Duchenne's syndrome,* **progressive bulbar paralysis.**

duck embryo vaccine. See **rabies vaccine.**

duck walk. See **metatarsus valgus.**

duct [L, *ducere,* to lead], a narrow tubular structure, especially one through which material is secreted or excreted.

duct carcinoma, a neoplasm of the epithelium of ducts, especially in the breast or pancreas.

duct ectasia, an abnormal dilation of a duct by lipids and cellular debris. In a mammary duct the condition, which tends mainly to affect postmenopausal women, may be accompanied by inflammation and infiltration by plasma cells.

ductile, having the property of allowing metals to be drawn into the thinness of a wire.

ductility /duktil′itē/, the property of a material of having a large elastic range and tending to deform before failing from stress.

duction /duk′shən/, the movement of an individual eyeball from the primary to secondary or tertiary position of gaze.

ductless gland /dukt′les/, a gland lacking an excretory duct, such as an endocrine gland, that secretes hormones directly into blood or lymph.

duct of Rivinus /rivē′nəs/ [Augustus Q. Rivinus, German anatomist, 1652–1723]; [L, *ducere,* to lead], one of the minor sublingual ducts. Compare **Bartholin's duct.**

duct of Wirsung. See **pancreatic duct.**

ductoscopy, endoscopy that assesses early changes in the breast ducts in women.

ductus /duk′təs/, *pl.* **ductus** /duk′to͞os/, the Latin term for **duct.**

ductus arteriosus, a vascular channel in the fetus that joins the pulmonary artery directly to the descending aorta. It normally closes after birth.

ductus deferens. See **vas deferens.**

ductus epididymidis, a tube into which the efferent ductules of the testes empty.

ductus venosus, the vascular channel in the fetus passing through the liver and joining the umbilical vein with the inferior vena cava. Before birth it carries highly oxygenated blood from the placenta to the fetal circulation. It closes shortly after birth as pulmonary circulation is established and as the vessels in the umbilical cord collapse and become occluded. See also **ductus arteriosus, foramen ovale.**

due diligence, efforts made by responsible persons to prevent causing harm to others or their property or organization.

due process, ability to take legal action when rights are violated; derived from the words due, owed or owing as a natural or moral right, and process, to proceed against by law.

Duhring's disease. See **dermatitis herpetiformis.**

Duke longitudinal study, long-range in-depth research into the normal aging process of middle-aged and older men and women conducted at Duke University Medical Center, Durham, NC. The Duke studies led to development of the "longevity quotient" used to evaluate an individual's rate of aging. It is calculated by the number of years a person survives beyond a given time divided by the expected number of years derived from actuarial tables.

Dukes' classification, a staging system for colorectal tumors, from A to D, according to the degree of tissue invasion and metastasis. A Dukes' A tumor is one that is confined to the mucosa and submucosa. A B tumor is one that has invaded the musculature but has not involved the lymphatic system. C tumors have invaded the musculature with metastatic involvement of the regional lymph nodes. D tumors are those that have metastasized to distant organ tissues.

Dulcolax, a trademark for a stimulant laxative **(bisacodyl).**

dull, **1.** blunt. **2.** sluggish. **3.** not sharp, vivid, or intense.

dull pain [ME, *dul,* not sharp; L, *poena,* penalty], a mildly throbbing acute or chronic pain, which may not deter the patient from expected or desired activity.

duloxetine, a miscellaneous antidepressant.

■ INDICATIONS: This drug is used to treat major depressive disorder and neuropathic pain associated with diabetic neuropathy.

■ CONTRAINDICATIONS: Narrow angle glaucoma and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include insomnia, anxiety, dizziness, tremor, fatigue, decreased appetite, decreased weight, thrombophlebitis, peripheral edema, constipation, diarrhea, dysphagia, nausea, vomiting, anorexia, dry mouth, colitis, gastritis, abnormal and delayed ejaculation, erectile dysfunction, urinary hesitation, photosensitivity, bruising, and swelling. A common side effect is abnormal vision.

dumb terminal [AS, *tumb,* mute; L, *terminalis,* end], a computer terminal that serves as an input or output device only and is incapable of performing any data-processing functions by itself. Compare **intelligent terminal.**

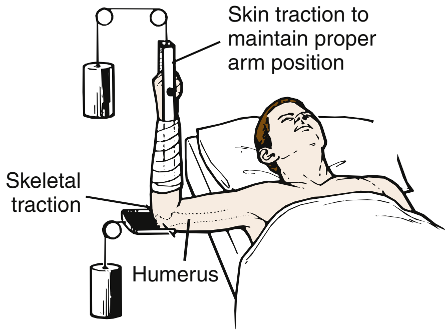
dumdum fever. See **kala-azar.**

dump [ME, *dumpen,* to throw down], **1.** to print out the contents of a computer memory or other computer-storage medium. **2.** the printout resulting from such an operation.

dumping syndrome [ME, *dumpen,* to throw down], the combination of profuse sweating, nausea, dizziness, and weakness experienced by patients who have had a subtotal gastrectomy. Symptoms are felt soon after eating, when the contents of the stomach empty too rapidly into the duodenum. The entrance of this hypertonic material into the small intestine causes fluid to shift into the intestine via osmosis. This increased volume causes peristalsis and diarrhea. The loss of fluid from capillaries causes hypotension with resulting weakness and dizziness. A high-protein, high-calorie diet, with small, dry meals taken frequently, should prevent discomfort and ensure adequate nutrition. See also **gastrectomy.**

Duncan's mechanism [James M. Duncan, English obstetrician, 1826–1890; Gk, *mechane,* machine], a technique for delivery of the placenta with the maternal surface rather than the fetal surface presenting.

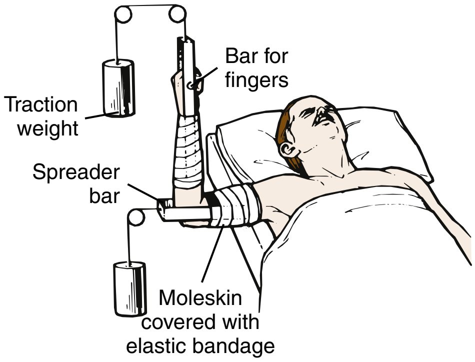
Dunlop skeletal traction, an orthopedic mechanism that helps immobilize the upper arm in the treatment of contracture or supracondylar fracture of the elbow. The mechanism uses a system of traction weights, pulleys, and ropes and may be accompanied by skin traction. Dunlop skeletal traction is usually applied unilaterally but may also be applied bilaterally. Compare **Dunlop skin traction.**



Skin traction to maintain proper arm position
Skeletal traction
Humerus

Dunlop skeletal traction

Dunlop skin traction, an orthopedic mechanism consisting of adhesive or nonadhesive skin traction that helps immobilize the upper limb in the treatment of contracture or supracondylar fracture of the elbow. The mechanism uses a system of traction weights, pulleys, and ropes, usually applied unilaterally but sometimes bilaterally. Compare **Dunlop skeletal traction.**



Dunlop skin traction

duodena. See **duodenum.**

duodenal /do͞o′ədē′nəl/ [L, *duodeni,* 12 fingers], pertaining to the duodenum.

duodenal atresia, congenital absence or occlusion of a portion of the duodenum, characterized by vomiting a few hours after birth, cessation of bowel movements after 1 to 3 days, and usually distension of the epigastrium. It is often associated with Down syndrome.

duodenal bulb, the first part of the superior portion of the duodenum, which has a bulblike appearance on radiographic views of the small intestine.

duodenal digestion [L, *duodeni,* 12 fingers, *digere,* to separate], digestion that occurs in the first intestinal segment beyond the pylorus, where secretions of the liver and pancreas are received and mixed with the partially digested food from the stomach. Chyle is formed, fats are emulsified, starch is hydrolyzed, and proteolytic enzymes begin to break down proteins.

duodenal mesentery. See **mesoduodenum.**

duodenal switch, a surgical treatment for morbid obesity consisting of resection of the greater curvature of the stomach, leaving in place the pylorus and a little of the duodenum, which are anastomosed to the ileum. The rest of the duodenum and jejunum simply empty their secretions into the distal ileum through a new anastomosis.

duodenal ulcer, an ulcer in the duodenum, the most common type of peptic ulcer. See also **peptic ulcer.**

duodenectomy /do͞o′ədēnek′təmē/ [L, *duodeni,* 12 fingers, Gk, *ektomē,* excision], the total or partial excision of the duodenum.

duodenitis /do͞o′ədēnī′tis/ [L, *duodeni,* 12 fingers; Gk, *itis,* inflammation], a condition of inflammation of the duodenum.

duodeno-, prefix meaning "duodenum": *duodenocolic, duodenohepatic, duodenostomy.*

duodenogastric reflux /do͞o′ədē′nōgas′trik/ [L, *duodeni,* 12 fingers + Gk, *gaster,* stomach; L, *refluere,* to flow back], reflux of the contents of the duodenum into the stomach, which may occur normally, especially during fasting.

duodenogastroesophageal reflux. See **gastroesophageal reflux.**

duodenography /do͞o′ədənog′rəfē/ [L, *duodeni,* 12 fingers; Gk, *graphein,* to record], the radiographic examination of the duodenum and pancreas. It usually requires drug-induced paralysis of the duodenum to prevent peristaltic activity, use of a double-contrast medium, and maximum distension with the contrast medium so that the duodenum presses against and outlines the head of the pancreas. Also called *hypotonic duodenography.*

duodenojejunal flexure. See **angle of Treitz.**

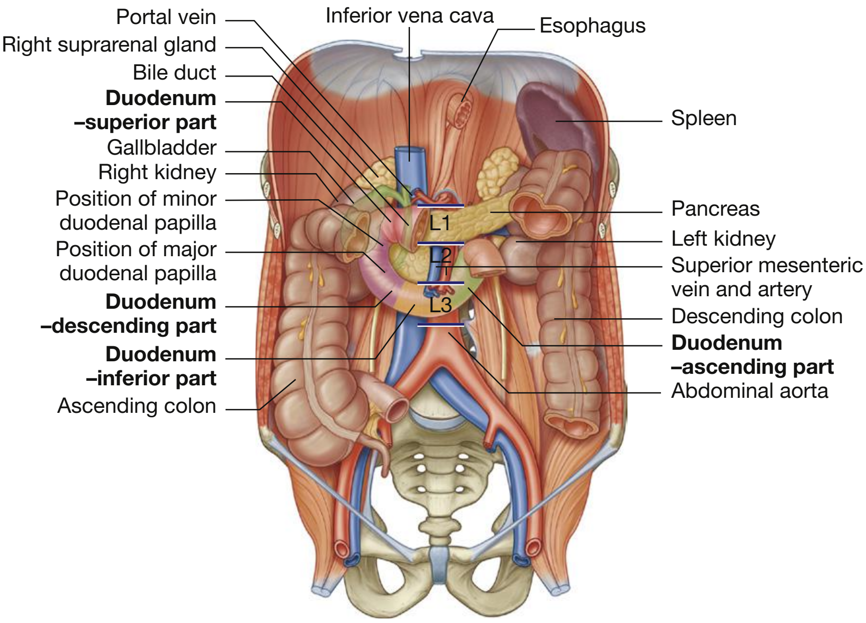
duodenoscope /do͞o′ədē′nəskōp′/, an endoscopic instrument, usually fiberoptic, inserted via the mouth for the visual examination of the duodenum.

duodenoscopy /do͞o′ədənos′kəpē/, the visual examination of the duodenum by means of an endoscope.

duodenostomy /do͞o′ədēnos′təmē/ [L, *duodeni,* 12 fingers; Gk, *stoma,* mouth], the surgical creation of a direct opening to the duodenum through the abdominal wall.

duodenum /do͞o′ədē′nəm, do͞o·od′inəm/ *pl.* *duodena, duodenums* [L, *duodeni,* 12 fingers], the shortest, widest, and most fixed portion of the small intestine, taking an almost circular course from the pyloric valve of the stomach so that its termination is close to its starting point. It is about 25 cm long and is divided into superior, descending, horizontal, and ascending portions. The superior portion extends from the pylorus to the neck of the gallbladder. The descending portion extends from the neck of the gallbladder at the level of the first lumbar vertebra to the cranial border of the fourth lumbar vertebra. The horizontal portion passes from right to left, from the level of the fourth lumbar vertebra to the diaphragm. The ascending portion rises on the left side of the aorta to the level of the second lumbar vertebra, turning ventrally to become the jejunum at the duodenojejunal flexure. Compare **jejunum, ileum.**

dup, (in cytogenetics) abbreviation for *duplication.*



Portal vein
Right suprarenal gland
Bile duct
Duodenum –superior part
Gallbladder
Right kidney
Position of minor duodenal papilla
Position of major duodenal papilla
Duodenum –descending part
Duodenum –inferior part
Ascending colon
Inferior vena cava
Esophagus
Spleen
Pancreas
Left kidney
Superior mesenteric vein and artery
Descending colon
Duodenum –ascending part
Abdominal aorta
L1
L2
L3

Duodenum *(Drake, Vogl, and Mitchell, 2010)*

duplex inheritance. See **amphigenous inheritance.**

duplex kidney /do͞o′pleks/, a kidney that has two separate collecting systems, with either a duplex ureter or a single ureter.

duplex scanner /do͞o′pleks/, an ultrasound machine that generally combines a 7.5- or 10-MHz imaging probe with a 3-MHz pulsed Doppler to allow visualization of a portion of the venous system. The scanner can determine the direction of blood flow within the veins.

duplex transmission [L, *duplex,* twofold], the passage of a neural impulse in both directions along a nerve fiber.

duplex ultrasonography, a combination of real-time and Doppler ultrasonography. See also **duplex scanner.**

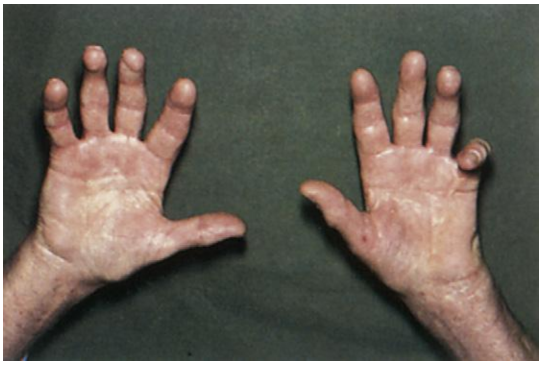
duplicated collecting system. See **double collecting system.**

duplicating film /do͞o′plikā′ting/, a single-emulsion film used to copy an existing radiographic image by exposing it to ultraviolet light.

duplicatus anterior, conjoined twins. See **anadidymus.**

dupp /dup/, a syllable used to represent the second heart sound in auscultation. It is shorter and higher pitched than the first heart sound. See also **heart sound.**

Dupuytren's contracture /dYpY·itraNs′, dēpē·itranz′/ [Guillaume Dupuytren, French surgeon, 1777–1835; L, *contractura* drawing together], a progressive painless thickening and tightening of subcutaneous tissue of the palm, causing the fourth and fifth fingers to bend into the palm and resist extension. Tendons and nerves are not involved. Although the condition begins in one hand, both become symmetrically affected. Of unknown cause, it is most frequent in middle-aged males. Early surgical removal of the excess fibrous tissue under general anesthesia restores full use of the hand. An incision is made in the palm, and the thickened tissue is excised carefully to prevent injury to adjacent ligaments.



Dupuytren's contracture *(Moll, 1997)*

Dupuytren's fracture. See **Galeazzi's fracture.**

dura. See **dura mater.**

durable power of attorney for health care /dyŏŏr′əbəl/, a document that designates an agent or proxy to make health care decisions if the patient is no longer able to make them. The document directs the surrogate person to function as "attorney-in-fact" and make decisions regarding all treatment, including the final decision about cessation of treatment.

Durabolin, a trademark for an anabolic steroid (nandrolone phenpropionate).

dural sac /dyŏŏr′əl/, the blind pouch formed by the lower end of the dura mater, at the level of the second sacral segment.

dural sheath, an extension of the dura mater covering the optic nerve and spinal nerve roots.

dural venous sinuses, endothelial-lined spaces between the outer periosteal and inner meningeal layers of the dura mater into which empty the cerebral veins, the cerebellar veins, and the veins draining the brainstem and that lead to the internal jugular veins.

dura mater /do͞o′rə mā′tər, dyŏŏ′rə/ [L, *durus,* hard, *mater,* mother], the outermost and most fibrous of the three membranes surrounding the brain and spinal cord. The dura mater encephali covers the brain, and the dura mater spinalis covers the cord. See also **meninges.**

Duranest, a trademark for a local anesthetic (etidocaine hydrochloride).

duration, the length of time a current is flowing. Also called **pulse width.**

duration tetany, a tetanic contraction occuring in response to the application of a galvanic current. See **tetany.**

duress /dyo͞ores′/ [L, *durus,* hard], (in law) an action compelling another person to do what he or she would not do voluntarily. A consent form signed under duress is not valid.

Durham-Humphrey Amendment, a 1952 modification of the 1938 U.S. Food, Drug, and Cosmetic Act. It differentiates between prescription and over-the-counter medications and specifies medications that can or cannot be refilled without a new prescription. It also identifies which original prescriptions and refills can be authorized over the telephone.

Duroziez' murmur /dY′rōzyās, dir′-, do͞o′r-/ [Paul L. Duroziez, French physician, 1826–1897; L, *murmur*], a systolic murmur heard over the femoral or another large artery when the artery is compressed. The phenomenon is associated with high arterial pulse pressure or aortic insufficiency. A diastolic murmur may also be heard when pressure on the artery is increased distal to the stethoscope.

dust [AS], any fine, particulate, dry matter. Kinds of dust include **inorganic dust** and **organic dust.**

dustborne infection, a disease in which the pathogenic organism is airborne in dust particles, as in coccidioidomycosis.

dust fever. See **brucellosis.**

dutasteride, a sex hormone 5 alpha-reductase inhibitor used to treat benign prostatic hyperplasia in men with an enlarged prostate gland.

Dutch type periodic fever. See **hyperimmunoglobulinemia D syndrome.**

Dutton's relapsing fever [Joseph E. Dutton, English pathologist, 1877–1905], an infection caused by a spirochete, *Borrelia duttonii,* which is transmitted by a soft tick, *Ornithodoros moubata,* found in human dwellings in tropical Africa. The spirochete enters the lesion through a tick bite, characteristically producing a high fever, chills, rapid heartbeat, headache, joint and muscle pain, vomiting, and neurological disorders. The symptoms recur in a pattern of remissions and peaks of fever and other effects. The infection is spread through the community as ticks bite infected people, thereby acquiring the spirochete for inoculation in others. Treatment with tetracycline is usually effective in curing the infection. Also called **African relapsing fever, tick-borne relapsing fever.** See also **relapsing fever.**

duty [ME, *duete,* conduct], (in law) an obligation owed by one party to another. Duty may be established by statute or other legal process, as by contract or oath supported by statute, or it may be voluntarily undertaken. Every person has a duty of care to all other people to prevent causing harm or injury by negligence.

duty cycle, the percentage of time that ultrasound is being generated (pulse duration) over one pulse period. Also called *duty factor,* **mark:space ratio.**

Duverney's fracture /do͞o′vərnāz′/ [Joseph G. Duverney, French anatomist, 1648–1730], a break in the ilium just below the anterior superior spine.

Duvoid, a trademark for a cholinergic receptor agonist **(bethanechol chloride).**

DVD, abbrevation for *digital video disk,* an optical computer disk that is used to digitally store large graphic and video content in two layers (gold and silver). A DVD can hold many gigabytes of information. Commercial DVDs contain entire motion pictures or other video data. Compare **compact disc.**

dV/dt, the rate of change of voltage with respect to time.

D.V.M., abbreviation for *Doctor of Veterinary Medicine.*

DVT, abbreviation for **deep vein thrombosis.**

dwarf /dwôrf/ [AS, *dweorge*], **1.** *n,* also called **nanus.** an abnormally short, undersized person, especially one whose body parts are not proportional. Kinds of dwarfs include **achondroplastic dwarf, asexual dwarf, ateliotic dwarf, Brissaud's dwarf, cretin dwarf, diastrophic dwarf, nanocephalic dwarf, phocomelic dwarf, pituitary dwarf, primordial dwarf, rachitic dwarf, renal dwarf, Russell dwarf, sexual dwarf, Silver dwarf,** and **thanatophoric dwarf. 2.** *v,* to prevent or retard, for example, normal growth.

dwarfism /dwôrf′izəm/, the abnormal underdevelopment of the body, characterized predominantly by extreme shortness of stature, although the condition is associated with numerous other defects and may involve varying degrees of mental retardation. Dwarfism has multiple causes, including genetic defects, endocrine dysfunction involving either the pituitary or the thyroid gland, chronic diseases such as rickets, renal failure, intestinal malabsorption defects, and psychosocial stress, as in the maternal deprivation syndrome. See also **dwarf.**

dwarf tapeworm infection, a type of intestinal parasitic disease caused by an infestation of *Hymenolepis nana*. It occurs mainly in the southern United States and usually affects children who ingest eggs by placing contaminated materials into the mouth. It is the most common tapeworm infection diagnosed in the United States and throughout the world. The disease may be asymptomatic or may result in abdominal complaints and diarrhea. An infection may be treated with niclosamide or paromomycin. Prevention involves good hygiene practices. It is often seen in children subject to institutional living. See also ***Hymenolepis.***

Dwayne-Hunt law /dwān′hunt′/, the principle that x-ray energy is inversely proportional to the photon wavelength. Thus, as the photon wavelength increases, photon energy decreases, and vice versa.

dwell time, the time that something therapeutic or diagnostic remains inside a patient's body. In peritoneal dialysis, the time needed for the dialysis solution to remain in the body for equilibration to be reached on the two sides of the membrane.

dwindles, *(informal)* a condition of physical deterioration involving several body systems, usually in an elderly person.

Dwyer instrumentation /dwī′ər/, one method for correcting the spinal curvature associated with scoliosis, involving a cable that is inserted to assist in maintaining the corrected curvature while the fusion heals. It is not usually removed unless there is postoperative indication of displacement or a pattern of associated symptoms. Dwyer cable instrumentation involves surgical intervention through the pulmonary cavity and the rib cage and is accompanied by a relatively greater surgical risk than a posterior approach. It is often inadequate to correct the spinal curvature involved and must frequently be followed several weeks later by a posterior spinal fusion.

D-xylose absorption test, a blood or urine test whose results reflect intestinal absorption, of the monosaccharide D-xylose, which is not metabolized by the body. In patients with malabsorption, intestinal D-xylose absorption is diminished, and as a result, blood levels and urine excretion are reduced. The test is used to separate patients with diarrhea caused by maldigestion (pancreatic/biliary dysfunction) from those with diarrhea caused by malabsorption (sprue, Whipple's disease, Crohn's disease).

D-xylose breath test, a breath test for bacterial overgrowth in the intestine in which the fasting patient is administered a dose of D-xylose labeled with carbon 14 and the amount of radiolabeled carbon dioxide in the breath is measured at regular time intervals. Excessive levels of carbon dioxide mean that there are high levels of anaerobic bacteria in the intestines breaking down the xylose.

Dy, symbol for the element **dysprosium.**

dyad /dī′ad/ [Gk, *dyas,* two], one of the paired homologous chromosomes, consisting of two chromatids, that result from the division of a tetrad in the first meiotic division of gametogenesis. **—***dyadic, adj.*

dyadic interpersonal communication /dī·ad′ik/, a process in which two people interact face to face as senders and receivers, as in a conversation.

Dyazide, a trademark for a fixed-combination drug containing two diuretic agents (potassium-sparing **triamterene** and potassium-losing **hydrochlorothiazide).**

dyclonine hydrochloride /dī′klənīn/, a local anesthetic, with bactericidal and fungicidal properties, for oral pain, pruritus, insect bites, and minor skin burns and injuries.

dye /dī/ [AS, *deag*], **1.** *v,* to apply coloring to a substance. **2.** *n,* a chemical compound capable of imparting color to a substance to which it is applied. Various dyes are used in medicine as stains for tissues, test reagents, therapeutic agents, and coloring agents in pharmaceutic preparations.

dye laser, a system of highly selective laser destruction of skin blemishes using various dyes at wavelengths at the longer oxygenated hemoglobin absorption peaks to overcome interference from overlying melanin.

dying care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the promotion of physical comfort and psychological peace in the final phase of life. See also **Nursing Interventions Classification.**

Dymelor, a trademark for an antidiabetic **(acetoHEXAMIDE).**

-dynamia, -dynamy, suffix meaning "(condition of) strength": *ataxiadynamia, hyperdynamia, plastodynamia.*

dynamic /dīnam′ik/ [Gk, *dynamis,* force], **1.** tending to change or to encourage change, such as a dynamic nurse-patient relationship. **2.** (in respiratory therapy) a condition of changing volume. Compare **static.**

dynamic cardiac work, the energy transfer that occurs during the ventricular ejection of blood.

dynamic compliance, the distensibility of the lungs, as measured by plethysmography during the breathing cycle. See also **lung compliance.**

dynamic equilibrium, the ability of a person to adjust to displacements of the body's center of gravity by changing its base of support.

dynamic ileus, an intestinal obstruction with associated recurrent and continuous muscle spasms. Also called **spastic ileus.**

dynamic imaging, the ultrasonographic imaging of an object in motion at a frame rate that does not cause significant blurring of images and at a repetition rate sufficient to represent the movement pattern adequately. Also called **real-time imaging.**

dynamic nurse-patient relationship, a conceptual framework in which the interpersonal aspects of the nurse-patient relationship are analyzed. Many factors affect the relationship. Elements in the process include the behavior of the patient, the reaction of the nurse, and the actions of the nurse that are intended to aid the patient. Also examined are the means for validating nurses' perceptions and interpretations and for evaluating the effects of the nursing actions taken.

dynamic orthosis, a medical device that allows movement in desired joint(s); a splint that assists an individual with movements. See **orthosis.**

dynamic psychiatry, the study of motivational, emotional, and biological factors as determinants of human behavior.

dynamic range, **1.** in radiology, the range of voltage or input signals that result in a digital output. **2.** the range of sound intensity from the faintest sound a person can hear to the level that causes pain.

dynamic response, the accuracy with which a physiological monitoring system such as an electrocardiograph simulates the actual event being recorded.

dynamic retinoscopy, a type of retinoscopy in which the patient fixes the gaze on a target at a near distance. Accommodation is active.

dynamic spatial reconstructor (DSR), a radiographic device that allows moving, three-dimensional images of organs to be examined from any direction. It is used in research.

dynamic splint [Gk, *dynamis,* force; D, *splinte*], any splint that incorporates springs, elastic bands, or other materials that produce a constant active force to counteract deforming forces of a splint.

dynamo-, prefix meaning "power or strength": *dynamogenesis, dynamometer, dynamophore.*

dynamometer /dī′nəmom′ətər/ [Gk, *dynamis,* force, *metron,* measure], a device for measuring the degree of force used in the contraction of a group of muscles, such as a squeeze dynamometer, which measures the gross grip strength of the hand muscles. Also called **ergometer.**

-dynamy. See **-dynamia.**

Dynapen, a trademark for an antibiotic **(dicloxacillin sodium).**

dyne /dīn/, a unit of force, specifically the force required to accelerate a free mass of 1 g at 1 cm/sec. One dyne equals 10^{-5} newton.

-dynia, suffix meaning "pain": *cephalodynia, gastrodynia.*

dynode /dī′nōd/, one of a series of platelike elements that amplify electron pulses in a photomultiplier tube. Each electron that strikes a dynode causes several secondary electrons to be emitted. The dynode gain is the ratio of the number of secondary electrons to the number of incident electrons.

dynorphin /dīnôr′fən/, an endogenous opioid derived from the prohormone prodynorphin. It is a neuroactive peptide with potent analgesic effects.

dyphylline /dīfil′in/, a methylxanthine bronchodilator.

■ INDICATIONS: It can be prescribed in the treatment of bronchospasm in acute bronchial asthma, bronchitis, and emphysema but is no longer widely used.

■ CONTRAINDICATIONS: It is used with caution in patients with peptic ulcer or cardiovascular disease. Known hypersensitivity to this or to other xanthines prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are GI distress, dizziness, tachycardia, headache, and palpitations.

Dyrenium, a trademark for a potassium-sparing diuretic **(triamterene).**

dys-, prefix meaning "bad, painful, disordered": *dysadrenia, dysbolism, dysmnesia.*

dysacusis /dis′əko͞o′sis/ [Gk, *dys,* difficult, *akouein,* to hear], **1.** any impairment of hearing involving difficulty processing details of sound as opposed to any loss of sensitivity to sound. **2.** pain or discomfort in the ear from exposure to sound. Also called *dysacousia, dysacousis.*

dysadrenia /dis′adrē′nē·ə/ [Gk, *dys,* bad; L, *ad,* to, *ren,* kidney], abnormal adrenal function characterized by decreased hormone production, as in hypoadrenalism or hypoadrenocorticism, or by increased secretion of the products of the gland, as in hyperadrenalism or hyperadrenocorticism. Also called *dysadrenalism.*

dysaesthesia. See **dysesthesia.**

dysaphia. See **paraphia.**

dysarthria /disär′thrē·ə/ [Gk, *dys* + *arthroun,* to articulate], difficult, poorly articulated speech, resulting from interference in the control and execution over the muscles of speech usually caused by damage to a central or peripheral motor nerve.

dysarthrosis /dis′ärthrō′sis/ [Gk, *dys,* difficult, *arthron,* joint], any disorder of a joint, including disease, dislocation, or deformity, that makes movement of the joint difficult.

dysautonomia /disô′tənō′mē·ə/ [Gk, *dys* + *autonomia,* self-government], an autosomal-recessive disease of childhood characterized by defective lacrimation, skin blotching, emotional instability, motor incoordination, total absence of pain sensation, and hyporeflexia, seen almost exclusively in Ashkenazi Jews. Also called **familial autonomic dysfunction, familial dysautonomia, Riley-Day syndrome.**

dysbarism /dis′bäriz′əm/, a reaction to a sudden change in environmental pressure, such as rapid exposure to the lower atmospheric pressures of high altitudes. It is marked by symptoms similar to those of decompression sickness.

dysbasia /disbā′zhə/, difficulty in walking caused by a nerve lesion or lameness associated with atherosclerosis.

dysbetalipoproteinemia /disbet′əlip′əprō′tinē′mē·ə/. See **broad beta disease.**

dyscholia /diskō′lē·ə/ [Gk, *dys* + *chole,* bile], any abnormal condition of the bile, related to either the quantity secreted or the condition of the constituents.

dyschondroplasia. See **enchondromatosis.**

dyschroic film fault /diskrō′ik/, a defect in a photograph or radiograph that appears as a pinkish coloration when the film is viewed by transmitted light and as a green coloration when the film is viewed by reflected light. It is usually caused by incomplete fixation of the film or by an overused fixing solution with a depleted acid concentration.

dyscrasia /diskrā′zhə/ [Gk, *dys* + *krasis,* mingling], pertaining to an abnormal condition of the blood or bone marrow, such as leukemia, aplastic anemia, or prenatal Rh incompatibility.

dyscrastic fracture /diskras′tik/, any fracture caused by the weakening of a specific bone as a result of a debilitating disease.

dysdiadochokinesia /dis′dī·ədō′kōkinē′zhə/ [Gk, *dys* + *diadochos,* working in turn, *kinesis,* movement], an inability to perform rapidly alternating movements, such as rhythmically tapping the fingers on the knee. The cause is a cerebellar lesion and is related to dysmetria, which also involves inappropriate timing of muscle activity.

dyseidetic /dis′idet′ik/, dyslexic regarding the sight or recognition of whole words.

dysenteric /dis′enter′ik/ [Gk, *dys* + *enteron,* intestine], pertaining to or resembling dysentery.

dysentery /dis′inter′ē/ [Gk, *dys* + *enteron,* intestine], an inflammation of the intestine, especially of the colon. The most common causes are bacterial (***Shigella*** infection) and amebic (***Entamoeba histolytica*** infection), although it can also be caused by chemical irritants. It is characterized by frequent and bloody stools, abdominal pain, and tenesmus. Dysentery is common in underdeveloped areas of the world and in times of disaster and social disorganization when sanitary living conditions, clean food, and safe water are not available. Treatment involves rehydration therapy. See also **amebic dysentery, shigellosis.**

dysentery toxin, an exotoxin produced by ***Shigella dysenteriae.***

dysentry. See **dysentery.**

dysergia /disur′jē·ə/ [Gk, *dys* + *ergon,* work], a condition characterized by lack of muscle coordination caused by a defect of efferent nerve impulses.

dyserythropoiesis, defective development of erythrocytes.

dysesthesia /dis′esthē′zhə/, a common effect of spinal cord injury characterized by sensations of numbness, tingling, burning, or pain felt below the level of the lesion. It may also follow a dermatome distribution of a spinal nerve, as in the pain of shingles. Also spelled *dysaesthesia*.

dysfibrogenemia /disfi′brojĕne′mīə/, the presence in the blood of abnormal fibrinogen; secondary to liver disease.

dysfluency /disflo͞o′ənsē/ [Gk, *dys*-, difficult + L, *fluere,* to flow], difficulty of proceeding, said of speech disorders such as stuttering. —*dysfluent, adj.*

dysfunctional /disfungk′shənəl/ [Gk, *dys* + L, *functio,* performance], (of a body organ or system) unable to function normally. —*dysfunction, n.*

dysfunctional communication, a communication that results from inaccurate perceptions, faulty internal filters (personal interpretations of information), and social isolation. Communication behaviors of emotionally ill persons may have characteristics that prevent their establishing and maintaining relationships with others.

dysfunctional stereotype, a stereotype in which abnormal or impaired aspects of a culture are emphasized.

dysfunctional uterine bleeding (DUB), abnormal uterine bleeding that is not caused by a tumor, inflammation, or pregnancy. It may be characterized by painless, irregular heavy bleeding or intermenstrual spotting or periods of amenorrhea. The condition is associated with anovulation and unopposed estrogen stimulation. The plan of treatment depends on the patient's age and may include dilation and curettage and use of hormones and other medications.

dysgammaglobulinemia /disgam′əglob′yəlinē′mē·ə/, an inherited immunodeficiency disease. Affected individuals do not produce adequate numbers of immunoglobulins, including antibodies, and therefore are susceptible to infection, cancer, and other diseases. Also spelled *dysgammaglobulinaemia*.

dysgenesis /disjen′əsis/ [Gk, *dys* + *genein,* to produce], **1.** also called *dysgenesia,* defective or abnormal formation of an organ or part, primarily during embryonic development. **2.** impairment or loss of ability to procreate. A kind of dysgenesis is **gonadal dysgenesis.** Compare **agenesis.** —*dysgenic, adj.*

dysgenics /disjen′iks/, the study of factors or situations that are genetically detrimental to the future of a race or species. Compare **eugenics.**

dysgenitalism /disjen′itəliz′əm/ [Gk, *dys* + L, *genitalis,* belonging to birth], any condition involving the abnormal development of the genital organs.

dysgerminoma /dis′jərminō′mə/ *pl. dysgerminomas, dysgerminomata* [Gk, *dys* + L, *germen,* germ; Gk, *oma,* tumor], a rare malignant tumor of the ovary that occurs in young women and is believed to arise from the undifferentiated germ cells of the embryonic gonad. The tumor is histologically identical to seminoma. Dysgerminomas are extremely sensitive to irradiation and chemotherapy, and most patients retain their fertility. Also called **embryoma of the ovary, ovarian seminoma.**

dysgeusia /disgo͞o′zhə/ [Gk, *dys* + *geusis,* taste], an abnormal or impaired sense of taste.

dysglandular /disglan′dyələr/, caused by or related to excessive or inadequate secretion by a gland.

dysgnathia, malformation and/or abnormalities of the teeth that involve the jaws.

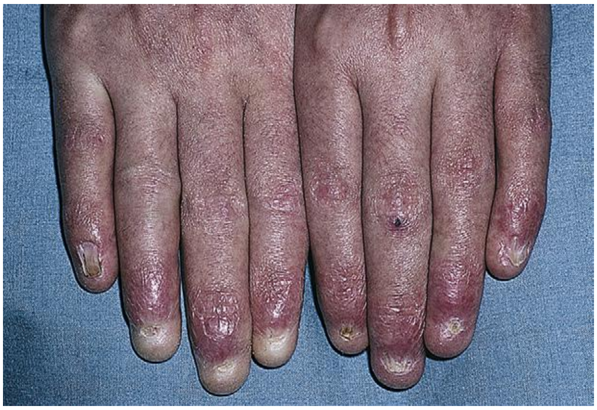
dysgnathic anomaly /disnath′ik/ [Gk, *dys* + *gnathos,* jaw], an abnormality that affects one or both jaws. Also called **dysgnathia.**

dysgraphia /disgraf′ē·ə/ [Gk, *dys* + *graphein,* to write], an impairment of the ability to write. Compare **agraphia.**

dyshidrosis /dishīdrō′sis/ [Gk, *dys,* difficult + *hidros,* sweat], any disorder of the eccrine sweat glands. Also spelled *dyshydrosis*.

dyskeratosis /dis′kerətō′sis/ [Gk, *dys* + *keras,* horn, *osis,* condition], an abnormal or premature keratinization of epithelial cells.

dyskeratosis congenita, an X-linked syndrome with onset in childhood, characterized by nail dystrophy, reticular cutaneous hyperpigmentation, mucosal leukokeratosis, and pancytopenia resembling that of Fanconi's syndrome.



Dyskeratosis congenita: nail dystrophy

(Callen et al, 2000)

dyskinesia /dis′kinē′zhə/ [Gk, *dys* + *kinesis,* movement], an impairment of the ability to execute voluntary movements. Tardive dyskinesia is caused by an adverse effect of prolonged use of phenothiazine medications in elderly patients or persons with brain injuries. See also **tardive dyskinesia.** —*dyskinetic* /-et′ik/, *adj.*

dyskinesia intermittens, a condition of intermittent limping caused by circulatory impairment.

dyskinetic syndrome /dis′kinet′ik/, a form of cerebral palsy involving a basal ganglion disorder. Clinical features include athetoid movements of the extremities and sometimes the trunk. There may also be choreiform movements that tend to increase with emotional tension and diminish during sleep.

dyslexia /dislek′sē·ə/ [Gk, *dys* + *lexis,* word], an impairment of the ability to read, as a result of a variety of pathological conditions, some of which are associated with the central nervous system. Dyslexic persons often reverse letters and words, cannot adequately distinguish the letter sequences in written words, and have difficulty determining left from right. Compare **alexia.** —*dyslexic, adj.*

dyslipidemia /dislip′id·ē′mē·ə/ [Gk, *dys,* difficult + *lipid* + Gk, *haima,* blood], abnormality in, or abnormal amounts of, lipids and lipoproteins in the blood. See also **hyperlipidemia**, **hypolipoproteinemia.**

dysmaturity /dis′macho͝or′itē/ [Gk, *dys* + L, *maturare,* to make ripe], **1.** the failure of an organism to develop, ripen, or otherwise achieve maturity in structure or function. **2.** the condition of a fetus or newborn who is abnormally small or large for its age of gestation. Kinds of dysmaturity are **small for gestational age** and **large for gestational age.** Compare **postmature infant, premature.** —*dysmature, adj.*

dysmegalopsia /dis′megəlop′sē·ə/ [Gk, *dys* + *megas,* large, *opsis,* appearance], an inability to judge the size or measure of an object accurately. Also called **dysmetropsia.**

dysmelia /dismē′lyə/ [Gk, *dys* + *melos,* limb], an abnormal congenital condition characterized by missing or shortened extremities of the body and associated with abnormalities of the spine in some individuals. It is caused by abnormal metabolism during the embryonic development of the limbs. See also **phocomelia.**

dysmenorrhea /dis′menərē′ə/ [Gk, *dys* + *men,* month, *rhein,* to flow], pain associated with menstruation. **Primary dysmenorrhea** is menstrual pain that results from factors intrinsic to the uterus and the process of menstruation. It is extremely common, occurring at least occasionally in almost all women. If the painful episode is mild and brief, it is considered functional and normal and requires no treatment. In approximately 10% of women, dysmenorrhea is sufficiently severe to cause episodes of partial or total disability. The cause in most cases is poorly understood; various anatomical, neurohormonal, and psychosomatic abnormalities have been suggested. Pain occurs typically in the lower abdomen or back and is crampy, occurring in successive waves, apparently in conjunction with intense uterine contractions and slight cervical dilation. Pain usually begins just before or at the onset of, menstrual flow and lasts from a few hours to 1 day or more. It may persist through the entire period in a few women. Pain is frequently associated with nausea, vomiting, and frequent bowel movements with intestinal cramping. Dizziness, fainting, pallor, and obvious distress may also be observed. Treatment with an antiprostaglandin provides relief for many women if begun 1 to 3 days before menstruation and continued through the first day of the menses. Oral contraceptive steroids are also effective for many women and are taken through the full monthly cycle. Potent analgesics or narcotics may be required by a few women. Secondary dysmenorrhea is menstrual pain that occurs secondary to specific pelvic abnormalities, such as endometriosis, adenomyosis, chronic pelvic infection, chronic pelvic congestion, or degenerating fibroid tumors. Typically the pain begins earlier in the cycle and lasts longer than the pain of primary dysmenorrhea. Painful bowel or bladder function may accompany the condition, depending on the location of the specific lesions. Diagnosis of the chief cause is made by pelvic examination, ultrasonography, laparoscopy, or laparotomy. Treatment is directed at the specific organic disease involved. Also spelled *dysmenorrhoea.* Also called *menorrhalgia.*

dysmetria /dismē′trē·ə/ [Gk, *dys* + *metron,* measure], an abnormal condition that prevents the affected individual from properly measuring distances associated with muscular acts and from controlling muscular action. It is associated with cerebellar lesions and typically characterized by overestimating or underestimating the range of motion needed to place the limbs correctly during voluntary movement. A normal person with eyes closed can move the arms from a position of 90 degrees of flexion to a position over the head and then return them to the 90-degree position; a person with dysmetria is unable to perform this test accurately. See also **hypermetria, hypometria.**

dysmetropsia, a visual illusion. See **dysmegalopsia.**

dysmnesic syndrome /disnē′sik/, a memory disorder characterized by an inability to learn simple new skills, although the person can still perform highly complex skills learned before the onset of the condition. The cause is a disease or injury that affects only certain brain tissues associated with memory. The victim often confabulates about events of the recent past for which there is no clear memory. Also called *dysmnesia.*

dysmorphogenesis /dis′môrfōjen′əsis/, the development of ill-shaped or otherwise malformed body structures.

dysmorphophobia /-fō′bē·ə/ [Gk, *dys* + *morphe,* form, *phobos,* fear], **1.** a fundamental delusion of body image. **2.** the morbid fear of deformity.

dysmyelination /dismi′ĕ-lina′shun/, breakdown or defective formation of a myelin sheath, usually involving biochemical abnormalities.

dysorexia /dis′ôrek′sē·ə/, **1.** an eating disorder associated with emotional or psychological impairment. **2.** a diminished, disordered, or unnatural appetite.

dysostosis /dis′ostō′sis/ [Gk, *dys* + *osteon,* bone, *osis*], an abnormal condition characterized by defective ossification, especially defects in the normal ossification of fetal cartilages. Kinds of dysostoses include **cleidocranial dysostosis, craniofacial dysostosis, mandibulofacial dysostosis, metaphyseal dysostosis,** and **Nager's acrofacial dysostosis.**

dysostosis mandibularis. See **Nager's acrofacial dysostosis.**

dyspareunia /dis′pəro͞o′nē·ə/, an abnormal pain during sexual intercourse due to a spasm. It may result from abnormal conditions of the genitalia, dysfunctional psychophysiological reaction to sexual union, forcible coition, or incomplete sexual arousal. Dyspareunia is also associated with hormonal changes of menopause and lactation that result in drying of the vaginal tissues and with endometriosis, which may result in painful adhesions around the vagina and ligaments, decreasing their flexibility during intercourse. Dryness is commonly relieved by the local application of water-soluble lubricants. See also **vaginismus.**

dyspepsia /dispep′sē·ə/ [Gk, *dys* + *peptein,* to digest], a vague feeling of epigastric discomfort after eating. There is an uncomfortable feeling of fullness, heartburn, bloating, and nausea. Dyspepsia is not a distinct condition, but it may be a sign of an underlying intestinal disorder such as peptic ulcer, gallbladder disease, or chronic appendicitis. Symptoms usually increase in times of stress. —**dyspeptic,** *adj.*

dysphagia /disfā′jē·ə/ [Gk, *dys* + *phagein,* to swallow], difficulty in swallowing, commonly associated with obstructive or motor disorders of the oropharynx, hypopharynx, or esophagus. Patients with obstructive disorders, such as esophageal tumor or lower esophageal ring, are unable to swallow solids but can tolerate liquids. Persons with motor disorders, such as achalasia, are unable to swallow solids or liquids. Diagnosis of the underlying condition is made through barium studies, the observed clinical signs, and evaluation of the patient's symptoms. See also **achalasia, aphagia, corkscrew esophagus.**

dysphagia lusoria, an abnormal condition characterized by difficulty in swallowing, caused by the compression of the esophagus from an anomalous right subclavian artery that arises from the descending aorta and courses behind or in front of the esophagus. Compare **contractile ring dysphagia, vallecular dysphagia.**

dysphasia. See **aphasia.**

dysphonia /disfō′nē·ə/ [Gk, *dys* + *phone,* voice], any abnormality in the speaking voice, such as hoarseness. Dysphonia puberum refers to the voice changes that occur in adolescent boys.

dysphoria /disfôr′ē·ə/, a disorder of affect characterized by depression and anguish.

dysphrasia. See **aphasia.**

dysphylaxia /dis′filek′sē·ə/, a sudden awakening from deep sleep or a condition marked by too early awakening.

dyspigmentation /dispig′məntā′shən/, any abnormal increase or decrease in the production or distribution of skin pigment. See also **depigmentation.**

dysplasia /displā′zhə/ [Gk, *dys* + *plassein,* to form], any abnormal development of tissues or organs. An alteration in cell growth resulting in cells that differ in size, shape, and appearance, often as a result of chronic irritation. Common sites for dysplasia are the respiratory tract in smokers and the cervix.

-dysplasia, suffix meaning "(condition of) abnormal development": *chondrodysplasia, epidermodysplasia, osteomyelodysplasia.*

dysplasia epiphysealis hemimelica, a rare condition characterized by swellings in the extremities, usually on the inner and outer aspects of the ankles and knees, consisting of bone covered with epiphyseal cartilage, leading to limitation of motion of the joints. Also called **Trevor's disease.**

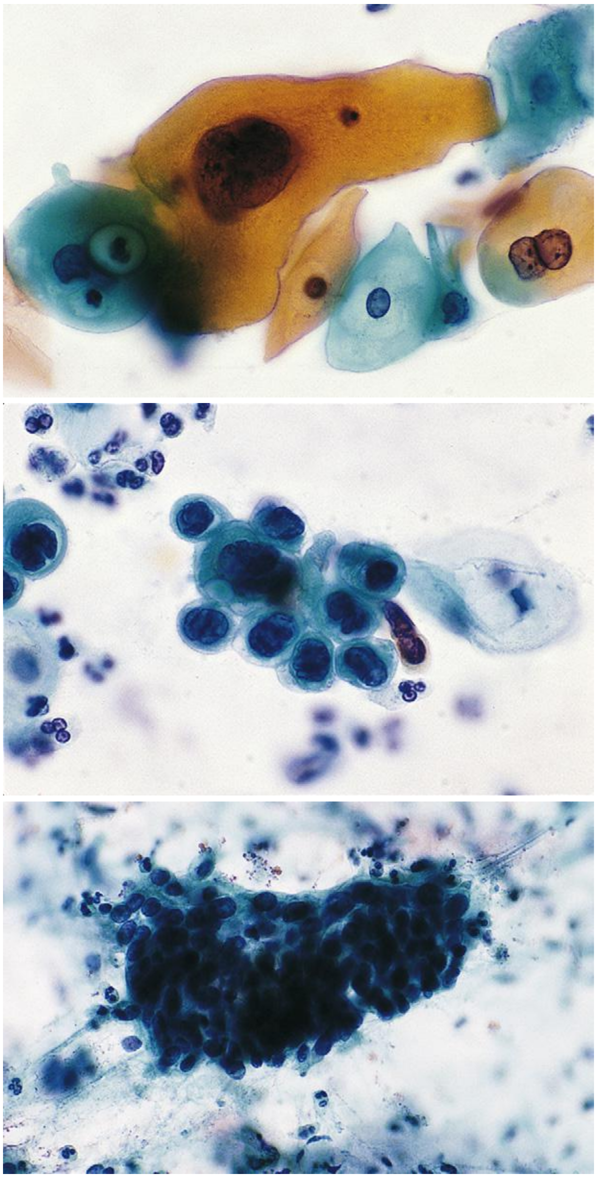
dysplastic nevus, an acquired atypical nevus with an irregular border, indistinct margin, and mixed coloration, often occurring in large numbers and often a precursor of malignant melanoma.

dysplastic nevus syndrome, an inherited genetic syndrome that causes the individual to have a large number of nevi (moles), often 100 or more. These nevi tend to become dysplastic and predispose the individual to the development of malignant melanoma. Also called familial atypical mole-malignant melanoma syndrome (FAMMM) and B-K mole syndrome.

dyspnea /dispnē′ə/ [Gk, *dys* + *pnoia,* breathing], a distressful subjective sensation of uncomfortable breathing that may be caused by many disorders, including certain heart and respiratory conditions, strenuous exercise, or anxiety. Also spelled *dyspnoea.* Also called **breathlessness.** Compare **hyperpnea.** —*dyspneal, dyspneic, adj.*

dyspraxia /disprak′sē·ə/ [Gk, *dys* + *prassein,* to do], a partial loss of the ability to perform skilled, coordinated movements in the absence of any associated defect in motor or sensory functions. See also **apraxia.**

dysprosium (Dy) /disprō′sē·əm/ [Gk, *dys* + *prositos,* to approach], a rare-earth metallic element. Its atomic number is 66, and its atomic mass is 162.50. Radioactive isotopes of dysprosium are used in radioisotope scanning, particularly in studies of the bones and joints.



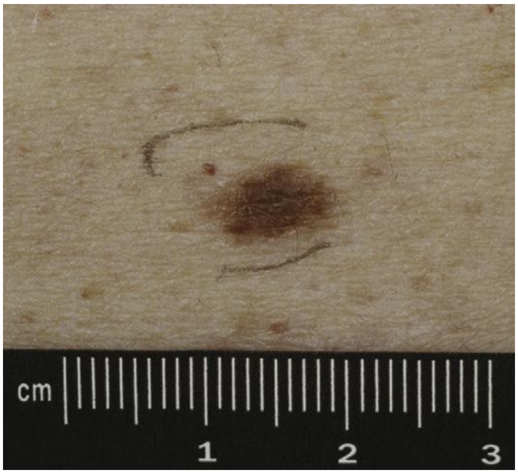
Top, **Mild dysplasia.** ***Center,*** **Severe dysplasia.** ***Bottom,*** **Carcinoma in situ** *(Damjanov and Linder, 2000)*

dysproteinemia /disprō′tēnē′mē·ə/ [Gk, *dys* + *protos,* first, *haima,* blood], an abnormality of the protein content of the blood, usually involving the immunoglobulins.

dysraphia /disrā′fē·ə/ [Gk, *dys* + *raphe,* seam], failure of a raphe (an atomic seam) to fuse completely, as in incomplete closure of the neural tube. Also called **status dysraphicus.**

dysraphic syndrome /disraf′ik/, a developmental disorder, usually involving the spinal cord, such as encephalocele or myelomeningocele. See also **Arnold-Chiari malformation.**

dysreflexia management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as prevention and elimination of stimuli that cause hyperactive reflexes and inappropriate autonomic responses in a patient with a cervical or high thoracic cord lesion. See also **Nursing Interventions Classification.**



Dysplastic nevus *(Goldman et al, 2008)*

dysregulation hypothesis /disreg′yəlā′shən/, the view that depression and affective disorders do not simply reflect decreased or increased catecholamine activity but that they are failures of the regulation of these systems.

dysrhythmia /disrith′mē·ə/, any disturbance or abnormality in a normal rhythmic pattern, specifically, irregularity in the brain waves or cadence of speech. Compare **arrhythmia.**

dysrhythmia management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preventing, recognizing, and facilitating treatment of abnormal cardiac rhythms. See also **Nursing Interventions Classification.**

dyssebacea /disibā′shē·ə/ [Gk, *dys* + L, *sebum,* suet], a skin condition characterized by red, scaly, greasy patches on the nose, eyelids, scrotum, and labia. It results from a deficiency of vitamin B_2 and is most commonly associated with chronic alcoholism, liver disease, chronic diarrhea, and protein malnutrition. Also called *(informal)* **shark skin.**

dyssynergia /dis′inur′jē·ə/ [Gk, *dys* + *syn,* together, *ergein,* work], any disturbance in muscular coordination, as in cases of ataxia.

dystaxia /distak′sē·ə/ [Gk, *dys* + *taxis,* order], partial ataxia, such as dystaxia agitans, in which a spinal cord irritation causes a tremor but no paralysis.

dysthymia /disthim′ē·ə/ [Gk, *dys* + *thymos,* mind], a form of chronic unipolar depression that tends to occur in elderly persons with debilitating physical disorders, multiple interpersonal losses, and chronic marital difficulties. Several depressive episodes may merge into a low-grade chronic depressive state.

dysthymic disorder /disthim′ik/ [Gk, *dys* + *thymos,* mind], a disorder of mood in which the essential feature is a chronic disturbance of mood of at least 2 years' duration. It involves either depressed mood or loss of interest or pleasure in all or almost all usual activities and pastimes, and associated symptoms, but not of sufficient severity and duration to meet the criteria for a major depressive episode.

dysthyroid orbitopathy /disthī′roid or′bitop′əthē/ [Gk, *dys-,* difficult + *thyreos,* shield + *eidos,* form; L, *orbita,* wheel track + Gk, *pathos,* disease], the inflammatory changes of the eye orbit associated with thyroid dysfunction, usually in Graves' disease. Also called *dysthyroid ophthalmopathy, Graves' orbitopathy.*

dystocia /distō′shə/ [Gk, *dys* + *tokos,* birth], pathological or difficult labor, which may be caused by an obstruction or constriction of the birth passage or abnormal size, shape, position, or condition of the fetus. See also **clinical pelvimetry, fetal presentation, x-ray pelvimetry.**

dystonia /distō′nē·ə/ [Gk, *dys* + *tonos,* tone], any impairment of muscle tone. The condition commonly involves the head, neck, and tongue and often occurs as an adverse effect of a medication.

dystonia musculorum deformans, a rare abnormal condition characterized by intense, irregular torsion muscle spasms that contort the body. The muscles of the trunk, shoulder, and pelvis are commonly involved. This disease appears in several forms, generally classified as autosomal recessive or autosomal dominant. The cause of this disorder is not known; a biochemical dysfunction is suspected. The autosomal recessive form appears most often in Ashkenazic Jews and starts between 5 and 15 years of age, causing abnormalities of movement and speech. Muscle power and tone appear normal, but convulsive spasms make the involved muscles relatively useless. The autosomal-recessive form of the disease commonly begins with intermittent spasmodic inversion of the foot, so that the affected individual has difficulty in placing the heel on the ground when walking and an odd, bowing gait develops. Lordosis and torsion of pelvis appear as the proximal muscles become more involved. Torticollis is often an early sign if the muscles of the neck and shoulder girdle are affected. The autosomal-dominant form of the disease appears in early adult life, generally affects the axial musculature, and progresses more slowly than the autosomal-recessive form. Some muscle-relaxing drugs, such as the benzodiazepines, have been helpful in treating both forms of the condition. Mild cases have been successfully controlled for long periods with treatments that combine the use of muscle-relaxing drugs and psychotherapy.

dystonic /diston′ik/, referring to impairments of muscle tone, often excessive increase in tone, when the muscle is in action, and to hypotonia when it is at rest, often resulting in postural abnormalities.

dystrophia. See **dystrophy.**

dystrophic /distrof′ik/ [Gk, *dys* + *trophe,* nourishment], pertaining to a usually congenital disorder of structure or function of an organ or tissue that is aggravated by defective nutrition, such as accumulation of calcium salts in the cornea.

dystrophic calcification [Gk, *dys* + *trophe,* nourishment; L, *calx,* lime, *facere,* to make], **1.** the pathological accumulation of calcium salts in necrotic or degenerated tissues. Compare **metastatic calcification. 2.** severe dental caries that are promoted by the sugars, acids, viscosity of liquids, and sometimes *Streptococcus mutans* in a bottle of milk or juice left in contact with a child's primary teeth. This can also occur from contact with breast milk left in a sleeping child's mouth. The condition is preventable; no child should be permitted to fall asleep nursing on any liquid other than plain water. Also called **bottle mouth caries.**

dystrophin /distrof′in/, a missing or defective protein in Duchenne muscular dystrophy that is localized to the sarcolemma of the muscle cell membrane. Its absence results in abnormal cell permeability, which may lead to cell destruction.

dystrophin-glycoprotein complex (DGC), a large oligomeric complex of proteins and glycoproteins of the sarcolemma that are critical to the stability of muscle fiber membranes and to the linking of the actin cytoskeleton to the extracellular matrix. It includes dystrophin, sarcoglycans, dystroglycans, sarcospan, syntrophins, and dystrobrevin. Abnormalities of the plasma membrane of the muscle fiber that destroy this complex have been associated with several types of muscular dystrophy and with cardiomyopathy.

dystrophy /dis′trəfē/ [Gk, *dys* + *trophe,* nourishment], any abnormal condition caused by defective nutrition. It often entails a developmental change in muscles that does not involve the nervous system, such as fatty degeneration associated with increased size but decreased strength. Also called **dystrophia.**

dysuria /disyo͝or′ē·ə/ [Gk, *dys* + *ouron,* urine], painful, burning urination, often caused by a bacterial infection, inflammation, or obstruction of the urinary tract. Laboratory examination of the urine may reveal the presence of blood, bacteria, or white blood cells. Dysuria is a symptom of cystitis, urethritis, prostatitis, urinary tract tumors, and some gynecological disorders and of the use of certain medications, such as opiates. Compare **hematuria, pyuria.**

E

e-, prefix meaning “out from”: *ebonation, egesta, emollient.*

E, ε. See **epsilon.**

E, symbol for **expired gas.**

***E*,** **1.** symbol for *elastance*. **2.** symbol for *energy*. **3.** symbol for *expectancy*. **4.** symbol for *electromotive force*. **5.** symbol for *illumination*.

E_1, symbol for **monomolecular elimination reaction.**

E_2, symbol for **bimolecular reaction.**

ea, abbreviation for *each*.

Eakes, Georgene Gaskill, a nursing theorist who, with Mary Lermann Burke and Margaret A. Hainsworth, developed the Theory of Chronic Sorrow to describe the ongoing feelings of loss that arise from illness, debilitation, or death.

Eales’ disease /ēlz/ [Henry Eales, British physician, 1852–1913], a condition marked by recurrent hemorrhages into the retina and vitreous, affecting mainly males in the second and third decades of life.

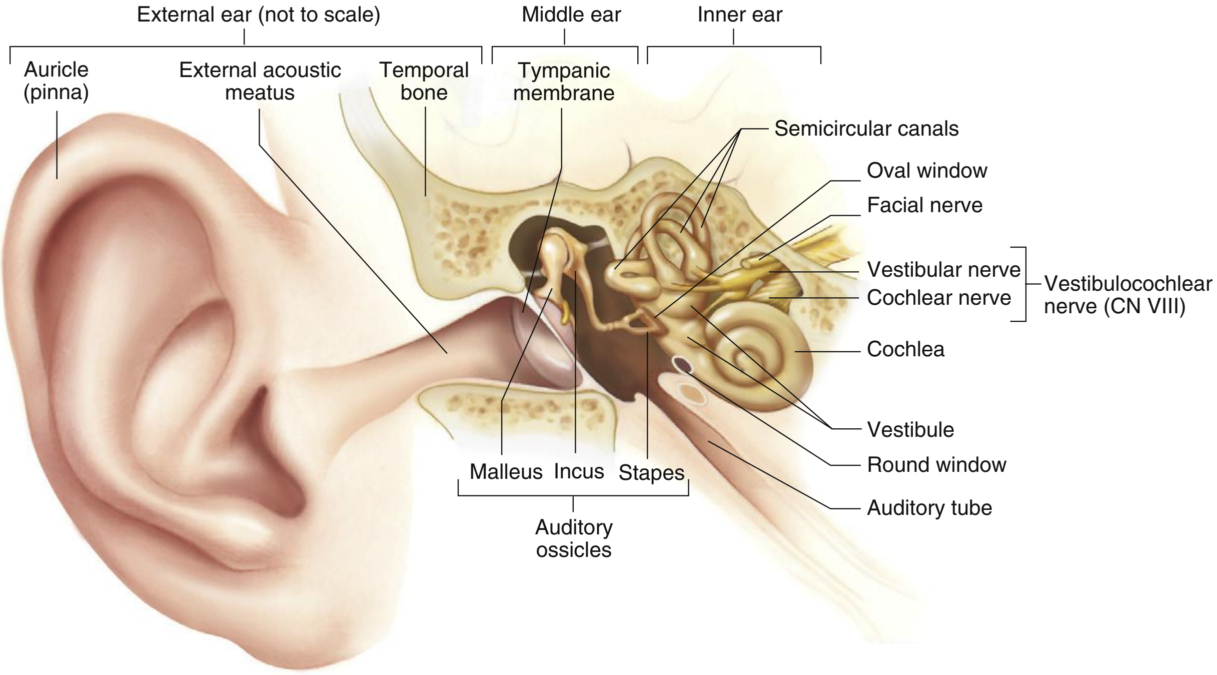
E and GW, abbreviation for **Economic and General Welfare.**

ear [AS, *eare*], one of two organs of hearing and balance, consisting of the external, middle, and internal ear. The external ear includes the skin-covered cartilaginous auricle visible on either side of the head and the part of the external auditory canal outside the skull. Together they form a funnel that directs sound waves toward the eardrum, or tympanic membrane, which marks the boundary between the external ear and the air-filled middle ear. The middle ear contains three very small bones, the malleus, incus, and stapes, which transmit vibrations caused by sound waves reaching the tympanic membrane to the oval window of the inner ear. The leverage of the ossicles, or middle-ear bones, increases the intensity of sound vibrations by more than 25 dB. Because the inner ear is filled with fluid, the increased intensity helps compensate for the loss of signal normally caused by sound-wave reflection of the fluid. The inner ear contains two separate organs: the vestibular apparatus, which provides the sense of balance, and the cochlea, with the organ of Corti, which receives vibrations from the middle ear and translates them into nerve impulses, which are again interpreted by brain cells as specific sounds.

earache /ir′āk/ [AS, *eare* + *acan,* to hurt], a pain in the ear, sensed as sharp, dull, burning, intermittent, or constant. The cause is not necessarily a disease of the ear, because infections and other disorders of the nose, oral cavity, larynx, and temporomandibular joint can produce referred pain in the ear. Also called **otalgia, otodynia.**

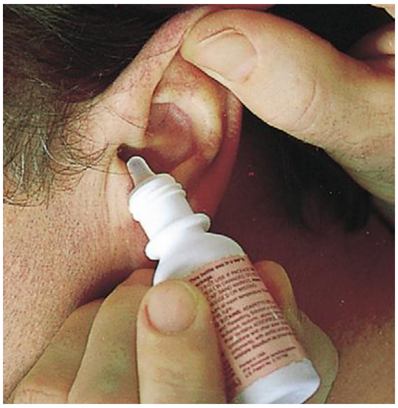
ear care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as prevention or minimization of threats to ear or hearing. See also **Nursing Interventions Classification.**

eardrop instillation, the instillation of a medicated solution into the external auditory canal of the ear. The patient is asked to turn the head to the side so that the ear being treated faces upward. The orifice is exposed, and the drops of medicine are directed toward the internal wall of the canal. The pinna is pulled upward and outward in a person more than



Structures of the ear *(Patton and Thibodeau, 2010)*

3 years of age and down and back in a younger child. The tragus is pushed against the ear canal to ensure that the drops stay in the canal.



Eardrop instillation *(Potter et al, 2011)*

eardrops [AS, *eare* + *dropa*], a topical, liquid form of medication for the local treatment of various conditions of the ear, such as inflammation or infection of the lining of the external auditory canal or impacted cerumen (earwax).

eardrum. See **tympanic membrane.**

Early and Periodic Screening Diagnosis and Treatment (EPSDT), a section of the Medicaid program that requires all states to maintain a program to determine the physical and mental defects of persons who are covered by the program and to provide short- and long-range treatment. See also **Medicaid.**

early childhood caries, a chronic oral disease of young children characterized by the presence of one or more decayed, missing, or filled tooth surfaces.

ear oximeter [AS, *eare* + Gk, *oxys,* sharp, *genein,* to produce, *metron,* measure], a device placed over the earlobe that transmits a beam of light through the earlobe tissue to a receiver. It is a noninvasive method of measuring the level of saturated hemoglobin in the blood. As the amount of saturated hemoglobin alters the wavelengths of light transmitted through the earlobe, analysis of the light received is translated into percentage of oxygen saturation (SO_2) of the blood. See also **pulse oximeter.**

ear speculum [AS, *eare* + L, *speculum,* mirror], a short, funnel-shaped tube attached to an otoscope for examining the ear canal.

ear thermometry, the measurement of the temperature of the tympanic membrane by detection of infrared radiation from the eardrum. See also **tympanic membrane thermometer.**

earwax. See **cerumen.**

East African sleeping sickness. See **Rhodesian trypanosomiasis.**

eastern equine encephalitis. See **equine encephalitis.**

eating disorders, a group of behaviors often fueled by unresolved emotional conflicts symptomized by altered food consumption. Disorders include anorexia nervosa, bulimia nervosa, and binge eating. Compare **pica.**

eating disorders management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as prevention and treatment of severe diet restriction and overexercising or binging and purging of food and fluids. See also **Nursing Interventions Classification.**

Eaton agent pneumonia. See **mycoplasma pneumonia.**

Eaton-Lambert syndrome [Lee M. Eaton, American neurologist; Edward H. Lambert, twentieth-century American physiologist], a form of myasthenia that tends to be associated with lung cancer.

EAV, abbreviation for **electroacupuncture after Voll.**

Ebbecke's reaction. See **autographism.**

EBCT, abbreviation for **electron beam computed tomography.**

Ebner's glands [Victor von Ebner, Austrian histologist, 1842–1925], serous glands of the tongue, opening at the bottom of the trough surrounding the circumvallate papillae.

Ebola virus disease /ēbō′lə/ [Ebola River District, Congo], an infection caused by a species of ribonucleic acid viruses of the ***Filovirus*** genus. There are four identified subtypes of Ebola virus: Côte d'Ivoire, Sudan, and Zaire, which have been associated with human disease, and Reston, which causes fatal hemorrhagic disease in nonhuman primates and originated in the Philippines. The usually lethal disease is characterized by hemorrhage and fever. The natural reservoir and method of transmission of primary infections are unknown, but secondary infection is by direct contact with infectious blood or other body secretions, in research settings, or by airborne particles. The incubation period ranges from 2 to 21 days. Initial symptoms include high fever, headache, chills, myalgia, sore throat, red itchy eyes, and malaise. Later symptoms include severe abdominal pain, chest pain, bleeding, shock, vomiting, and diarrhea. Maculopapular rash may occur in some patients. Treatment is supportive; in nearly 90% of cases, death occurs within 1 week. It is not known why some patients are able to recover from the Ebola virus while others are not, but the latter have no detectable immune response to the infection. The Ebola virus is related to the Marburg virus. Also called **African hemorrhagic fever,** *Ebola hemorrhagic fever.* See also **Marburg virus disease.**

EBP, abbreviation for **epidural blood patch.**

Ebstein's anomaly [Wilhelm Ebstein, German physician, 1836–1912; Gk, *anomalia,* irregularity], a congenital heart defect in which the tricuspid valve is displaced downward into the right ventricle. The abnormality is often associated with right-to-left atrial shunting and **Wolff-Parkinson-White syndrome.**

EBV, abbreviation for **Epstein-Barr virus.**

EC, abbreviation for **Enzyme Commission.**

ec-, prefix meaning "out of": *ecbolic, eccephalosis, ecchondroma.*

ECC, **1.** abbreviation for **emergency cardiac care.** **2.** abbreviation for *external cardiac compression.*

eccentric /eksen′trik/ [Gk, *ek,* out, *centre,* center], **1.** pertaining to an object or activity that departs from the usual course or practice. **2.** pertaining to behavior that may appear to be odd or unconventional but does not necessarily reflect a disorder.

eccentric contraction, a type of muscle contraction that occurs as the muscle fibers lengthen, such as when a weight is lowered through a range of motion. The contractile force generated by the muscle is weaker than an opposing force, which causes the muscle to stretch. Compare **concentric contraction.**

eccentric exercise, a voluntary muscle activity in which there is an overall lengthening of the muscle in response to external resistance.

eccentric implantation [Gk, *ek,* out, *centre,* center], (in embryology) the embedding of the blastocyst within a fold or recess of the uterine wall, which then closes off from the main cavity.

eccentricity /ek′sentris′itē/, behavior that is regarded as odd or peculiar for a particular culture or community, although not unusual enough to be considered pathological.

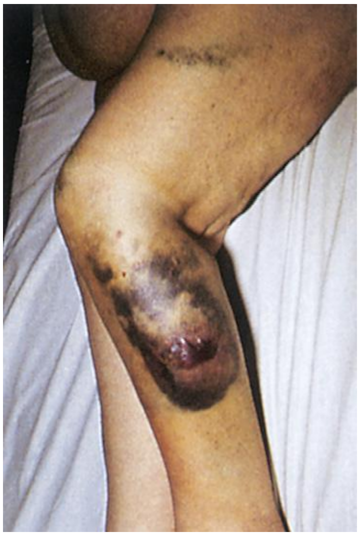
eccentric jaw relation, any jaw relation other than centric relation at closure.

eccentric occlusion [Gk, *ek* + *centre* + L, *occludere,* to close up], a closed position of the teeth that does not coincide with centric relation, resulting in premature tooth contacts. Also called **acentric occlusion.**

ecchondroma /ek′əndrō′mə/ [Gk, *ek* + *chondros,* cartilage, *oma,* tumor], a benign tumor that develops on the surface of a cartilage or under the periosteum of bone. Also called *ecchondrosis.*

ecchymoma /ek′imō′mə/, a swelling caused by accumulation of blood on the site of a bruise.

ecchymosis /ek′imō′sis/ *pl.* **ecchymoses** [Gk, *ek* + *chymos,* juice], bluish discoloration of an area of skin or mucous membrane caused by the extravasation of blood into the subcutaneous tissues as a result of trauma to the underlying blood vessels or fragility of the vessel walls. Also called **bruise.** Compare **contusion, petechiae.**



Ecchymosis *(Moll, 1997)*

ecchymotic /ek′imot′ik/ [Gk, *ek,* out, *chymos,* juice], pertaining to a discolored area on the skin or membrane caused by blood seeping into the tissue as a result of a contusion. Compare **bruise**.

ecchymotic mask [Gk, *ek* + *chymos* + Fr, *masque*], a cyanotic or bluish discoloration of the face of a victim of traumatic asphyxia, as in strangulation or choking. The color is the result of petechial hemorrhages.

ecchymotic rash [Gk, *ek* + *chymos,* juice; OFr, *rasche,* scurf], a skin eruption characterized by black-blue spots caused by extravasation of blood into the tissues, usually as a result of a contusion.

eccrine /ek′rin/ [Gk, *ekkrinein,* to secrete], pertaining to a sweat gland that secretes outwardly through a duct to the surface of the skin. See also **exocrine.**

eccrine gland, one of the sudoriferous glands located in the dermis. Such glands are unbranched, coiled, and tubular. They promote cooling by evaporation of their secretion, which is clear, has a faint odor, and contains water, sodium chloride, and traces of albumin, urea, and other compounds. Compare **apocrine gland.** See also **sudoriferous gland.**

eccyesis. See **ectopic pregnancy.**

ECF, **1.** abbreviation for **extended care facility. 2.** abbreviation for **extracellular fluid.**

ECG, **1.** abbreviation for **electrocardiogram. 2.** abbreviation for **electrocardiograph. 3.** abbreviation for **electrocardiography. 4.** abbreviation for **echoencephalogram.**

-echia, suffix meaning a “condition of holding”: *asynechia, blepharosynechia, synechia.*

echinacea, a perennial herb found only in Missouri, Nebraska, and Kansas in the United States.

■ USES: It is used for those with low immune status, for hard-to-heal superficial wounds, and as a sun protectant. It is most commonly used to treat the common cold and upper respiratory infections. It has no apparent protective effects but may decrease the duration and symptoms of the infection if started when symptoms are first noticed. There are insufficient reliable data for other indications.

■ CONTRAINDICATIONS: It is not recommended during pregnancy and lactation or in children. It is also contraindicated in people who have autoimmune diseases such as lupus erythematosus, multiple sclerosis, HIV/AIDS, or collagen disease and in people with tuberculosis or hypersensitivity to *Bellis* species or the Compositae family of herbs. Immunosuppression may occur after extended therapy with this herb. It should not be used for more than 8 weeks.

echino-, prefix meaning “spine or spiny”: *echinochroma, echinosis, echinostomiasis.*

echinococcosis /ekī′nōkokō′sis/ [Gk, *echinos,* prickly husk, *kokkos,* berry, *osis,* condition], an infestation, usually of the liver, caused by the larval stage of a tapeworm of the genus ***Echinococcus.*** Dogs are the principal hosts of the adult worm; sheep, goats, horses, camels, cattle, rodents, and deer are the natural intermediate hosts for the larvae. Humans, especially children, can become infested with larvae by ingesting eggs shed in the stool of infected dogs and cats or by petting or handling household dogs or cats. The disease is most common in countries where livestock is raised with the help of dogs. Fluid-filled cysts form in affected organs such as the liver, lungs, brain, bones, or heart. Clinical manifestations and prognosis vary, depending on the tissue invaded and the extent of infestation. Diagnosis is made by skin tests for sensitivity, serological tests, radiological evidence of cyst formation, and identification of larval cysts in infected tissue. Treatment is an extended course of benzimidazole; puncture, aspiration, injection, and reaspiration of cysts; or careful removal of cysts, avoiding rupture of a cyst, which could cause severe allergic reactions or disseminate infection. The disease can be prevented by avoiding contact with infected dogs, deworming pet animals, and preventing dogs from eating carcasses of infected intermediate hosts. Also called **hydatid disease, hydatidosis.** See also **cysticercosis, tapeworm infection.**

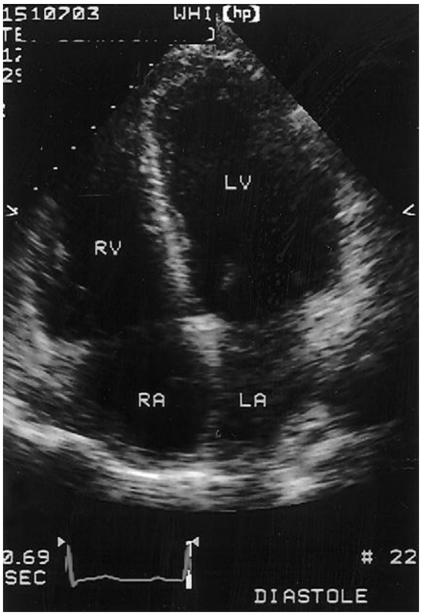
Echinococcus /ekī′nōkok′əs/ [Gk, *echinos,* prickly husk, *kokkos,* berry], a genus of small tapeworms that primarily infect canines. See also **echinococcosis.**

echinocyte. See **burr cell.**

echo /ek′ō/, **1.** the reflection of an ultrasound wave back to the transducer from a structure in the plane of the sound beam. **2.** *(informal)* echoradiography.

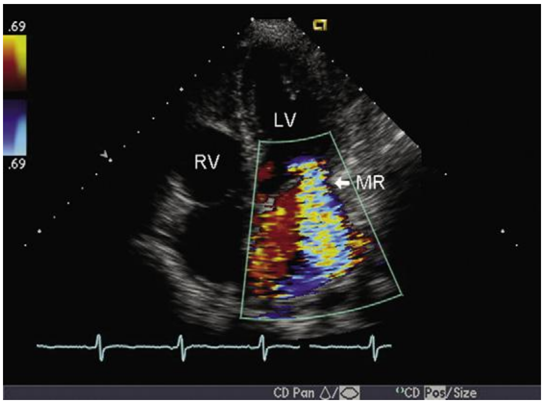
echo beat. See **reciprocal beat.**

echocardiogram /ek′ōkär′dē·əgram′/ [Gk, *echo,* sound, *kardia,* heart, *gramma,* record], a graphic outline of the movements of heart structures produced by ultrasonography.



Echocardiogram *(Goldman et al, 2008)*

echocardiography /ek′ōkär′dē·og′rəfē/ [Gk, *echo* + *kardia,* heart, *graphein,* to record], a diagnostic, noninvasive procedure for studying the structure and motion of the heart. Ultrasonic waves directed through the heart are reflected backward, or echoed, when they pass from one type of tissue to another, such as from cardiac muscle to blood. The sound waves are transmitted from and received by a transducer and are recorded on a strip chart. Major diagnostic uses include the detection of atrial tumors and pericardial effusion, measurement of the ventricular septa and ventricular chambers, evaluation or monitoring of prosthetic valve function, and determination of mitral valve motion abnormalities and congenital lesions. Also called **ultrasonic cardiography.** See also **phonocardiograph, ultrasonography.**



Color-flow echocardiography *(Goldman et al, 2004)*

echoencephalogram (EEG) /ek′ōensef′ələgram′/ [Gk, *echo* + *enkephalos,* brain, *gramma,* record], a recording produced by an echoencephalograph.

echoencephalography /ek′ō·ensef′əlog′rəfē/, the use of ultrasound to study the intracranial structures of the brain. The technique is useful for showing ventricular dilation and a major shift of midline structures caused by an expanding lesion. See also **ultrasonography. —echoencephalographic,** *adj.*

echogram /ek′ōgram/ [Gk, *echo,* sound, *gramma,* record], a recording of ultrasound echo patterns of a body structure, such as a gravid uterus.

echographia. See **pseudoagraphia.**

echography. See **ultrasonography.**

echo home, an independent housing facility for an older person in or near the family home.

echolalia /ek′ōlā′lyə/ [Gk, *echo* + *lalein,* to babble], **1.** (in psychiatry) the automatic and meaningless repetition of another's words or phrases, especially as seen in schizophrenia. A kind of echolalia is **delayed echolalia. 2.** (in pediatrics) a baby's imitation or repetition of sounds or words produced by others. It occurs normally in early childhood development. Also called *echophrasia,* **echo speech. —echolalic,** *adj.*

echo planar imaging (EPI), a fast magnetic resonance imaging mode.

echopraxia /ek′ōprak′sē·ə/ [Gk, *echo* + *prassein,* to practice], imitation or repetition of the body movements of another person, sometimes practiced by schizophrenic patients.

echoradiography /ek′ōrā′dē·og′rəfē/ [Gk, *echo* + L, *radius,* ray; Gk, *graphein,* to record], a diagnostic procedure using ultrasonography and various devices for the visualization of internal structures of the body.

echo sign, **1.** a repeated sound heard on percussion of a hydatid cyst. **2.** an involuntary repetition of words heard. See also **echolalia.**

echo speech. See **echolalia.**

echothiophate iodide /-thī′ōfāt/, an anticholinesterase used for ophthalmic purposes.

■ INDICATIONS: It is prescribed for the treatment of chronic open-angle glaucoma and accommodative esotropia.

■ CONTRAINDICATIONS: Uveal inflammation, most types of angle-closure glaucoma, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are retinal detachment, nonreversible cataract, lens opacity, activation of iritis or uveitis, and iris cysts.

ECHO virus /ek′ō vī′rəs/ [*e*nteric *c*ytopathogenic *h*uman *o*rphan + L, *virus,* poison], a picornavirus associated with many clinical syndromes but not identified as the causative organism of any specific disease. ECHO stands for *e*nteric, *c*ytopathic, *h*uman, *o*rphan. There are many ECHO viruses. More than 30 serotypes have been identified; many are harmless. Bacterial or viral disease may be complicated by ECHO virus infection, as aseptic meningitis accompanying some severe bacterial and viral infections.

Eck's fistula [Nikoli V. Eck, Russian physiologist, 1849–1917], an artificial passage between the end of the hepatic portal vein and the side of the inferior vena cava. It is used to treat esophageal varices in portal hypertension.

eclampsia /iklamp′sē·ə/ [Gk, *ek,* out, *lampein,* to flash], the gravest form of pregnancy-induced hypertension. It is characterized by grand mal seizure, coma, hypertension, proteinuria, and edema. The symptoms of impending seizure often include body temperature of up to 104° F, anxiety, epigastric pain, severe headache, and blurred vision. The nurse is alert to persistently and extremely high blood pressure and to increasingly hyperactive deep-tendon reflexes, or clonus. Convulsions may be prevented by bed rest in a quiet, dimly lit room and parenteral administration of magnesium sulfate and antihypertensive medications. The nurse attentively monitors the mother's general condition, including respiration, deep tendon reflexes, blood pressure, magnesium sulfate levels, and urine and protein excretion, as well as the baby's heart rate. Treatment of a convulsion must include maintenance of the mother's airway, protection of the mother against self-injury, and administration of medication to check the convulsion and decrease the blood pressure. Once this is accomplished, delivery is indicated. Convulsions rarely occur in the puerperium. Complications of eclampsia include cerebral hemorrhage, pulmonary edema, renal failure, liver necrosis, abruptio placentae, hypofibrinogenemia, hemolysis, and retinal hemorrhages, sometimes with temporary blindness. The maternal mortality rate in eclampsia is 10%; the fetal mortality rate is 25%. Eclampsia occurs in 0.2% of pregnancies. The cause is not known.

eclectic /iklek′tik/ [Gk, *eklektikos,* selecting], pertaining to a therapy that selects, combines, and incorporates diverse techniques from several systems or theories into an integrated approach.

eclipse scotoma /iklips′/ [Gk, *ekleipsis,* abandoning, *skotos,* darkness, *oma,* tumor], a small central area of depressed or lost vision caused by looking directly at the sun without adequate protection. Also called **solar maculopathy, solar retinopathy.**

ECM, abbreviation for *erythema chronicum migrans*.

ECMO, abbreviation for **extracorporeal membrane oxygenator.**

-ecoia, suffix meaning "(condition of the) sense of hearing": *bradyecoia, dysecoia, oxyecoia*.

***E. coli*,** abbreviation for ***Escherichia coli*.**

ecological chemistry /ikəloj′ik/, the study of chemical compounds synthesized by plants that influence ecological characteristics through chemical communication or toxic effects.

ecological fallacy, a false assumption that the presence of a pathogenic factor and a disease in a population can be accepted as proof that a particular individual is the cause of the disease.

ecology /ikol′əjē/ [Gk, *oekos,* house, *logos,* science], the study of the interaction between organisms and their environment.

econazole /ikon′əzōl/, a topical antifungal agent.

■ INDICATIONS: It is prescribed in the treatment of tinea pedis, tinea cruris, tinea corporis, tinea versicolor, and candidiasis.

■ CONTRAINDICATION: Known sensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are local irritation and hypersensitivity of the skin.

Economic and General Welfare (E and GW), a structural unit of the American Nurses Association and state nurses' associations whose major goal is to upgrade the salaries, benefits, and working conditions of nurses.

ecosystem /ek′ōsis′təm/, the total of all living things within a particular area and the nonliving things with which they interact.

EC space, abbreviation for **extracellular space.** See **extracellular.**

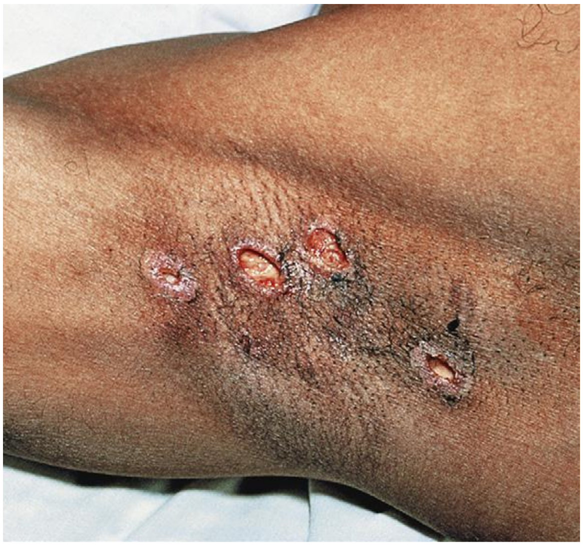
ecstasy /ek′stəsē/ [Gk, *ekstasis,* derangement], **1.** an emotional state characterized by exultation, rapturous delight, or frenzy. Compare **euphoria, mania. —ecstatic,** *adj*. **2.** *(informal)* popular name for 3,4-methylenedioxymethamphetamine, a hallucinogenic drug of abuse. See also **drug abuse.**

ECT, **1.** abbreviation for **electroconvulsive therapy.** **2.** abbreviation for **emission computed tomography.**

-ectasia, suffix meaning "dilatation, dilation, extension, or distension of an organ": *esophagectasia, lymphectasia, pharyngectasia*.

ectatic emphysema. See **panacinar emphysema.**

ecthyma /ek′thimə/ [Gk, *ek,* out, *thyein,* to rush], an ulcerative pyoderma characterized by large pustules, crusts, and ulcerations surrounded by erythema. It is caused by a streptococcal infection after a minor trauma. The skin of the legs is most frequently affected. Treatment includes vigorous cleansing, application of compresses of cool Burow's solution to soften and remove crusts, and systemic administration of antibiotics. Compare **folliculitis, impetigo.**



Ecthyma *(James, 2006)*

ecthyma contagiosum. See **contagious pustular dermatitis.**

ecto-, prefix meaning "outside": *ectoblast, ectocolon, ectodermal*.

ectocytic /ek′təsit′ik/ [Gk, *ektos,* outside, *kytos,* cell], outside a cell and not part of its organization.

ectoderm /ek′tədurm/ [Gk, *ektos,* outside, *derma,* skin], the outermost of the three primary cell layers of an embryo. The ectoderm gives rise to the nervous system; the organs of special sense, such as the eyes and ears; the epidermis and epidermal tissue, such as fingernails, hair, and skin glands; and the mucous membranes of the mouth and anus. See also **embryo, endoderm, mesoderm. —ectodermal, ectodermic,** *adj*.

ectodermal cloaca /ek′tədur′məl/, a part of the cloaca in the developing embryo that lies external to the cloacal membrane and eventually gives rise to the anus and anal canal. Compare **endodermal cloaca.**

ectodermal dysplasia, any of a group of hereditary disorders involving tissues and structures derived from the embryonic ectoderm. Ectodermal dysplasia is a component of various syndromes, including **anhidrotic ectodermal dysplasia** and **EEC syndrome.**

ectodermic. See **ectoderm.**

ectodermoidal /ek′tədərmoi′dəl/ [Gk, *ektos,* outside, *derma,* skin, *eidos,* form], resembling or having the characteristics of ectoderm.

ectomorph /ek′təmôrf′/ [Gk, *ektos* + *morphe,* form], a person whose physique is characterized by slenderness, fragility, and a predominance of structures derived from the ectoderm. Compare **endomorph, mesomorph.** See also **asthenic habitus.**

-ectomy, suffix meaning the "surgical removal" of something specified: *lobectomy, thrombectomy, thyroidectomy.*

ectoparasite /ek′tōper′əsīt/ [Gk, *ektos* + *parasitos,* guest], (in medical parasitology) an organism that lives on the outside of the body of the host, such as a louse.

-ectopia, suffix meaning a "condition in which a (specified) organ or part is out of its normal place": *corectopia, osteectopia, tarsectopia.*

ectopic /ektop′ik/ [Gk, *ek* + *topos,* place], **1.** (of an object or organ) situated in an unusual place, away from its normal location, for example, an ectopic pregnancy, which occurs outside the uterus. **2.** (of an event) occurring at the wrong time, as a premature heartbeat or premature ventricular contraction.

ectopic beat [Gk, *ek,* out, *topos,* place; AS, *beatan*], an impulse that originates in the heart at a site other than the sinus node. Also called **extrasystole.**

ectopic focus, an area in the heart that initiates abnormal beats. Ectopic foci may occur in both healthy and diseased hearts and are usually associated with irritation of a small area of myocardial tissue. They are produced in association with myocardial ischemia, drug (catecholamine) effects, emotional stress, and stimulation by foreign objects, including pacemaker catheters. Also called **ectopic pacemaker.**

ectopic kidney, a kidney not in the usual position. The most common types are abdominal, lumbar, pelvic, thoracic, and crossed fused ectopic kidneys.

ectopic myelopoiesis. See **extramedullary myelopoiesis.**

ectopic pacemaker. See **ectopic focus.**

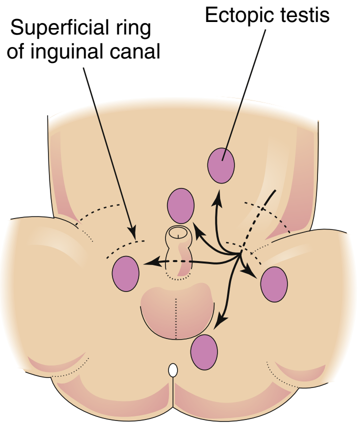
ectopic pregnancy, an abnormal pregnancy in which the conceptus implants outside the uterine cavity. Kinds of ectopic pregnancy are **abdominal pregnancy, ovarian pregnancy,** and **tubal pregnancy.** Also called **eccyesis** /ek′sī·ē′sis/.

ectopic rhythm [Gk, *ek* + *topos,* place, *rhythmos,* beat], an abnormal heart rhythm caused by the formation of impulses in a focus outside the sinus node. Such a rhythm may be protective in cases of failure of the sinus node or excessive slowing of its rhythm, or it may indicate an active abnormal focus.

ectopic tachycardia [Gk, *ek* + *topos,* place, *tachys,* swift, *kardia,* heart], an abnormally rapid heartbeat caused by excitation arising from a focus outside the sinus node.

ectopic teratism, a congenital anomaly in which one or more parts are misplaced, such as dextrocardia, palatine teeth, and transposition of the great vessels.

ectopic testis, a testis that has descended from the abdominal cavity and settled in the suprapubic area, the thigh, or the perineum instead of the scrotum. Therapy requires surgery. See also **cryptorchidism.**



Usual locations of ectopic testes *(Moore and Persaud, 2008)*

ectopic ureter, a ureter that opens in a place other than the bladder wall. In women it may open into the vestibule, terminal urethra, vagina, cervix, or uterine cavity. In men it invariably enters the genital or urinary tract above the level of the external sphincter.

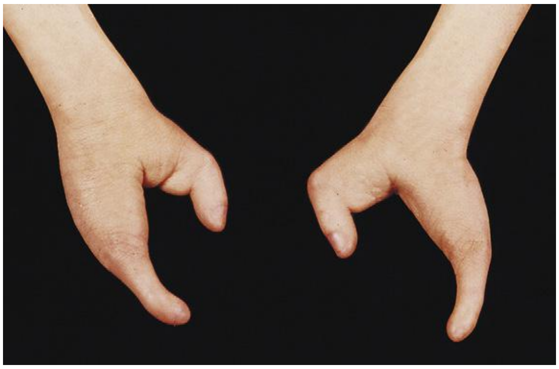
ectoplasm, the compact, peripheral portion of the cytoplasm of a cell.

ectopy /ek′təpē/ [Gk, *ek,* out, *topos,* place], a condition in which an organ or substance is not in its natural or proper place, such as an ectopic pregnancy that develops outside the uterus or an ectopic heartbeat.

ectotoxin. See **exotoxin.**

ectro-, prefix meaning "loss or absence of, miscarriage, abortion"; used primarily to indicate a loss of limbs or body parts: *ectrodactyly, ectromelia.*

ectrodactyly /ek′trōdak′təlē/ [Gk, *ektrosis,* miscarriage, *daktylos,* finger], a congenital anomaly characterized by the absence of part or all of one or more of the fingers or toes. Also called *ectrodactylia, ectrodactylism.*



Ectrodactyly involving the hands *(Moore, Persaud, and Shiota, 2000/Courtesy Dr. A.E. Chudley, Department of Pediatrics and Child Health, University of Manitoba, Children's Hospital)*

ectrodactyly-ectodermal dysplasia-clefting syndrome. See **EEC syndrome.**

ectrogenic. See **ectrogeny.**

ectrogenic teratism /-jen′ik/ [Gk, *ektrosis* + *genein,* to produce, *teras,* monster], a congenital anomaly caused by developmental failure in which one or more parts or organs are missing.

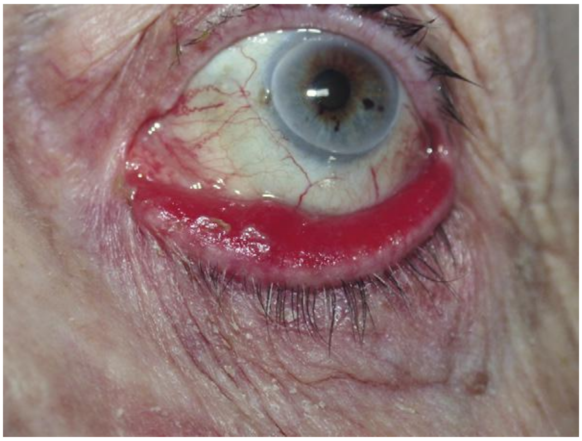
ectrogeny /ektroj′ənē/ [Gk, *ektrosis* + *genein,* to produce], the congenital absence or defect of any organ or part of the body. **—ectrogenic,** *adj.*

ectromelia /ek′trōmē′lyə/ [Gk, *ektrosis* + *melos,* limb], the congenital absence or incomplete development of the long bones of one or more of the limbs. Kinds of ectromelia are **amelia, hemimelia,** and **phocomelia. —ectromelic,** *adj.,* **ectromelus,** *n.*

ectropic /ektrop′ik/, inside-out.

ectropion /ektrō′pē·on/ [Gk, *ek* + *trepein,* to turn], eversion, most commonly of the eyelid, exposing the conjunctival membrane lining the eyelid and part of the eyeball. The condition may involve only the lower eyelid or both eyelids. The cause may be paralysis of the facial nerve, scarring, neoplasia, or, in an older person, atrophy of the eyelid tissues. Compare **entropion.**

ectrosyndactyly /ek′trōsindak′təlē/ [Gk, *ektrosis* + *syn,* together, *daktylos,* finger], a congenital anomaly characterized by the absence of some but not all of the digits, with



Ectropion *(Kanski, 2007/Courtesy A. Pearson)*

those that are formed webbed so as to appear fused. Also called *ectrosyndactylia*.

ECU, abbreviation for **environmental control unit.**

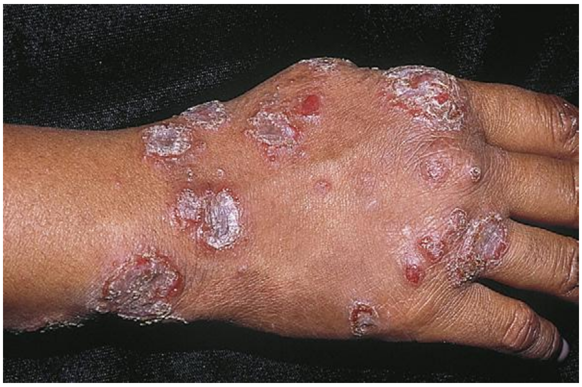
eculizumab, a monoclonal antibody.

■ INDICATIONS: This drug is used to treat proximal nocturnal hemoglobinuria, a rare, genetic form of hemolytic anemia.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. Rapid discontinuation may result in serious hemolysis.

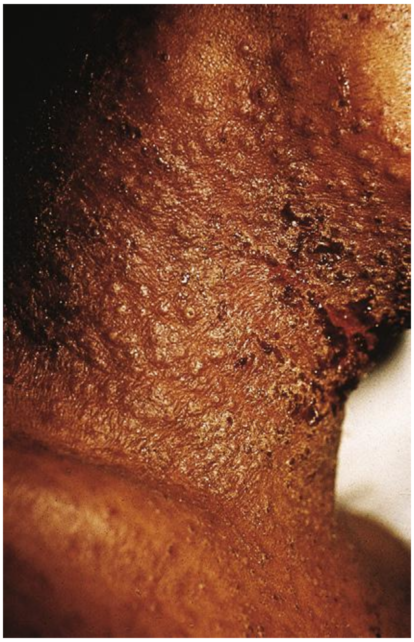
■ ADVERSE EFFECTS: Adverse effects of this drug include rash, dyspnea, calf or leg pain, chest pain, confusion, coughing up blood, sensitivity to light, fever, chills, persistent sore throat, mental changes, headache, nausea, vomiting, fever, stiff neck or back, mouth sores, fever blisters, and severe muscle aches. A life-threatening side effect is meningococcal infection. Common side effects are headache, nasopharyngitis, back pain, nausea, fatigue, and cough.

eczema /ek′simə/ [Gk, *ekzein,* to boil over], a general superficial dermatitis of unknown cause. In the early stage it may be pruritic, erythematous, papulovesicular, edematous, and weeping. Later it becomes crusted, scaly, thickened, or lichenified. Exacerbating factors include sudden temperature changes, humidity, psychological stress, illness, allergies, fibers, detergents, and perfumes. Eczema is not a distinct disease entity. See also **atopic dermatitis, nummular dermatitis. —eczematous,** *adj*.



Nummular eczema *(White and Cox, 2006)*

eczema herpeticum, a generalized vesiculopustular rash caused by herpes simplex virus or vaccinia virus infection of a preexisting rash such as atopic dermatitis. Also called **Kaposi's varicelliform eruption.**



Eczema herpeticum *(Stone and Gorbach, 2000)*

eczema marginatum. See **tinea cruris.**

eczematous. See **eczema.**

eczematous conjunctivitis /eksem′ətəs/, conjunctival and corneal inflammation associated with multiple tiny ulcerated vesicles. The cause is believed to be a delayed hypersensitivity to bacterial protein. If untreated, the condition may lead to ingrowth of small blood vessels in the cornea, eventually obscuring vision. Treatment usually includes topical instillation of corticosteroids. Also called **staph marginal disease.**

eczopiclone, a sedative/hypnotic.

■ INDICATION: This drug is used to treat insomnia.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include depression, hallucinations, headache, daytime drowsiness, peripheral edema, chest pain, dry mouth, bitter taste, and rash.

ED, **1.** abbreviation for **effective dose. 2.** abbreviation for **emergency department.**

ED_{50}, symbol for **median effective dose.**

ED_{90}, the dose of a therapeutic agent that eradicates 90% of the target pathogen.

edaphon /ed′əfon/, the composite of organisms that live in the soil. **—edaphic,** *adj*.

EDB, **1.** abbreviation for **ethylene dibromide. 2.** abbreviation for *expected date of birth*. See **expected date of delivery.**

EDC, abbreviation for *expected date of confinement*. See **expected date of delivery.**

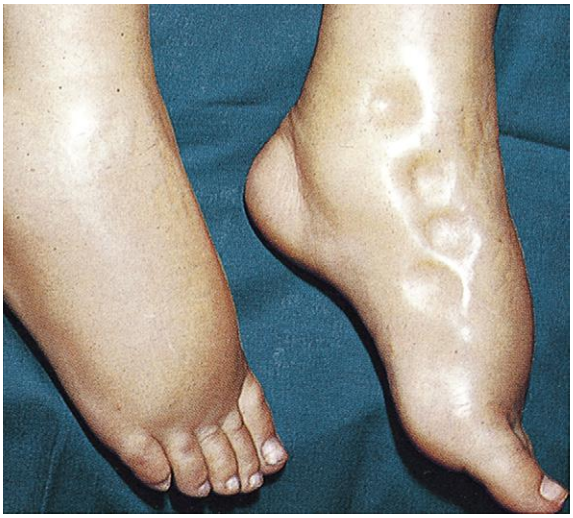
EDD, abbreviation for **expected date of delivery.**

eddy currents, small circular electric fields induced when a magnetic field is created. They result in intramolecular oscillation or vibration of tissue contents, causing generation of heat.

Edecrin Sodium, a trademark for a loop diuretic **(ethacrynate sodium).**

EDE limit, abbreviation for **effective dose equivalent limit.**

edema /idē′mə/ [Gk, *oidema,* swelling], the abnormal accumulation of fluid in interstitial spaces of tissues, such as in the pericardial sac, intrapleural space, peritoneal cavity, or joint capsules. Edema may be caused by increased capillary fluid pressure; venous obstruction such as occurs in varicosities; thrombophlebitis; pressure from casts, tight bandages, or garters; congestive heart failure; overloading with parenteral fluids; renal failure; hepatic cirrhosis; hyperaldosteronism such as in Cushing's syndrome; corticosteroid therapy; and inflammatory reactions. Edema may also result from loss of serum protein in burns, draining wounds, fistulas, hemorrhage, nephrotic syndrome, or chronic diarrhea; in malnutrition, especially kwashiorkor; in allergic reactions; and in blockage of lymphatic vessels caused by malignant diseases, filariasis, or other disorders. Treatment of edema focuses on correcting the underlying cause. Potassium-sparing diuretics may be administered to promote excretion of sodium and water. Edematous parts of the body should be protected from prolonged pressure, injury, and temperature extremes. In the evaluation of tissue turgor, edema may be evaluated by position change, specific location, and response to pressure, as in pitting edema when pressing the fingers into the edematous area causes a temporary indentation. An ultrasound evaluation of the affected extremity is indicated to rule out thrombosis. When a limb is edematous as a result of venous stasis, elevating the extremity and applying an elastic stocking or sleeve facilitate venous return. Also spelled **oedema.** See also **anasarca, lymphedema. —edematose, edematous,** *adj.*



Pitting edema *(Bloom and Ireland, 1992)*

-edema, -edem, suffix meaning "swelling resulting from an excessive accumulation of serous fluid in the tissues of the body in (specified) locations": *cephaledema, dactyledema, papilledema.*

edema of glottis [Gk, *oidema,* swelling, *glossa,* tongue], a swelling caused by fluid accumulation in the soft tissues of the larynx. Symptoms include stridor, hoarseness, and dyspnea. The condition, usually inflammatory, may result from infection, injury, or inhalation of toxic gases. Also called **laryngeal edema.**

edematogenic /ēdem′ətōjen′ik/, causing edema.

edentulism /eden′tulizem/, the condition of being without natural teeth.

edentulous /ēden′chələs/, lacking natural teeth.

edetate calcium disodium (EDTA) /ed′ətāt/, a chelating agent used to treat lead poisoning. It is not the same as edetate disodium.

edetate disodium, a parenteral chelating agent used to lower plasma calcium levels.

■ INDICATIONS: It should be prescribed only when clinical conditions such as hypercalcemic crisis or ventricular arrhythmia and heart block resulting from digitalis toxicity mandate aggressive therapy. It must be administered slowly and the recommended dosage should not be exceeded.

■ CONTRAINDICATIONS: Hypocalcemia, kidney disease, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypocalcemia, which can lead to tetany, arrhythmia, seizures, and death from respiratory arrest. Other adverse effects include nausea, vomiting, cramps, fever, thrombophlebitis, kidney damage, and hemorrhage associated with hypocoagulability.

edetic acid (EDTA) /idet′ik/, a chelating agent.

EDG, abbreviation for **electrodynograph.**

edge /ej/ [ME, *egge*], **1.** a thin side or border. **2.** the end of a surface, e.g., the edge of a cliff.

edge enhancement, the enhancement of structure margins (edges) using digital processing techniques.

edge response function (ERF), the ability of a computed tomography system to produce a sharp image of a high-contrast edge, such as the edge of the heart.

edgewise appliance, a fixed orthodontic appliance whose attachment brackets have a rectangular slot that engages a round or rectangular arch wire. The most widely prescribed orthodontic appliance, it is used to correct or improve malocclusion.

EDI, abbreviation for **Electronic Data Interchange.**

edible, pertaining to a substance that can be eaten.

EDRF, abbreviation for **endothelial-derived relaxing factor,** a term which is now used synonymously with nitric oxide.

edrophonium chloride /ed′rōfō′nē·əm/, a cholinesterase inhibitor that acts as an antidote to curare and other nondepolarizing neuromuscular blockers and is an aid in the diagnosis of **myasthenia gravis.**

■ INDICATIONS: It is prescribed to reverse neuromuscular blockade, to treat curare toxicity, and to aid in the diagnosis of suspected **myasthenia gravis.**

■ CONTRAINDICATIONS: Obstruction of the GI or urinary tract, hypotension, bradycardia, or known hypersensitivity to this drug prohibits its use. Should be used with caution in patients with asthma and those taking cardiac glycosides.

■ ADVERSE EFFECTS: Among the most serious adverse effects are respiratory paralysis, hypotension, bradycardia, and bronchospasm.

edrophonium test, a test for myasthenia gravis in which an IV solution of edrophonium chloride is injected into a patient. A total of 10 mg of the cholinergic drug is prepared, and a 2-mg dose is injected. If there is no reaction in 30 seconds, the remaining 8 mg is administered. A brief improvement in muscle activity is regarded as a positive result. Edrophonium chloride is also used to distinguish between myasthenia gravis and a cholinergic crisis. Because edrophonium chloride can precipitate respiratory depression, the test should not be performed unless an anticholinergic antidote, such as atropine, and respiratory resuscitation equipment are available. For further explanation of electroencephalographic recording of brain waves. See also **alpha wave, beta wave, delta wave, theta wave.**

Edsall's disease [David L. Edsall, American physician, 1869–1945], a cramping condition that is the result of excessive exposure to heat. Also called **heat cramp.**

EDTA, **1.** abbreviation for *ethylene-diamineteraacetic acid (edetic acid).* **2.** abbreviation for **edetate calcium disodium. 3.** abbreviation for **edetic acid.**

educational psychology /ej′əkā′shənəl/ [L, *educatus,* to rear; Gk, *psyche,* mind, *logos,* science], the application of psychological principles, techniques, and tests to educational problems, such as the determination of more effective instructional methods, the assessment of student advancement, and the selection of students for specialized programs. See also **applied psychology.**

Edwards' syndrome. See **trisomy 18.**

EEC syndrome, an autosomal-dominant syndrome involving both ectodermal and mesodermal tissues, with ectodermal dysplasia associated with hypopigmentation of skin and hair, scanty hair and eyebrows, absence of lashes, nail dystrophy, small or missing teeth, missing digits, and cleft lip and palate. Also called *ectrodactyly-ectodermal dysplasia-clefting syndrome*.

EEE, abbreviation for **eastern equine encephalitis.** See **equine encephalitis.**

EEG, **1.** abbreviation for **electroencephalogram. 2.** abbreviation for **electroencephalograph. 3.** abbreviation for **electroencephalography.**

eelworm /ēl′werm/, a nematode, especially any of various small, free-living or plant parasitic roundworms.

EENT, abbreviation for *eyes, ears, nose, and throat*.

EEOC, abbreviation for **Equal Employment Opportunity Commission.**

ef-. See **ex-.**

EFA, abbreviation for **essential fatty acid.**

efalizumab, a rarely used immunosuppressant.

■ INDICATIONS: This drug is used in adults 18 years of age and older to treat moderate to severe plaque psoriasis.

efavirenz, an antiviral.

■ INDICATIONS: It is used to treat HIV-1 in combination with other antiretroviral agents.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects include abdominal pain, headache, dizziness, fatigue, impaired concentration, insomnia, abnormal dreams, and depression. Common side effects include diarrhea, nausea, and rash.

effacement /ifās′mənt/ [Fr, *effacer,* to erase], the shortening of the vaginal portion of the cervix and thinning of its walls as it is stretched and dilated by the fetus during labor. When the cervix is fully effaced, the constrictive neck of the uterus is obliterated; the cervix is then continuous with the lower uterine segment. The extent of effacement, determined by vaginal examination, is expressed as a percentage of full effacement. See also **birth, cervix, dilation, station.**

effect, the result of an agent or cause.

effective atomic number, the average atomic number obtained from a weighted summation of the atomic constituents of a compound. See also **atomic number.**

effective compliance /ifek′tiv/ [L, *effectus,* performance], the ratio of tidal volume to peak airway pressure.

effective dose (ED), **1.** on a graded dose-response curve in the laboratory, the dosage of a drug that may be expected to cause a response of the desired magnitude. **2.** in a clinical setting, the dose needed to cause the desired response in a percentage of the people to whom it is given (e.g., an ED_{50} dosage of a drug is expected to produce a response in 50% of the patients receiving it).

effective dose equivalent limit (EDE limit), the largest amount of ionizing radiation a person may receive according to radiation protection guidelines. It combines both internal and external dose and has replaced the concept of maximum permissible dose for occupational exposures. The EDE limit is prescribed for various organs as well as whole body and for various working conditions. The current EDE limit for occupational exposures is 100 mrem/wk (or 1 mSv/wk). The annual EDE limit is 5000 mrem/yr or (50 mSv/yr). Effective dose limits are regulated, and guidelines are published by the National Council of Radiation Protection (NCRP) and the FDA. Also called maximum permissible dose. See also **dose equivalent.**

effective half-life (ehl), the time required for a radioactive element in an animal body to be diminished by 50% as a result of radioactive decay and biological elimination. The effective half-life is equal to the product of the biological half-life *(bhl)* and the radioactive half-life *(rhl)* divided by the sum of the *bhl* and the *rhl: ehl |m= (bhl × rhl)/(bhl + rhl)*. See also **biological half-life.**

effective osmotic pressure, the part of total osmotic pressure of a solution that determines the tendency of the solvent to pass through a boundary, such as a semipermeable membrane.

effective radiating area, the total area of the surface of the transducer that actually produces the sound wave.

effective refractory period. See **refractory period.**

effector /ifek′tər/ [L, *efficere,* to accomplish], **1.** an organ that produces an effect, such as glandular secretion, as a result of nerve stimulation. **2.** a molecule, such as an enzyme, that can start or stop a chemical reaction.

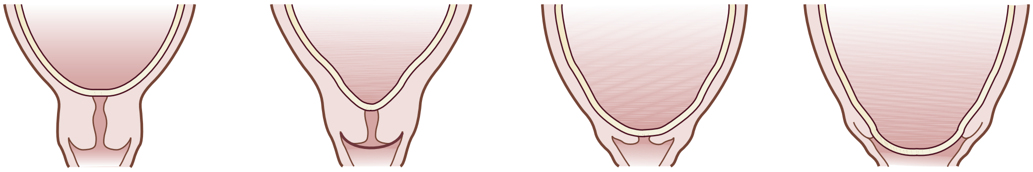
effector cell, **1.** a terminally differentiated leukocyte that performs more than one specific function. **2.** a muscle cell or gland cell.

effeminate /ifem′init/ [L, *effeminare,* to make womanish], womanly or female in physical and mental characteristics, regardless of biological sex.

efferent /ef′ərənt/ [L, *effere,* to carry out], directed away from a center, such as certain arteries, veins, nerves, kidney, and lymphatic vessels. Compare **afferent.**

efferent duct, any duct through which a gland releases its secretions.

efferent nerve, a nerve that transmits impulses away or outward from a nerve center, such as the brain or spinal cord,



Before labor

Early effacement

Complete effacement

Complete dilation

Cervical effacement *(Bonewit-West, 2012)* usually causing a muscle contraction or release of a glandular secretion.

efferent pathway [L, *effere*, to carry out; ME, *paeth* + *weg*], **1.** the route of nerve fibers carrying impulses away from a nerve center. **2.** the system of blood vessels that conveys blood away from a body part. Compare **afferent.**

effervesce [Gk, *effervescere*, to foam up], to produce small bubbles or foam on the release of gas from a fluid.

effervescence /ef′ərves′əns/ [L, *effervescere*, to foam up], the production of small bubbles or foam associated with the escape of gas from a fluid.

effervescent /ef′ərves′ənt/, producing and releasing gas bubbles.

efficacy /ef′əkəsē/ [L, *effectus*, performance], (of a drug or treatment) the ability of a drug or treatment to produce a specific result, regardless of dosage. Opioids have a nearly identical efficacy but require various dosages to obtain the effect.

efficiency /ifish′ənsē/, **1.** the production of desired results with the minimum waste of time and effort. **2.** the amount of achievement compared with the effort expended. **3.** (in radioassay) the counts perceived by a beta or gamma counter relative to the known disintegration rate of a comparable standard radioactive source.

effleurage /ef′ləräzh′/ [Fr, skimming the surface], a technique in massage in which long, light, or firm strokes are used, usually over the spine and back. Fingertip effleurage is a light technique performed with the tips of the fingers in a circular pattern over one part of the body or in long strokes over the back or an extremity. Fingertip effleurage of the abdomen is a technique commonly used in the Lamaze method of natural childbirth. Compare **pétrissage, rolling effleurage.**

Effleurage *(Harkreader, Hogan, and Thobaben, 2007)*

effluent /ef′lo͞o·ənt/, a liquid, solid, or gaseous emission, such as the discharge or outflow from a machine or an industrial process.

effluvium /iflo͞o′vē·əm/ [L, *effluvium*, a flowing out], an outflow of gas or vapor, usually malodorous or toxic.

effort syndrome [Fr, exertion; Gk, *syn*, together, *dromos*, course], an abnormal condition characterized by chest pain; dizziness; fatigue; palpitations; cold, moist hands; and sighing respiration. The condition is often associated with soldiers in combat but occurs also in other individuals. The pain often mimics angina pectoris but is more closely connected to anxiety states and occurs after rather than during exercise. Because angina may also be associated with anxiety, positive diagnosis of effort syndrome may require an exercise electrocardiogram. Other chest pains that mimic effort syndrome and angina may be caused by musculoskeletal problems, such as inflammation of the costochondral junctions, fractured ribs, or cervical spondylosis. Also called **neurocirculatory asthenia.**

effort thrombosis, an abnormal condition in which a clot develops within the subclavian or axillary vein following strenuous exercise. The condition is accompanied by pain, edema, and skin discoloration in the shoulder and upper arm. Also called **Paget-Schroetter's syndrome, Paget-von Schroetter's syndrome.**

effraction /ifrak′shən/, a breaking open or weakening.

effusion /ifyo͞o′zhən/ [L, *effundere*, to pour out], **1.** the escape of fluid, for example, from blood vessels as a result of rupture or seepage, usually into a body cavity. The condition is usually associated with a circulatory or renal disorder and is often an early sign of congestive heart disease. The term may be associated with an affected body area, as pleural or pericardial effusion. See also **edema, transudate. 2.** the outward spread of a bacterial growth.

eflornithine hydrochloride /eflôr′nithēn/, an inhibitor of the enzyme ornithine decarboxylase, applied in creams by females over age 12 to limit unwanted facial hair growth and administered by injection to treat the meningoencephalitic stage (sleeping sickness) of a protozoal infection caused by *Trypanosoma brucei*.

EFM, abbreviation for **electronic fetal monitor.**

Efudex, a trademark for an antineoplastic **(fluorouracil).**

EGD, abbreviation for **esophagogastroduodenoscopy.**

egest /ijest′/ [L, *egerere*, to expel], to discharge or evacuate a substance from the body, especially to evacuate unabsorbed residue of foods from the intestines. **—egesta,** *n. pl.*, **egestive,** *adj*.

EGF, abbreviation for **epidermal growth factor.**

egg /eg/ [ONorse], a female reproductive cell at any stage before fertilization. After fertilization and fusion of the pronuclei, it is called a zygote. Also called **ovum.**

eglandulous /ēglan′dyələs/, describing an absence of glands.

ego /ē′gō, eg′ō/ [Gk, I or self], **1.** the conscious sense of the self; those elements of a person, such as thinking, feeling, and willing, that distinguish him or her as an individual. **2.** (in psychoanalysis) the part of the psyche that experiences and maintains conscious contact with reality and tempers the primitive drives of the id and the demands of the superego with the social and physical needs of society. It represents the rational element of the personality, is the seat of such mental processes as perception and memory, and develops defense mechanisms against anxiety. See also **id, superego.**

ego-alien. See **ego-dystonic.**

ego analysis, (in psychoanalysis) the intensive study of the ego, especially the defense mechanisms.

ego boundary, (in psychiatry) a sense or awareness that there is a distinction between the real and unreal. In some psychoses the person does not have an ego boundary and cannot differentiate his or her personal perceptions and feelings from those of other people.

egocentric /ē′gōsen′trik/ [Gk, *ego* + *kentron*, center], **1.** *adj*, regarding the self as the center, object, and norm of all experience and having little regard for the needs, interests, ideas, and attitudes of others. **2.** *n*, a person possessing these characteristics.

ego-defense mechanism. See **defense mechanism.**

ego-dystonic /ē′gōdiston′ik/, describing elements of a person's behavior, thoughts, impulses, drives, and attitudes that are unacceptable to him or her and cause anxiety. Also called **ego-alien, self-alien.** Compare **ego-syntonic.**

ego-dystonic homosexuality, a psychosexual disorder characterized by discomfort with one's sexuality and a persistent desire to change sexual orientation to heterosexuality. See also **homosexual.**

ego ideal, the image of the self to which a person aspires both consciously and unconsciously and against which he or she measures himself or herself and judges personal performance. It is usually based on a positive identification with the significant and influential figures of the early childhood years. See also **identification.**

ego-integrity, an acceptance of self, both successes and failure. It implies a healthy psychological state. Despair often precedes ego-integrity.

egoism /ē′gō·iz′əm, eg′-/, **1.** selfishness, an overvaluation of the importance of the self, expressed as a willingness to gain an advantage at the expense of others. See also **egotism. 2.** the belief that individual self-interest is, or ought to be, the basic motive for all conscious behavior.

egoist /ē′gō·ist, eg′-/, **1.** a selfish person, one who seeks to satisfy his or her own interests at the expense of others. See also **egotist. 2.** a person who believes in or acts in accordance with the concept that all conscious action is justifiably motivated by self-interest. **—egoistic, egoistical,** *adj.*

ego libido, (in psychoanalysis) concentration of the libido on the self; self-love, narcissism.

egomania /ē′gōmā′nē·ə/ [Gk, *ego,* I, *mania,* madness], a pathological preoccupation with the self and an exaggerated sense of one's own importance.

egophony /ēgof′ənē/, a change in the voice sound of a patient with pleural effusion or pneumonia as heard on auscultation. When the patient is asked to make /ē-ē-ē/ sounds, they are heard over the peripheral chest wall as /ä-ä-ä/, particularly over an area of consolidated or compressed lung above the effusion. Also called *tragophony.*

ego strength, (in psychotherapy) the ability to maintain the ego by a cluster of traits that together contribute to good mental health. The traits usually considered important include tolerance of the pain of loss, disappointment, shame, or guilt; forgiveness of those who have caused an injury, with feelings of compassion rather than anger and retaliation; acceptance of substitutes and ability to defer gratification; persistence and perseverance in the pursuit of goals; openness, flexibility, and creativity in learning to adapt; and vitality and power in the activities of life. The psychiatric prognosis for a client correlates positively with ego strength.

ego-syntonic /ē′gō sinton′ik/, describing those elements of a person's behavior, thoughts, impulses, drives, and attitudes that are acceptable to him or her and are consistent with the total personality. Compare **ego-dystonic.**

egotism /ē′gətiz′əm, eg′-/, vanity, conceit, or overvaluation of the importance of the self and undervaluation or contempt of others. See also **egoism. —egotistic, egotistical,** *adj.*

egotist /ē′gətist, eg′-/, one who is vain or conceited or who places too much importance on the self and is boastful, egocentric, and arrogant. See also **egoist.**

egotistic, egotistical. See **egotism.**

egress /ē′gres/, the act of emerging or moving forward.

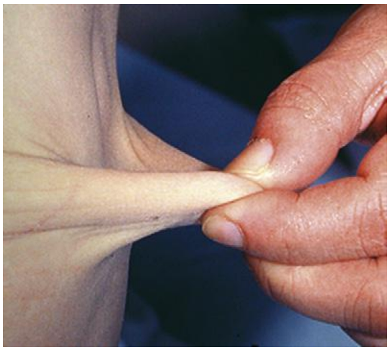
Egyptian ophthalmia. See **trachoma.**

EHD, abbreviation for **electrohemodynamics.**

EHEC, abbreviation for **enterohemorrhagic *Escherichia coli.***

ehl, abbreviation for **effective half-life.**

Ehlers-Danlos syndrome /ā′lərz dan′ləs/ [Edward Ehlers, Danish physician, 1863–1937; Henri A. Danlos, French physician, 1844–1912], a hereditary disorder of connective tissue, marked by hyperplasticity of skin, tissue fragility, and hypermotility of joints. Minor trauma may cause a gaping wound with little bleeding. Sprains, joint dislocations, and synovial effusions are common. However, life expectancy is usually normal. Treatment includes symptomatic therapy, emotional support for the patient and family, and emphasis on avoiding trauma in childhood.



Skin laxity in Ehlers-Danlos syndrome
(Graham-Brown and Bourke, 2007)

Ehrlichia, a genus of small spherical to ellipsoidal, nonmotile gram-negative bacteria. They occur singly or in compact inclusions in circulating mammalian leukocytes. Some species are the causative agents of ehrlichiosis and are transmitted by ticks. Two human tick-borne diseases have been associated with *Ehrlichia* species: human monocytic ehrlichiosis caused by *E. chaffeensis,* and human granulocytic ehrlichiosis caused by *E. equi.*

ehrlichiosis, a sometimes fatal tick-borne infection with symptoms similar to those of Lyme disease. The great majority of infections are asymptomatic. Most cases present as mild to moderate acute febrile illness. The disease usually begins about 10 days after the bite of an infected tick, although some cases have begun abruptly, within hours, with influenza-like symptoms, including painful muscle aches, headaches, fever, chills, loss of appetite, and depressed blood cell counts. Although similar to Lyme disease, the infection does not respond to the antibiotics used to treat Lyme disease. However, ehrlichiosis does respond to early treatment with tetracycline antibiotics. The tick that carries the ehrlichiosis infection is the same species as the vector of Lyme disease, ***Borrelia burgdorferi,*** but the patient usually recovers within 8 weeks without the chronic arthritis symptoms associated with Lyme disease. Diagnosis is difficult because of the similarities with Lyme disease, and cases of simultaneous infections of both types of bacteria have been reported. Also, one of the organisms associated with ehrlichiosis, *Ehrlichia equi,* is nearly identical to a bacterium that causes fevers in horses. Also called **human granulocytic ehrlichiosis, human monocytic ehrlichiosis.** See also ***Ehrlichia.***

eicosanoic acid /ī′kōsənō′ik/ [Gk, *eikosa,* twenty], a saturated fatty acid containing 20 carbon atoms in a straight chain, found in peanut oil, butter, and other fats. Also called *arachidic acid.*

eicosapentaenoic acid /ī·kō′sə·pen′tə·ē·nō′ik/, an omega-3, 20-carbon fatty acid found almost exclusively in fish and marine animal oils.

EID, abbreviation for **electronic infusion device.**

eidetic /īdet′ik/ [Gk, *eidos,* a form or shape seen], **1.** *adj,* pertaining to or characterized by the ability to visualize and reproduce accurately the image of objects or events previously seen or imagined. **2.** *n,* a person possessing such ability.

eidetic image, an unusually vivid, elaborate, and apparently exact mental image resulting from a visual experience and occurring as a fantasy, dream, or memory. See also **image.**

eighth cranial nerve. See **vestibulocochlear nerve.**

einsteinium (Es) /īnstī′nē·əm/ [Albert Einstein, German-born physicist and Nobel laureate, 1879–1955], a synthetic transuranic metallic element. Its atomic number is 99. The mass of its longest-lived, best-known isotope is 254. Einsteinium was first found in the debris from a hydrogen bomb explosion. It decays rapidly into berkelium.

Einthoven's formula /īnt′hōvənz/ [Willem Einthoven, Dutch physiologist, scientist, and Nobel laureate, 1860–1927; L, *forma,* pattern], a mathematical expression relating the voltages measured by electrocardiographic leads. The formula states that the sum of the voltages from lead I plus those from lead III minus those from lead II equals zero (I + III − II |m= 0). This formula is based on the principle that the sum of the voltages in any closed path equals zero. Because the positive and negative electrodes of lead II are reversed, the voltage from lead II is subtracted instead of added to the voltages from leads I and III. See also **Einthoven's triangle.**

Einthoven's triangle [Willem Einthoven], an equilateral triangle whose vertices lie at the left and right shoulders and the pubic region and whose center corresponds to the vector sum of all electric activity occurring in the heart at any given moment, allowing for the determination of the electrical axis. Einthoven's triangle is approximated by the triangle formed by the axes of the bipolar electrocardiographic (ECG) limb leads I, II, and III. The center of the triangle offers a reference point for the unipolar ECG leads.

Eisenmenger's complex /ī′sənmeng′ərz/ [Victor Eisenmenger, German physician, 1864–1932; L, *complexus,* encirclement], a congenital heart disease characterized by a defect of the ventricular septum, a malpositioned aortic root that overrides the interventricular septum, and a dilated pulmonary artery.

Eisenmenger's syndrome /i′sən·meng′ərz/ [Victor Eisenmenger, German physician, 1864-1932], ventricular septal defect with pulmonary hypertension and cyanosis resulting from right-to-left (reversed) shunt of blood. It is sometimes defined as pulmonary hypertension and cyanosis with the shunt being at the atrial, ventricular, or great vessel area.

ejaculate /ijak′yəlit/, *n.* the semen discharged in a single emission. See also **ejaculation. —ejaculate** /ijak'yəlāt/, *v.*

ejaculation /-ā′shən/ [L, *ejaculari,* to hurl out], the sudden emission of semen from the male urethra, usually during copulation, masturbation, or nocturnal emission. It is a reflex action in two phases. In the first phase, sperm, seminal fluid, and prostatic and bulbourethral gland secretions are moved into the urethra. In the second phase, strong spasmodic peristaltic contractions force ejaculation. The sensation of ejaculation is commonly also called **orgasm**. The fluid volume of the ejaculate is usually between 2 and 5 mL. Each milliliter usually contains 50 million to 150 million spermatozoa. **—ejaculatory** /ijak'yələtôr'ē/, *adj.*

ejaculator urinae. See **bulbospongiosus.**

ejaculatory duct /ijak′yələtôr′ē/, the passage formed by the junction of the duct of the seminal vesicles and ductus deferens through which semen enters the urethra.

ejection /ijek′shən/ [L, *ejicere,* to cast out], forceful expulsion, as of blood from a ventricle of the heart.

ejection click, a sharp, clicking sound arising from near the heart. It may be caused by sudden swelling of a pulmonary artery, abrupt dilation of the aorta, or forceful opening of the aortic cusps. Ejection clicks are often heard during examination of individuals with septal defects or patent ductus arteriosus. Although they are associated with high pulmonary resistance and hypertension, they are common and of no clinical significance in pregnant women and in many other healthy people. Compare **systolic click.** See also **ejection sound.**

ejection fraction (EF), the fraction of the total ventricular filling volume that is ejected during each ventricular contraction. The normal EF of the left ventricle is 65%.

ejection murmur. See **systolic murmur.**

ejection period, the second phase of ventricular systole, when the semilunar valves are open and blood is being discharged into the aortic and pulmonary arteries. Also called **sphygmic interval.**

ejection sound, a sharp, clicking sound heard early in systole, coinciding with the onset of either right or left ventricular ejection. Aortic ejection sounds are commonly heard in aortic valvular stenosis, aortic insufficiency, coarctation of the aorta, and hypertension with aortic dilation. Pulmonary ejection sounds are heard in mild to moderate pulmonary stenosis, pulmonary hypertension, and dilation of the pulmonary artery. See also **ejection click.**

Ekbom's syndrome. See **restless legs syndrome.**

EKC, abbreviation for **epidemic keratoconjunctivitis.**

EKG, abbreviation for **electrocardiogram.**

elaboration /ilab′ərāshən/ [L, *elaborare,* to work out], (in endocrinology) a process by which a gland synthesizes a complex substance from simpler substances and secretes it, usually under the stimulation of a tropic hormone from the pituitary gland. This process, regulated by a negative feedback system, which includes the hypothalamus, pituitary, and target gland, serves to maintain homeostasis in body function. **—elaborate,** *adj.*

elaio-. See **eleo-.**

elapid /el′äpid/, **1.** *adj,* pertaining to the members of a family of pit vipers that includes the genera ***Micruroides*** and ***Micrurus.*** **2.** *n,* any of the members of this group.

Elaprase, a trademark for **idursulfase.**

Elase, a trademark for a topical fixed-combination drug containing enzymes (**fibrinolysin** and desoxyribonuclease).

Elase with Chloromycetin, a trademark for a topical fixed-combination drug containing two lytic enzymes (**fibrinolysin** and desoxyribonuclease) and an antibacterial (**chloramphenicol**).

elastance /ilas′təns/ [Gk, *elaunein,* to drive], **1.** the quality of recoiling or returning to an original form after the removal of pressure. **2.** the degree to which an air- or fluid-filled organ, such as a lung, bladder, or blood vessel, can return to its original dimensions when a distending or compressing force is removed. **3.** the measurement of the unit volume of change in such an organ per unit of decreased pressure change. **4.** the reciprocal of compliance.

elastase, an enzyme that cleaves bonds adjacent to neutral amino acids in elastin.

elastic bandage /ilas′tik/ [Gk, *elaunein,* to drive; Fr, *bande,* strip], a bandage of stretchable fabric that provides support and allows movement. Among its uses is application to swollen extremities, such as knees or wrists, varicose veins, and broken ribs.

elastic-band fixation, a method of treatment of fractures of the jaw using rubber bands to connect metal splints or wires that are attached to the maxilla and mandible. The rubber bands produce traction and draw the teeth into occlusion and proper alignment while the fracture is healing. Rubber bands are safer than rigid wires in the event of vomiting. See also **maxillomandibular fixation, nasomandibular fixation.**

elastic bougie, a flexible bougie that can be passed through angular or winding channels. See also **bougie.**

elastic cartilage, the most pliant of the three kinds of cartilage, consisting of elastic fibers in a flexible fibrous matrix.

It is yellow and is located in various parts of the body, such as the external ear, the auditory tube, and the epiglottis. Also called **yellow cartilage.** Compare **hyaline cartilage, white fibrocartilage.**

elasticity /iʹlastisʹitē/, the ability of tissue to regain its original shape and size after being stretched, squeezed, or otherwise deformed. Muscle tissue is generally regarded as elastic because it is able to change size and shape and return to its original condition.

elastic membrane. See **cricothyroid membrane.**

elastic recoil /rēʹkoil/, the difference between intrapleural pressure and alveolar pressure at a given lung volume under static conditions.

elastic stocking, a type of hosiery that applies gradient pressure to the legs to prevent excessive blood accumulation in the lower extremities caused by faulty vein valves. The stockings are commonly prescribed for patients with varicose veins. Compare **antiembolism (AE) hose.**

Elastic stocking *(Sorrentino, 2012)*

elastic tissue [Gk, *elaunein,* to drive; OFr, *tissu*], a type of connective tissue containing elastic fibers. It is found in ligaments of the spinal column, in the cartilage of the external ear, and in the walls of some large blood vessels.

elastic traction [Gk, *elaunein* + L, *trahere,* to draw], any therapeutic apparatus that uses an elastic device to pull on a limb.

elastin /ilasʹtin/ [Gk, *elaunein,* to drive], a protein that forms the principal substance of yellow elastic tissue fibers.

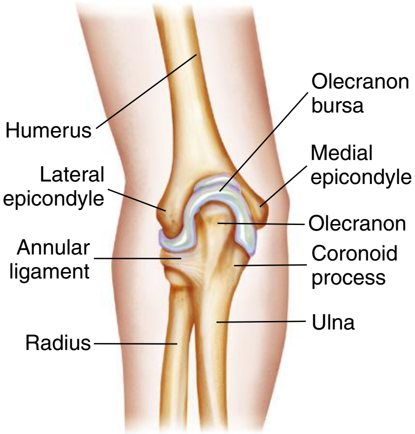
elastofibroma /ilasʹtōfībrōʹmə/, a benign nonencapsulated mass of collagenous, fibrous, and elastic tissue that develops in subscapular fatty tissue in older persons.

elastomer /i·lasʹtōmər/ [Gk, *elaunein,* to drive + *meros,* part], a synthetic rubber; any of various soft, elastic, rubberlike polymers used in dentistry as an impression material and for maxillofacial extraoral prostheses. **—elastomeric,** *adj.*

elation /ilāʹshən/ [L, *elatus,* a lifting up], an emotional reaction characterized by euphoria, excitement, extreme joyfulness, optimism, and self-satisfaction. It is considered to be of pathological origin when such a response does not realistically reflect a person's actual circumstances. Thus an elated mood may be characteristic of a manic state.

Elavil, a trademark for a tricyclic antidepressant (amitriptyline hydrochloride).

elbow [AS, *elboga*], the bend of the upper limb at the joint that connects the arm and the forearm. It is a common site of inflammation and injuries, such as those incurred during participation in various sports. See also **elbow joint.**



Structures of the elbow *(Seidel et al, 2011)*

elbow bone. See **ulna.**

elbow jerk. See **triceps reflex.**

elbow joint, the hinged articulation of the humerus, the ulna, and the radius. It is covered by a protective capsule associated with three ligaments and an extensive synovial membrane. The elbow joint allows flexion and extension of the forearm and accommodates the radioulnar articulation. Also called **articulatio cubiti.**

elbow reflex. See **triceps reflex.**

elder, an herb found in the United States and Europe as a tall shrub.

■ USES: This berry or flower may be useful for limiting the duration of symptoms from colds and flu; the flower is also used as a mouthwash and applied topically as an astringent for nasal and chest congestion, earache associated with chronic congestion, and hay fever.

■ CONTRAINDICATIONS: It is not recommended during pregnancy and lactation, in children, or in those with known hypersensitivity to this plant or similar plants. Raw or unripe fruit can cause nausea, vomiting, and severe diarrhea.

elder abuse, a reportable offense of physical, sexual, psychological, or material abuse, as well as violation of the rights of safety, security, and adequate health care of older adults. Contributing factors may include economic considerations, interpersonal conflicts, health, and dependency. Often the abused person denies that abusive acts occur and feels helpless and resigned to abuse. Health care workers are required to report suspected abuse, and perpetrators may be subject to criminal charges. Also called **abuse of the elderly.**

■ OBSERVATIONS: Manifestations are dependent on the form of abuse. *Physical abuse* signs include cuts; lacerations; bruises; welts; black eyes; broken bones and sprains; dislocations; injury incompatible with history; broken eyeglasses; torn clothing; physical signs of punishment or restraint; laboratory findings of medication overdose or underuse of prescription drugs; elder report of being hit, slapped, kicked, or maltreated; and caregiver's refusal to allow visitors to see elder alone. *Sexual abuse* signs include bruises around the breasts or genitalia; unexplained venereal disease or genital infections; unexplained vaginal or rectal bleeding; torn, stained, or bloody underclothing; and elder report of being assaulted or raped. *Emotional abuse* signs include emotional upset or agitation; hesitation to speak; extreme withdrawal; unusual behavior usually attributed to dementia; implausible stories; and reports of being verbally or emotionally abused. *Neglect* signs include dirty appearance; presence of feces and/or urine; environmental safety hazards; dehydration; malnutrition; untreated bed sores; poor personal hygiene; untreated health care problems; and elder report of mistreatment. *Abandonment* signs include desertion of an elder at a public institution or location such as a hospital, clinic, or shopping center, and elder self-report of abandonment. Signs of *exploitation* include unusual, sudden, or inappropriate activity in bank accounts; signatures on checks that do not resemble the older person's signature; unusual concern by caregiver that an excessive amount of money is being spent on care of the older person; numerous unpaid bills; overdue rent; abrupt changes in a will or other financial documents; unexplained disappearance of funds or valuable possessions; and unexplained or sudden transfer of assets to a family member or someone outside the family. Signs of *self-neglect* include dehydration; malnutrition; untreated or improperly attended medical conditions; poor personal hygiene; hazardous or unsafe living conditions; inappropriate or inadequate clothing; and overall lack of self-care. Diagnosis is typically made by social service, health care, and legal experts after history, investigation, and physical examination. Laboratory tests and drug screening may be done to determine the extent of malnutrition, dehydration, and medication drug levels. Severe injury, disfigurement, and death are all complications of chronic or severe physical abuse.

■ INTERVENTIONS: Obvious signs of abuse are reported to the local authorities for immediate investigation and elder protection. If the elder is perceived to be in immediate danger, elder protection should be sought through the local Adult Protective Services or the county Department of Social Services. If signs are vague or inconsistent, observations are documented and reported to appropriate local authorities for investigation.

■ NURSING CONSIDERATIONS: Nurses serve as a frontline resource for the detection, intervention, and prevention of elder abuse. This includes the identification of high-risk dependent elder relationships, such as those where an elder is dependent on caretakers; elders with functional impairments; previous history of abuse or neglect; evidence of substance abuse or polypharmacy; signs of depression; and lack of or limited financial and/or support resources. The nurse needs to do a thorough assessment for signs of coercive caretaker arrangements or lack of caretaker skills, identification of family crises that could trigger abuse or neglect, and identification of signs of abuse or neglect. All evidence should be carefully documented and reported to appropriate sources. The nurse is also instrumental in assisting elder and family to seek respite care services, counseling, and support groups. Social agency referrals are needed for financial and functional assistance (e.g., housekeeping, cooking, and shopping). Skill-building workshops for family members, coordinated care of elderly needs, public education about the problem, and coordination among state agencies and service providers are all mechanisms for prevention. Education includes caregiver instruction about alternative forms of venting frustrations and information about available community resources.

elderly primigravida, a woman who becomes pregnant for the first time after the age of 34. Although an elderly primigravida was in the past at greater risk of adverse complications of a pregnancy, newer techniques and drugs have eliminated most of the risk and made it possible even for women of menopausal age to bear children.

Eldopaque, a trademark for a dermatological bleaching agent **(hydroquinone).**

elective /ilek′tiv/ [L, *eligere,* to choose], pertaining to a procedure that is performed by choice and is not essential, such as elective surgery.

elective abortion, induced termination of a pregnancy (TOP), usually before the fetus has developed enough to live if born, deemed necessary by the woman carrying it and performed at her request. Commonly (but incorrectly) called **therapeutic abortion.** See also **induced abortion.**

elective induction of labor. See **induction of labor.**

Electra complex /ilek′trə/, (in psychiatry) the libidinous desire of a daughter for her father. Compare **oedipus complex.** See also **phallic stage.**

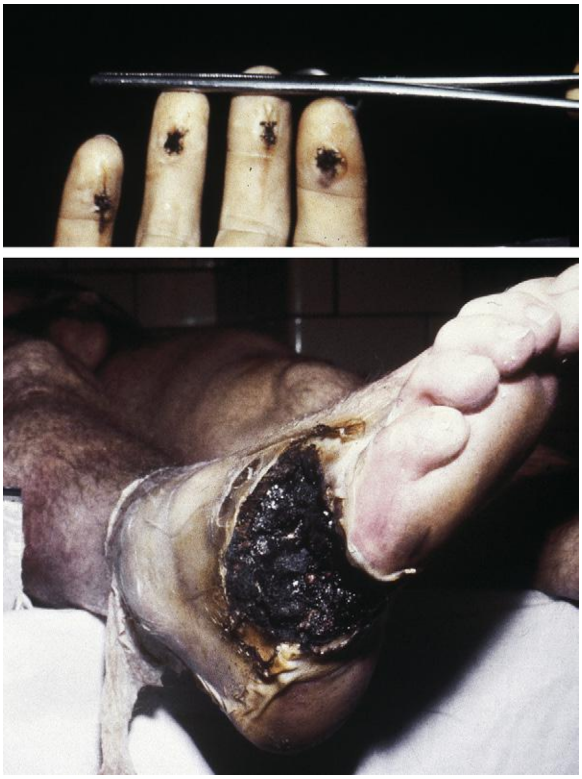
electret /ilek′trət/, an insulator carrying a permanent charge similar to a permanent magnet.

electrically stimulated osteogenesis /ilek′triklē/ [Gk, *elektron,* amber; L, *stimulare,* to incite; Gk, *osteon,* bone, *genein,* to produce], a bone regeneration process induced by surgically implanted electrodes conveying electric current, especially at nonunion fracture sites. The process is effective because of the different electric potentials within bone tissue. Viable nonstressed bone is electronegative in the metaphyseal regions and over a fracture callus and electropositive in the diaphyses and other less active regions. Electric stimulation of fractures can accelerate osteogenesis, forming bone more quickly in the area of a surgically inserted negative electrode. The precise mechanisms by which electricity induces osteogenesis are not understood, but research shows that when cathodes are implanted at a fracture site and an electric potential of less than 1 volt is applied, oxygen is consumed at the cathode, and hydroxyl ions are produced, decreasing the oxygen tension of the local tissue and increasing the alkalinity. Low tissue oxygen tension encourages bone formation, which follows a predominantly anaerobic metabolic pathway. Studies of bone-forming junctions demonstrate that an alkaline pH exists in the zone of hypertrophic cells of the bone growth plate when calcification starts. Electrically stimulated osteogenesis can be achieved with a device that stimulates the fracture site electrically by means of several surgically implanted cathodes. Cathode pins are connected to an external power supply that delivers 20 μA to each pin. The cathodes are inserted and positioned in the fracture space with the aid of image intensification or other radiographic techniques. Other methods for applying electrical current to fractured bone involve open surgical procedures and implantation of electrodes. The percutaneous technique involving the insertion of cathode pins is performed with a local anesthetic and usually involves less postoperative pain than open surgery methods. The number and the position of the cathodes in the percutaneous technique vary, depending on the bone involved. Generally two cathodes are used for nonunion fractures of small bones, such as the medial malleolus or the carpal navicular. Three or more cathodes are used in the clavicle and the bones of the forearm. Four cathodes are used in the treatment of large bones, such as the tibia, the femur, and the humerus. Cathodes are generally inserted from opposite directions into the nonunion site. If four cathodes are used, two are placed above, and two below the fracture site. The exposed tips of the cathodes rest directly in the nonunion space. Patients who receive such treatment are routinely released from the hospital the day after the procedure, and the stimulation of their fractures by a portable power supply strapped to the skin over the fracture site continues during the healing period. The osteogenesis is radiographically monitored, and after about 12 weeks the cathode pins are removed and the affected portion of the limb involved is placed in a weight-bearing cast. Use of the cathode-pin method of electrically stimulated osteogenesis is contraindicated in the treatment of pathological fractures associated with benign or malignant tumors and in the treatment of congenital conditions such as congenital pseudarthrosis and osteogenesis imperfecta. The cathode-pin method is also contraindicated in the presence of active systemic infections, clinically active osteomyelitis, proven patient sensitivity to the nickel or chromium from which the pins are made, or synovial pseudarthrosis, unless the fluid-filled cavity at the nonunion site is excised before the cathode pins are inserted. The success rate of treatment with the percutaneous method of electrically stimulated osteogenesis is significantly reduced in nonunions in which the gap is wider than one half the diameter of the bone involved. Compare **oedipus complex.** See also **phallic stage.**

electrical silence, in electroencephalography and electromyography, absence of measurable electrical activity in tissue.

electric blood warmer, a device for heating blood before infusions, especially massive transfusions in which cold blood may cause a state of shock. The electric blood warmer includes a receptacle containing an electric heater and space for the insertion of a disposable blood-warming bag composed of parallel plastic tubes. The warmer is also equipped with a temperature indicator, which shows when the heating bag reaches the proper temperature of 99° F (37.6° C). An IV Y-set is commonly used in transfusions involving the electric blood warmer.

electric burn, the tissue damage resulting from heat of up to 5000° C generated by an electric current. The points of entrance and exit on the skin are burned, along with the muscle and subcutaneous tissues through which the current passes. Fatal cardiac arrhythmia may result.



Entry site *(top)* and exit site *(bottom)* of an electric burn *(Sanders et al, 2007)*

electric cautery. See **electrocautery.**

electric circuit, the path of the electron flow from a generating source through various components and back to the generating source.

electric current, the net movement of electrons along a conducting medium.

electric field, the lines of force exerted on charged ions in the tissues by the electrodes that cause charged particles to move from one pole to another.

electric impedance, an opposition to electron flow in a conducting material.

electricity /i′lektris′itē/ [Gk, *elektron,* amber], a form of energy expressed by the activity of electrons and other subatomic particles in motion, as in dynamic electricity, or at rest, as in static electricity. Electricity can be produced by heat generated by a voltaic cell or produced by induction, rubbing of nonconductors with dry materials, or chemical activity. Electricity may be negative, when there is a surplus of electrons, or positive, when there is a surplus of protons or a deficiency of electrons.

electric muscle stimulator (EMS), a therapeutic electric current used to stimulate muscle directly, such as when the muscle is denervated and peripheral nerves are not functioning. See also **electrostimulation.**

electric potential, the potential difference between charged particles. See also **potential.**

electric potential gradient. See **membrane potential.**

electric shock, a traumatic physical state caused by the passage of electric current through the body. It usually involves accidental contact with exposed parts of electric circuits in home appliances and domestic power supplies but may also result from lightning or contact with high-voltage wires. The resultant damage depends on the intensity of the electric current, the type of current, and the duration and the frequency of current flow. Alternating current (AC), direct current (DC), and mixed current cause different kinds and degrees of damage. High-frequency current produces more heat than low-frequency current and can cause burns, coagulation, and necrosis of affected body parts. Low-frequency current can burn tissues if the area of contact is small and concentrated. Severe electric shock commonly causes unconsciousness, respiratory paralysis, muscle contractions, bone fractures, and cardiac disorders. Even passage of small electric currents through the heart can cause fibrillation. About 1000 persons in the United States die from electric shock each year. Treatment may involve such measures as cardiopulmonary resuscitation, defibrillation, and IV administration of electrolytes to help stabilize vital functions. See also **cardiogenic shock, hypovolemic shock.**

electric shock therapy. See **electroconvulsive therapy.**

electric spinal orthosis (ESO), an electric device that helps control curvature of the spine by stimulating back muscles. The portable battery-powered machine does not correct scoliosis but prevents it from worsening.

electro-, prefix meaning “electricity”: *electrobiology, electrocatalysis, electrolepsy.*

electroacupuncture after Voll (EAV), a system of diagnosis and treatment based on the measurement of the electrical characteristics of acupoints, the results being used to determine a specific remedy.

electroanalgesia /ilek′trō·an′əljē′sē·ə/, the use of an electric current to relieve pain. See also **transcutaneous electrical nerve stimulation.**

electroanalytic chemistry /-an′əlit′ik/ [Gk, *elektron* + *analysis,* a loosening, *chemeia,* alchemy], the branch of chemistry concerned with the analysis of compounds by use of electrical properties to produce characteristic observable change in the substance being studied. See also **chemistry.**

electroanesthesia /-an′esthē′zhə/, the use of an electric current to produce local anesthesia.

electroaxonography. See **axonography.**

electrocardiogram (ECG, EKG) /-kär′dē·əgram′/ [Gk, *elektron* + *kardia*, heart, *gramma*, record], a graphic record produced by an electrocardiograph, a device for recording electrical conduction through the heart.

electrocardiograph (ECG) /-kär′dē·əgraf′/, a device used for recording the electrical activity of the myocardium to detect transmission of the cardiac impulse through the conductive tissues of the muscle. Electrocardiography allows diagnosis of specific cardiac abnormalities. Leads are affixed to certain anatomical points on the patient's chest, usually with an adhesive gel that promotes transmission of the electric impulse to the recording device. **—electrocardiographic,** *adj.*

electrocardiographic technician /-kär′dē·ōgraf′ik/, an allied health worker with special training and experience in operating and maintaining electrocardiographic equipment and providing recorded data for diagnostic review by a physician.

electrocardiograph lead /lēd/, **1.** an electrode placed on part of the body and connected to an electrocardiograph. **2.** a record, made by the electrocardiograph, that varies with the site of the electrode. Electrocardiography is generally performed with the use of six limb leads and six leads placed on the precordium. The peripheral or extremity leads are designated I, II, III, AVR, AVL, and AVF. The chest leads are designated V_1, V_2, V_3, V_4, V_5, and V_6 to indicate the points on the precordium on which the electrodes are placed.

electrocardiography (ECG) /-kär′dē·og′rəfē/ [Gk, *elektron* + *kardia*, heart, *graphein*, to record], the study of records of electric activity generated by the heart muscle. Also called **cardiography.**

electrocardiophonograph. See **phonocardiograph.**

electrocatalysis, the chemical decomposition of tissues caused by the application of electric current to the body.

electrocautery /ilek′trōkô′tərē/ [Gk, *elektron* + *kauterion*, branding iron], the application of a needle or snare heated by electric current for the destruction of tissue, such as for removing warts or polyps and cauterizing small blood vessels to limit blood loss during surgery. Also called **electric cautery, galvanic cautery, galvanocautery.** See also **diathermy.**

electrochemistry, the study of the electric effects that accompany chemical action and the chemical activity produced by electric influence.

electrocoagulation /-kō·ag′yəlā′shən/ [Gk, *elektron* + L, *coagulare*, to curdle], a therapeutic destructive form of electrosurgery in which tissue is hardened by the passage of high-frequency current from an electric cautery device. Also called **surgical diathermy.** Compare **electrodesiccation.**

electroconvulsive therapy (ECT) /-kənvul′siv/, the induction of a brief convulsion by passing an electric current through the brain for the treatment of affective disorders, especially in patients resistant to psychoactive-drug therapy. ECT is primarily used when rapid definitive response is required for either medical or psychiatric reasons, such as for a patient who is extremely suicidal and when the risks of other treatments outweigh the risk of ECT. A secondary use of ECT is treatment failure of other choices. Also called **electric shock therapy, electroshock therapy, electrotherapy.**

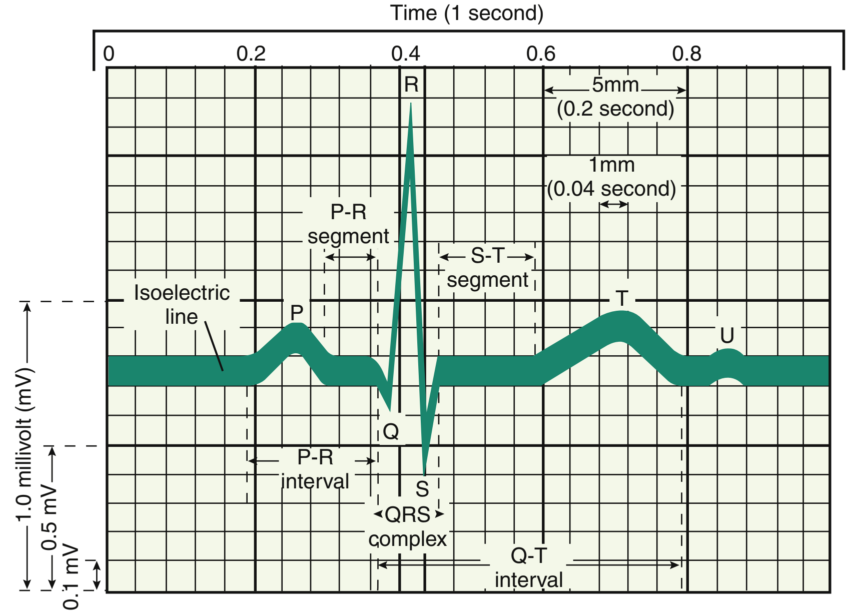
electroconvulsive therapy (ECT) management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting with the safe and efficient provision of electroconvulsive therapy in the treatment of psychiatric illness. See also **Nursing Interventions Classifications.**

electrocution /-kyo͞o′shən/, death caused by the passage of electric current through the body. See also **electric shock.**

electrode /ilek′trōd/ [Gk, *elektron* + *hodos*, way], **1.** a contact for the induction or detection of electrical activity. **2.** a medium for conducting an electrical current from the body to physiological monitoring equipment.

electrodermal /-dur′məl/, pertaining to electrical properties of the skin, particularly altered resistance.

electrodermal activity therapy, a type of biofeedback therapy in which sensors attached to the palm or the palmar aspect of the fingers are used to monitor sweat output in response to stress. It is used in the treatment of stress, anxiety disorders, chronic pain, and hyperhidrosis.



QRS complex and Q-T interval on a normal ECG waveform *(Black and Hawks, 2005)*

electrodermal audiometry [Gk, *elektron* + *derma,* skin; L, *audire,* to hear; Gk, *metron,* measure], a method for determining hearing thresholds in which a harmless electric shock is used to condition the subject to a pure tone, which thereafter, coupled with the anticipation of a shock, elicits a brief electrodermal response. The lowest intensity of the sound that produces the skin response is considered the subject's hearing threshold. It is a very old procedure and rarely used today.

electrodesiccation /-des′ikā′shən/ [Gk, *elektron* + *desiccare,* to dry up], a technique in electrosurgery in which tissue is destroyed by burning with an electric spark. It is used primarily for eliminating small superficial growths but may be used with curettage to eradicate abnormal tissue deeper in the skin or to stop bleeding. In the latter case, layers of skin may be burned, then successively scraped away. The procedure is performed under local anesthesia.

electrodiagnosis /-dī′agnō′sis/ [Gk, *elektron* + *dia,* twice, *gnosis,* knowledge], the diagnosis of disease or injury by electric stimulation of various nerves and muscles.

electrodynamics /-dīnam′iks/, the study of electrostatic charges in motion, such as the flow of electrons in an electric current. Compare **electrohemodynamics.**

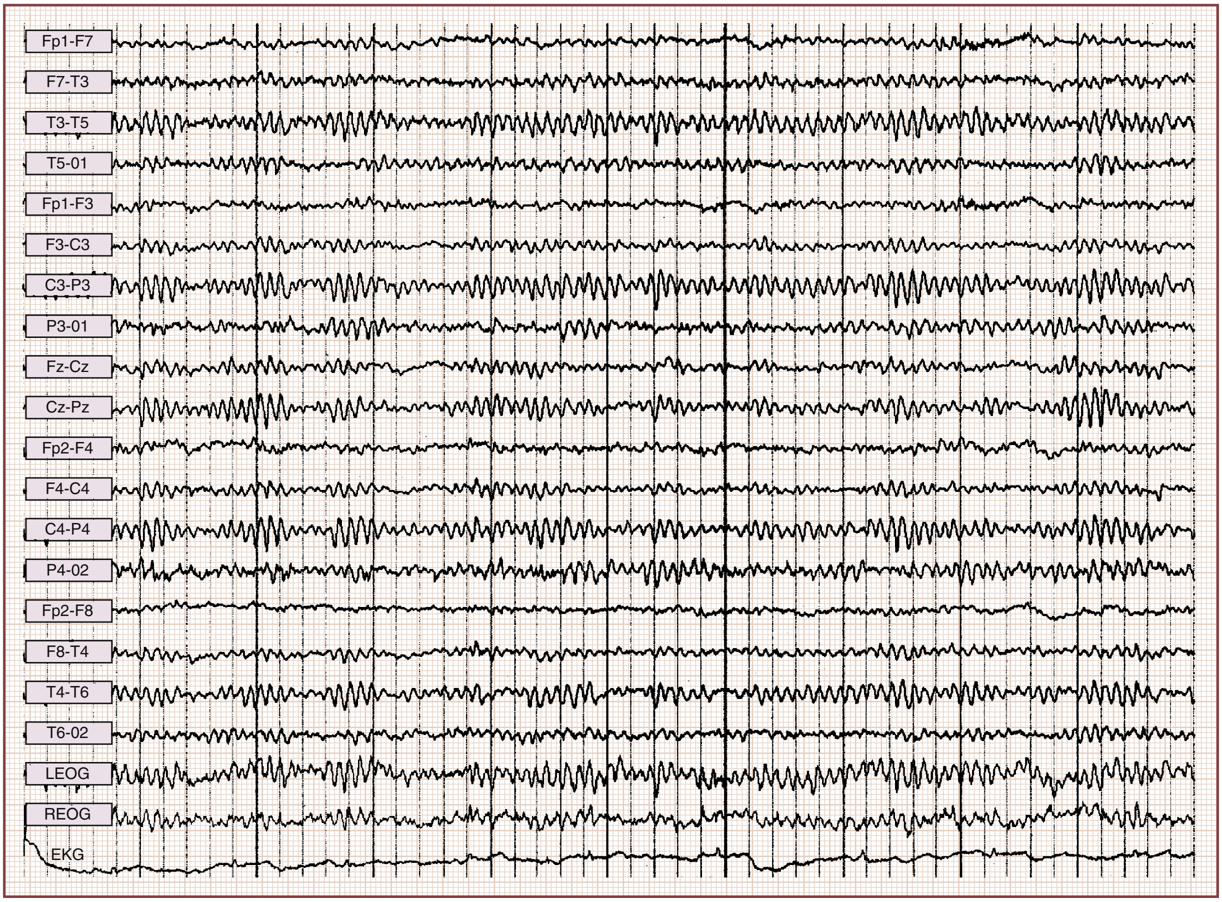
electrodynograph (EDG) /-din′əgraf′/ [Gk, *elektron* + *dynamis,* force, *graphein,* to record], an electronic device used to measure pressures exerted in biological activity, such as those exerted by the human foot in walking, running, jogging, or climbing stairs.

electroencephalogram (EEG) /ilek′trō·ensef′ələgram′/ [Gk, *elektron* + *enkephalos,* brain, *gramma,* record], a graphic chart on which is traced the electric potential produced by the brain cells, as detected by electrodes placed on the scalp. The resulting brain waves are called alpha, beta, delta, and theta rhythms, according to the frequencies they produce, which range from 2 to 12 cycles per second with an amplitude of up to 100 μV. Variations in brain wave activity are correlated with neurological conditions, psychological states, and level of consciousness. See also **encephalography.**

electroencephalograph (EEG) /ilek′trō·ensef′ələgraf′/, an instrument for receiving and recording the electric potential produced by the brain cells. It consists of a vacuum tube amplifier that magnifies the electrical currents received through electrodes placed on the scalp and electromagnetically records the patterns on a graphic chart. See also **electroencephalography.**

electroencephalographic technologist /ilek′trō·ensef′ələgraf′ik/, a person trained in the management of an electroencephalographic laboratory. The technologist may supervise electroencephalographic technicians, who are generally responsible for the operation and maintenance of the equipment.

electroencephalography (EEG) /ilek′trō·ensef′əlog′rəfē/, the process of recording brain wave activity. Electrodes are attached to various areas of the patient's head with collodion. During the procedure the patient remains quiet, with



Electroencephalogram: normal awake adult *(Goldman et al, 2012)* eyes closed, and refrains from talking or moving. In certain cases prescribed activities, especially hyperventilation, may be requested. The test is used to diagnose seizure disorders, brainstem disorders, focal lesions, and impaired consciousness. During neurosurgery the electrodes can be applied directly to the surface of the brain (intracranial electroencephalography) or placed within the brain tissue **(depth electroencephalography)** to detect lesions or tumors. See also **electroencephalogram. —electroencephalographic,** *adj*.

electrogram /ilek′trōgram′/ [Gk, *elektron* + *gramma*, record], a unipolar or bipolar record of the electric activity of the heart as recorded by electrodes within the cardiac chambers or on the epicardium. Examples are the atrial electrogram, ventricular electrogram, and His bundle electrogram.

electrohemodynamics (EHD) /ilek′trōhē′mōdīnam′iks/ [Gk, *elektron* + *haima*, blood, *dynamis*, force], a technique for noninvasively measuring the mechanical properties and hemodynamic characteristics of the vascular system, including arterial blood pressure, electric impedance, blood flow, and resistance to blood flow.

electroimmunodiffusion. See **immunodiffusion.**

electrolarynx /i·lek′troler′ingks/ [Gr, *elektron*, amber + *larynx*], an electromechanical device that enables a laryngectomized person to speak. When it is placed against the region of the laryngectomy a buzzing sound is produced, which is converted into simulated speech by movements of the organs of articulation (lips, tongue, glottis).

electrolysis /il′ektrol′isis/ [Gk, *elektron* + *lysis*, loosening], a process in which electric energy causes a chemical change in a conducting medium, usually a solution or a molten substance, or the decomposition of a substance such as hair follicles. **—electrolytic,** *adj*.

electrolyte /ilek′trōlīt/ [Gk, *elektron* + *lytos*, soluble], an element or compound that, when melted or dissolved in water or another solvent, dissociates into ions and is able to conduct an electric current. Electrolytes differ in their concentrations in blood plasma, interstitial fluid, and cell fluid and affect the movement of substances between those compartments. Proper quantities of principal electrolytes and balance among them are critical to normal metabolism and function. For example, calcium (Ca^{++}) is necessary for relaxation of skeletal muscle and contraction of cardiac muscle; potassium (K^+) is required for contraction of skeletal muscle and relaxation of cardiac muscle. Sodium (Na^+) is essential in maintaining fluid balance. Certain diseases, conditions, and medications may lead to a deficiency of one or more electrolytes and to an imbalance among them; for example, certain diuretics and a low-sodium diet prescribed in hypertension may cause hypokalemic shock as a result of a loss of potassium. Diarrhea may cause a loss of many electrolytes, leading to hypovolemia and shock, especially in infants. Careful and regular monitoring of electrolytes and IV replacement of fluid and electrolytes are aspects of acute care in many illnesses. **—electrolytic,** *adj*.

electrolyte & acid/base balance, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the balance of electrolytes and nonelectrolytes in the intracellular and extracellular compartments of the body. See also **Nursing Outcomes Classification.**

electrolyte balance, the equilibrium between electrolytes in the body.

electrolyte imbalance, the serum concentrations of an electrolyte that are either higher or lower than normal. See also **electrolyte**.

electrolyte management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion of electrolyte balance and prevention of complications resulting from abnormal or undesired serum electrolyte levels. See also **Nursing Interventions Classification.**

electrolyte management: hypercalcemia, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the promotion of calcium balance and prevention of complications resulting from serum calcium levels higher than desired. See also **Nursing Interventions Classification.**

electrolyte management: hyperkalemia, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the promotion of potassium balance and prevention of complications resulting from serum potassium levels higher than desired. See also **Nursing Interventions Classification.**

electrolyte management: hypermagnesemia, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion of magnesium balance and prevention of complications resulting from serum magnesium levels higher than desired. See also **Nursing Interventions Classification.**

Clinical manifestations of electrolyte imbalance

Imbalance	*Clinical manifestations*	*Causes*
Hyponatremia Na <135 mEq/L	Fatigue, abdominal cramps, diarrhea, weakness, hypotension, cool clammy skin	Excess sweating, excess intake of water, diuretics, adrenal insufficiency, renal failure
Hypernatremia Na >145 mEq/L	Thirst, dry, sticky mucous membranes, dry tongue and skin, flushed skin, increased temperature	Diarrhea, decreased water intake, saltwater ingestion, impaired renal function, febrile illness, inability to swallow, burns, diabetes insipidus
Hypokalemia K <3.5 mEq/L	Weakness, fatigue, anorexia, abdominal distention, cardiac arrhythmias	Diarrhea, vomiting, diuretics, burns, heat stress, ulcerative colitis, potassium-free IV fluids, metabolic acidosis, steroids
Hyperkalemia K >5.0 mEq/L	Cardiac arrhythmias, anxiety, increased bowel sounds, abdominal cramps	Acute/chronic renal failure, burns, crush injuries, metabolic acidosis, potassium-sparing diuretics
Hypocalcemia Ca <4.5 mg/dl	Abdominal cramps, tingling, muscle spasm, convulsions	Parathyroid dysfunction, vitamin D deficiency, pancreatitis
Hypercalcemia Ca >5.6 mg/dl	Bone pain, nausea, vomiting, constipation	Parathyroid tumor, bone cancer/metastasis, osteoporosis

Adapted from ENA: *Sheehy's emergency nursing: principles and practice*, ed 6, St Louis, 2010, Mosby.

electrolyte management: hypernatremia, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the promotion of sodium balance and prevention of complications resulting from serum sodium levels higher than desired. See also **Nursing Interventions Classification.**

electrolyte management: hyperphosphatemia, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the promotion of phosphate balance and prevention of complications resulting from serum phosphate levels higher than desired. See also **Nursing Interventions Classification.**

electrolyte management: hypocalcemia, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the promotion of calcium balance and prevention of complications resulting from serum calcium levels lower than desired. See also **Nursing Interventions Classification.**

electrolyte management: hypokalemia, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the promotion of potassium balance and prevention of complications resulting from serum potassium levels lower than desired. See also **Nursing Interventions Classification.**

electrolyte management: hypomagnesemia, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the promotion of magnesium balance and prevention of complications resulting from serum magnesium levels lower than desired. See also **Nursing Interventions Classification.**

electrolyte management: hyponatremia, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the promotion of sodium balance and prevention of complications resulting from serum sodium levels lower than desired. See also **Nursing Interventions Classification.**

electrolyte management: hypophosphatemia, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the promotion of phosphate balance and prevention of complications resulting from serum phosphate levels lower than desired. See also **Nursing Interventions Classification.**

electrolyte monitoring, a nursing intervention from the Nursing Interventions Classification (NIC) defined as collection and analysis of patient data to regulate electrolyte balance. See also **Nursing Interventions Classification.**

electrolyte solution, any solution containing electrolytes prepared for oral, parenteral, or rectal administration for the replacement or supplementation of ions necessary for homeostasis. The loss of potassium ion (K^+) by vomiting, by diarrhea, or by the action of certain medications, including diuretics and corticosteroids, may be corrected by administering a solution high in potassium. Other electrolyte solutions containing combinations of sodium, potassium, calcium, magnesium, chloride, bicarbonate, phosphate, and/or lactate may be given to treat acid-base disturbance, as seen in chronic renal dysfunction or diabetic ketoacidosis. The solutions are available in a wide range of balanced formulas for replacement or maintenance, and most include various trace minerals.

electrolytic. See **electrolysis.**

electromagnetic /-magnet′ik/ [Gk, *elektron, Magnesia,* ancient source of lodestone], **1.** pertaining to magnetism that is induced by an electric current. **2.** pertaining to radiation such as light, microwaves, x-rays, gamma rays, or radio waves.

electromagnetic induction [Gk, *elektron* + *magnes,* lodestone; L, *inducere,* to bring in], the production of electric current in a circuit when it is passed through a changing magnetic field.

electromagnetic radiation, radiation that is produced with a combination of magnetic and electric forces. It exists as a continuous spectrum of radiation, from that with the highest energy level and shortest wavelength (gamma rays) to that with the lowest energy and longest wavelength (long radio waves). The visible part of the electromagnetic spectrum has a wavelength between 400 and 700 nm. Ultraviolet and infrared radiation have wavelengths just below the short end and above the long end of the visible spectrum, respectively. X-rays have wavelengths from about 0.005 to 10 nm. All forms of electromagnetic radiation travel at the speed of light.

electromagnetic spectrum, the range of frequencies and wavelengths associated with radiant energy.

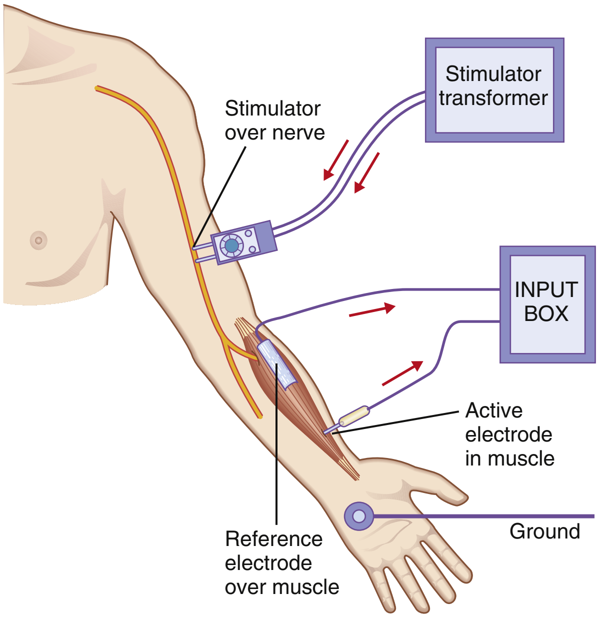
electromallet condenser /-mal′ət/ [Gk, *elektron* + OFr, *mail,* maul; L, *condensare,* to make dense], an electromechanical device formerly used for compacting direct-filling gold, such as gold foil restorations in prepared tooth cavities.

electromechanical dissociation. See **pulseless electrical activity.**

electromotive force (EMF) /-mō′tiv/, the electric potential, or ability of electric energy to perform work. EMF is usually measured in joules per coulomb, or volts. The higher the voltage, the greater the potential of electric energy. Any device, such as a storage battery, that converts some form of energy into electricity is a source of EMF.

electromyogram (EMG) /ilek′trōmī′əgram′/, a record of the intrinsic electric activity in a skeletal muscle. Such data aid the diagnosis of neuromuscular problems and are obtained by applying surface electrodes or by inserting a needle electrode into the muscle and observing electric activity with an oscilloscope and a loudspeaker. Some electromyograms show abnormalities, such as spontaneous electric potentials within the muscle under study, and help pinpoint lesions of motor nerves. Electromyograms also measure electric potentials induced by voluntary muscular contraction. See also **electroneuromyography.**

Electromyogram *(Mourad, 1991)*



Electromyogram *(Black and Hawks, 2005)*

electromyographic biofeedback /-mī′əgraf′ik/, a therapeutic procedure that uses electronic or electromechanical instruments to measure, process, and feed back reinforcing information with auditory and visual signals accurately. It is used to provide information about muscle activity during ambulation, for example, in clients with brain injury, stroke, or cerebral palsy.

electromyographic technician /-mī′əgraf′ik/, a health care provider with special training and experience to assist the physician in recording and analyzing muscle action potentials with the use of various electronic devices.

electromyography (EMG) /-mī·og′rəfē/, the electrical recording of muscle action potentials.

electromyography of pelvic floor sphincter, an electrodiagnostic test performed to evaluate the neuromuscular function of the urinary or anal sphincter. It is done most often in patients with urinary or fecal incontinence.

electron /ilek′tron/ [Gk, *elektron,* amber], **1.** a negatively charged elementary particle that has a specific charge, mass, and spin. The number of electrons associated with the nucleus of an atom is equal to the atomic number of the substance. **2.** a negative beta particle emitted from a radioactive substance. See also **atom, element, ion, neutron, proton.**

electronarcosis /ilek′trōnärkō′sis/ [Gk, *elektron* + *narkosis,* numbness], anesthesia produced by passing an electric current through the brain. The experimental procedure has been used in the former USSR. Compare **electrosleep therapy.**

electron beam computed tomography (EBCT), ultrafast computed tomography done with a scanner in which the patient is surrounded by a large circular anode that emits x-rays as the electron beam is guided around it.

electron capture, a radioactive decay process in which an atomic nucleus with an excess of protons draws an electron into itself, creating a neutron out of a proton and thus decreasing the atomic number by 1. Often the resulting nucleus is unstable and achieves stability by giving off a gamma ray.

electroneurodiagnostic technologist, an allied health professional who, in collaboration with an electroencephalographer, obtains interpretable recordings of a patient's nervous system function. The electrodiagnostic technologist takes a patient history; applies adequate recording electrodes and uses optimal EEG, EP, and PSG techniques; and documents the clinical condition of patients.

electroneurography, an electrodiagnostic test that assists in detecting and locating peripheral nerve injury or disease. This study is usually done in conjunction with electromyography and may also be called *electromyoneurography*.

electroneuromyography /ilek′trōnŏŏr′ōmī·og′rəfē/ [Gk, *elektron* + *neuron,* nerve, *mys,* muscle, *graphein,* to record], a procedure for testing and recording neuromuscular activity by electric stimulation of nerves. Needle electrodes are inserted into any skeletal muscle being studied, electric current is applied to the electrodes, and neuromuscular functions are observed and recorded by means of instruments, such as a cathode-ray oscilloscope and an appropriate recording device. The procedure is helpful in the study of neuromuscular conduction, the extent of nerve lesions, and reflex responses. Compare **nerve conduction test.** See also **electromyogram.**

electronic bulletin board /ilektron′ik/, a computerized communication system that allows users to compose and store information to be retrieved by other users of the system.

Electronic Data Interchange (EDI), a method by which two or more autonomous computer systems exchange computer-readable transaction data. It is possible even when the computers use different operating systems. It is the key factor in achieving automated medical records that can be shared electronically among providers.

electronic fetal monitor (EFM) [Gk, *elektron* + L, *fetus* + *monere,* to warn], a device that allows observation of the fetal heart rate and the maternal uterine contractions. It may be applied externally or internally. With an external monitor the fetal heart is detected by an ultrasound transducer positioned on the abdomen. Internal monitoring of the fetal heart rate is accomplished via an electrode clipped to the fetal scalp.

electronic fetal monitoring: antepartum, a nursing intervention from the Nursing Interventions Classification (NIC) defined as electronic evaluation of fetal heart rate response to movement, external stimuli, or uterine contractions during antepartal testing. See also **Nursing Interventions Classification.**

electronic fetal monitoring: intrapartum, a nursing intervention from the Nursing Interventions Classification (NIC) defined as electronic evaluation of fetal heart rate response to uterine contractions during intrapartal care. See also **Nursing Interventions Classification.**

electronic health record (EHR) a computerized repository for a patient's health information providing information to members of the health care team regarding a clinical encounter. Many systems can also provide decision support, quality assurance information and outcome data.

electronic infusion device (EID), an automated system of introducing a fluid other than blood into a vein. The device may have programmable settings that control the amount of fluid to be infused, rate, low-volume notification level, and a keep-vein-open rate. Some EIDs have titration modes that allow a change in the delivery rate without interrupting fluid flow. They also allow delivery in milliliters per hour. Also called *IV pump*.

Electronic infusion device *(Elkin, Perry, and Potter, 2011)*

electronic mail (email, e-mail, E-mail), messages sent by one user of a computerized communications system and retrieved almost instantaneously by other users. The messages may be transmitted via modem through telephone lines, a wireless network, or, in some instances, by shortwave radio. See also **electronic bulletin board.**

electronic stethoscope, a stethoscope designed and equipped to detect and amplify body sounds.

electronic thermometer, a battery-powered thermometer that registers temperature by electronic means.

IVAC COVERS
TEMP-PLUS II

Electronic thermometer *(Potter and Perry, 2007)*

electron microscope, an electronic instrument that scans cell and tissue sections with a beam of electrons instead of visible light. The specimen is stained with electron-opaque dyes. With its high magnification power, it creates an image that can be photographed or viewed on a fluorescent screen. Compare **scanning electron microscope.** See also **electron microscopy.**

electron microscopy, a technique using an electron microscope in which a beam of electrons is focused by an electromagnetic lens and directed onto an extremely thin specimen. The electrons emerging are focused and directed by a second lens onto a fluorescent screen. The magnified image produced is 1000 times greater than that produced by an optic microscope and well resolved, but it is two-dimensional because of the thinness of the specimen. Also called *transmission electron microscopy.* Compare **scanning electron microscopy, transmission scanning electron microscopy.**

electron scanning microscope. See **scanning electron microscope.**

electron transfer flavoprotein (ETF), a component of a side chain of redox reactions by which electrons are funneled to ubiquinone and thus the electron transport chain. Electrons from acyl coenzyme A (CoA) thioesters and choline are transferred via the flavin of acyl CoA dehydrogenases, dimethylglycine dehydrogenase, and sarcosine dehydrogenase to the flavin adenine dinucleotide prosthetic group of ETF, which is then oxidized by reduction of electron transfer flavoprotein ubiquinone oxidoreductase. Deficiency of ETF results in glutaric aciduria, type II.

electron volt (eV), a unit of energy equal to the energy acquired by an electron falling through a potential difference of 1 volt. One eV equals 1.6×10^{-12} erg or 1.6×10^{-19} J.

electronystagmography /ilek′trōnis′tagmog′rəfē/ [Gk, *elektron* + *nystagmos,* nodding, *graphein,* to record], a method of assessing and recording eye movements by measuring the electric activity of the extraocular muscles. See also **electroencephalogram, nystagmus.**

electropalatography, a technique for recording the timing and location of tongue contact with the hard palate during speech, using an artificial palate that fits against the roof of the mouth and has electrodes embedded in the surface that faces the tongue. A computer records and displays the pattern of the pulses generated by contact of the tongue with the electrodes.

electrophoresis /ilek′trōfərē′sis/ [Gk, *elektron* + *pherein,* to bear], the movement of charged suspended particles through a liquid medium in response to changes in an electric field. Charged particles of a given substance migrate in a predictable direction and at a characteristic speed. The pattern of migration can be recorded in bands on an electrophoretogram. The technique is widely used to separate and identify serum proteins and other substances. **—electrophoretic,** *adj.*

electrophysiological study (EPS), an invasive electrodiagnostic or manometric procedure that uses electrode catheters to pace the heart and potentially induce arrhythmias. The test identifies defects in the heart conduction system and arrhythmias that are otherwise inapparent. It also is used to assess the effectiveness of antiarrhythmic drugs.

electrophysiology /-fis′ē·ol′əjē/ [Gk, *elektron* + *physis,* nature, *logos,* science], a branch of biology concerned with the relationship between electric phenomena and biological function.

electropiezo activity. See **piezoelectric activity.**

electroplating /i·lek′trōplāt′ing/ [Gk, *electron,* amber + Fr, *plat,* flat dish], plating or coating of an object with a layer of metal through the use of electrolytic processes.

electroporation /-pôrā′shən/, a type of osmotic transfection in which an electric current is used to produce temporary holes in cell membranes, allowing the entry of nucleic acids or macromolecules (a way of introducing new deoxyribonucleic acid into the cell). See also **transfection.**

electroresection /-risek′shən/ [Gk, *elektron* + L, *re,* again, *secare* to cut], a technique for the removal of bladder tumors or prostate tissue by electrocautery. A wire is guided to the site through the urethra with the aid of an optic probe. Electricity is passed through the wire when the wire is properly located in the tissue to be destroyed. The procedure is performed after administration of an anesthetic.

electroshock [Gk, *elektron* + Fr, *choc*], a condition of shock caused by accidental contact with an electric current. The symptoms are similar to those of shock produced by thermal burns, trauma, or coronary thrombosis.

electroshock therapy. See **electroconvulsive therapy.**

electrosleep therapy [Gk, *elektron* + AS, *slaep* + Gk, *therapeia,* treatment], a technique designed to induce sleep, especially in psychiatric patients, by administering a low-amplitude pulsating current to the brain. The cathode is placed supraorbitally, and the anode is placed over the mastoid process. The current, which is discharged for 15 to 20 minutes, produces a tingling sensation but does not always induce sleep. The procedure is repeated from 5 to 30 times. Electrosleep therapy is said to be beneficial for patients with anxiety, depression, gastric distress, insomnia, personality disorders, and schizophrenia. Compare **electronarcosis.**

electrostatic imaging /-stat′ik/ [Gk, *elektron* + *stasis,* standing still; L, *imago,* image], a radiographic technique in which the ionic charge liberated during the irradiation process is converted into a visible image. The image may be produced by an electronic read-out device or by liquid or powdered toner.

electrostimulation /-stim′yəlā′shən/, the application of electric current to stimulate bone or muscle tissue for therapeutic purposes, such as facilitation of muscle activation and muscle strengthening. See also **electric muscle stimulator.**

electrosurgery /-sur′jərē/ [Gk, *elektron* + *cheiourgos,* surgeon], surgery performed with various electric instruments that operate on high-frequency electric current. Kinds of electrosurgery include **electrocoagulation, electrodesiccation.**

electrotherapeutic current, any of three types of electric current, which, when introduced into biological tissue, is capable of producing specific physiological changes. The three types are direct monophasic, alternating biphasic, and pulsed polyphasic electric current.

electrotherapist /-ther′əpist/, a health care provider who has specific training and experience in the therapeutic uses of electricity.

electrotherapy. See **electroconvulsive therapy.**

electrotonic current [Gk, *elektron* + *tonos,* tension], a current induced in a nerve sheath without the generation of new current by an action potential.

electrotonic synapse, a gap junction that transmits electrical impulses in electrically excitable tissue. See also **gap junction.**

electrovalence, the valence of an ion, equal to the absolute value of its charge. See also **valence, valence electron.**

eleidin /əlē′ədin/ [Gk, *elaia,* olive tree], a transparent, proteinaceous substance resembling keratin, found in the outer stratum lucidum of the epidermis.

element [L, *elementum,* first principle], one of more than 100 primary, simple substances that cannot be broken down by chemical means into any other substance. Each atom of any element contains a specific number of protons in the nucleus and an equal number of electrons outside the nucleus. In most elements, the nucleus may contain a variable number (high or low) of neutrons. An element with a disproportionate number of neutrons may be unstable, in which case the nucleus undergoes radioactive decay into a more stable element. See also **atom, compound, molecule, radioactivity.**

element 104. See **rutherfordium.**

element 105. See **dubnium.**

element 106. See **seaborgium.**

element 107, an element reportedly synthesized in 1976 by Russian scientists who bombarded isotopes of bismuth with heavy nuclei of chromium-54. The finding was not confirmed by scientists of other nations. It has been named **bohrium (Bh).**

elemental formula. See **defined formula diet.**

elementary particle, (in physics) a subatomic particle, such as an electron, neutron, or proton.

eleo-, prefix meaning "oil": *eleoma, eleomyenchysis, eleopten.*

eleoma /ē′lē·ō′mə/, a lipogranuloma, or swelling, usually caused by subcutaneous injection of oil.

elephantiasis /el′əfəntī′əsis/ [Gk, *elephas,* elephant, *osis,* condition], the end-stage lesion of filariasis, characterized by extensive swelling, usually of the external genitalia and the legs, resulting from obstruction of the lymphatics by filariae. The overlying skin becomes dark, thick, and coarse. Elephantiasis results from filariasis of many years' duration. Nonfilarial elephantiasis occurring in the absence of filarial infection, seen mainly in the central African mountains, may be caused by persistent contact with volcanic ash. Nonfilarial elephantiasis is difficult to diagnose in the early stages, when it is most responsive to treatment. See also **filariasis.**

elephantine psoriasis /el′əfan′tīn/, a rare form of psoriasis that is characterized by thick, scaly plaques on the hips, thighs, and back.

elephantoid fever. See **elephantiasis, filariasis.**

eletriptan, an antimigraine agent used for the acute treatment of migraine with or without aura.

elevation /el′əva′shən/ [L, *elevare,* to lift], a raised area, or point of greater height.

elevator /el′əvā′tər/ [L, *elevare,* to lift], an instrument for lifting tissues, extracting teeth, removing bony fragments, or removing roots of teeth.

eleventh cranial nerve. See **accessory nerve.**

elfin facies syndrome. See **Williams syndrome.**

eligibility /el′əjəbil′itē/, entitlement of an individual to receive services based on that individual's enrollment in a health care plan.

Eligibility Guarantee Payment, a contract provision for guaranteeing payment from the health maintenance organization to the provider for services already delivered to enrollees whose coverage is terminated retroactively. Not applicable in Canada.

elimination /i·lim′i·nā′shən/ [L, *ex,* out + *limen,* threshold], **1.** the act of expulsion or of extrusion, especially of expulsion from the body. See also **clearance, defecation, excretion, urination. 2.** omission or exclusion, as in an **elimination diet.**

elimination diet /ilim′inā′shən/ [L, *eliminare,* to expel; Gk, *diata,* way of living], a procedure for identifying a food or foods to which a person is allergic by successively omitting from the diet certain foods in order to detect those responsible for the symptoms.

ELISA /əlī′zə/, abbreviation for **enzyme-linked immunosorbent assay,** a technology used to measure a variety of proteins and antigens.

elixir /ilik′sər/ [Ar, *il-iksir,* seen as the philosopher's stone], a clear liquid containing water, alcohol, sweeteners, or flavors, used primarily as a vehicle for the oral administration of a drug.

Elixophyllin, a trademark for a bronchodilator **(theophylline)** used as a bronchodilator.

Elliot forceps. See **obstetric forceps.**

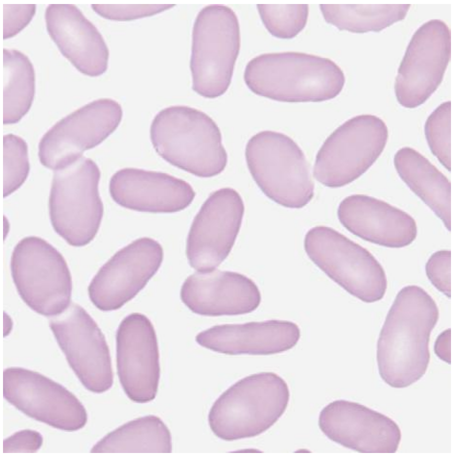
ellipsis /ilip′sis/, (in psychiatry) the omission by a patient of meaningful thoughts and ideas while undergoing therapy.

ellipsoidal, describing an object that has the shape of a spindle or an ellipse.

ellipsoid joint, a synovial joint in which a condyle is received into an elliptic cavity, as the wrist joint. A condyloid joint permits no axial rotation but allows flexion, extension, adduction, abduction, and circumduction. Also called **condyloid joint.** Compare **ball-and-socket joint, pivot joint, saddle joint.** See also **joint.**

elliptical trainer, exercise equipment designed to simulate motions such as stair-climbing and running by using pedals that move back and forth in an oval (elliptical) pattern to minimize the impact on the hips, back and knees.

elliptocyte /ilip′təsīt/ [Gk, *elleipsis,* ellipse, *kytos,* cell], an oval red blood cell. See also **elliptocytosis, ovalocytes, ovalocytosis.**



Elliptocyte *(Carr and Rodak, 2008)*

elliptocytic anemia, hereditary elliptocytosis. See also **elliptocytosis, ovalocytosis.**

elliptocytosis /ilip′tōsītō′sis/ [Gk, *elleipsis* + *kytos* + *osis,* condition], an abnormal condition of the blood characterized by increased numbers of elliptocytes. Less than 15% of the red blood cells appear in this form in normal blood; modest increases occur in a variety of anemias, including a rare congenital disorder, **hereditary elliptocytosis.** Also called **ovalocytosis.** Compare **spherocytosis.** See also **acanthocytosis, congenital nonspherocytic hemolytic anemia, sickle cell anemia, spherocytic anemia.**

Ellis–van Creveld syndrome. See **chondroectodermal dysplasia.**

elongation /i′longā′shən/ [L, *elongatio,* a prolonging], a state of being lengthened or extended.

elope /ilōp′/ [ME, *gantlopp,* to run away], *(informal)* to leave a locked or secured psychiatric institution without notice or permission.

elopement occurrence, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the number of times in the past 24 hours/1 week/1 month (select one) that an individual with a cognitive impairment escapes a secure area. See also **Nursing Outcomes Classification.**

elopement precautions, a nursing intervention from the Nursing Interventions Classification (NIC) defined as minimizing the risk of a patient leaving a treatment setting without authorization when departure presents a threat to the safety of patient or others. See also **Nursing Interventions Classification.**

elopement propensity risk, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the propensity of an individual with cognitive impairment to escape a secure area. See also **Nursing Outcomes Classification.**

Elspar, a trademark for an antineoplastic **(asparaginase).**

eluate /el′yo͞o·āt/ [L, *eluere,* to wash out], a solution or substance that results from an elution process. In column chromatography the eluate is collected as it drips from the column.

eluent /el′yo͞o·ənt/, a solvent or solution used in an elution process, such as column chromatography.

elution /elo͞o′shən/, the removal of an absorbed substance from a porous bed or chromatographic column by means of a stream of liquid or gas or the application of heat. The technique may consist of washing a material that dissolves out of just one component of a mixture. The term is also applied to the removal of antibodies or radioactive tracers from erythrocytes. In heat elution of antibodies, red cells in a saline solution are heated to 56° C and then centrifuged. Liquid elution of antibodies usually uses ether as the solvent.

em, abbreviation for **extrinsic muscle.**

EM, abbreviation for **erythema multiforme.**

em-, prefix meaning “in, on”: *embolism, empasma.*

emaciation /imā′shi·ā′shən/ [L, *emaciare,* to make lean], **1.** excessive leanness caused by disease or lack of nutrition. **—emaciated**, /imā′shē·ā′tid/ *adj.* **2.** characterized by an extreme loss of subcutaneous fat that results in an abnormally lean body, such as with starvation.

e-mail. See **electronic mail.**

emancipated minor /iman′sipā′tid/ [L, *emancipare,* to set free], a person who is not legally an adult but who, because he or she is married, in the military, or otherwise no longer dependent on the parents, may not require parental permission for medical or surgical care. State and national laws vary in specific interpretations of the rule.

emasculation /imas′kyəlā′shən/, a loss of the testes or penis or both. See also **castration.**

embalming /embä′ming/, the practice of applying antiseptics and preservatives to a corpse to retard the natural decomposition of tissues.

Embden-Meyerhof defects /emb′den mī′ərhof/ [Gustav G. Embden, German biochemist, 1874–1933; Otto F. Meyerhof, German biochemist, 1884–1951], a group of hereditary hemolytic anemias caused by enzyme deficiencies. The most common form of the disorder is a pyruvate kinase deficiency. The condition is characterized by an absence of spherocytes and the presence of small numbers of crenated erythrocytes. The trait is transmitted as an autosomal-recessive gene, and the hemolytic anemia occurs only in homozygotes.

Embden-Meyerhof pathway. See **glycolysis.**

embedded tooth, an unerupted tooth, usually completely covered with bone. Also spelled **imbedded tooth.** Compare **impacted tooth.**

embol-, **1.** prefix meaning “to insert”: *embolia, embole.* **2.** prefix meaning “embolus or plug”: *embolectomy.*

embolectomy /em′bəlek′təmē/ [Gk, *embolos,* plug, *ektomē,* excision], a surgical incision into an artery for the removal of an embolus or clot, performed as emergency treatment for arterial embolism. The operation is done as soon as possible after a decrease in perfusion is detected. Thrombi tend to lodge at the juncture of major arteries. More than half lodge in the aorta, in arteries of the lower extremities, in the common carotid arteries, or in the pulmonary arteries. Before surgery, heparin may be administered, and an arteriogram may be used to identify the affected artery. A longitudinal incision is made in the artery, and the embolus is removed. After surgery the blood pressure is maintained close to the level of the preoperative baseline, as a decrease might predispose to new clot formation.

embolic. See **embolus, embolism.**

embolic gangrene [Gk, *embolos* + *gaggraina*], the death and decay of body tissues caused by an embolus blocking the blood supply to that part.

embolic necrosis, death of a portion of tissue that results from an infarction caused by an embolus.

embolic thrombosis [Gk, *embolos,* plug, *thrombos,* lump, *osis,* condition], a clot that develops at the site of an impacted embolus (foreign body) in a blood vessel.

emboliform nucleus, a small cerebellar nucleus lying between the dentate nucleus and the globose nucleus and contributing to the superior cerebellar peduncles.

embolism /em′bəliz′əm/, an abnormal condition in which an embolus travels through the bloodstream and becomes lodged in a blood vessel. Symptoms vary with the character of the embolus, the degree of occlusion that results, and the size, nature, and location of the occluded vessel. Kinds of embolism include **air embolism, fat embolism,** and **gas embolism. —embolic,** *adj.*

embolization agent, a substance used to occlude or drastically reduce blood flow within a vessel. Examples include microfibrillar collagen, absorbable gelatin sponge (Gelfoam), polyvinyl alcohol particles, tris-acryl gelatin microspheres, and silicone beads.

embolized atheroma, a fat particle lodged in a blood vessel.

emboloid. See **embolus.**

embolotherapy /em′bəlōther′əpē/, a technique of blocking a blood vessel with a balloon catheter. It is used for treating bleeding ulcers and blood vessel defects and for stopping blood flow to a tumor during surgery.

embolus /em′bələs/ *pl.* **emboli** [Gk, *embolos,* plug], a foreign object, quantity of air or gas, bit of tissue or tumor, or piece of a thrombus that circulates in the bloodstream until it becomes lodged in a vessel. **—embolic, emboloid,** *adj.*

embolus care: peripheral, a nursing intervention from the Nursing Interventions Classification (NIC) defined as limitation of complications for a patient experiencing, or at risk for, occlusion of peripheral circulation. See also **Nursing Interventions Classification.**

embolus care: pulmonary, a nursing intervention from the Nursing Interventions Classification (NIC) defined as limitation of complications for a patient experiencing, or at risk for, occlusion of pulmonary circulation. See also **Nursing Interventions Classification.**

embolus precautions, a nursing intervention from the Nursing Interventions Classification (NIC) defined as reduction of the risk of an embolus in a patient with thrombi or at risk for thrombus formation. See also **Nursing Interventions Classification.**

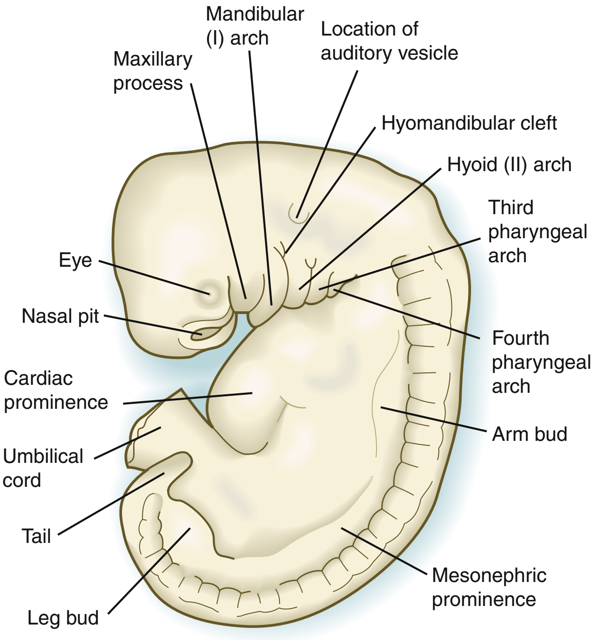
embolysis /embol′isis/, the dissolution of an embolus, especially one caused by a blood clot. See also **thrombolysis.**

embrasure /embrā′zhər/, a normally occurring space between adjacent teeth on the same arch (maxillary or mandibular) resulting from variations in the positions and contours of teeth. Embrasures provide a spillway for the escape of food during mastication. See also **spillway.**

embryatrics. See **fetology.**

embryectomy /em′brē·ek′təmē/ [Gk, *en,* in, *bryein,* to grow, *ektomē,* excision], the surgical removal of an embryo, most commonly in an ectopic pregnancy.

embryo /em′brē·ō/ [Gk, *en,* in, *bryein,* to grow], **1.** any organism in the earliest stages of development. **2.** in humans the stage of prenatal development from the time of fertilization of the ovum (conception) until the end of the eighth week. The period is characterized by rapid growth, differentiation of the major organ systems, and development of the main external features. Compare **fetus, zygote. —embryonal, embryonic, embryonoid,** *adj.*



Embryo: end of fourth week *(Carlson, 2009)*

embryo-, prefix meaning a "fetus": *embryoctony, embryology.*

embryocidal /em′brē·əsī′dəl/, pertaining to the killing of an embryo.

embryoctony /em′brē·ok′tənē/ [Gk, *en* + *bryein* + *kteinein,* to kill], the intentional destruction of a living embryo or fetus in utero. Also called **feticide.** See also **abortion.**

embryogenesis /em′brē·ōjen′əsis/ [Gk, *en* + *bryein* + *genein,* to produce], the process in sexual reproduction by which an embryo forms from the fertilization of an ovum. Also called *embryogeny* /em′brē·oj′ənē/. See also **heterogenesis, homogenesis. —embryogenetic, embryogenic,** *adj.*

embryological development /-loj′ik/, the various intrauterine stages and processes involved in the growth and differentiation of the conceptus from the time of fertilization of the ovum until the eighth week of gestation. The stages are related to the biological status of the unborn child and involve the differentiation of the various cells, tissues, and organ systems and the development of the main external features of the embryo. It occurs from approximately the end of the second week to the eighth week of intrauterine life. The fetal stage follows these stages, beginning at about the ninth week of gestation. The entire process of growth and development of the embryo and fetus is loosely called prenatal development. See also **prenatal development.**

embryologic, embryological. See **embryology.**

embryologist /em′brē·ol′əjist/, one who specializes in embryology.

embryology /em′brē·ol′əjē/ [Gk, *en, bryein* + *logos,* science], the study of the origin, growth, development, and function of an organism from fertilization to birth. Kinds of embryology include **comparative embryology, descriptive embryology,** and **experimental embryology. —embryologic, embryological,** *adj.*

embryoma /em′brē·ō′mə/ *pl.* **embryomas, embryomata** [Gk, *en* + *bryein* + *oma,* tumor], a tumor that arises from embryonic cells or tissues.

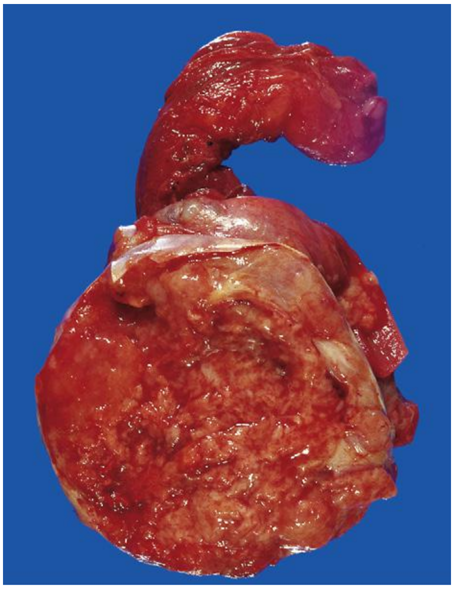
embryoma of the ovary. See **dysgerminoma.**

embryomorph /embrē′əmôrf′/ [Gk, *en* + *bryein* + *morphe*, form], any structure that resembles an embryo, especially a mass of tissue that may represent an aborted conceptus. **—embryomorphous,** *adj*.

embryonal. See **embryo.**

embryonal adenomyosarcoma, embryonal adenosarcoma. See **Wilms' tumor.**

embryonal carcinoma /em′brē·ənəl/, a malignant neoplasm derived from germinal cells that usually develops in gonads, especially the testes. The tumor, a firm nodular mass with hemorrhagic areas, is characterized histologically by large, undifferentiated cells with indistinct borders, eosinophilic cytoplasm, and prominent nucleoli in pleomorphic nuclei. Bodies resembling a 1- or 2-week-old embryo are occasionally seen in these tumors. The neoplasm is relatively resistant to radiation therapy. The tumor metastasizes by way of lymph channels. Surgery and chemotherapy are usually used in the treatment. See also **choriocarcinoma.**



Embryonal carcinoma *(Kumar et al, 2007)*

embryonal leukemia. See **stem cell leukemia.**

embryonate /em′brē·ənāt′/ [Gk, *en* + *bryein* + **L,** *atus*, shaped like], **1.** impregnate. **2.** pertaining to or resembling an embryo. **3.** containing an embryo.

embryonic. See **embryo.**

embryonic abortion, **1.** termination of pregnancy before the twentieth week of gestation. **2.** products of conception expelled before the twentieth week. Compare **fetal abortion.**

embryonic anideus [Gk, *en* + *bryein* + *an*, not, *eidos*, form], a blastoderm in which the axial elongation of the primitive streak and primitive groove fail to develop.

embryonic area. See **embryonic disk.**

embryonic blastoderm, the area of the blastoderm that gives rise to the primitive streak from which the embryonic body develops. Compare **extraembryonic blastoderm.**

embryonic competence, the ability of an embryonic cell to react normally to the stimulation of an inductor, allowing continued normal growth or differentiation of the embryo.

embryonic disk, the thickened plate from which the embryo develops in the second week of pregnancy. Scattered cells from the border of the disk migrate to the space between the trophoblast and yolk sac and become the embryonic mesoderm. The disk develops from the ectoderm and endoderm. Also called **embryonic area, gastrodisk, germ disk, germinal area.**

embryonic layer, one of the three layers of cells in the embryo: the endoderm, the mesoderm, and the ectoderm. From these layers of cells arise all of the structures and organs and parts of the body. The endoderm and the ectoderm are the first to develop. During the third week of gestation the mesoderm arises between the ectoderm and the endoderm.

embryonic period, the earliest period or phase of lung development in utero, lasting from the third week after conception to the sixth week. It is sometimes not named as a defined period of lung development, which is instead considered to begin with the following pseudoglandular period. During this period, a ventral respiratory diverticulum (lung bud) arises from the caudal end of the laryngotracheal groove and grows into bronchial buds and the primordial trachea. Also called *embryonic phase*.

embryonic pole, the area of the blastocyst where the embryoblast and the trophoblast are in contact. The embryoblast attaches to the endometrial epithelium at this pole.

embryonic rest, a portion of embryonic tissue that remains in the adult organism. Also called **epithelial rest, fetal rest.**

embryonic stage, (in embryology) the interval of time from fertilization to the eighth week.

embryonic tissue [Gk, *en* + *bryein*, to grow; OFr, *tissu*], **1.** also called **mucous tissue, mucoid tissue,** a loose, gelatinous mass of connective tissue cells. The gelatinous matrix is caused by the presence of mucopolysaccharides. **2.** pertaining to tissue of an embryo.

embryoniform /em′brē·on′ifôrm′/ [Gk, *en* + *bryein* + L, *forma*, form], resembling an embryo.

embryonoid. See **embryo.**

embryopathy /em′brē·op′əthē/ [Gk, *en* + *bryein* + *pathos*, disease], any anomaly occurring in the embryo or fetus as a result of interference with normal intrauterine development. A kind of embryopathy is **rubella embryopathy.**

embryoplastic /em′brē·ōplas′tik/ [Gk, *en* + *bryein* + *plassein*, to mold], pertaining to the formation of an embryo, usually with reference to cells.

embryoscopy /em′brē·os′kəpē/, the direct examination of an embryo by insertion of a lighted instrument through the mother's abdominal wall and uterus. The technique may be used to obtain tissue specimens for analysis or to perform needed surgery.

embryotome /em′brē·ətōm′/ [Gk, *en* + *bryein* + *temnein*, to cut], a cutting instrument for the removal of a fetus when normal birth is not possible. See also **embryotomy.**

embryotomy /em′brē·ot′əmē/ [Gk, *en* + *bryein* + *temnein*, to cut], **1.** the dismemberment or mutilation of a fetus for removal from the uterus when normal delivery is not possible. **2.** the dissection of an embryo for examination and analysis.

embryo transfer, a process of implanting a fertilized ovum in a uterus.

embryotroph /em′brē·ətrof′/ [Gk, *en* + *bryein* + *trophe*, nourishment], the liquefied uterine nutritive material, composed of glandular secretions and degenerative tissue, that nourishes the mammalian embryo until placental circulation is established. Also called **embryotroph** /-trōf′/, **histotroph, histotrophic nutrition.** Compare **hemotroph.**

embryotrophy /em′brē·ot′trəfē/, the nourishment of the embryo. See also **embryotroph, hemotroph. —embryotrophic,** *adj*.

embryulcia /em′brē·ul′sē·ə/ [Gk, *en* + *bryein* + *elkein*, to draw], the surgical extraction of the embryo or fetus from the uterus.

Emcyt, a trademark for an antineoplastic agent **(estramustine phosphate sodium).**

eme-, prefix meaning “to vomit”: *emetocathartic, emetine*.

emedastine /em′ĕdas′tēn/, an antihistamine applied topically to the conjunctiva as *emedastine difumarate* in treatment of allergic conjunctivitis.

Emend, a trademark for **aprepitant.**

emergence /imur′jəns/ [L, *emergere,* to come forth], the point in the process of recovery from general anesthesia at which a return of spontaneous respiration, protective airway reflexes, and consciousness occurs. See also **postanesthesia care.**

emergency /imur′jənsē/ [L, *emergere,* to come forth], a perilous situation that arises suddenly and threatens the life or welfare of a person or a group of people, as a natural disaster, medical crisis, or trauma situation.

emergency cardiac care (ECC) [L, *emergeere,* to come forth; Gk, *kardia* + ME, *caru,* sorrow], the concentration of personnel and facilities organized to sustain the cardiovascular and pulmonary systems when a myocardial infarction or cardiac arrest occurs. The interventions assure prompt availability of basic life support, monitoring and treatment facilities, prevention of complications, and psychological reassurance. If cardiac arrest occurs outside a hospital, efforts are devoted to stabilizing the patient’s cardiovascular and pulmonary systems before removing the individual to a hospital.

emergency care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as providing life-saving measures in life-threatening situations. See also **Nursing Interventions Classification.**

emergency cart checking, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the systematic review and maintenance of the contents of an emergency cart at established time intervals. See also **Nursing Interventions Classification.**

emergency childbirth, a birth that occurs accidentally or precipitously in or out of the hospital, without standard obstetric preparations and procedures. Signs and symptoms of impending delivery include increased bloody show, frequent strong contractions, the mother’s desire to bear down forcibly or her report that she feels as though she is going to defecate, visible bulging of the bag of waters, and crowning of the baby’s head at the vaginal introitus.

■ METHOD: If time permits, equipment is readied, but the delivery is not delayed for such preparations. Useful equipment includes sterile gloves, towels, bulb syringe, receiving blankets, scissors, two Kelly clamps, cord clamp or tie, and a basin for the placenta. The mother’s vital signs are taken, and the fetal heart sounds are listened to if time permits and if equipment is available. The mother is reassured that emergency deliveries are usually simple and that all procedures and events will be explained. Despite her compelling urge to push and to deliver quickly, the mother is encouraged to ease the baby out slowly by not pushing and by blowing air forcibly out through pursed lips as she feels the strength of the urge building. As the head emerges, it is supported but allowed to rotate naturally. A check is made immediately to determine whether or not the umbilical cord is wound around the neck. If it is, a gentle attempt is made to slip it over the baby’s head; if it is too tight, it is immediately clamped with two Kelly clamps placed 2 or 3 inches apart, cut between the clamps, and unwound from the neck. If the baby does not deliver immediately, mucus and fluid in the nose and mouth are sucked out with a bulb syringe. The shoulders are delivered one at a time by guiding the head downward to deliver the anterior (upper) shoulder under the symphysis pubis, and then upward to deliver the posterior (lower) shoulder over the perineum. The rest of the baby is quickly born. If the membranes of the amniotic sac are intact, the sac is snipped or torn behind the baby’s neck and peeled away from the face so that the baby can breathe. If necessary, the nares, nasopharynx, and mouth may be suctioned with the bulb syringe, taking care not to slow the heart rate by stimulating the vagus nerve with the tip of the syringe on the back of the throat. The baby is kept warm and held with the head lower than the chest; it may be laid skin-to-skin on the mother’s abdomen. The baby may thus be positioned, observed, and warmed in one place as the nurse or other helper covers the mother and baby with a dry blanket or towel and continues to provide emergency care as necessary through the third stage of labor. There is no urgent need to cut the cord or to deliver the placenta. When it is desired, the cord may be cut by clamping it in two places several inches from the baby and cutting it between the clamps with sterile scissors. The cord clamp may be put on later. If possible, an Apgar score is taken first at 5 minutes of age, then at 10. The placenta is ready to be delivered when the cord is seen to advance a few inches, the uterus becomes firmer and rises in the abdomen, and a small gush of bright red blood emerges from the vagina. The mother may help expel it by bearing down. The placenta is lifted out of the vagina slowly, with care, so that all of the membranes are drawn out with it. The placenta and membranes are kept for further evaluation. The uterus is massaged to ensure that it is well contracted, and the baby is put to breast if the mother wishes. The uterus is palpated frequently, and it is massaged when necessary. The baby is kept with the mother and observed for warmth, color, activity, and respiration. After delivery of the placenta, the perianal area is rinsed with warm sterile water and dried with a clean towel or cloth, and an ice pack and a sanitary pad or small towel are applied in such a way that the mother can hold them in place by drawing her legs together.

■ OUTCOME CRITERIA: Almost all births are normal and do not constitute true medical emergencies. If a mother is healthy and is not bleeding, if her vital signs are normal, and if the fetal heart sounds are normal, there is no immediate cause for alarm, even if the birth is imminent. Emergency care is directed to ensuring that the newborn breathes well and is kept warm, that the mother is protected from hemorrhage, and that the mother’s privacy is maintained. The nurse is likely to be the person who must initially evaluate the situation and decide whether to attempt to transfer or transport the mother or to prepare for emergency delivery. If a mother says the baby is coming, the attendant is advised to believe her and to act accordingly. Throughout the delivery and the third stage of labor, the nurse works to help the mother to feel calm, confident, and well cared for.

emergency contraceptive. See **postcoital contraceptive.**

emergency department (ED), (in a health care facility) a section of an institution that is staffed and equipped to provide rapid and varied emergency care, especially for those who are stricken with sudden and acute illness or who are the victims of severe trauma. The emergency department may use a triage system of screening and classifying clients to determine priority needs for the most efficient use of available personnel and equipment. Formerly called **emergency room.**

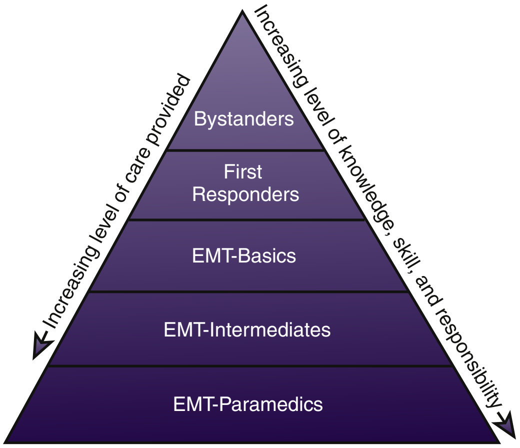
emergency doctrine, (in law) a doctrine that assumes a person’s consent to medical treatment when he or she is in imminent danger and unable to give informed consent to treatment. Emergency doctrine assumes that the person would consent if able to do so. Commonly known as **implied consent.**

emergency handling of radiation accidents. See **radiation exposure, emergency procedures.**

emergency medical identification. See **Medic Alert.**

emergency medical service (EMS), a network of services coordinated to provide aid and medical assistance from primary response to definitive care, involving personnel trained in the rescue, stabilization, transportation, and advanced treatment of traumatic or medical emergencies. Linked by a communication system that operates on both a local and a regional level, EMS is a tiered system of care, which is usually initiated by citizen action in the form of a telephone call to an emergency number. Subsequent stages include the emergency medical dispatch, first medical responder, ambulance personnel, medium and heavy rescue equipment, and paramedic units, if necessary. In the hospital, service is provided by emergency department nurses, emergency department physicians, specialists, and critical care nurses and physicians. See also **emergency medical technician, emergency medical technician-advanced life support, emergency medical technician-intermediate, emergency medical technician-intravenous, emergency medical technician-paramedic.**

emergency medical technician (EMT), a person trained in and responsible for the administration of specialized emergency care and the transportation of victims of acute illness or injury to a medical facility in compliance with national standards developed by the U.S. Department of Transportation. In addition to basic life-support skills, the EMT is trained in extrication, operation of emergency vehicles, basic anatomy, basic assessment of injury or illness, triage, care for specific injuries and illnesses, environmental emergencies, childbirth, and transport of the patient. See also **emergency medical service.**



Increasing level of care provided
Increasing level of knowledge, skill, and responsibility
Bystanders
First Responders
EMT-Basics
EMT-Intermediates
EMT-Paramedics

Pyramid of care *(Shade et al, 2012)*

emergency medical technician-advanced life support (EMT-ALS), a third-level EMT. The EMT-ALS is locally certified in all the skills of the basic-level EMT and EMT-IV. The EMT-ALS may also administer certain medications following the protocols or orders of the hospital physician, with whom radio contact is maintained. An EMT-ALS is also trained in the use of advanced life support systems, including electrical defibrillation equipment. See also **emergency medical service.**

emergency medical technician-intermediate (EMT-I), a second-level emergency medical technician nationally certified as both an EMT-ALS and an EMT-IV. See also **emergency medical service.**

emergency medical technician-intravenous (EMT-IV), a second-level emergency medical technician. The EMT-IV is trained and locally certified in IV therapy, endotracheal intubation, and use of other antishock techniques. See also **emergency medical service.**

emergency medical technician-paramedic (EMT-P), an advanced-level emergency medical technician who works in prehospital care settings under the direction of a physician, often through radio contact. The EMT-P is nationally certified in all the skills of EMTs of other levels and has additional training in pharmacology and administration of emergency drugs. See also **emergency medical service.**

emergency medicine, a branch of medicine concerned with the diagnosis and treatment of conditions resulting from trauma or sudden illness. The patient's condition is stabilized, and care is transferred to the primary physician or to a specialist. Emergency medicine requires broad interdisciplinary training in the physiological and pathological characteristics of all body systems.

Emergency Nurses' Association (ENA), a national professional organization of emergency department nurses that defines and promotes emergency nursing practice. The association, which was founded in 1970 and has more than 11,000 members, has written and implemented the Standards of Emergency Nursing Practice. The association offers a certification examination and awards the designation Certified Emergency Nurse (CEN) to nurses who successfully complete it. ENA publishes the *Journal of Emergency Nursing* and *Continuing Education Core Curriculum of Emergency Nursing Practice*. The association, which has headquarters in Chicago, works closely with its members and with related associations to define practice and to prepare professionals to deliver emergency care.

emergency nursing, nursing care provided to prevent imminent severe damage or death or to avert serious injury. Activities that exemplify emergency nursing are basic life support, cardiopulmonary resuscitation, and control of hemorrhage.

emergency readiness, a state of having made advance plans for coping with an unexpected natural disaster, civil disturbance, or military attack that may threaten death and injury to a local population. The planning includes educating the population about location of shut off valves for utilities and about first aid, including cardiopulmonary resuscitation; ensuring that adequate sources of food, water, basic medical supplies, and bedding materials will be available; arranging for the disposal of human wastes when toilets are not functional; and establishing procedures for emergency care of the elderly, infants, small children, and women who may be pregnant. Plans for communication systems also may be part of emergency readiness.

emergency room (ER, E.R.), obsolete. See **emergency department.**

emergent /imur′jənt/ [L, *emergens,* emerging], arising, often unexpectedly, or improving or modifying an existing thing.

emergent evolution, the theory that evolution occurs in a series of major changes at certain critical stages and results from the total rearrangement of existing elements so that completely new and unpredictable characteristics appear within the species. See also **saltatory evolution.**

Emery-Dreifuss syndrome /em′ərē drī′fəs/ [Alan E.H. Emery, British geneticist, b. 1928; Fritz E. Dreifuss, twentieth-century British physician, 1926–1997], an X-linked recessive form of muscular dystrophy that begins in early childhood and is characterized by joint contractures and cardiac conduction disorders. Patients who reach adulthood are often unable to work and require cardiac pacemakers to control arryhthmias.

emesis. See **vomit,** def. 2.

-emesis, suffix meaning "to vomit": *hyperemesis*.

emesis basin /em′əsis, əmē′sis/ [Gk, *emesis,* vomiting; Fr, *bassin,* hollow vessel], a kidney-shaped bowl or pan that fits against the neck to collect vomitus.

emesis gravidarum, vomiting associated with pregnancy.

Emete-con, a trademark for an antiemetic (benzquinamide hydrochloride).

emetic /imet′ik/, **1.** *adj,* pertaining to a substance that causes vomiting. **2.** *n,* an emetic agent. Apomorphine hydrochloride, acting through the central nervous system, induces vomiting 10 to 15 minutes after parenteral administration. Syrup of ipecac is used in the emergency treatment of some drug overdosages and in certain cases of poisoning.

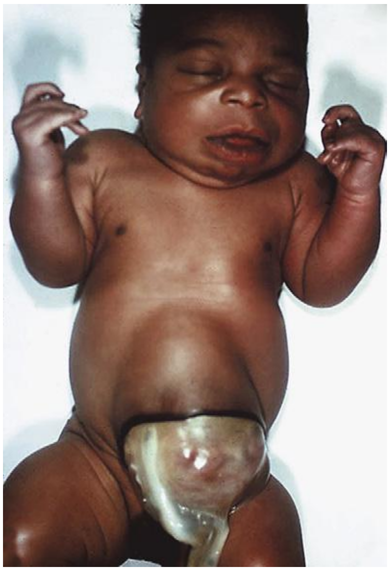
-emetic, -emetical, suffix meaning "to cause vomiting": *antiemetic, hematemetic, hyperemetic.*

Emetrol, a trademark for a fixed-combination drug containing **fructose, glucose,** and orthophosphoric acid, used to treat nausea and vomiting.

EMF, abbreviation for **electromotive force.**

EMG, **1.** abbreviation for **electromyogram.** **2.** abbreviation for **electromyography.**

EMG syndrome, a hereditary disorder transmitted as an autosomal-recessive trait, characterized by umbilical hernia (exomphalos), macroglossia, and gigantism, often accompanied by visceromegaly, dysplasia of the renal medulla, and enlargement of the cells of the adrenal cortex. Also called **Beckwith-Wiedemann syndrome, exophthalmos-macroglossia-gigantism syndrome.**



Beckwith-Wiedemann syndrome. Note omphalocele and macroglossia. *(Optiz, 2008/Courtesy R. Spencer, Los Angeles, California, and J. B. Beckwith, Missoula, Montana)*

-emia, -aemia, -hemia, -haemia, a suffix meaning "blood condition": *anemia, polycythemia, hyperemia.*

emissary veins /em′əser′ē/ [L, *emittere,* to send forth], the small vessels in the skull that connect the sinuses of the dura mater with the veins on the exterior of the skull through a series of anastomoses.

emission /imish′ən/ [L, *emittere,* to send out], a discharge or release of something, as a fluid from the body, electronic signals from a radio transmitter, or an alpha or beta particle from an atomic nucleus during radioactive decay.

emission computed tomography (ECT) [L, *emittere,* to send forth; *computare,* to count; Gk, *tome,* section, *graphein,* to record], a form of tomography in which the emitted decay products, as positrons or gamma rays, of an ingested radioactive pharmaceutical are recorded in detectors outside the body. Computer reconstruction of the data yields a cross-sectional image of the body.

emit [L, *emittere,* to send out], to give or send out something, such as energy, sound, heat, or radiation.

emmetr-, prefix meaning "the correct measure": *emmetropia, emmetrope.*

emmetropia /em′ətrō′pē·ə/ [Gk, *emmetros,* proportioned, *opsis,* vision], a state of normal vision characterized by the proper relationship between the refractive system of the eyeball and its axial length. This correlation ensures that light rays entering the eye parallel to the optic axis are focused exactly on the retina. Compare **amblyopia, hyperopia, myopia. —emmetropic,** *adj.*

Emmet's operation, a surgical procedure for repair of a lacerated perineum or ruptured uterine cervix.

emollient /imol′yənt/ [L, *emolliere,* to soften], a substance that softens tissue, particularly the skin and mucous membranes.

emollient bath, a bath taken in water containing an emollient, such as bran, to relieve irritation and inflammation. See also **colloid bath.**

emotion /imō′shən/ [L, *emovere,* to disturb], **1.** the outward expression or display of mood or feeling states. **2.** the affective aspect of consciousness as compared with volition and cognition. Physiological alterations often occur with a marked change of emotion regardless of whether the feelings are conscious or unconscious, expressed or unexpressed. See also **emotional need, emotional response.**

emotional abuse /imō′shənəl/, the debasement of a person's feelings that causes the individual to perceive himself or herself as inept, not cared for, and worthless.

emotional age [L, *emovere,* to disturb; L, *aetas,* age], the age of an individual as determined by the stage of emotional development reached.

emotional amalgam, an unconscious effort to deny or counteract anxiety.

emotional amenorrhea, a suppression of menstrual discharge from the uterus caused by psychological factors.

emotional care of the dying patient, the compassionate, consistent support offered to help the terminally ill patient and the family cope with impending death. See also **hospice, stages of dying.**

■ METHOD: The professional person providing emotional support for the terminally ill encourages the expression of personal feelings, anxieties, and experiences regarding death and empathizes with the patient and the family. To prevent conflicting statements, it is essential to know what the physician, other professionals, and family members tell the patient about the outcome. Effective support in terminal illness involves a nonjudgmental approach to the patient's relatives and significant others, an understanding of their problems, and efforts to assist them in the grieving process. The patient needs relief from pain, tender care, and continued attention through all the stages of dying. A patient may not progress through all of these stages or may progress through them in a different order. When the patient denies the prognosis and refuses to follow directions, the nursing staff does not interfere with or support the denial mechanism but spends time with the sick person and encourages self-care. During the stage of anger, often manifested by refusal of care and food and by abusive language and negative criticism of the staff, the patient is not allowed to indulge in physically harmful behavior but is encouraged to verbalize his or her anger. In the period in which the patient tries to make bargains, such as "If I could live until…" it should be recognized that time is needed to accept death and that the person may appreciate discussing the importance of various events and people in earlier life. When depression, marked by apathy, insomnia, inability to concentrate, poor appetite, and weariness, sets in, efforts to cheer the patient or interrupt crying are inappropriate. The patient may want only the most beloved person to be present. In the final stage of acceptance the patient usually experiences less pain and discomfort, seems peaceful and lacking in emotional affect, and appreciates care from people who are close and familiar.

■ INTERVENTIONS: The nurse has the major role in providing emotional care for the hospitalized terminally ill patient and may help the family arrange for hospice care or home care when it is possible and desirable. The nurse may teach methods of care required at home, may assist the family in realizing the patient's need to live as normally and as long as possible, and may refer the family to the social service department and to community resources for assistance.

■ OUTCOME CRITERIA: Sensitive emotional support appropriate to the stages of dying may help the person to move more rapidly to acceptance. The family usually goes through similar stages; therefore, support and counseling by an experienced person may greatly enhance the quality of life of the patient and family.

emotional deprivation [L, *emovere,* to disturb, *deprivare,* to deprive], a lack of adequate warmth, affection, and interest, especially of a parent or significant nurturer. It is a relatively common problem among institutionalized persons or children from broken homes.

emotional diarrhea, the frequent passage of liquid stools caused by extreme emotional stress.

emotional glycosuria, a temporary increase in the level of sugar excretion in the urine resulting from extreme emotional disturbances.

emotional hyperhidrosis, an autosomal-dominant disorder of the eccrine sweat glands, most often of the palms, soles, and axillae, in which emotional stimuli (e.g., anxiety) and sometimes mental or sensory stimuli elicit volar or axillary sweating (usually not both in the same individual). Eccrine sweat glands in other areas of the body are affected less often and are less sensitive to such stimuli.

emotional illness. See **mental disorder.**

emotional lability, a condition of excessive emotional reactions and frequent mood changes.

emotional need, a psychological or mental requirement of intrapsychic origin that usually centers on such basic feelings as love, fear, anger, sorrow, anxiety, frustration, and depression and involves the understanding, empathy, and support of one person for another. Such needs normally occur in everyone but usually increase during periods of excessive stress or physical and mental illness and during various stages of life, such as infancy, early childhood, and old age. If these needs are not routinely met by appropriate, socially accepted means, they can precipitate psychopathological conditions. Appropriate measures common in nursing for anticipating and satisfying the emotional needs of patients in stress include physical closeness, especially remaining with the person during periods when the feeling is acute; empathetic listening as the patient discusses the feeling; encouragement to verbalize feelings; and planning activities that provide a constructive outlet for the feeling or the situation causing it. Compare **dependency needs.** See also **emotion.**

emotional response, a reaction to a particular intrapsychic feeling or feelings, accompanied by physiological changes that may or may not be outwardly manifested but that motivate or precipitate some action or behavioral response. See also **emotion.**

emotional support^1, the sensitive, understanding approach that helps patients accept and deal with their illnesses; communicate their anxieties and fears; derive comfort from a gentle, sympathetic, caring person; and increase their ability to care for themselves.

■ METHOD: Essential in providing emotional support are recognizing and respecting the individuality, personal preferences, and human needs of each patient. Understanding the sick and appreciating the psychological effects on the patient of the transition from health to illness are also important. The patient is encouraged to verbalize feelings and concerns, and the attentive listener avoids interjecting clichés, such as "Don't worry," "Take it easy," or "Everything will be all right." The nurse and other health team members realize that the patient may express some fears but may act out others through anger, hostility, silence, or assumed joviality. Efforts to change the patient, negative criticism, a judgmental attitude, and facial expressions that may indicate rejection are carefully avoided. Opportunities to listen to the troubled patient and provide compassionate and realistic counseling and care are sought.

■ INTERVENTIONS: The nurse establishes means of communication, provides an atmosphere that invites the patient to discuss worrisome feelings, and presents a caring attitude. This is especially important when the illness damages the person's body image or self-concept.

■ OUTCOME CRITERIA: Emotional support frequently improves the patient's psychological and physical state, often enabling him or her to accept the illness and to adjust with less anxiety to the changes required.

emotional support^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as provision of reassurance, acceptance, and encouragement during times of stress. See also **Nursing Interventions Classification.**

empathic /empath′ik/ [Gk, *en,* into, *pathos,* feeling], pertaining to or involving the entering of one person into the emotional state of another while remaining objective and distinctly separate.

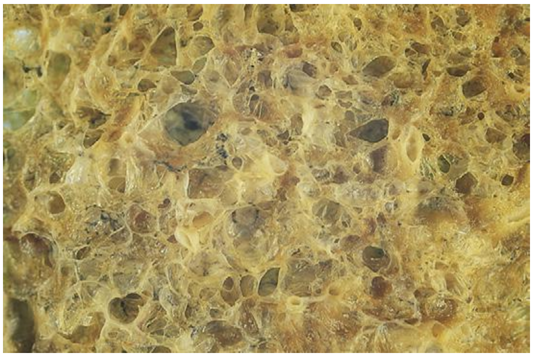
empathy /em′pəthē/ [Gk, *en,* in, *pathos,* feeling], the ability to recognize and to some extent share the emotions and states of mind of another and to understand the meaning and significance of that person's behavior. It is an essential quality for effective psychotherapy. Compare **sympathy.** —**empathic,** *adj.,* **empathize,** *v.*

emphysema /em′fəsē′mə/ [Gk, *en* + *physema,* a blowing], an abnormal condition of the pulmonary system, characterized by overinflation and destructive changes in alveolar walls. It results in a loss of lung elasticity and decreased gas exchange. When emphysema occurs early in life, it is usually related to a rare genetic deficiency of serum alpha-1-antitrypsin, which inactivates the enzymes leukocyte collagenase and elastase. More common causes are air pollution and cigarette smoking. Acute emphysema may be caused by the rupture of alveoli during severe respiratory efforts, as may occur in acute bronchopneumonia, suffocation, whooping cough, and, occasionally, labor. Patients with chronic emphysema may also have a component of chronic bronchitis. Emphysema also occurs after asthma or tuberculosis, conditions in which the lungs are overstretched until the elastic fibers of the alveolar walls are destroyed. In old age the alveolar membranes atrophy and may collapse, producing large, air-filled spaces and a decreased total surface area of the pulmonary membranes. There are three primary types: centriacinar emphysema, distal acinar emphysema, and panacinar emphysema. —**emphysematous,** *adj.*

■ OBSERVATIONS: The patient may have dyspnea on exertion or at rest, cough, orthopnea, unequal chest expansion, tachypnea, tachycardia, diminished breath sounds caused by air trapping, or, atypically, an elevated temperature and breath sounds if there is an infection. Anxiety, increased $PaCO_2$, restlessness, confusion, weakness, anorexia, hypoxemia, and respiratory failure are common in advanced cases. Chronic emphysema is characterized by increased anterior-posterior chest diameter secondary to hyperinflation and air trapping and use of accessory muscles.

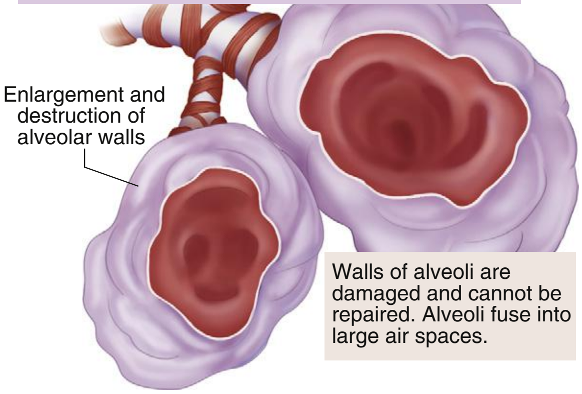
■ INTERVENTIONS: The primary treatment consists of breathing exercises, oxygen administration, and avoiding infection. The airway is kept open, and oxygen is administered to maintain an arterial oxygen saturation of 92%. Bronchodilators, antibiotics, expectorants when bronchitis is also present, methylxanthines, and corticosteroids may be prescribed. Sedation is to be avoided because sedatives depress respiratory function.

■ NURSING CONSIDERATIONS: The patient is taught breathing exercises and encouraged to drink between 2 and 3 L of fluids daily, if not contraindicated by cardiac function. Activity is encouraged to the limit of the patient's tolerance. Fatigue, constipation, and upper respiratory tract infection and irritation are to be avoided. Mechanical ventilation and oxygen therapy may be prescribed for use at home. The patient is taught the adverse role that smoking plays in the disease and is encouraged to stop smoking.



Panacinar emphysema: ruptured alveoli
(Kumar et al, 2010)

EMPHYSEMA



Enlargement and destruction of alveolar walls
Walls of alveoli are damaged and cannot be repaired. Alveoli fuse into large air spaces.

Emphysema *(Patton and Thibodeau, 2010)*

emphysematous /em′fisem′ətəs/ [Gk, *en,* in, *physema,* a blowing], pertaining to or affected with emphysema.

emphysematous abscess, an abscess in which air or gas is present.

emphysematous chest. See **barrel chest.**

emphysematous gastritis, infectious gastritis in which the infectious agents are gas-producing bacteria. Radiologically it resembles gastric emphysema but is much more serious, even life threatening.

emphysematous pyelitis, pyelitis with air or gas only in the collecting system.

empiric /empir′ik/ [Gk, *empeirikos,* experimental], pertaining to a method of treating disease based on observations and experience without an understanding of the cause or mechanism of the disorder or the way the therapeutic agent or procedure affects improvement or cure. The empiric treatment of a new disease may be based on observations and experience gained in the management of analogous disorders. **—empirical,** *adj.*

empirical formula, a chemical formula that shows the smallest whole number ratio of atoms of different elements in a molecule. It does not indicate structural linkage. An example is CH_2O, a carbohydrate.

empiricism /empir′isiz′əm/, a form of therapy based on the therapist's personal experience and that of other practitioners. **—empiricist,** *n.*

empiric treatment. See **treatment.**

Employment Retirement Income Security Act (ERISA), a federal law, enacted in 1974, regulating employee welfare benefit plans, including group health plans.

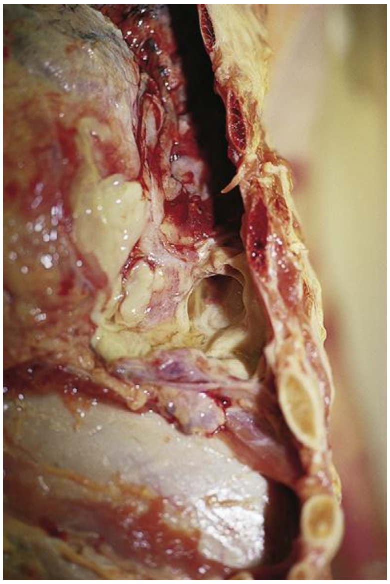
emprosthotonos /em′prosthot′ənəs/ [Gk, *emprosthen,* forward, *tenein,* to cut], a position of the body characterized by forward, rigid flexure at the waist. The position is the result of a prolonged involuntary muscle spasm that is most commonly associated with tetanus infection or strychnine poisoning.

empty end-feel, the sensation in the examiner's hand when a joint is hypermobile. See **end-feel.**

empty follicle syndrome, a condition in which oocytes are absent from stimulated follicles.

empty sella syndrome [AS, *oemettig,* unoccupied; L, *sella,* saddle], an abnormal enlargement of the sella turcica filled with cerebrospinal fluid. The pituitary gland may be smaller than normal and flattened, or it may be absent. Signs and symptoms of hormonal imbalance (for example, hypopituitarism) may be present, as may headache, but some patients are asymptomatic. The diagnosis may be made by computed axial tomography scan, skull radiographic study, or pneumoencephalography.

empyema /em′pī·ē′mə, em′pē·ē′mə/ [Gk, *en* + *ipyon,* pus], an accumulation of pus in the pleural space, as a result of bacterial infection, such as pleurisy or tuberculosis. It is usually removed by surgical incision, aspiration, and drainage. Antibiotics, usually penicillin or vancomycin, are administered to combat the underlying infection. Oxygen therapy may also be administered.



Empyema *(Finkbeiner, Ursell, and Davis, 2009)*

Common distinguishing features of emphysema and chronic bronchitis*

Patient data	*Emphysema (type A: pink puffer)*	*Bronchitis (type B: blue bloater)*
History		
Lifestyle	Smoker	Smoker
Weight	Weight loss	Overweight
Onset of symptoms	Usually after age 50	Usually after age 40
Sputum	Mild, mucoid	Excessive, purulent
Cough	Minimal or absent	Chronic; more severe in mornings
Dyspnea	Progressive exertional dyspnea	Mild to moderate, but may gradually progress to severe exertional dyspnea
Patient complaints	Dyspnea on exertion, fatigue, insomnia	Chronic cough with mucopurulent sputum, chills, malaise, muscle aches, fatigue, insomnia, loss of libido
Physical signs		
Edema	Absent	Present
Central cyanosis	Absent	Present in advanced disease
Use of accessory muscles to breathe	Present	Absent until end stage
Body build	Thin, wasted	Stocky, overweight
Anteroposterior chest diameter	"Barrel chest," 1:1 ratio anteroposterior chest diameter	Normal
Auscultation of chest	Decreased breath sounds, decreased heart sounds, prolonged expiration	Wheezes, crackles, rhonchi, depending on the severity of disease
Percussion	Hyperresonance	Normal
Jugular vein distention	Absent	Present
Other	Pursed-lip breathing	Evidence of right-sided heart failure (cor pulmonale)
General diagnostic tests		
Chest radiography	Narrowed mediastinum; normal or small vertical heart; hyperinflation; low, flat diaphragm; presence of blebs or bullae	Congested lung fields, increased bronchial vascular markings, enlarged horizontal heart
Arterial blood gas analysis	Decreased PaO_2 (60-80 mm Hg); normal or increased $PaCO_2$ (increases with advancing disease)	Decreased PaO_2 (65 mm Hg); increased $PaCo_2$
Electrocardiography	Normal or tall symmetrical P waves; tachycardia, if hypoxic	Right axis deviation, right ventricular hypertrophy, atrial arrhythmias
Hematocrit	Normal	Polycythemia
Pulmonary function tests		
Functional residual capacity	Increased	Normal or slight increase
Residual volume	Increased	Increased
Total lung capacity	Increased	Normal
Forced expiratory volume	Decreased	Decreased
Vital capacity	Decreased	Normal or slight decrease
Static lung compliance	Increased	Normal

From Copstead LEC, Banasik JL: *Pathophysiology*, ed 4, Philadelphia, 2010, Saunders.

*Clinically, features of bronchitis and emphysema are not always clear-cut because many patients have a combined disease process.

-empyema, suffix meaning an "accumulation of pus": *arthroempyema, pneumoempyema, typhloempyema*.

EMS, **1.** abbreviation for **electric muscle stimulator. 2.** abbreviation for **emergency medical service. 3.** abbreviation for **eosinophilia-myalgia syndrome.** See **eosinophilia-myalgia syndrome, tryptophan induced.**

EMS standing orders, routine medical procedures approved in advance for emergency medical service (EMS) crews to perform before consulting a physician.

EMT, abbreviation for **emergency medical technician.**

EMT-A, abbreviation for *emergency medical technician-ambulance,* a member of an emergency medical services crew.

EMT-ALS, abbreviation for **emergency medical technician-advanced life support.**

EMT-B, abbreviation for *emergency medical technician-basic,* an entry-level emergency medical technician who is trained in basic emergency care skills, such as defibrillation, airway maintenance, CPR, spinal immobilization, bleeding control, and fracture management.

EMT-D, abbreviation for *emergency medical technician-defibrillator,* a member of an emergency medical services crew with special training in the use of cardiac defibrillating equipment.

EMT-I, abbreviation for **emergency medical technician-intermediate.**

EMT-IV, abbreviation for **emergency medical technician-intravenous.**

EMT-P, abbreviation for **emergency medical technician-paramedic.**

emtricitabine, a retroviral.

■ INDICATION: This drug is used with other retrovirals to treat HIV infection.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include headache, abnormal dreams, depression, dizziness, insomnia, neuropathy, paresthesia, arthralgia, myalgia, cough, change in body fat distribution, rash, and skin discoloration. Common side effects include nausea, vomiting, diarrhea, anorexia, abdominal pain, and dyspepsia.

Emtriva, a trademark for **emtricitabine.**

emulsification /imul′sifikā′shən/, the breakdown of large fat globules into smaller, uniformly distributed particles. It is accomplished mainly by bile acids in the small intestine. Emulsification is the first preparation of fat for chemical digestion by specific enzymes. See also **emulsify.**

emulsifier /imul′sifī′ər/ [L, *emulgere*, to milk out, *facere*, to make], a substance such as egg yolk or gum arabic that can cause oil to be suspended in water.

emulsify [L, *emulgere*, to milk out, *facere*, to make], to disperse a liquid into another liquid with which it is immiscible, making a colloidal suspension. Soaps and detergents emulsify by surrounding small globules of fat, preventing them from settling out. Bile acts as an emulsifying agent in the digestive tract by dispersing ingested fats into small globules. **—emulsification,** *n.*

emulsion /imul′shən/ [L, *emulgere*, to milk out], **1.** a system consisting of two immiscible liquids, one of which is dispersed in the other in the form of small droplets. **2.** (in photography) a composition sensitive to actinic rays of light, consisting of one or more silver halides suspended in gelatin applied in a thin layer to film.

en-, prefix meaning "in, on": *enanthema, encelialgia, enostosis.*

ENA, abbreviation for **Emergency Nurses' Association.**

enabler /enā′blər/, a significant other of a substance abuser who provides either implicit or explicit support of substance-abusing or dysfunctional behavior.

enalapril maleate /enal′əpril/, an angiotensin-converting enzyme (ACE) inhibitor used as an oral antihypertensive drug.

■ INDICATIONS: It is prescribed in the treatment of hypertension or heart failure or as a preventive for myocardial infarction, stroke, or cardiovascular death.

■ CONTRAINDICATIONS: It should be used with caution in patients suffering severe salt or fluid depletion or in combination with a potassium-sparing diuretic. ACE inhibitors should not be used during pregnancy, especially during the second and third trimesters.

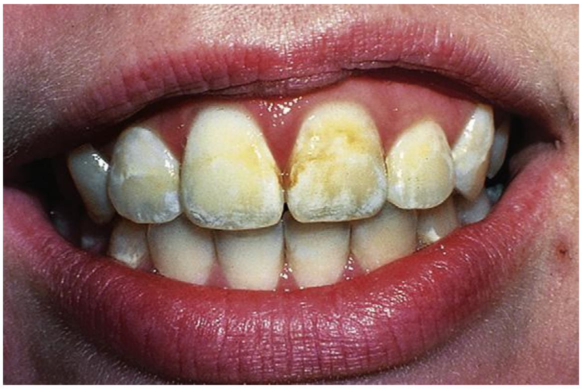
■ ADVERSE EFFECTS: Among the more serious adverse effects are hyperkalemia, cough, hypotension, dizziness, and headache.

enamel /inam′əl/ [OFr, *esmail*], the hard, white crystalline substance of the minerals hydroxyapatite and/or fluorapatite that forms the outermost covering of the clinical and anatomical crown of a tooth. It contains no nerves or blood vessels and is the hardest bony substance in the body. It is produced by epithelial cells called ameloblasts.

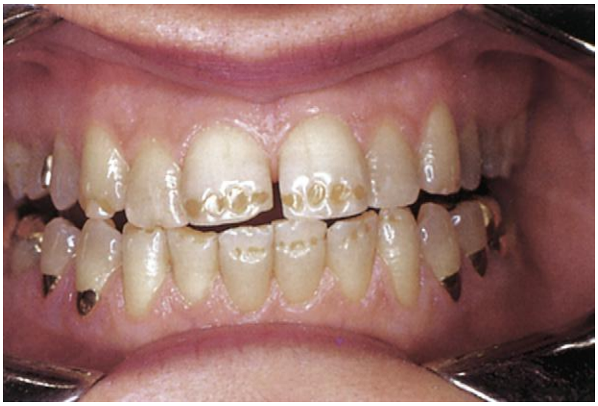
enamel cell. See **ameloblast.**

enamel hypocalcification, a defect in which the enamel of the teeth is soft and undercalcified and opaque in appearance but normal in quantity. It is caused by defective maturation of ameloblasts. The teeth are chalky in consistency, their surfaces wear down rapidly and are more susceptible to caries, and a yellowish-brown stain appears on the teeth as the underlying dentin is exposed. The condition affects both primary and secondary teeth. Compare **enamel hypoplasia.** See also **amelogenesis imperfecta.**

enamel hypoplasia, a defect in which the enamel of the teeth is hard but thin and deficient in amount as a result of defective enamel matrix formation with a shortage of the cementing substance. It is characterized by lack of contact between teeth, rapid breakdown of occlusal surfaces, and a yellowish-brown stain that appears where the dentin is exposed. The condition affects both primary and secondary dentition. It is transmitted genetically or caused by environmental factors such as vitamin A, C, or D deficiency; fluorosis; rash-producing childhood diseases; congenital syphilis; injury or trauma to the mouth; or administration of tetracyclines during the second half of pregnancy or during early tooth development. Compare **enamel hypocalcification.** See also **amelogenesis imperfecta.**



Enamel hypocalcification *(Heymann and Swift, 2006)*



Enamel hypoplasia *(Regezi, Sciubba, and Jordan, 2008)*

enamel niche, either of two depressions on a tooth, located between the lateral dental lamina and the developing dental germ.

enamel organ, a complex epithelial structure on the dental papilla. It produces enamel for the developing tooth.

enanthema /en′anthē′mə/ [Gk, *en* + *anthema*, blossoming], a sudden eruptive lesion of the surface of a mucous membrane. Also called *enanthem* /ənan′thəm/.

enantiomer, (in physical science) one of the two nonsuperimposable mirror image forms of a chiral compound.

enarthrosis. See **ball-and-socket joint.**

en bloc /enblok′, äNblôk′/ [Fr, in a block], all together, or as a whole.

encapsulated /enkaps′yəlā′tid/ [Gk, *en* + L, *capsula*, little box], (of arteries, muscles, nerves, and other body parts) enclosed in fibrous or membranous sheaths. It refers to organisms that form a protective capsule. See also **fascia bulbi, synovial sheath.**

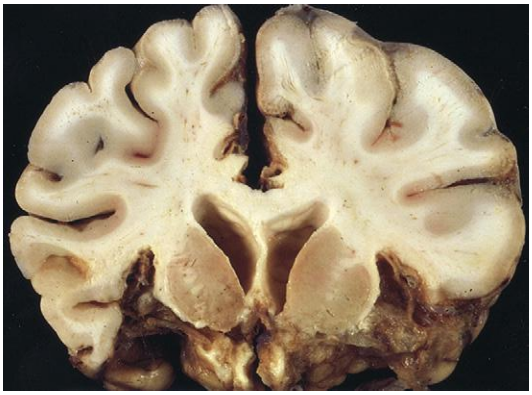
-ence. See **-ency.**

encephal-, prefix meaning "the brain": *encephalopathy, encephalitis.*

encephalalgia /ənsef′əlal′jə/, headache. See also **cephalalgia.**

-encephalia, -encephaly, suffix meaning "(condition of the) brain": *amyelencephalia, rhinencephalia, synencephalia.*

encephalitis /ensef′əlī′tis/ *pl.* **encephalitides** [Gk, *enkephalos,* brain, *itis,* inflammation], an inflammatory condition of the brain. The cause is usually an arbovirus infection transmitted by the bite of an infected mosquito, but it may be the result of lead or other poisoning or of hemorrhage. Certain protozoal infections such as toxoplasmosis can cause encephalitis in immunocompromised patients. Postinfectious encephalitis occurs as a complication of another infection, such as chickenpox, influenza, or measles, or after smallpox vaccination. The condition is characterized by headache, neck pain, fever, nausea, and vomiting. Neurological disturbances, including seizures, personality change, irritability, lethargy, paralysis, weakness, and coma, may occur. The outcome depends on the cause, the age and condition of the person, and the extent of inflammation. Severe inflammation with destruction of nerve tissue may result in a seizure disorder, loss of a special sense or other permanent neurological problem, or death. Usually the inflammation involves the spinal cord and brain; hence, in most cases a more accurate term is **encephalomyelitis.** Compare **meningitis.** See also **equine encephalitis.**



Herpes encephalitis *(Kumar et al, 2010/Courtesy Dr. T.W. Smith, University of Massachusetts Medical School, Worcester, Massachusetts)*

encephalitis lethargica. See **epidemic encephalitis.**

encephalitis neonatorum. See **neonatorum encephalitis.**

encephalitis periaxialis diffusa. See **Schilder's disease.**

encephalocele /ensef′ələsēl′/ [Gk, *enkephalos* + *koilia,* cavity], **1.** protrusion of the brain through a congenital defect in the skull. **2.** hernia of the brain. See also **neural tube defect.**

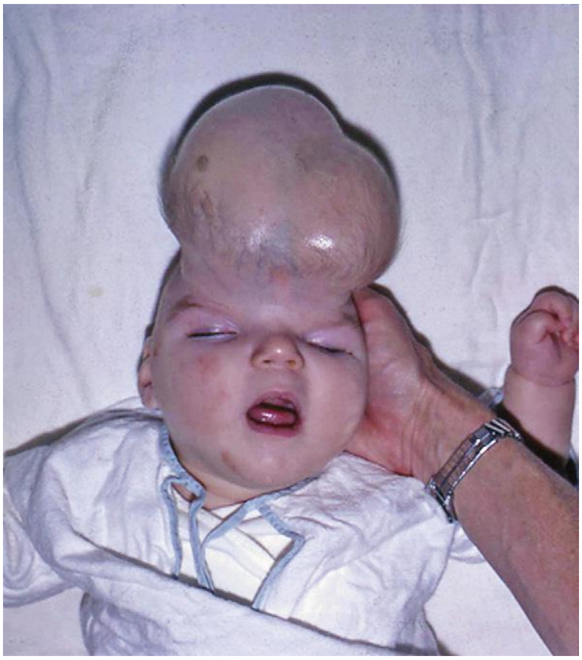
encephalodysplasia, any congenital anomaly of the brain.

encephalogram /ensef′ələgram′/ [Gk, *enkephalos* + *gramma,* record], a radiograph of the brain made during encephalography.

encephalography /ensef′əlog′rəfē/, radiographic delineation of the structures of the brain containing fluid after the cerebrospinal fluid is withdrawn and replaced by a gas, such as air, helium, or oxygen. The procedure is used mainly for indicating the site of cerebrospinal fluid obstruction in hydrocephalus or structural abnormalities of the posterior fossa. Because of the risks involved, it is used only when results of computed tomography are not definitive. Kinds of encephalography are **pneumoencephalography** and **ventriculography.** Also called *air encephalography.* Compare **echoencephalography, electroencephalography.** **—encephalographic,** *adj.*

encephaloid carcinoma. See **medullary carcinoma.**

encephalomeningitis /-men′injī′tis/ [Gk, *enkephalos,* brain, *meninx,* membrane, *itis,* inflammation], an inflammation of the brain and meninges.



Encephalocele *(Cohen and Lemire, 1982)*

encephalomeningocele. See **meningoencephalocele.**

encephalomyelitis /ensef′əlōmī′əlī′tis/ [Gk, *enkephalos* + *myelos,* marrow, *itis*], an inflammatory condition of the brain and spinal cord that damages myelin, characterized by fever, headache, stiff neck, back pain, and vomiting. Depending on the cause, the age and condition of the person, and the extent of the inflammation and irritation to the central nervous system, seizures, paralysis, personality changes, a decreased level of consciousness, coma, or death may occur. Sequelae, such as seizure disorders or decreased mental ability, may occur after severe inflammation that causes extensive damage to the cells and tissues of the nervous system. See also **acute disseminated encephalomyelitis, encephalitis, equine encephalitis.**

encephalomyocarditis /ensef′əlōmī′ōkärdī′tis/ [Gk, *enkephalos* + *mys,* muscle, *kardia,* heart, *itis,* inflammation], an infectious disease of the central nervous system and heart tissue caused by a group of small ribonucleic acid picornaviruses. Rodents are a major reservoir of the infection. Human illness ranges from asymptomatic infection to severe encephalomyelitis. Symptoms are generally similar to those of poliomyelitis. Myocarditis is not a feature of infection in humans, and most victims recover promptly without sequelae. Treatment is supportive. See also **picornavirus.**

encephalon [Gk, *enkephalos,* brain], **1.** the cerebrum and its related structures of cerebellum, pons, and medulla oblongata. **2.** the contents of the cranium.

encephalopathy /ensef′əlop′əthē/ [Gk, *enkephalos* + *pathos,* disease], any abnormal condition of the structure or function of brain tissues, especially chronic, destructive, or degenerative conditions, as Wernicke's encephalopathy or Schilder's disease.

encephalotrigeminal angiomatosis. See **Sturge-Weber syndrome.**

-encephaly. See **-encephalia.**

enchondroma /en′kəndrō′mə/ *pl.* **enchondromas, enchondromata** [Gk, *en* + *chondros,* cartilage, *oma,* tumor], a benign, slowly growing tumor of cartilage cells that arises in the extremity of the shaft of tubular bones in the hands or feet. The growth of the neoplasm may distend the bone. Also called **enchondrosis, true chondroma.**

enchondromatosis /en′kəndrō′mətō′sis/ [Gk, *en* + *chondros,* cartilage, *oma,* tumor, *osis,* condition], a congenital disorder characterized by the proliferation of cartilage within the extremity of the shafts of bones, causing thinning of the cortex and distortion in length. Also called **dyschondroplasia, Ollier's disease.** Compare **Maffucci's syndrome.**

enchondromatous myxoma /en′kondrō′mətəs/, a tumor of the connective tissue, characterized by the presence of cartilage between the cells of connective tissue. See also **myxoma.**

enchondrosarcoma. See **central chondrosarcoma.**

enchondrosis. See **enchondroma.**

enchylema. See **hyaloplasm.**

-enchyma, suffix meaning the "liquid that nourishes tissue, or tissue itself": *karyenchyma, mesenchyma, sclerenchyma.*

enclave /en′klāv, enklāv′/, a detached mass of tissue enclosed in an organ or in a different kind of tissue.

encode /enkōd′/ [Gk, *en* + L, *caudex,* book], **1.** to translate a message, signal, or stimulus into a code. **2.** to rewrite information into a form that can be interpreted by a computer manually or automatically, as by a computer program.

encoded message, (in communication theory) a message as transmitted by a sender to a receiver.

encopresis /en′kōprē′sis/, fecal holding with constipation and fecal soiling. **—encopretic,** *adj.*

encounter [Gk, *en* + L, *contra,* against], (in psychotherapy) the interaction between a patient and a psychotherapist, such as occurs in existential therapy, or among several members of a small group, such as encounter or sensitivity training groups. In an encounter emotional change and personal growth are affected by participants' expression of strong feelings.

encounter data, information showing use of provider services by health plan enrollees that is used to develop cost profiles of a particular group of enrollees and then to guide decisions about or provide justification for the maintenance or adjustment of premiums.

encounter group, (in psychology) a small group of people who meet to increase self-awareness, promote personal growth, and improve interpersonal communication. Members focus on becoming aware of their feelings and on developing the ability to express those feelings openly, honestly, and clearly. See also **group therapy, psychotherapy, sensitivity training group.**

enculturation /enkul′chərā′shən/ [Gk, *en* + L, *cultura,* cultivation], the process of learning the concepts, values, and behavioral standards of a particular culture.

-ency, -ance, -ancy, -ence, **1.** suffixes meaning a "quality or state": *deficiency, dependency.* **2.** suffixes meaning a "person or thing in a state": *latency.* **3.** suffixes meaning an "instance of a quality or state": *emergency.*

encyst /ensist′/, to form a cyst or capsule. See also **cyst. —encysted,** *adj.*

encysted pleurisy, a form of pleurisy with adhesions that surround the effused material. Also called **blocked pleurisy, circumscribed pleurisy.**

end, abbreviation for **endoreduplication.**

end-. See **endo-.**

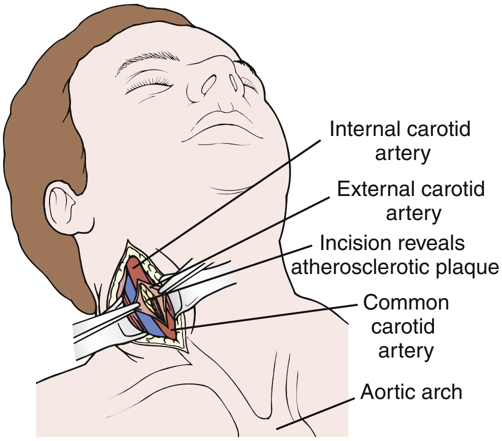
Endameba, any ameba of the genus ***Endamoeba.***

endamebiasis. See **amebiasis.**

Endamoeba, a genus of amebic parasites in invertebrates, originally described from cockroaches.

endamoebiasis. See **amebiasis.**

endarterectomy /en′därtərek′təmē/ [Gk, *endon,* within, *arteria,* airpipe, *ektomē,* excision], the surgical removal of the intimal lining of an artery. The procedure is done to clear a major artery that may be blocked by plaque accumulation. Kinds of endarterectomy include **disobliterative endarterectomy** and **gas endarterectomy.**



Endarterectomy of the carotid artery

(Lewis, Heitkemper, and Dirksen, 2004)

endarteritis /en′därtərī′tis/ [Gk, *endon* + *arteria* + *itis,* inflammation], inflammation of the inner layer of one or more arteries, which may become partially or completely occluded. Also called **acute endarteritis.**

endarteritis deformans. See **chronic endoarteritis.**

endarteritis obliterans, an inflammatory condition of the lining of the arterial walls in which the intima proliferates, narrowing the lumen of the vessels and occluding the smaller vessels. Also called **arteritis obliterans.**

end artery, a blood vessel that does not join with any other vessel. Also called **terminal artery.**

end bud [AS, *ende* + Gk, *bolbos,* onion], a mass of undifferentiated cells produced from the remnants of the primitive node and the primitive streak at the caudal end of the developing embryo after formation of the somites is completed. In lower animals it gives rise to the tail or any other caudal appendage and part of the trunk. In humans it forms the caudal portion of the trunk. Also called **tail bud.**

end bulbs of Krause. See **Krause's corpuscles.**

end-diastolic pressure /-dī·əstol′ik/ [AS, *ende* + Gk, *dia* + *stellein,* to set; L, *premere,* to press], the pressure of the blood in the ventricles at the end of diastole.

endemic /endem′ik/ [Gk, *endemos,* native], (of a disease or microorganism) the expected or "normal" incidence indigenous to a geographic area or population. See also **epidemic, pandemic.**

endemic disease, a physical or mental disorder caused by health conditions constantly present within a community. It usually describes an infection that is transmitted directly or indirectly between humans and is occurring at the usual expected rate.

endemic goiter, an enlargement of the thyroid gland caused by the intake of inadequate amounts of dietary iodine. Iodine deprivation leads to diminished production and secretion of thyroid hormone by the gland. The pituitary gland, operating on a negative feedback system, senses the deficiency and secretes increased amounts of thyroid-stimulating hormone, causing hyperplasia and hypertrophy of the thyroid gland. The goiter may grow during the winter months and shrink during the summer months when the person eats more iodine-containing fresh vegetables. Initially the goiter is diffuse; later it becomes multinodular. Endemic goiter occurs occasionally in adolescents at puberty and widely in population groups in geographic areas in which limited amounts of iodine are present in soil, water, and food. The use of iodized salt is a prophylactic treatment. Desiccated thyroid given orally may prevent further growth of adult goiters and may reduce the size of diffuse goiters. A large goiter may cause dysphagia, dyspnea, tracheal deviation, and cosmetic problems. Also called *colloid nodular goiter*.

endemic syphilis, a chronic infectious skin disease that is closely related to ***Treponema pallidum*** and is frequently contracted in childhood without venereal contact. It is known as **bejel** in heavily populated communities of undeveloped nations. Also called **nonvenereal syphilis.**

endemic typhus. See **murine typhus.**

end-feel, the sensation imparted to the examiner's hands at the end point of the available range of motion. It varies according to the limiting structure or tissue. Types of end-feel include capsular, bone-on-bone, spasm, and springy block. **Empty end-feel** is the absence of an end-feel during a range of motion examination when the patient stops further movement of a joint before the examiner senses any organic resistance to the movement.

endo-, end-, ent-, ento-, prefix meaning "inward, within": *endobiotic, endocranial, endognathion*.

endobronchitis /en′dōbrongkī′tis/, inflammation of the smaller bronchi, often caused by a bronchial mucosal infection.

endocardia. See **endocardium.**

endocardial, pertaining to the **endocardium.**

endocardial candidiasis. See ***Candida*** **endocarditis.**

endocardial cushion defect /en′dōkär′dē·əl/, any cardiac defect resulting from the failure of the endocardial cushions in the embryonic heart to fuse and form the atrial septum. It is common in Down syndrome. See also **atrial septal defect, congenital cardiac anomaly.**

endocardial cushions, a pair of thickened tissue sections in the embryonic atrial canal. During embryonic development they meet and fuse to form a septum dividing the canal into two channels which eventually become the atrioventricular orifices.

endocardial fibroelastosis /fī′brō·ē′lastō′sis/ [Gk, *endon* + *kardia,* heart; L, *fibra,* fiber; Gk, *elaunein,* to drive, *osis,* condition], an abnormal condition characterized by the development of a thick, fibroelastic endocardium that can cause failure of the heart to pump blood.

endocardial murmur, a continuous, soft sound made by an abnormality within the heart.

endocardial pacing. See **pacing.**

endocardial tubes, paired, longitudinal, endothelial-lined channels formed from the cardiogenic mesoderm in embryonic development that fuse to form the primordial heart tube.

endocarditis /en′dōkärdī′tis/ [Gk, *endon* + *kardia,* heart, *itis,* inflammation], an inflammation of the endocardium and heart valves. The condition is characterized by lesions caused by a variety of diseases. Kinds of endocarditis are bacterial endocarditis, nonbacterial thrombotic endocarditis, and Libman-Sacks endocarditis. All types of endocarditis are rapidly lethal if untreated, but most patients with endocarditis are successfully treated by various antibacterial and surgical measures. See also **bacterial endocarditis, subacute bacterial endocarditis.**

endocardium /en′dōkär′dē·əm/, *pl.* **endocardia,** the lining of the heart chambers, containing small blood vessels and a few bundles of smooth muscle. It is continuous with the endothelium of the great blood vessels. Compare **epicardium, myocardium.**

endocervical /-sur′fikəl/ [Gk, *endon* + L, *cervix,* neck], pertaining to the interior of the cervix. Also called **intracervical.**

endocervicitis /en′dōsur′visī′tis/, an abnormal condition characterized by inflammation of the epithelium and glands of the canal of the uterine cervix. See also **cervicitis.**

endocervix /en′dōsur′viks/, **1.** the membrane lining the canal of the uterine cervix. **2.** the opening of the cervix into the uterine cavity.

endochondral /-kon′drəl/ [Gk, *endon,* within, *chondros,* cartilage], pertaining to something within the cartilage.

endochondral bone. See **cartilaginous bone.**

endocrinasthenia /-krin′asthē′nē·ə/, a neural deficit caused by an alteration of the endocrine system.

endocrine /en′dəkrēn, -krīn/ [Gk, *endon* + *krinein,* to secrete], pertaining to a process in which a group of cells secretes into the blood or lymph circulation a substance (for example, hormone) that has a specific effect on tissues in another part of the body.

endocrine diabetes mellitus [Gk, *endon,* within, *krinein,* to secrete, *diabainein,* to pass through, *mellitus,* honeyed], a form of diabetes associated with diseases of other glands, such as the adrenals, pituitary, or thyroid, classified under other specific types in the American Diabetes Association Classification.

endocrine fracture /-krēn/, any fracture that results from weakness of a specific bone caused by an endocrine disorder such as hyperparathyroidism, in which calcium loss from bone is accelerated.

endocrine gland, a ductless gland that produces and secretes hormones into the blood or lymph nodes, affecting metabolism and other body processes. The endocrine glands include the pituitary, pineal, hypothalamus, thymus, thyroid, parathyroid, adrenal cortex, medulla, pancreatic islands of Langerhans, and gonads. Cells in other structures, such as the GI mucosa, the kidneys, the heart, and the placenta, also have endocrine functions. Compare **exocrine gland.**

endocrine system [Gk, *endon* + *krinein,* to secrete; *systema*], the network of ductless glands and other structures that elaborate and secrete hormones directly into the bloodstream, affecting various processes throughout the body, such as metabolism, growth, and secretions from other organs. Glands of the endocrine system include the thyroid, the parathyroid, the anterior pituitary, the posterior pituitary, the pancreas, the suprarenal glands, and the gonads. The pineal gland is also considered an endocrine gland because it is ductless, although its precise endocrine function is not established beyond its involvement in daily, monthly, and annual rhythms. Various other organs have some endocrinological function. Compare **exocrine.** See also the **Color Atlas of Human Anatomy, pp. A18–A19.**

endocrine therapy. See **hormone therapy.**

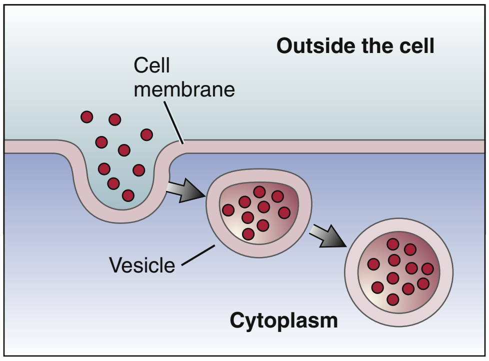
endocrino- [Gk, *endon,* within, *krinein,* to secrete], prefix meaning "endocrine system, endocrine structures or function": *endocrinology, endocrinopathy.*

endocrinologist /en′dōkrinol′əjist/, a physician who specializes in the endocrine system and its disorders.

endocrinology /-krinol′əjē/ [Gk, *endon* + *krinein,* to secrete, *logos,* science], the study of the anatomical, physiological, and pathological characteristics of the endocrine system and of the treatment of endocrine problems.

endocrinopathy /-krinop′əthē/ [Gk, *endon,* within, *krinein,* to secrete, *pathos,* disease], a disease involving an endocrine gland or a dysfunction that decreases the quality or quantity of the gland's secretion or response to a hormone.

endocytosis /en′dōsītō′sis/ [Gk, *endon,* within, + *kytos,* cell], uptake by a cell of material from the environment by invagination of its plasma membrane, which may be either phagocytosis or pinocytosis. Compare **exocytosis.**



Endocytosis *(Herlihy, 2011)*

endoderm /en′dədurm/ [Gk, *endon* + *derma,* skin], (in embryology) the innermost of the cell layers that develop from the embryonic disk of the inner cell mass of the blastocyst. From the endoderm arises the epithelium of the trachea, bronchi, lungs, GI tract, liver, pancreas, urinary bladder, anal canal, pharynx, thyroid, tympanic cavity, tonsils, and parathyroid glands. The endoderm thus comprises the lining of the cavities and passages of the body and the covering of most of the internal organs. Compare **ectoderm, hypoblast, mesoderm.**

endodermal /-dur′məl/ [Gk, *endon,* within, *derma,* skin], pertaining to the inner of the three layers of the embryo and the epithelial lining of the respiratory system, the digestive tract, and other tissues. Also spelled **entodermal.** See also **endoderm.**

endodermal cloaca, a part of the cloaca in the developing embryo that lies internal to the cloacal membrane and gives rise to the bladder and urogenital ducts. Compare **ectodermal cloaca.** See also **urogenital sinus.**

endodermal sinus tumor, yolk sac tumor.

endodontics [Gk, *endon,* within, *odous,* tooth], the branch of dentistry that specializes in the diagnosis and treatment of diseases of the dental pulp, tooth root, and surrounding tissues and in the associated practice of root canal therapy. Also called *endodontia,* **endodontology, pulpodontia.**

endodontist /-don′tist/ [Gk, *endon,* within, *odous,* tooth], a dentist who specializes in endodontics.

endodontology. See **endodontics.**

endogenous /endoj′ənəs/ [Gk, *endon* + *genein,* to produce], **1.** growing within the body. **2.** originating from within the body or produced from internal causes, such as a disease caused by the structural or functional failure of an organ or system. Compare **exogenous. —endogenic,** *adj.*

endogenous carbon dioxide, carbon dioxide produced within the body by metabolic processes.

endogenous hypertriglyceridemia. See **hyperlipidemia type IV.**

endogenous infection, an infection caused by the reactivation of previously dormant organisms, as in coccidioidomycosis, histoplasmosis, and tuberculosis. Compare **germinal infection, mixed infection, retrograde infection, secondary infection.**

endogenous iritis. See **primary iritis.**

endogenous obesity, obesity resulting from dysfunction of the endocrine or metabolic system. Compare **exogenous obesity.** See also **obesity.**

endogenous opioid, an opiate-like substance, such as an endorphin, produced by the body.

endogenous uric acid [Gk, *endon,* within + *genein,* to produce + *ouron,* urine; L, *acidus*], uric acid produced by the metabolism of purines in the body's own nucleoproteins, as distinguished from metabolism of purine products in foods.

endointoxication /en′dō·intok′sikā′shən/, poisoning caused by a toxin produced within the body, such as from dead and infected tissue in gangrene.

endolith. See **denticle.**

endolymph /en′dəlimf/ [Gk, *endon* + *lympha,* water], the pale fluid in the membranous labyrinth (cochlear duct) of the internal ear. Compare **perilymph.**

endolymphatic appendage, an outgrowth of the otic vesicle that forms the endolymphatic duct and sac during embryonic development.

endolymphatic duct /-limfat′ik/, a labyrinthine passage joining an endolymphatic sac with the utricle and saccule.

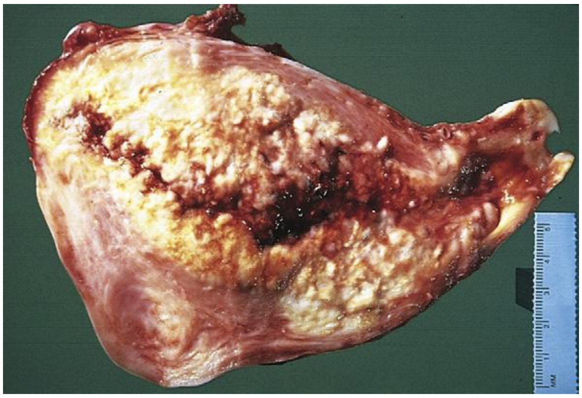
endolymphatic sac, the blind end of an endolymphatic duct.

endomastoiditis /-mas′toidī′tis/, an inflammation within the mastoid cavity and cells.

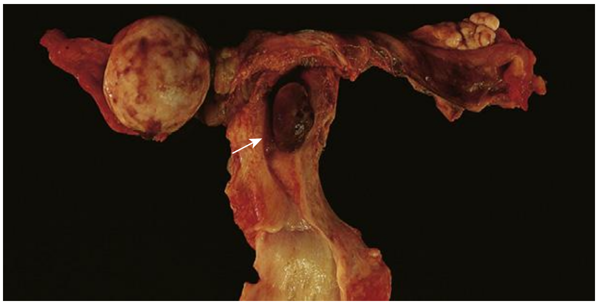
endometrial /en′dōmē′trē·əl/ [Gk, *endon* + *metra,* womb], **1.** pertaining to endometrium. **2.** pertaining to the uterine cavity.

endometrial biopsy, a microscopic examination of a sample of endometrial tissue to assess corpus luteum function. It is performed in infertile women with regular ovulatory cycles and no identifiable reason for infertility, in women with repeated first trimester abortions, in cases of abnormal vaginal bleeding, and during ovulation induction therapy.

endometrial cancer, a carcinoma of the endometrium of the uterus. It is the most prevalent gynecological malignancy, most often occurring in the fifth or sixth decade of life. Although the cause of endometrial cancer is not clear, some of the risk factors associated with an increased incidence of the disease are a medical history of infertility, anovulation, late menopause (52 years), administration of unopposed exogenous estrogen, uterine polyps, and a combination of diabetes, hypertension, and obesity. Abnormal vaginal bleeding, especially in a postmenopausal woman, is the cardinal symptom. Lower abdominal and low back pain may also be present; a large, boggy uterus is often a sign of advanced disease. Fewer than half the patients with endometrial cancer have a positive finding on Papanicolaou's (Pap) test of the cervix and vagina because the tumor cells rarely exfoliate in early stages of the lesion. A Pap test of cells removed from the endometrium obtained from jet washings of the uterine cavity provides more accurate data. Vacuum curettage is also used to extract endometrial cells for study, but the diagnostic technique most frequently recommended is dilation and curettage, in which each section of the uterus is examined and curetted for biopsy specimens. Adenocarcinomas constitute roughly 90% of all endometrial tumors; the remaining 10% comprise mixed carcinomas, sarcomas, and benign adenoacanthomas. Endometrial lesions may spread to the cervix but rarely invade the vagina. They metastasize to the broad ligaments, fallopian tubes, and ovaries so frequently that bilateral salpingo-oophorectomy with abdominal hysterectomy is the usual treatment. Radiotherapy is usually administered before and after surgery. High doses of a progestogen may be prescribed for palliation in advanced or inoperable cases. Chemotherapy may also be used.



Endometrial cancer *(Kumar, Cotran, and Robbins, 2003/Courtesy Dr. Kyle Molberg, Department of Pathology, University of Texas Southwestern Medical Center)*



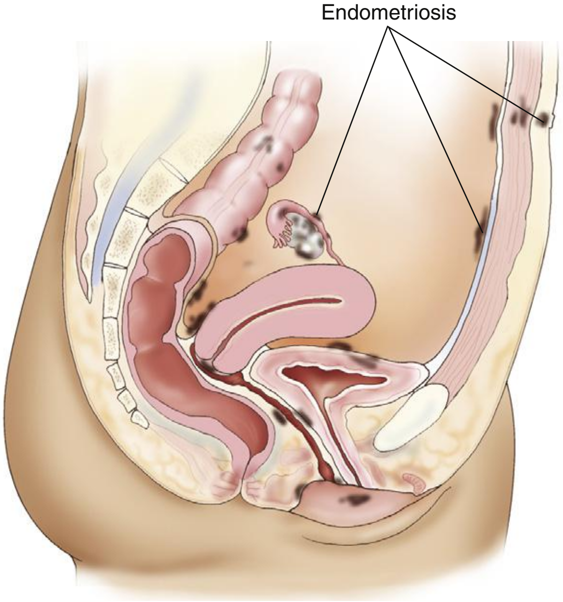
Endometrial polyp *(Finkbeiner, Ursell, and Davis, 2009)*

endometrial cyst [Gk, *endon,* within, *metra,* womb, *kystis,* bag], **1.** an endometrial tumor. **2.** an ovarian cyst that develops as a distension of an endometrial gland.

endometrial hyperplasia, an abnormal condition characterized by overgrowth of the endometrium resulting from sustained stimulation by estrogen (of endogenous or exogenous origin) that is not opposed by progesterone. Estrogen acts as a growth hormone for the endometrium. Through a complex intercellular mechanism, endometrial cells bind estrogen preferentially and undergo changes characteristic of the proliferative phase of the menstrual cycle. If estrogen stimulation continues for 3 to 6 months without periodic cessation or counteractive progesterone stimulation, as occurs in anovulatory or perimenopausal women and in those receiving replacement estrogen without added progestogen, the endometrium becomes abnormally thickened and glandularized. Unremitting estrogen stimulation eventually causes cystic or adenomatous endometrial hyperplasia. The latter is a premalignant lesion that undergoes malignant degeneration in approximately 25% of cases. The causative relationship between estrogen and endometrial hyperplasia is well established; there is some indication but no proof that estrogen also provokes the change from hyperplasia to neoplasia and malignancy. Endometrial hyperplasia often results in abnormal uterine bleeding. Such bleeding, particularly in older women, constitutes an indication for biopsy or curettage of the endometrium to establish histopathological diagnosis and to rule out malignancy. A functioning estrogen-secreting tumor is suspected if the woman is not taking estrogen medication. Progestogen therapy is effective in reversing the abnormal histopathological changes of endometrial hyperplasia. If hyperplasia is adenomatous, hysterectomy is commonly performed.

endometrial polyp, a pedunculated overgrowth of endometrium, usually benign. Polyps are a common cause of vaginal bleeding in perimenopausal women and are often associated with other uterine abnormalities, such as endometrial hyperplasia or fibroids. They may occur singly or in clusters and are usually 1 cm or less in diameter, but they may become much larger and prolapse through the cervix. Treatment for the condition includes surgical dilation and curettage.

endometriosis /en′dōmē′trē·ō′sis/ [Gk, *endon* + *metra,* womb, *osis,* condition], an abnormal gynecological condition characterized by ectopic growth and function of endometrial tissue. Precise incidence of the disease is unknown, but evidence of it is found in approximately 15% of women who undergo pelvic laparotomy for other indications. The average age of women found to have endometriosis is 37 years. Pregnancy may have an influence in preventing or ameliorating the disease. The causes of endometriosis are unknown; evidence suggests that the ectopic endometrium of endometriosis develops from vestigial tissue of the wolffian or müllerian duct. Other evidence strongly suggests that fragments of endometrium from the lining of the uterus are refluxed during menstruation backward through the fallopian tubes into the peritoneal cavity, where they attach, grow, and function. The tissue is microscopically similar to or identical with endometrium, having glands or glandlike structures, stroma, and areas of hemorrhage. Fragments may be found in the wall of the uterus or on its surface; in or on the tubes, ovaries, rectosigmoid, or pelvic peritoneum; or occasionally in remote extrapelvic areas. Foci of endometriosis have been found in surgical scars, the umbilicus, the bowel, the lung, the eye, and the brain. When endometriosis occurs in a critical location it may cause grave dysfunction of the organ involved or, rarely, death; intestinal obstruction is a common complication. The lesions of pelvic endometriosis are typically small cystic structures a few millimeters in diameter that appear individually or in clusters as black nodules on the visceral and parietal peritoneum.



Common sites of endometriosis
(Leonard, 2009)

endometriosis interna. See **primary endometriosis.**

endometritis /en′dōmitrī′tis/ [Gk, *endon,* within, + *metra,* womb, *itis,* inflammation], an inflammatory condition of the endometrium or decidua, with extension into the myometrium and parametrial tissues. It is usually caused by bacterial infection, commonly by gonococci or hemolytic streptococci. The condition is characterized by fever, abdominal pain, tachycardia, malodorous discharge, tenderness, and enlargement of the uterus. It occurs most frequently after childbirth or abortion and is associated with the use of an intrauterine contraceptive device. It can also be the result of caesarean delivery. Diagnosis may be made by physical examination, history, laboratory analysis revealing an elevated white blood cell count, ultrasound, and bacteriological identification of the pathogen. Treatment includes antibiotics, rest, analgesia, adequate fluid intake, and, if necessary, surgical drainage of a suppurating abscess, hysterectomy, or salpingo-oophorectomy. Endometritis may be mild and self-limited, chronic or acute, and unilateral or bilateral. It may cause sterility if scar formation occludes the passage of the fallopian tubes. Septic abortion and puerperal fever are forms of endometritis that caused many deaths before asepsis and antibiotics became commonly available. A kind of endometritis is **decidual endometritis.** See also **pelvic inflammatory disease.**

endometrium /en′dōmē′trē·əm/ [Gk, *endon* + *metra,* womb], the mucous membrane lining of the uterus, consisting of the stratum compactum, the stratum spongiosum, and the stratum basale. The endometrium changes in thickness and structure with the menstrual cycle. The stratum compactum and the stratum spongiosum constitute the pars functionalis and are shed with each menstrual flow. The pars functionalis is known as the decidua during pregnancy, when it underlies the placenta. Compare **myometrium, parametrium.**

endomorph /en′dəmôrf′/ [Gk, *endon* + *morphe,* form], a person whose body build is characterized by a soft, round physique with a large trunk and thighs, tapering extremities, an accumulation of fat throughout the body, and a predominance of structures derived from the endoderm. Compare **ectomorph, mesomorph.** See also **pyknic.**

endomyocardial fibrosis [Gk, *endon,* within + *mys,* muscle + *kardia,* heart; L, *fibra,* fiber + *osis,* condition], idiopathic myocardiopathy occurring endemically in various parts of Africa and rarely in other areas, characterized by cardiomegaly; marked thickening of the endocardium with dense, white fibrous tissue that frequently extends to involve the inner third or half of the myocardium; and congestive heart failure.

endomyocarditis /-mī′ōkärdī′tis/ [Gk, *endon,* within, *mys,* muscle, *kardia,* heart, *itis,* inflammation], an inflammation of the lining of the heart.

endoneurial nerve sheath. See **nerve sheath.**

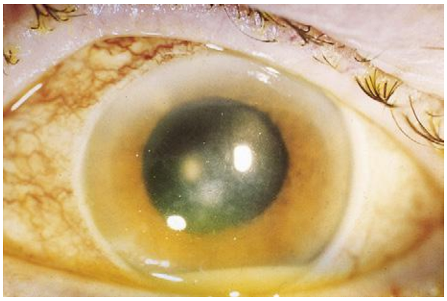
endonuclease, an enzyme that cleaves or hydrolyzes phosphodiester bonds within a polynucleotide chain. Compare **exonuclease.**

endoparasite /en′dōper′əsīt/ [Gk, *endon* + *parasitos,* guest], (in medical parasitology) an organism that lives within the internal organs or tissues of the host, such as a tapeworm.

endopathy /endop′əthē/, any disease originating within the person.

endopeptidase /en′dōpep′ti·dās/ [Gk, *endon,* within + Gk, *peptein,* to digest + *ase,* enzyme suffix], any peptidase that catalyzes the cleavage of internal peptide bonds in a polypeptide or protein. Endopeptidases are divided into subclasses on the basis of catalytic mechanism and comprise the serine endopeptidases, cysteine endopeptidases, aspartic endopeptidases, metalloendopeptidases, and other endopeptidases.

endophthalmitis /endof′thalmī′tis/ [Gk, *endon* + *ophthalmos,* eye, *itis*], an infectious condition of the internal eye in which the primary signs are decreased vision, vitritis, and development of a hypopyon. Patients usually complain of pain. Other symptoms include erythema and edema. It may result from bacterial or fungal infection or from trauma. Depending on the cause, therapy requires surgical intervention or administration of an intraocular antibiotic. Also called *endophthalmia.*



Bacterial endophthalmitis *(Stone and Gorbach, 2000/Courtesy Dr. Jay Duker, New England Medical Center)*

endophthalmitis phacoanaphylactica /fak′ō·an′əfilak′təkə/. See **phacolytic glaucoma.**

endophytic /en′dōfit′ik/ [Gk, *endon* + *phyton,* plant], pertaining to the tendency to grow inward, such as a tumor that grows into the wall of a hollow organ.

endoplasm /en′dōplaz′əm/ [Gk, *endon,* within, *plasma,* plasm], the inner portion of cytoplasm.

endoplasmic reticulum /-plaz′mik/ [Gk, *endon* + *plassein,* to mold], an extensive network of membrane-enclosed tubules in the cytoplasm of cells. The structure functions in the synthesis of proteins and lipids and in the transport of these metabolites within the cell.

endoprosthesis /-prosthē′sis, -pros′thəsis/ [Gk, *endon* + *prosthesis,* addition], a prosthetic device installed within the body, such as an internal cardiac pacemaker.

endopyelotomy /en′dopi′ĕlot′äme/, an incision procedure to correct a stenosed ureteropelvic junction by cutting from within with an instrument inserted through an endoscope.

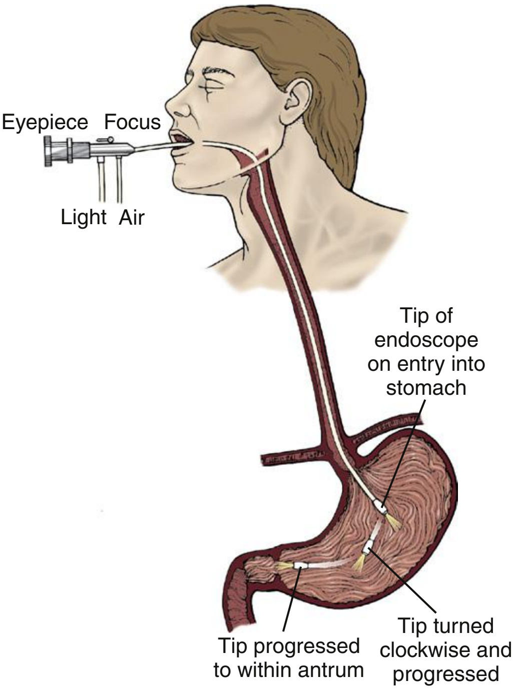
endoreduplication (end) /en′dōrido͞o′plikā′shən/ [Gr, *endon* + L, *re-,* again, *duplicare,* to duplicate], replication of the chromosomes without subsequent cell division.

end-organ [AS, *ende* + Gk, *organon,* instrument], a nerve ending in which the terminal nerve filaments are encapsulated.

endorphin /endôr′fin/ [Gk, *endon* + *morphe,* shape], one of the three groups of endogenous opioid peptides composed of many amino acids, elaborated by the pituitary gland and other brain areas, and acting on the central and the peripheral nervous systems to reduce pain. There are three known, designated alpha, beta, and gamma. Beta-endorphin has been isolated in the brain and in the GI tract and seems to be the most potent of the endorphins. Beta-endorphin is composed of 30 amino acids that are identical to part of the sequence of 91 amino acids of the hormone beta-lipotropin, also produced by the pituitary gland. Behavioral tests indicate that beta-endorphin is a powerful analgesic in humans and animals. Brain-stimulated analgesia in humans releases beta-endorphin into the cerebrospinal fluid. Compare **enkephalin.**

endorsement /endôrs′mənt/ [Gk, *en* + L, *dorsum,* the back], a statement of recognition of the license of a health practitioner in one state by another state. An endorsement relieves the health practitioner of the necessity of completing the full licensing procedure of the state in which practice is to be undertaken.

endoscope /en′dəskōp′/ [Gk, *endon* + *skopein,* to look], an illuminated optic instrument for the visualization of the interior of a body cavity or organ. Instruments are available in varying lengths. The fiberoptic endoscope has great flexibility, reaching previously inaccessible areas. Although the endoscope is generally introduced through a natural opening in the body, it may also be inserted through an incision. Instruments for viewing specific areas of the body include the bronchoscope, cystoscope, gastroscope, laparoscope, otoscope, and vaginoscope. See also **fiberoptics. —endoscopic,** *adj.*

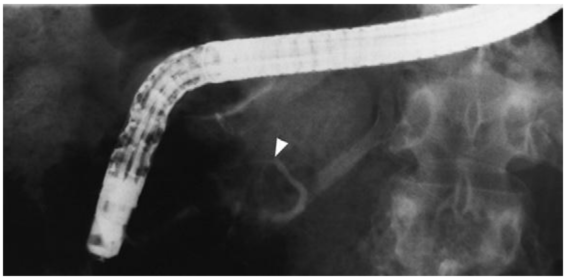


Eyepiece
Focus
Light
Air
Tip of endoscope on entry into stomach
Tip turned clockwise and progressed
Tip progressed to within antrum

Flexible endoscope *(Monahan et al, 1998)*

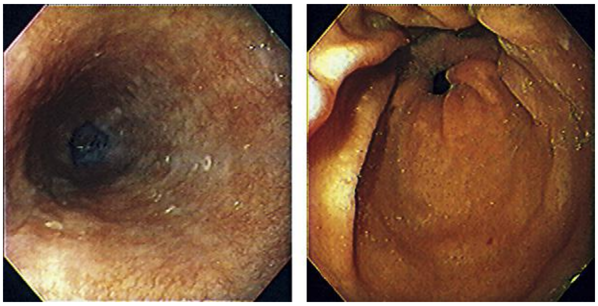
endoscopic laser cholecystectomy. See **cholecystectomy.**

endoscopic retrograde cholangiopancreatography (ERCP), an endoscopic test that provides radiographic visualization of the bile and pancreatic ducts. A flexible fiberoptic duodenoscope is placed into the common bile duct. A radiopaque substance is instilled directly into the duct, and serial x-ray films are taken. It is useful in identifying partial or total obstruction of these ducts, as well as stones, benign strictures, cysts, ampullary stenosis, anatomical variations, and malignant tumors. See also **cholangiography.**



Endoscopic retrograde cholangiopancreatogram *(Kowalczyk and Mace, 2009)*

endoscopy /endos′kəpē/, the visualization of the interior of organs and cavities of the body with an endoscope. The GI structures that can be examined through this procedure include the esophagus, stomach, duodenum, colon, and pancreas and the biliary tract with the aid of x-ray film and fluoroscopy. Endoscopy can also be used to obtain samples for cytological and histological examination and to follow the course of a disease, such as the assessment of the healing of gastric and duodenal ulcers. See also **abdominoscopy, bronchoscopy, cystoscopy, gastroscopy, laparoscopy.**



Endoscopy *(Black and Hawks, 2005)*

endoskeletal prosthesis /-skel′ətəl/ [Gk, *endon* + *skeletos,* dried up, *prosthesis,* addition], a lower-limb support consisting of an internal pylon usually covered with a lightweight material, such as plastic foam. See also **pylon.**

endoskeleton, the internal network of bones, to which muscles are attached. Compare **exoskeleton.**

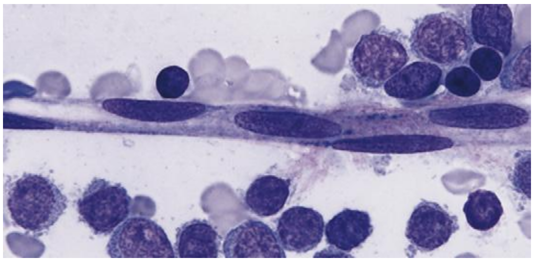
endosteal hyperostosis /endos′tē·əl/, an inherited bone disorder characterized by an overgrowth of the mandible and brow areas. The excessive bone growth can lead to entrapment of cranial nerves, causing facial palsy and loss of hearing. Also called **van Buchem's syndrome.**

endosteal implant [Gk, *endon,* within + *osteon,* bone], a dental implant made of metal, ceramic, or polymeric material, consisting of a blade, screw, pin, or vent, inserted into the jaw bone through the alveolar or basal bone, with a post protruding through the mucoperiosteum into the oral cavity to serve as an abutment for dentures or orthodontic appliances, or to serve in fracture fixation.

endostomy therapist. See **enterostomal therapist.**

endothelial /en′dōthē′lē·əl/ [Gk, *endon,* within, *thele,* nipple], pertaining to endothelium.

endothelial cell [Gk, *endon,* within, *thele,* nipple; L, *cella,* storeroom], a lining cell of a body cavity or of the cardiovascular system. It is usually seen as a flat, nucleated cell.



Endothelial cells *(Carr and Rodak, 2008)*

endothelial-derived relaxing factor (EDRF), nitric oxide or related substances produced by the endothelial cells lining blood vessels. Its vasodilatory effect on neighboring vascular smooth muscle cells is an important regulator of local blood flow.

endothelial myeloma. See **Ewing's sarcoma.**

endothelin (ET) /-thē′lin/, any of a group of vasoconstrictive peptides produced by endothelial cells. Three known endothelins, designated ET-1, ET-2, and ET-3, are chemically related to asp venom. ET-1 is the most potent vasoconstrictor yet discovered, being 10 times stronger than the second-most potent vasoconstrictor known, angiotensin II.

-endothelioma, suffix meaning "a tumor of endothelial tissue": *hemendothelioma, lymphendothelioma*.

endothelium /en′dōthē′lē·əm/ [Gk, *endon* + *thele,* nipple], the layer of simple squamous epithelial cells that lines the heart, the blood and lymph vessels, and the serous cavities of the body. It is highly vascular, heals quickly, and is derived from the mesoderm.

endothoracic fascia /-thôras′ik/, a sheet of connective tissue within the thorax; the outer boundary of the thoracic cavity. It separates the parietal pleura from the chest wall and the diaphragm. A thickened portion also attaches to the medial border of the first rib.

endotoxin /en′dōtok′sin/ [Gk, *endon* + *toxikon,* poison], a toxin contained in the cell walls of some microorganisms, especially gram-negative bacteria, that is released when the bacterium dies and is broken down in the body. Fever, chills, shock, leukopenia, and a variety of other symptoms result, depending on the particular organism and the condition of the infected person. Compare **exotoxin.**

endotoxin shock [Gk, *endon,* within, *toxikon,* poison; Fr, *choc*], a septic shock in response to the release of endotoxins produced by gram-negative bacteria. The toxin is released on the death of the bacterial cell, especially ***Escherichia coli.***

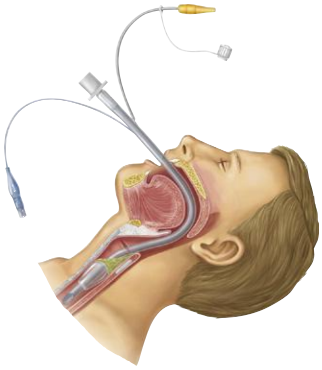
endotracheal /en′dōtrā′kē·əl/ [Gk, *endon* + *tracheia* + *arteria,* airpipe], within or through the trachea.

endotracheal anesthesia, general anesthesia that includes an endotracheal tube or a supraglottic airway such as a laryngeal mask airway (LMA) as a method for controlling ventilation. Anesthesia may be maintained using inhalational anesthetic agents or a combination that includes intravenous agents.

endotracheal extubation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as purposeful removal of the endotracheal tube from the nasopharyngeal or oropharyngeal airway. See also **Nursing Interventions Classification.**

endotracheal intubation, the management of the patient with an airway catheter inserted through the mouth or nose into the trachea. An endotracheal tube may be used to maintain a patent airway, to prevent aspiration of material from the digestive tract in the unconscious or paralyzed patient, to permit suctioning of tracheobronchial secretions, or to administer positive-pressure ventilation that cannot be given effectively by a mask. Endotracheal tubes may be made of rubber or plastic and usually have an inflatable cuff to maintain a closed system with the ventilator.

■ METHOD: With the aid of paralytic agents to ease the passage, the endotracheal tube is inserted via the mouth or nose through the larynx into the trachea. If the oral route is used, a bite block may be required to prevent the patient from biting and obstructing the tube. Breath sounds are auscultated immediately after insertion and every 1 or 2 hours thereafter to make certain the tube is properly positioned and is not obstructing one of the mainstem bronchi. Once the tube is correctly positioned, it is taped securely in place and checked for patency and slippage every 15 to 60 minutes or per institutional protocol. The trachea is suctioned every hour and as needed, as indicated by patient assessment (dyspnea, gurgling, respirations, activation of ventilator pressure alarms). If so ordered, the trachea is irrigated with normal saline solution. The patient is usually on intermittent positive-pressure breathing (IPPB) or a volume respirator with the cuff of the endotracheal tube inflated. If the patient can breathe independently, the trachea and mouth are suctioned, the cuff is deflated, and the respiratory rate and quality are checked hourly. The patient is turned every 1 to 2 hours, and the blood pressure and pulse checked every 2 to 4 hours or according to institutional protocol. Parenteral fluids are administered as ordered. Nothing is given orally. Fluid intake and output are measured and recorded. The patient's level of consciousness is determined hourly, and, if he or she is sufficiently conscious, a method of communication is established.



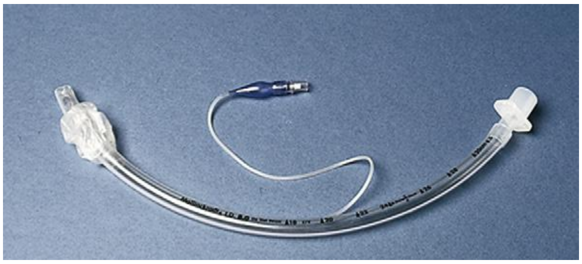
Endotracheal intubation

(Image used by permission from Nellcor Puritan Bennett LLC, Boulder, Colorado, doing business as Covidien)

■ NURSING ORDERS: The nurse monitors the position and patency of the endotracheal tube, performs the necessary suctioning, inflates and deflates the cuff at appropriate times, and administers IPPB or support with the volume respirator. The nurse checks the vital signs at specified intervals and provides emotional support and physical care for the patient, who is usually acutely ill, unable to communicate, and suffering from the discomfort of an endotracheal tube.

■ OUTCOME CRITERIA: Meticulous assessment of the patient with an endotracheal tube can promote the survival of a critically ill person.

endotracheal tube, a large-bore catheter inserted through the mouth or nose and into the trachea to a point above the bifurcation of the trachea. It is used for delivering oxygen under pressure when ventilation must be totally controlled and in general anesthetic procedures. See also **endotracheal intubation.**

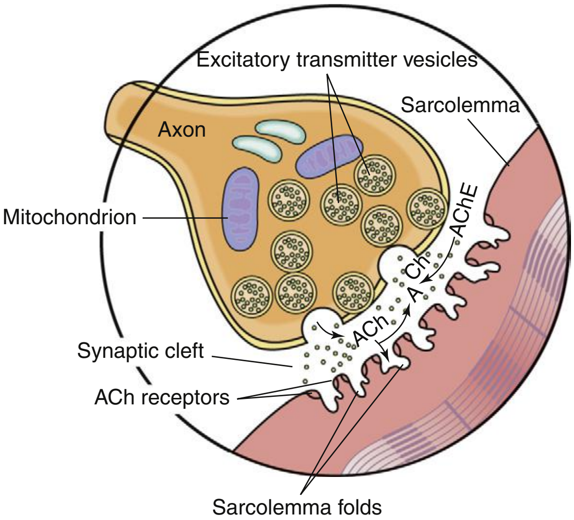


Endotracheal tube *(Lewis et al, 2011)*

endovasculitis /-vas′kyəlī′tis/, inflammation of the tunica intima of a blood vessel.

endoxin /endok′sin/, an endogenous analog of digoxin that occurs naturally in humans. It is a hormone that may regulate the excretion of salt.

end plate [AS, *ende* + ME, *plat*], the motor end plate in the nervous system, located at the terminal membrane of an axon and the postjunctional membrane of the adjoining muscle tissue. Also called **myoneural junction.**



End plate *(Phipps et al, 2003)*

end point, **1.** (in chemistry) the point at which the condition of equivalence is reached during a titration. This may be indicated by reaching a maximum value in the slope of a titration curve, for example. **2.** the point or time at which an activity is finished. **3.** the point at which a chemical indicator changes color, for example, in an acid-base titration.

end-positional nystagmus, a horizontal rhythmic oscillation of the eyes on extreme lateral gaze. It occurs in normal eyes when the fixation point is outside the binocular field. Also called **deviational nystagmus, pseudonystagmus.**

end product /endprod′əkt/, the chemical compound resulting from completion of a sequence of metabolic reactions.

end-stage disease [AS, *ende* + OFr, *estage* + L, *dis* + Fr, *aise,* ease], a disease condition that is essentially terminal because of irreversible damage to vital tissues or organs. Kidney or renal end-stage disease is defined as a point at which the kidney is so badly damaged or scarred that dialysis or transplantation is required for patient survival.

end-tidal capnography /end′tīdəl/, the process of continuously recording the level of carbon dioxide in expired air. The percentage of carbon dioxide at the end of expiration can be estimated and gives a close approximation of the alveolar carbon dioxide concentration. The process, which requires the use of infrared spectroscopy, is used to monitor critically ill patients and in pulmonary function testing. The data are typically recorded automatically on a strip of graph paper on a bedside patient monitor.

end-tidal CO_2. See **capnometry.**

end-tidal CO_2 determination, the concentration of carbon dioxide in a patient's end-tidal breath, assumed to reflect arterial carbon dioxide tension. A significant difference may indicate a change in ventilation/perfusion matching.

end-to-end anastomosis. See **anastomosis.**

end-to-side anastomosis, an anastomosis connecting the end of one vessel with the side of another one.

endurance[1] /endyŏŏr′əns/, the ability to continue an activity despite increasing physical or psychological stress, as in the effort to perform additional numbers of muscle contractions before the onset of fatigue. Although endurance and strength are different qualities, weaker muscles tend to have less endurance than do strong muscles.

endurance[2], a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the capacity to sustain activity. See also **Nursing Outcomes Classification.**

Enduron, a trademark for a thiazide diuretic **(methyclothiazide)** used to treat hypertension.

Enduronyl, a trademark for a fixed-combination cardiovascular drug containing a diuretic **(methyclothiazide)** and an antihypertensive (deserpidine).

-ene, suffix used for naming hydrocarbons: *ethidene, xanthene.*

enema /en′əmə/ [Gk, *enienai,* to send in], the introduction of a solution into the rectum for cleansing or therapeutic purposes. Enemas may be commercially packed disposable units or reusable equipment prepared just before use.

■ METHOD: The equipment is assembled. If disposable equipment is to be used, an 18- to 20-French catheter, a 2- to 3-foot length of tubing, an enema bag, the solution, and a clamp are collected and taken to the bedside. If a disposable set is to be used, no other equipment is necessary. The patient is positioned in the left lateral or dorsal position. After air is expelled from the tubing, the tip of the catheter is lubricated. (Disposable units usually have prelubricated tips.) The patient is asked to bear down, as if to defecate, and the tip of the catheter is gently inserted 3 to 4 inches into the rectum, depending on the size of the patient and the purpose of the enema. The solution is allowed to flow from a height of 18 to 20 inches above the level of the hips. The tip of the catheter or squeeze bottle is withdrawn when most of the solution has been administered. Some solution is left in the tubing to prevent air from entering the rectum. Light pressure is applied over the anus with toilet tissue or a gauze pad. The fluid is held in by the patient for the prescribed length of time. It is then expelled as the patient sits on the toilet.

■ INTERVENTIONS: The reasons for performing the procedure and the steps to be taken are explained to the patient. The solution is warmed to 99° F to 105° F (37.8° C to 40.6° C) to reduce the stimulation of intestinal peristalsis by a sudden temperature change in the colon. The patient is warned that some discomfort may occur because the colon tends to contract when distended by the fluid. The enema is given slowly to prevent sudden distension that would cause peristalsis or spasm and greater discomfort. A call bell is kept within reach of the patient during expulsion of the enema because the discomfort of the procedure and the effort required to expel the enema may cause faintness. The color, consistency, and amount of material evacuated are evaluated. If nondisposable equipment is used, it is rinsed in cold water before being washed with warm, soapy water and sterilized.

■ OUTCOME CRITERIA: A thorough explanation to the patient of all aspects of the procedure, careful observation of the patient during the procedure, slow and gentle administration of the enema, and evaluation of the results of the procedure are important to achieve the desired effect.

Positioning for enema administration
(Harkreader, Hogan, and Thobaben, 2007)

energy /en′ərjē/ [Gk, *energia*], the capacity to do work or to perform vigorous activity. Energy may occur in the form of heat, light, movement, sound, or radiation. Human energy is usually expressed as muscle contractions and heat production, made possible by the metabolism of food that originally acquired the energy from sunlight. **Chemical** energy is that released as a result of a chemical reaction, as in the metabolism of food. Compare **anergia. —energetic,** *adj.*

energy conservation^1, a principle that energy cannot be created or destroyed although it can be changed from one form into another, as when heat energy is converted to light energy. It is now superseded by the special relativity equation $E = mc^2$, but it is still applicable to chemical changes.

energy conservation^2, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to manage energy for initiating and sustaining activity. See also **Nursing Outcomes Classification.**

energy cost of activities, the metabolic cost in calories or kilojoules of various forms of physical activity. For example, the average metabolic equivalent (MET) of walking at a rate of 3 km/hr is 2 METs per minute, and the energy cost of walking at a speed of 6 km/hr is 5 METs per minute. See also **metabolic equivalent of task.**

energy field, the flow of energy surrounding a person.

energy management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as regulating energy use to treat or prevent fatigue and optimize function. See also **Nursing Interventions Classification.**

energy output, the amount of energy expended by work or activity by the body per specified period.

energy-protein malnutrition. See **protein-energy malnutrition.**

energy subtraction, a radiographic technique in which two different x-ray beams are used alternately to provide a subtraction image resulting from differences in photoelectric interaction.

enervation /en′ərvā′shən/ [L, *enervare,* to weaken], **1.** reduction or lack of nervous energy; weakness; lassitude; languor. **2.** removal of a complete nerve or a section of nerve.

en face /äNfäs′, enfās′/, "face-to-face"; a position in which the mother's face and the infant's face are approximately 8 inches apart and on the same plane, as when the mother holds the infant up in front of her face or when she nurses the child. Studies of maternal and infant bonding have shown that mothers seek eye-to-eye contact and that they will instinctively move the baby to an en face position. In addition, infants have been shown to prefer a human face to other visual stimuli and to be best able to focus at a distance of 8 to 10 inches.

enflurane /en′flo͞orān/, a halogenated volatile liquid; a nonflammable anesthetic gas of the ether family. Its use has almost entirely been supplanted by newer, shorter-acting agents.

enfuvirtide, an antiretroviral.

■ INDICATIONS: This drug is used in combination with other antiretrovirals to treat HIV-1 infection.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include anxiety, peripheral neuropathy, taste disturbance, insomnia, depression, abdominal pain, anorexia, constipation, pancreatitis, injection site reactions, influenza, cough, conjunctivitis, lymphadenopathy, myalgia, hyperglycemia, and pneumonia. Life-threatening side effects include glomerulonephritis, renal failure, Guillain-Barré syndrome, thrombocytopenia, and neutropenia.

engagement /engāj′mənt/ [Fr, a bonding], **1.** fixation of the presenting part of the fetus in the maternal true pelvis. The largest diameter of the presenting part is at or below the level of the ischial spines. **2.** fixation of the fetal head in the maternal midpelvis with the biparietal diameter of the head level with the ischial spines.

English position. See **lateral recumbent position.**

engorged /in·gôrjd′/ [Fr, *engorger,* to fill up], distended or swollen with fluids.

engorgement /engôrj′mənt/ [Fr, *engorger,* to fill up], distension or vascular congestion of body tissues, such as the swelling of breast tissue caused by an increased flow of blood and lymph before true lactation.

engram /en′gram/, **1.** a hypothetical neurophysiological storage unit in the cerebrum that is the source of a particular memory. **2.** an interneuronal circuit involving specific neurons and muscle fibers that can be coordinated to perform specific motor activity patterns. Thousands of repetitions may be needed to establish an engram. **3.** the permanent trace left by a stimulus in nerve tissue.

engrossment. See **bonding.**

enhancement /enhans′mənt/ [ME, *enhauncen,* to raise], the act of improving, heightening, or augmenting.

enkephalin /enkef′əlin/ [Gk, *enkepalos,* brain, *in,* within], one of two pain-relieving pentapeptides produced in the body, located in the pituitary gland, brain, and GI tract. Axon terminals that release enkephalins are concentrated in the posterior horn of the gray matter of the spinal cord, in the central part of the thalamus, and in the amygdala of the limbic system of the cerebrum. Enkephalins function as neurotransmitters or neuromodulators and inhibit neurotransmitters in the pathway for pain perception, thereby reducing the emotional as well as the physical impact of pain. Methionine-enkephalin and isoleucine-enkephalin are each composed of five amino acids, four of which are identical in both compounds. These two neuropeptides can depress neurons throughout the central nervous system. Although it is not known exactly how these neuropeptides function, the enkephalins are natural pain killers and may be involved, with other neuropeptides, in the development of psychopathological behavior in some cases. Compare **endorphin.**

enkephalinergic neuron /enkef′əlinur′jik/, a nerve cell that releases the peptide neurotransmitter enkephalin. Such neurons are widespread in the central nervous system.

enol /ē′nol/, an organic compound with an alcohol or hydroxyl group directly attached (bonded) to a double bond. By transfer of the hydrogen atom from oxygen to carbon, the enol form becomes the (usually more stable) keto form. Such compounds usually exist as enol-keto tautomers.

enophthalmos /en′əfthal′məs/ [Gk, *en,* in, *ophthalmos,* eye], backward displacement of the eye in the bony socket, caused by traumatic injury or developmental defect. Ptosis may cause an incorrect diagnosis of enophthalmos. —**enophthalmic,** *adj.*

enoxacin /ĕ-nok′säsin/, an antibacterial effective against many gram-positive and gram-negative bacteria, administered orally in the treatment of gonorrhea and urinary tract infections.

enoxaparin /e-nok′säpar′in/, a low-molecular-weight heparin used as the sodium salt to prevent pulmonary embolism and deep venous thrombosis after hip or knee replacement or high-risk abdominal surgery, administered subcutaneously as the sodium salt. It is also used together with warfarin in the treatment of deep venous thrombosis and together with aspirin in the prevention of coronary thrombosis associated with unstable angina or certain kinds of myocardial infarction.

enoximone /enok′sĭmōn/, a vasodilator similar to inamrinone, used as a cardiotonic in the short-term management of congestive heart failure. It is administered intravenously.

enriched, **1.** (in nutrition) pertaining to foods to which vitamins or minerals have been added within limits specified by the U.S. Food and Drug Administration, usually to replace nutrients lost during processing. For example, enriched grain products have four B vitamins (B_1, B_2, B_3, and folic acid) and iron added. **2.** (in chemistry) pertaining to a substance containing a proportion of isotope greater than that found in the naturally occurring form of the same element. **3.** (in chemistry) pertaining to a compound containing a greater proportion of one of two possible forms.

enrollee, an individual who has signed up to receive health care under a particular type of plan. Not applicable in Canada. Also called **beneficiary member, participant.**

ensiform cartilage, ensiform process. See **xiphoid process.**

ensulizole /ensul′ĭzōl/, a water-soluble absorber of ultraviolet B radiation, used topically as a sunscreen.

Ensure, a trademark for a lactose-free nutritional supplement containing protein, carbohydrates, fat, vitamins, and minerals.

ENT, abbreviation for *ear, nose, and throat*. See **ENT specialist.**

entacapone, an antiparkinson agent.

■ INDICATIONS: It is used to treat parkinsonism in patients who are experiencing end-of-dose decreased effect.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Serious adverse effects include psychosis, hallucination, hypomania, severe depression, dizziness, gastritis, GI disorders, alopecia, dark urine, back pain, dyspnea, purpura, fatigue, asthenia, and bacterial infection. Common side effects include involuntary choreiform movements, hand tremors, fatigue, headache, anxiety, twitching, numbness, dyskinesia, hypokinesia, hyperkinesia, weakness, confusion, agitation, nightmares, nausea, vomiting, anorexia, abdominal distress, dry mouth, flatulence, bitter taste, diarrhea, constipation, dyspepsia, and orthostatic hypotension.

ental /en′tal/ [Gk, *entos,* within], central or inner; interior or inside.

Entameba, any ameba of the genus ***Entamoeba.***

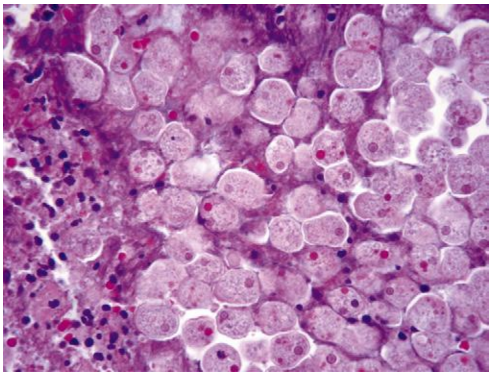
entamebiasis. See **amebiasis.**

Entamoeba /en′təmē′bə/ [Gk, *entos,* within, *amoibe,* change], a genus of intestinal amebic parasites of which several species are pathogenic to humans. See also ***Entamoeba histolytica.***

Entamoeba coli, a common nonpathogenic amebic parasite found in the intestines of humans and other mammals. It is similar to and sometimes confused with *E. histolytica,* the causal agent of amebic dysentery. However, *E. coli* organisms tend to be slightly larger, have more pseudopods, and be sluggish in movement.

Entamoeba gingivalis, a temperature-resistant species of ameba found in the mouth of humans and other mammals. As a causal agent of gingivitis, it is associated with poor dental hygiene.

Entamoeba histolytica /his′təlit′ikə/, a pathogenic species of ameba that causes amebic dysentery and hepatic amebiasis in humans. See also **amebiasis, amebic dysentery, hepatic amebiasis.**



***Entamoeba histolytica* in the colon** *(Kumar et al, 2007)*

entamoebiasis. See **amebiasis.**

entecavir, an antiviral.

■ INDICATION: This drug is used to treat chronic hepatitis B.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include fatigue, dizziness, insomnia, nausea, vomiting, and diarrhea. Life-threatening side effects include lactic acidosis and severe hepatomegaly with stenosis. Common side effects include headache and dyspepsia.

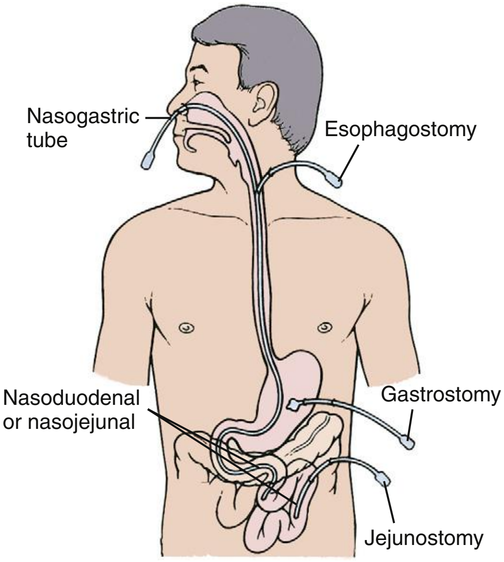
enter-. See **entero-.**

enteral /en′tərəl, enter′əl/ [Gk, *enteron,* bowel], within the small intestine, or via the small intestine.

enteral feeding, a mode of feeding that uses the GI tract, such as oral or tube feeding.

enteral nutrition, the provision of nutrients through the GI tract when the client cannot ingest, chew, or swallow food but can digest and absorb nutrients.

enteral tube feeding^{1} [Gk, *enteron,* bowel; L, *tubus* + AS, *faedan*], the introduction of nutrients directly into the GI tract by feeding tube. Routes include both nonsurgical and surgically placed: nasogastric, nasoduodenal, nasojejunal, esophagostomy, gastrostomy, and jejunostomy. See also **drip gavage, tube feeding.**



Common placement locations for enteral feeding tubes *(Lewis et al, 2007)*

enteral tube feeding^{2}, a nursing intervention from the Nursing Interventions Classification (NIC) defined as delivering nutrients and water through a gastrointestinal tube. See also **Nursing Interventions Classification.**

enterectomy /en′tərek′təmē/ [Gk, *enteron,* intestine, *ektomē,* excision], the surgical removal of a portion of intestine.

enteric /enter′ik/ [Gk, *enteron,* bowel], pertaining to the intestinal tract.

enteric coating, a layer added to oral medications that allows the medication to pass through the stomach and be absorbed in the intestinal tract. The coating protects against the effects of stomach juices, which can interact with, destroy, or degrade these drugs.

enteric cytopathogenic human orphan virus. See **ECHO virus.**

enteric fever. See **typhoid fever.**

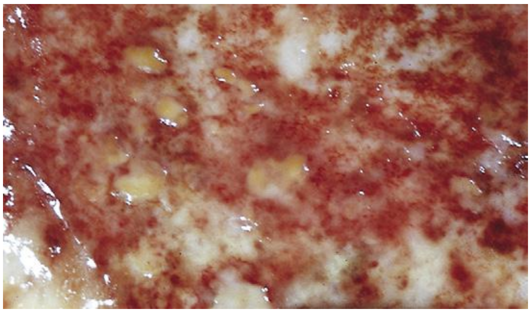
enteric infection, a disease of the intestine caused by any infection. Symptoms similar to those caused by pathogens may be produced by chemical toxins in ingested foods and by allergic reactions to certain food substances. Among bacteria commonly involved in enteric infections are ***Escherichia coli, Vibrio cholerae,*** and several species of ***Salmonella, Shigella,*** and anaerobic streptococci. Enteric infections are characterized by diarrhea, abdominal discomfort, nausea and vomiting, and anorexia. A significant loss of fluid and electrolytes may result from severe vomiting and diarrhea. Oral rehydration therapy with clean water and electrolyte solution may be given. Medication for sedation and relief of abdominal cramps may be prescribed. Antibiotics may be recom-

Common problems of patients receiving tube feedings

Problems and possible causes	*Corrective measures*
Vomiting and/or Aspiration	
Improper placement of tube	Replace tube in proper position. Check tube position before beginning feeding and every 8 hr if continuous feedings.
Delayed gastric emptying, increased residual volume	If gastric residual volume is ≥250 mL after second gastric residual check, a promotility agent should be considered. If gastric residual volume is >500 mL, hold enteral nutrition and reassess patient tolerance.
Potential for aspiration	Keep head of bed elevated to 30- to 45-degree angle. Have patient sit up on side of bed or in chair. Encourage ambulation unless contraindicated.
Diarrhea	
Feeding too fast	Decrease rate of feeding. Change to continuous drip feedings.
Medications	Check for drugs that may cause diarrhea (e.g., antibiotics).
Low-fiber formula	Change to formula with more fiber.
Tube moving distally	Properly secure tube before beginning feeding. Check before each feeding or at least every 24 hr if continuous feedings.
Contamination of formula	Refrigerate unused formula and record date opened. Discard outdated formula every 24 hr. Discard formula left standing for longer than manufacturer's guidelines: 8 hr for ready-to-feed formulas (cans), 4 hr for reconstituted formula, or 24-48 hr for closed-system enteral formulas. Use closed system to prevent contamination. Use sterile water for flushes.
Constipation	
Formula components	Consult health care provider for change in formula to one with more fiber content. Obtain laxative order.
Poor fluid intake	Increase fluid intake if not contraindicated. Give free water, as well as formula. Give total fluid intake of 30 mL/kg body weight.
Drugs	Check for drugs that may be constipating.
Impaction	Perform rectal examinations to check and manually remove feces if present.
Dehydration	
Excessive diarrhea, vomiting	Decrease rate or change formula. Check drugs that patient is receiving, especially antibiotics. Take care to prevent bacterial contamination of formula and equipment.
Poor fluid intake	Increase intake and check amount and number of feedings. Increase amount of intake if appropriate.
High-protein formula	Change formula.
Hyperosmotic diuresis	Check blood glucose levels frequently. Change formula.

From Lewis SL et al, *Medical surgical nursing: assessment and management of clinical problems*, ed 8, St Louis, 2011, Mosby.

mended, depending on the specific microorganism causing the infection.



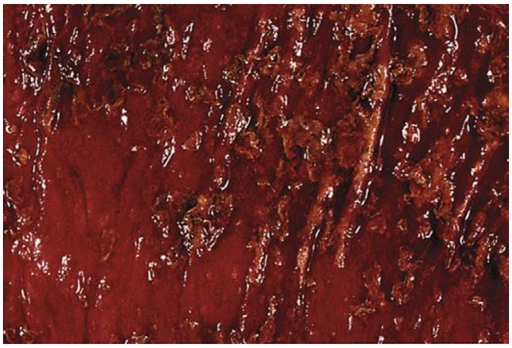
Colonic mucosa in enteric infection
(Kumar, Abbas, and Fausto, 2005)

enteric intussusception, intussusception involving two segments of the small intestine.

entericoid fever /enter′ikoid/ [Gk, *enteron* + *eidos,* form], a typhoid-like febrile disease characterized by intestinal inflammation and dysfunction. See also **enteric infection, typhoid fever.**

enteric orphan virus [Gk, *enteron,* bowel, *orphanos,* bereft; L, *virus,* poison], an enterovirus isolated from humans and other animals that was not originally associated with the disease. See also **ECHO virus.**

enteritis /en′tərī′tis/, inflammation of the mucosal lining of the small intestine, resulting from a variety of causes—bacterial, viral, functional, and inflammatory. Involvement of both small and large intestines is called **enterocolitis.** Compare **gastroenteritis.**



Fungal enteritis *(Damjanov and Linder, 2000)*

entero-, enter-, prefix meaning "intestines": *enteric, enterobiliary, enteroptosis.*

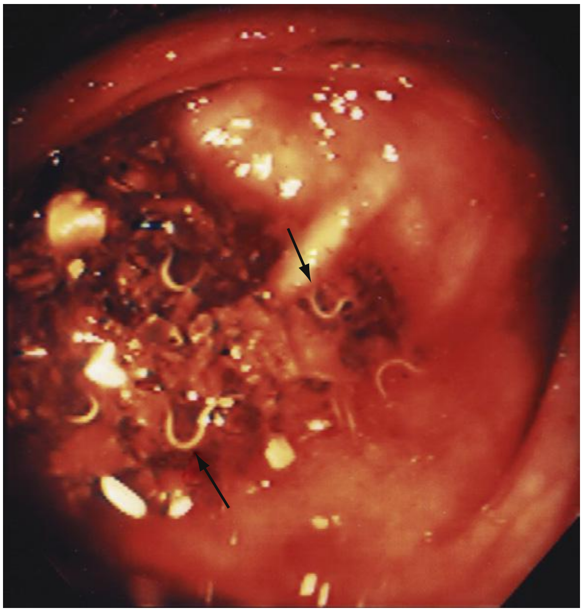
Enterobacter cloacae /en′tirōbak′tər klō·ā′kē, klō·ā′sē/ [Gk, *enteron* + *bakterion,* small staff; L, *cloaca,* sewer], a common species of gram-negative rod-shaped bacteria of the family Enterobacteriaceae found in human and animal feces, dairy products, sewage, soil, and water. *E. cloacae* and *E. aerogenes* are important nosocomial pathogens responsible for a number of infections such as bacteremia, lower respiratory tract infections, urinary tract infections, and septic arthritis. Also called ***Aerobacter aerogenes,*** *Enterobacter aerogenes.*

Enterobacteriaceae /en′tirōbaktir′ē·ā′si·ē/ [Gk, *enteron* + *bakterion,* small staff], a family of aerobic and anaerobic gram-negative bacteria that includes both normal and pathogenic enteric microorganisms. Among the significant genera of the family are *Escherichia, Klebsiella, Proteus,* and *Salmonella.*

enterobacterial /-baktir′ē·əl/ [Gk, *enteron* + *bakterion,* small staff], pertaining to a species of bacteria found in the digestive tract.

enterobiasis /en′tirōbī′əsis/ [Gk, *enteron* + *bios,* life, *osis,* condition], a parasitic infestation with ***Enterobius vermicularis,*** the common pinworm, causing a crawling sensation and pruritus. The nematodes infect the large intestine, and the females deposit eggs in the perianal area, causing pruritus and disturbed sleep. Reinfection commonly results from transfer of eggs to the mouth by contaminated fingers. Airborne transmission is possible because eggs remain viable for 2 weeks in contaminated clothing, bedding, or objects. Five hundred million cases are reported annually worldwide, and 50% of children will be infected at some point in their lives. Diagnosing enterobiasis requires the sticky side of an adhesive cellophane tape swab to be pressed against the perianal skin and examined for eggs under a microscope. Therapy for the whole family may be necessary. Effective anthelmintics include pyrantel pamoate, mebendazole, albendazole, and thiabendazole. Personal hygiene, including handwashing, is the best preventive measure. There appears to be little benefit derived from disinfection procedures for the home. Also called **oxyuriasis.**

Enterobius vermicularis /en′tərō′bē·əs/ [Gk, *enteron* + *bios,* life; L, *vermiculus,* small worm], a common parasitic nematode that resembles a white thread between 0.5 and 1 cm long. Also called **oxyuris vermicularis, pinworm, seatworm, threadworm.** See also **enterobiasis.**



Pinworms *(Enterobius vermicularis)* (arrows) found on screening colonoscopy of an institutionalized man *(Feldman, Friedman, and Brandt, 2010)*

enterocele /en′tirōsēl′/, **1.** a hernia of the intestine. **2.** posterior vaginal hernia. Compare **enterocoele.**

enterochromaffin cell. See **argentaffin cell.**

enteroclysis /en′tərok′lisis/, a radiographic procedure in which a contrast medium is injected into the duodenum to permit examination of the small intestine. To improve visualization of the bowel wall, air is sometimes injected into the small intestine after the contrast medium has reached the cecum.

enterococcemia /en′terokokse′meä/, blood infection by enterococci.

Enterococcus /en′terokok′us/ *pl.* **enterococci** [Gk, *enteron* + *kokkos,* berry], a genus of gram-positive, facultatively anaerobic bacteria of the family Streptococcaceae, formerly classified in the genus ***Streptococcus.*** *E. faecalis* and *E. faecium* are normal inhabitants of the human intestinal tract that occasionally cause urinary tract infections, infective endocarditis, bacteremia, and life-threatening nosocomial infections (vancomycin-resistant *enterococci* infection). *E. avium* is found primarily in the feces of chickens and may be associated with appendicitis, otitis, and brain abscesses in humans.

enterocoele, the abdominal cavity. Compare **enterocele.**

enterocolitis /-kōlī′tis/ [Gk, *enteron* + *kolon,* bowel, *itis*], an inflammation involving both the large and small intestines. Also called **coloenteritis.**

enterocutaneous fistula, a cutaneous fistula connecting the body surface and some parts of the intestine.

enterocystoplasty /en′terosis′toplas′te/, the most common type of augmentation cystoplasty, using a portion of intestine for the graft. Common types include ileocystoplasty, ileocecocystoplasty, and sigmoid cystoplasty.

enterodynia /-din′ē·ə/, intestinal pain.

enteroenterostomy /en′tərō·en′təros′təmē/, the surgical creation of an artificial connection between two segments of the intestine.

enterogastritis. See **gastroenteritis.**

enteroglucagon /-glo͞o′kəgon/, any of a group of glucagon-like hyperglycemic peptides, released by cells in the mucosa in the upper intestine in response to the ingestion of carbohydrates and fat and stimulating intestinal epithelial cell preparation and renewal. Enteroglucagons are similar to pancreatic glucagons but immunologically different. Glicentin and oxyntomodulin are the principal enteroglucagons.

enterohemorrhagic *Escherichia coli* (EHEC) /-hem′ôraj′ik/, a strain of *E. coli* that causes hemorrhage in the intestines. The organism produces shiga toxin, which damages bowel tissue, causing intestinal ischemia and colonic necrosis. Symptoms are stomach cramping and bloody diarrhea. An infectious dose may be as low as 10 organisms. Spread by contaminated beef, unpasteurized milk and juice, sprouts, lettuce, and salami, as well as contaminated water, the infection can be serious although there may be no fever. Treatment consists of antibiotics and maintenance of fluid and electrolyte balance. In advanced cases, surgical removal of portions of the bowel may be required.

enterohepatic circulation /en′tərōhəpat′ik/, a route by which part of the bile produced by the liver enters the intestine, is resorbed by the liver, and then is recycled into the intestine. The remainder of the bile is excreted in feces.

enterokinase /en′tirōkī′nās/ [Gk, *enteron* + *kinesis,* movement, *ase,* enzyme], an intestinal juice enzyme that activates the proteolytic enzymes in pancreatic juice as they enter the duodenum.

enterolith /en′tərōlith′/ [Gk, *enteron* + *lithos,* stone], a stone consisting of ingested material found within the intestine. See also **calculus.**

enterolithiasis /en′tərōlithī′əsis/, the presence of enteroliths in the intestine.

enteron. See **digestive tract, small intestine.**

enteropathic *Escherichia coli* (EPEC) /-path′ik/, a strain of *E. coli* that is the cause of epidemic infantile diarrhea. See also **epidemic diarrhea in newborns.**

enteropathy /en′tərop′əthē/, a disease or other disorder of the intestines.

enterostomal therapist /-stō′məl/, a registered nurse who is qualified by education in an accredited program in enterostomal therapy to provide care for persons with stomas, draining wounds, fistulae, incontinence, and actual or potential alterations in tissue integrity. Also called **endostomy therapist.** See also **Wound, Ostomy and Continence Nurses Society.**

enterostomy /en′təros′təmē/ [Gk, *enteron* + *stoma,* mouth], a surgical procedure that produces an artificial anus or fistula in the intestine through an incision in the abdominal wall. Compare **colostomy.**

enterotoxigenic /-tok′sijen′ik/, producing an enterotoxin.

enterotoxigenic *Escherichia coli* (ETEC), a strain of *E. coli* that is a frequent cause of diarrhea in travelers. See also **traveler's diarrhea.**

enterotoxin /-tok′sin/, a toxic substance that causes an adverse reaction by cells of the intestinal mucosa. Most enterotoxins are produced by certain species of bacteria, such as ***Staphylococcus.***

enterovesical fistula, a fistula connecting some part of the intestine with the urinary bladder. Also called *vesicoenteric fistula.*

Enterovirus /-vī′rəs/ [Gk, *enteron* + L, *virus,* poison], a genus of Picornaviridae that preferentially replicates in the mammalian intestinal tract. Kinds of *Enteroviruses* are **coxsackie virus, ECHO virus,** and **poliovirus. —enteroviral,** *adj.*

enthesitis /en′thəsī′tis/, an inflammation of the insertion of a muscle with a strong tendency toward fibrosis and calcification. It is usually only painful when the involved muscle is activated.

enthesopathy /en′thəsop′əthē/, an arthritic condition affecting tendons and ligaments rather than joint membranes.

ento-. See **endo-.**

entodermal. See **endodermal.**

entomophthoromycosis basidiobolae, a chronic infection caused by *Basidiobolus ranarum,* a filamentous fungus, in which gradually enlarging granulomas form in the subcutaneous tissues of the arms, chest, and trunk. Multiple purulent ulcers may develop. The infection is seen in children and adolescents in tropical areas of Indonesia, India, and Africa. Also called **subcutaneous chronic zygomycosis.**

entopic /entop′ik/, occurring in the proper place. Compare **ectopic.**

entopic phenomena, sensations perceived for mechanical reasons within the eye, such as floaters or flashes caused by retinal changes.

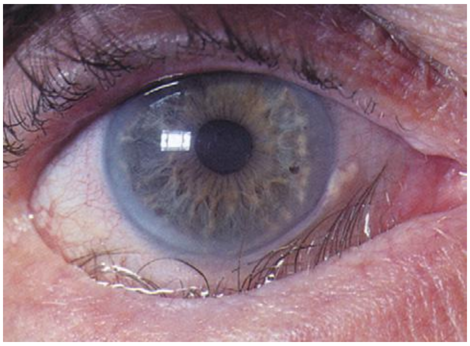
entrainment /entrān′mənt/ [Fr, *entrainer,* to drag along], a phenomenon observed in the microanalysis of sound films in which the speaker moves several parts of the body and the listener responds by moving in ways that are coordinated with the rhythm of the sounds. Infants have been observed to move in time to the rhythms of adult speech but not to random noises or disconnected words or vowels. Entrainment is thought to be an essential factor in the process of maternal-infant bonding.

entrance block [Fr, *entrer,* to enter; AS, *blok*], a theoretic zone that surrounds a pacemaker focus and protects it from discharge by an extraneous impulse that might trigger ectopic ventricular contractions.

entrance exposure, the skin dose of radiation as the beam enters the patient. It may be expressed in milliroentgens or C/kg.

entrapment neuropathy /entrap′mənt/ [OFr, *entraper,* to catch in a trap; Gk, *neuron,* nerve, *pathos,* disease], injury or inflammation of single nerves caused by pressure from surrounding tissues, such as ligaments and fascia.

entropion /entrō′pē·on/ [Gk, *en* + *tropos,* a turning], turning inward or turning toward, usually a condition in which the eyelid turns inward toward the eye. In either the upper or lower eyelid, **cicatricial entropion** can result from scar tissue formation. **Spastic entropion** results from an inflammation or other factor that affects tissue tone. An inflammation of the eyelid may be the result of an infectious disease or irritation from an inverted eyelash. Compare **ectropion.** See also **blepharitis.**

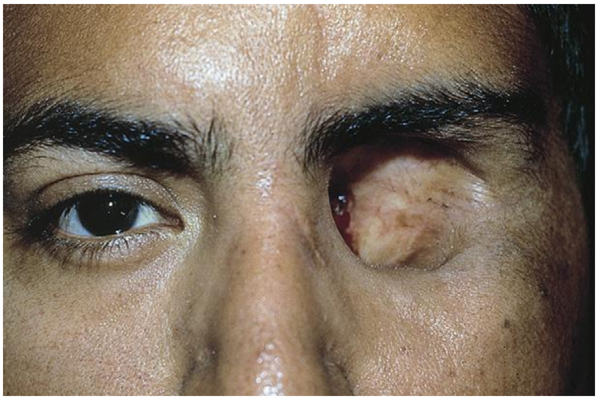


Entropion *(Kanski and Nischal, 1999)*

entropy /en′trəpē/ [Gk, *en* + *tropos,* a turning], the tendency of a system to change from a state of order to a state of disorder, expressed in physics as a measure of the part of the energy in a thermodynamic system that is not available to perform work. According to the principles of evolution, living organisms tend to go from a state of disorder to a state of order in their development and thus appear to reverse entropy. However, maintaining a living system requires the expenditure of energy, leaving less energy available for work, with the result that the entropy of the system and its surroundings increases.

ENT specialist. See **otolaryngologist.**

enucleation /ino͞o′klē·ā′shən/ [L, *e,* without, *nucleus,* nut], **1.** removal of an organ or tumor in one piece. **2.** removal of the entire eyeball, performed for malignancy, severe infection, extensive trauma, or control of pain in glaucoma. Local or general anesthesia is used. The optic nerve and muscle attachments are cut; if possible, the surrounding layer of fascia is left with the muscles. A round implant of hydroxyapatite (coralline or syntetic) is inserted, and the muscles are sutured around it, providing a permanent stump to give support and motion to an artificial eye, or an implant of porous polyethylene is inserted, allowing the rectus muscle to be sutured directly to the implant. After surgery, pressure dressings are kept in place for 1 or 2 days to prevent hemorrhage. Other possible complications include thrombosis of nearby blood vessels, which may lead to infection, including meningitis.



Enucleation *(Swartz, 2009/Courtesy Ben Serar, MA, CRA)*

enucleator /ino͞o′klē·ā′tər/ [L, *e,* without, *nucleus,* nut], a procedure or device for removing a nucleus from a cell.

enuresis /en′yo͝orē′sis/ [Gk, *enourein,* to urinate], incontinence of urine, especially nocturnal bed-wetting.

envenomation /enven′əmā′shən/, the injection of snake, arachnid, or insect venom into the body.

environment [Gk, *en,* in; L, *viron,* circle], all of the many factors, both physical and psychological, that influence or affect the life and survival of a person. See also **biome, climate. —environmental,** *adj.*

environmental carcinogen /envī′rənmen′təl/, any of the natural or synthetic substances that can cause cancer. Such agents may be divided into chemical agents, physical agents, hormones, and viruses. Some environmental carcinogens are arsenic, asbestos, uranium, vinyl chloride, ionizing radiation, ultraviolet rays, x-rays, and coal tar derivatives. Carcinogenic effects of chemicals may be delayed for as long as 30 years. Other carcinogens produce more immediate effects. Some studies indicate that the carcinogens in cigarette smoke are involved in 80% of all lung cancer. Most carcinogens are unreactive or secondary carcinogens but are converted to primary carcinogens in the body. Numerous factors, such as heredity, affect the susceptibilities of different individuals to cancer-causing agents.

environmental control unit (ECU), an apparatus for individuals with functional limitations that controls devices such as lamps, television, radio, telephone, and alarm systems. Similar to television remote control devices, they are typically switches manipulated by the lips, chin, or other body movements.

environmental health, the total of various aspects of substances, forces, and conditions in and about a community that affect the health and well-being of the population.

environmental health technician, a health care professional who performs technical assistance under professional supervision in monitoring environmental health hazards such as radioactive contamination, air and water pollution, and disposal of chemical wastes of industry.

environmental management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the manipulation of the patient's surroundings for therapeutic benefit, sensory appeal, and psychological well-being. See also **Nursing Interventions Classification.**

environmental management: attachment process, a nursing intervention from the Nursing Interventions Classification (NIC) defined as manipulation of the patient's surroundings to facilitate the development of the parent-infant relationship. See also **Nursing Interventions Classification.**

environmental management: comfort, a nursing intervention from the Nursing Interventions Classification (NIC) defined as manipulation of the patient's surroundings for promotion of optimal comfort. See also **Nursing Interventions Classification.**

environmental management: community, a nursing intervention from the Nursing Interventions Classification (NIC) defined as monitoring and influencing of the physical, social, cultural, economic, and political conditions that affect the health of groups and communities. See also **Nursing Interventions Classification.**

environmental management: home preparation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparing the home for safe and effective delivery of care. See also **Nursing Interventions Classification.**

environmental management: safety, a nursing intervention from the Nursing Interventions Classification (NIC) defined as monitoring and manipulation of the physical environment to promote safety. See also **Nursing Interventions Classification.**

environmental management: violence prevention, a nursing intervention from the Nursing Interventions Classification (NIC) defined as monitoring and manipulation of the physical environment to decrease the potential for violent behavior directed toward self, others, or environment. See also **Nursing Interventions Classification.**

environmental management: worker safety, a nursing intervention from the Nursing Interventions Classification (NIC) defined as monitoring and manipulation of the worksite environment to promote safety and health of workers. See also **Nursing Interventions Classification.**

environmental medicine, a practice of medicine in which the major focus is on cause-and-effect relationships in health. Evaluations are made of such factors as eating and living habits and types of air breathed. Testing in the patient's own environment is performed to determine what precipitators are present that may be related to disease or other health problems. A treatment protocol is developed from this information.

environmental risk protection, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preventing and detecting disease and injury in populations at risk from environmental hazards. See also **Nursing Interventions Classification.**

environmental services, a functional unit of a health care facility. It has the responsibility for laundry, liquid and solid waste control, safe disposal of materials contaminated by radiation or pathogenic organisms, and general maintenance of safety and housekeeping.

enzacamene /en′zah-kam′ēn/, an absorber of ultraviolet radiation, used topically as a sunscreen.

enzygotic twins. See **monozygotic twins.**

enzymatic debridement /en′zīmat′ik/, the use of nonirritating, nontoxic vegetable enzymes to remove dead tissue from a wound without destroying normal tissue.

enzymatic detergent asthma, an allergic reaction experienced by persons who have become sensitized to alcalase, an enzyme contained in some laundry detergents. Alcalase is produced by the bacterium *Bacillus subtilis,* and persons sensitive to the enzyme are also usually allergic to the bacterium. Asthmatic symptoms may progress in severe cases to an allergic alveolitis. The most serious cases were originally among workers in plants that manufacture laundry detergents.

enzyme /en′zīm/ [Gk, *en,* in, *zyme,* ferment], a protein produced by living cells that catalyzes chemical reactions in organic matter. Most enzymes are produced in tiny quantities and catalyze reactions that take place within the cells. Digestive enzymes, however, are produced in relatively large quantities and act outside the cells in the lumen of the digestive tract. The substance that is acted upon by an enzyme is called a **substrate.**

Enzyme Commission (EC), the International Commission on Enzymes, a committee established in 1956 by the International Union of Biochemistry to standardize enzyme classification and nomenclature.

enzyme deficiency anemia, a deficiency of enzymes in the pathways that metabolize glucose and adenosine triphosphate (Embden-Meyerhof and pentose phosphate shunt pathways), which frequently leads to premature red blood cell destruction.

enzyme induction [Gk, *en* + *zyme,* ferment; L, *inducere,* to lead in], the increase in the rate of a specific enzyme synthesis from basal to maximum level caused by the presence of a substrate or substrate analog that acts as an inducer. The inducer may be a substance that inactivates a repressor chemical in the cell.

enzyme-linked immunosorbent assay (ELISA), a laboratory technique for detecting specific antigens or antibodies by using enzyme-labeled immunoreactants and a solid-phase binding support, such as a test tube. A number of different enzymes can be used, including carbonic anhydrase, glucose oxidase, and alkaline phosphatase. Labeling is done by covalently binding the enzyme to the test substance through an enzyme-protein coupling agent such as glutaraldehyde. Products of the reaction may be detected by fluorometry or photometry. ELISA is nearly as sensitive as radioimmunoassay and more sensitive than complement fixation, agglutination, and other techniques.

enzyme therapy, in complementary medicine, the oral administration of proteolytic enzymes for the purpose of improving immune system function, used for a wide variety of disorders, including trauma, inflammation, autoimmune diseases, and viral infection, and as adjunctive therapy in cancer treatment.

enzymology /en′zīmol′əjē/, the study of enzymes and their actions.

enzymolysis /en′zīmol′isis/ [Gk, *en,* in, *zyme,* ferment, *lysis,* loosening], destruction or change of a substance caused by means of enzymatic action.

enzymopenia /en′zīmōpē′nē·ə/, the deficiency of an enzyme.

enzymuria /en′zīmo͞or′ē·ə/, the presence of enzymes in urine.

EOA, abbreviation for **esophageal obturator airway.**

EOMs, **1.** abbreviation for **extraocular muscles. 2.** abbreviation for **extraocular movement.**

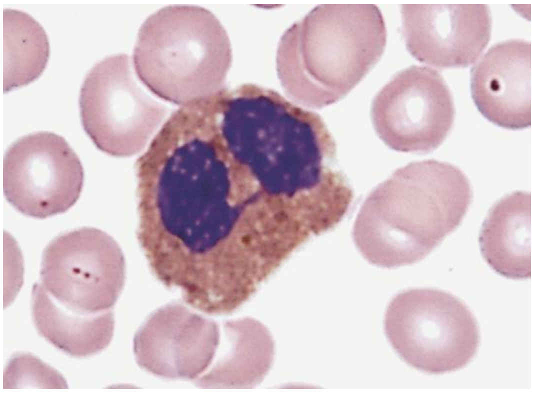
eosin /ē′əsin/, a group of red acidic xanthine dyes often used in combination with a blue-purple basic dye such as hematoxylin to stain tissue slides in the laboratory.

eosin-, prefix meaning "a rose, red, or dawn color": *eosinopenia, eosinophil, eosinophilic.*

eosinoblast. See **myeloblast.**

eosinopenia /ē′əsinəpē′nē·ə/, an abnormally low number of eosinophil leukocytes in the blood.

eosinophil /ē′əsin′əfil/ [Gk, *eos,* dawn, *philein,* to love], a granulocytic bilobed leukocyte characterized by large numbers of regular refractile cytoplasmic granules that stain bright orange with the acid dye eosin. Eosinophils constitute 1% to 3% of the white blood cells in peripheral blood films. They increase in number with allergy and some parasitic conditions and decrease with steroid administration. Compare **basophil, neutrophil. —eosinophilic,** *adj.*



Eosinophil *(Carr and Rodak, 2008)*

eosinophilia /ē′əsin′ōfil′yə/, abnormal increase in blood film eosinophils, accompanying an allergic response or parasitic infestation.

eosinophilia-myalgia syndrome, tryptophan-induced, a potentially fatal disorder resulting from ingestion of tryptophan. It is characterized by a symptom complex of severe muscle pain, tenosynovitis, muscle edema, and skin rash lasting several weeks.

eosinophilic /ē′əsin′əfil′ik/, **1.** the tendency of a cell, tissue, or organism to be readily stained by the dye eosin. **2.** pertaining to an eosinophilic leukocyte.

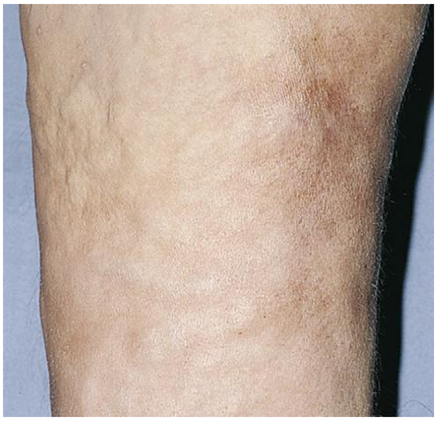
eosinophilic adenoma. See **acidophilic adenoma.**

eosinophilic cellulitis. See **Wells' syndrome.**

eosinophilic cholangitis, a rare type of cholangitis resulting from eosinophilic infiltration and characterized by multiple strictures in the bile ducts. The cause is unknown.

eosinophilic enteropathy, a rare form of food allergy that is characterized by nausea, crampy abdominal pain, diarrhea, urticaria, an elevated eosinophil count in the blood, and eosinophilic infiltrates in the intestine. Diagnosis is made by an elimination diet. Symptoms usually disappear when the offending food is removed from the diet.

eosinophilic fasciitis, inflammation of fasciae of the limbs, associated with eosinophilia, edema, and swelling. The cause is unknown, but the condition often occurs after strenuous exercise. Also called *Shulman's syndrome*.



Eosinophilic fasciitis *(Callen et al, 2000)*

eosinophilic gastroenteritis, a disorder marked by infiltration of the mucosa of the small intestine by eosinophils, with edema but without vasculitis, and by eosinophilia of the peripheral blood. Symptoms, including abdominal pain, diarrhea, nausea, fever, and malabsorption, depend on the site and extent of the disorder. The stomach is also frequently involved. The disorder is commonly associated with intolerance to specific foods.

eosinophilic granuloma. **1.** a simple or multiple growth in the bone or lung characterized by numerous eosinophils and histiocytes. Eosinophilic granulomas occur most frequently in children and adolescents. **2.** See **anisakiasis.**

eosinophilic leukemia, a malignant neoplasm of the blood-forming tissues in which eosinophils are the predominant cells. The disease resembles chronic myelocytic leukemia but may have an acute course, even when no blast forms are present in the peripheral blood.

eosinophilic leukocyte. See **eosinophil.**

eosinophilic meningitis, meningitis with an increase in lymphocytes and a high percentage of eosinophils in the cerebrospinal fluid. It usually results from infection with *Angiostrongylus cantonensis*.

eosinophilic myeloencephalitis, a complex of neurological symptoms produced by invasion of the central nervous system by *Gnathostoma spinigerum,* including severe nerve root pain, followed by paralysis of extremities and sudden sensorial impairment, accompanied by increased number of eosinophils in the cerebrospinal fluid, which is often bloody or yellowish.

eosinophilic pneumonia, inflammation of the lungs, characterized by infiltration of the alveoli with eosinophils and large mononuclear cells, pulmonary edema, fever, night sweats, cough, dyspnea, and weight loss. The disease may be caused by a hypersensitivity reaction to fungi spores; plant fibers; wood dust; bird droppings' porcine, bovine, or piscine proteins; *Bacillus subtilis* enzyme in detergents; or certain drugs. Treatment consists of removal of the offending allergen and symptomatic and supportive therapy. Compare **bronchopneumonia.** See also **asthmatic eosinophilia.**

-eous, suffix meaning "like" or "composed of" or "relating to" something specified: *cutaneous, osseous*.

EP, abbreviation for **evoked potential.**

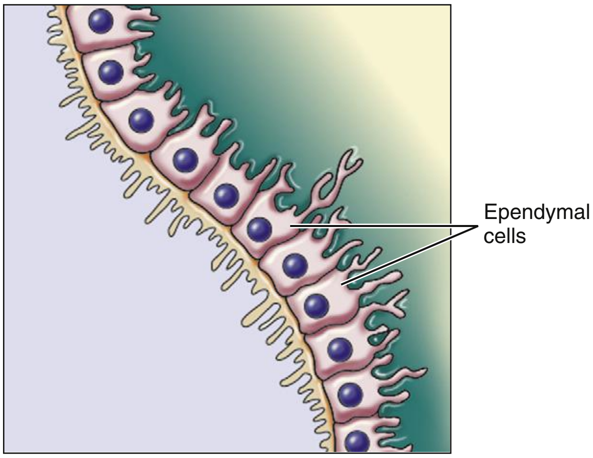
ep-. See **epi-.**

EPA, abbreviation for *Environmental Protection Agency*.

epaxial muscles, the intrinsic muscles of the back.

EPEC, abbreviation for **enteropathic *Escherichia coli.***

ependyma /ipen′dimə/ [Gk, an upper garment], a layer of ciliated epithelial membrane that lines the central canal of the spinal cord and the ventricles of the brain. **—ependymal** /ipen′diməl/, *adj*.



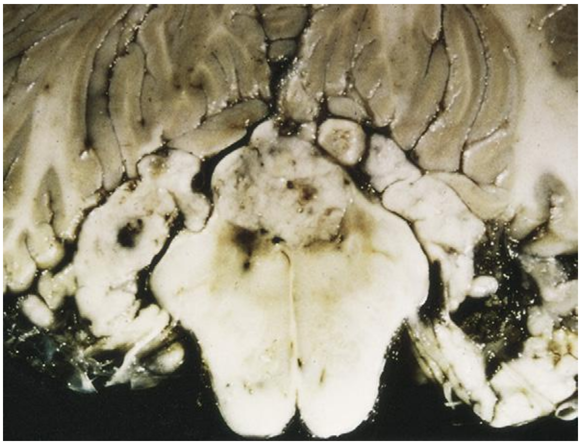
Ependymal cells *(Herlihy, 2011)*

ependymal glioma, a large vascular fairly solid tumor in the fourth ventricle, composed of malignant glial cells.

ependymitis /ipen′dimī′tis/, an inflammation of the ependymal tissue, the epithelial lining of the ventricles of the brain and of the canal of the spinal cord.

ependymoblastoma /ipen′dimōblastō′mə/, a malignant neoplasm composed of primitive cells of the ependyma. Also called **malignant ependymoma.**

ependymoma /ipen′dimō′mə/ [Gk, *ependyma,* an upper garment, *oma,* tumor], a neoplasm composed of differentiated cells of the ependyma. The tumor, which is usually a benign pale, firm, encapsulated, somewhat nodular mass, commonly arises from the roof of the fourth ventricle and may extend to the spinal cord. Primary lesions may also develop in the spinal cord. Also called *ependymocytoma*.



Ependymoma *(Kumar et al, 2010)*

ephapse /ef′aps/ [Gk, *ephasis,* a touching], a point of lateral contact between nerve fibers across which impulses may be transmitted directly through the cell membranes rather than across a synapse. Compare **synapse. —ephaptic,** *adj.*

ephaptic transmission /ifap′tik/, the passage of a neural impulse from one nerve fiber, axon, or dendrite to another through the membranes. The mechanism may be a factor in epileptic seizures. Compare **synaptic transmission.**

ephebiatrics /ēfeb′ē·at′riks/ [Gk, *ephebos,* puberty, *iatros,* physician], a branch of medicine that specializes in the health of adolescents.

ephedra, an evergreen herb found throughout the world. Also called *ma huang*.

■ USES: The sale of ephedra was banned in the U.S. by the FDA in December of 2003 because of safety concerns (e.g., highlighted by death of baseball pitcher Steve Bechler), making it the first over-the-counter nutritional supplement to be banned. This herb was used for seasonal and chronic asthma, nasal congestion, and cough.

■ CONTRAINDICATIONS: People cultivating their own ephedra should be aware that it is contraindicated in those with known hypersensitivity to sympathomimetics, women who are pregnant or lactating, children less than 12 years of age, and people with narrow-angle glaucoma, seizure disorders, hyperthyroidism, diabetes mellitus, prostatic hypertrophy, arrhythmias, heart block, hypertension, psychosis, tachycardia, and angina pectoris.

epHEDrine /ef′ədrēn/, an alpha- and beta-adrenergic agonist that also promotes the release of norepinephrine from sympathetic nerve terminals.

■ INDICATIONS: It is prescribed in the treatment of asthma and bronchitis and is used topically as a nasal decongestant. The drug is historically important, but its use is now limited because of the availability of more selective beta-2 agonists for treating asthma.

■ CONTRAINDICATIONS: Concomitant administration of monoamine oxidase inhibitors, hypertension, cardiac artery disease, cardiac arrhythmia, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are nervousness, insomnia, anorexia, and increased blood pressure.

ephemeral /ifem′ərəl/ [Gk, *epi,* above, *hemera,* day], pertaining to a short-lived condition, such as a fever.

ephemeral fever, an infection of cattle caused by the bovine ephemeral fever virus. It is characterized by respiratory symptoms including increased oropharyngeal secretions, lacrimation, joint pains, tremor, and stiffness. Also called **phlebotomus fever.**

EPI, abbreviation for **echo planar imaging.**

epi-, ep-, prefix meaning "on, upon": *epicanthus, epicostal, epidural.*

epiblast /ep′iblast′/ [Gk, *epi,* upon, *blastos,* germ], the primordial outer layer of the blastocyst or blastula, before differentiation of the germ layers, that gives rise to the ectoderm and contains cells capable of forming the endoderm and mesoderm. See also **ectoderm. —epiblastic,** *adj.*

epicanthus /ep′ikan′thəs/ [Gk, *epi* + *kanthos,* lip of a vessel], a vertical fold of skin over the angle of the inner canthus of the eye. It may be slight or marked, covering the canthus and the caruncle. It is a hereditary trait in Asian people and is of no clinical significance. Some infants with Down syndrome have marked epicanthal folds. Also called *epicanthal fold, epicanthic fold.* **—epicanthal, epicanthic,** *adj.*

epicardia /-kär′dē·ə/ [Gk, *epi,* above, *kardia,* heart], the part of the esophagus that lies between the cardiac orifice of the stomach and the esophageal opening of the diaphragm.

epicardial. See **epicardium.**

epicardial pacing. See **pacing.**

epicardium /ep′ikär′dē·əm/ [Gk, *epi* + *kardia,* heart], the outermost of the three layers of tissue that form the heart wall. It is composed of a single sheet of squamous epithelial cells overlying delicate connective tissue. The epicardium is the visceral portion of the serous pericardium and folds back on itself to form the parietal portion of the serous pericardium. Compare **myocardium.** See also **pericardium. —epicardial,** *adj.*

epicondylar. See **epicondyle.**

epicondylar fracture /-kon′dilər/, any fracture that involves the medial or lateral epicondyle of a specific bone, such as the humerus.

epicondyle /ep′ikon′dəl/ [Gk, *epi* + *kondylos,* knuckle], a projection on the surface of a bone above its condyle. **—epicondylar,** *adj.*

epicondylitis /ep′ikon′dilī′tis/, a painful and sometimes disabling inflammation of the muscle and surrounding tissues of the elbow, caused by repeated strain on the forearm near the medial or lateral epicondyle of the humerus. The strain may result from violent extension or supination of the wrist against a resisting force, such as may occur in playing tennis or golf, twisting a screwdriver, or carrying a heavy load with the arm extended. Treatment usually includes rest, injection of procaine with or without hydrocortisone, stretching and strengthening of the muscle, and, in some cases, surgery to release part of the muscle from the epicondyle. See also **golfer's elbow, lateral humeral epicondylitis.**

epicranial. See **epicranium.**

epicranial aponeurosis /-krā′nē·əl/ [Gk, *epi* + *kranion,* skull, *apo,* away, *neuron,* tendon], a fibrous membrane that covers the cranium between the occipital and frontal muscles of the scalp. Also called **galea aponeurotica.**

epicranium /-krā′nē·əm/ [Gk, *epi* + *kranion,* skull], the complete scalp, including the integument, the muscular sheets, and the aponeuroses. Compare **epicranius. —epicranial,** *adj.*

epicranius [Gk, *epi* + *kranion,* skull], the broad muscular and tendinous layer of tissue covering the top and sides of the skull from the occipital bone to the eyebrows. It consists of broad, thin muscular bellies, connected by an extensive aponeurosis. Innervation of the epicranius by branches of the facial nerves can draw back the scalp, raise the eyebrows, and move the ears. Compare **epicranium.** See also **epicranial aponeurosis, occipitofrontalis, temporoparietalis.**

epicritic /-krit′ik/, pertaining to the somatic sensations of fine discriminative touch, vibration, two-point discrimination, stereognosis, and conscious and unconscious proprioception.

epidemic /-dem′ik/ [Gk, *epi* + *demos,* people], **1.** *adj,* affecting a significantly large number of people at the same time. **2.** *n,* a disease that spreads rapidly through a demographic segment of the human population, such as everyone in a given geographic area, a military base, or similar population unit, or everyone of a certain age or sex, such as the children or women of a region. **3.** *n,* a disease or event whose incidence is beyond what is expected. Compare **endemic, epizootic, pandemic.**

epidemic cerebrospinal meningitis. See **meningococcal meningitis.**

epidemic diarrhea in newborns [Gk, *epi,* above, *demos,* the people, *dia,* through, *rhein,* flow; ME, *newe* + *beren*], any severe gastroenteritis epidemic among a community of newborns, as may occur in a hospital nursery.

epidemic encephalitis, any diffuse inflammation of the brain occurring in epidemic form. Two kinds of epidemic encephalitis are **Japanese encephalitis** and **St. Louis encephalitis.** Also called **von Economo's encephalitis.** See also **encephalitis.**

epidemic hemoglobinuria. See **hemoglobinuria.**

epidemic hemorrhagic conjunctivitis [Gk, *epi,* above, *demos,* the people, *haima,* blood, *rhegnynei,* to gush; L, *conjunctivus,* connecting; Gk, *itis,* inflammation], a highly contagious infection, commonly involving an enterovirus, that begins with eye pain accompanied by swollen eyelids and hyperemia of the conjunctiva. It is a self-limiting disorder that has no specific remedy.

epidemic hemorrhagic fever, a severe viral infection marked by fever and bleeding. The disorder develops rapidly and is characterized initially by fever and muscle ache, possibly followed by hemorrhage, peripheral vascular collapse, hypovolemic shock, and acute kidney failure. The arbovirus or other pathogen is believed to be transmitted by mosquitoes, ticks, mites, or rodents. The pathophysiological characteristics of the hemorrhagic effect are uncertain, although it is assumed the disease organism causes damage to the lining of the capillaries. Among the various forms of epidemic hemorrhagic fevers are **Argentine hemorrhagic fever, Bolivian hemorrhagic fever, dengue fever, Lassa fever,** and **yellow fever.** See also specific viral infections.

epidemic hysteria. See **major hysteria.**

epidemic keratoconjunctivitis (EKC) [Gk, *epi,* above, *demos,* the people, *keras,* horn; L, *conjunctivus;* Gk, *itis,* inflammation], an adenovirus infection consisting of an acute, severely painful conjunctivitis followed by keratitis. In the western world, EKC strikes predominantly in selected environments: industry eye clinics, emergency rooms, nursing homes, schools, camps, and child-care centers. The virus is often found on the hands of people with active EKC. Hand-to-eye transmission is felt to be a common method of spread, especially in the medical setting. Swimming pools and schools have been implicated in transmission, and it can spread through inanimate objects. In the eye clinic and emergency room, instruments and contaminated eye drops can transmit the virus. EKC is quite contagious and prone to epidemics that may be quite large. It is treated by lubrication with artificial tears.

epidemic myalgia, a disease caused by coxsackie B virus. It is characterized by sudden acute chest or epigastric pain and fever lasting 3 to 14 days, followed by complete spontaneous recovery. Also called **devil's grip, epidemic myositis, epidemic pleurodynia.**

epidemic myositis. See **epidemic myalgia, epidemic pleurodynia.**

epidemic parotitis. See **mumps.**

epidemic pleurodynia, an acute infectious disease caused by strains of enterovirus *Coxsackie,* type B, mainly affecting children. It is characterized by severe intermittent pain in the abdomen or lower chest, fever, headache, sore throat, malaise, and extreme myalgia. The symptoms may continue for weeks or subside after a few days and recur for a period of weeks. Transmission is through the fecal-oral route. Treatment is symptomatic; complete recovery is usual. Also called **Bornholm disease, devil's grip, epidemic myalgia, epidemic myositis.**

epidemic typhus, an acute severe rickettsial infection characterized by prolonged high fever, headache, and a dark maculopapular rash that covers most of the body. The causative organism, *Rickettsia prowazekii,* is transmitted indirectly as a result of the bite of the human body louse or squirrel flea or louse; the pathogen is contained in feces of the louse and enters the body tissues as the bite is scratched. Disease is manifested by the abrupt onset of an intense headache and a fever reaching 40° C (104° F) beginning after an incubation period of 1 week. The rash follows on the fifth day of onset. Complications may include vascular collapse, renal failure, pneumonia, or gangrene. Mortality rate is as high as 40% depending on preexisting clinical conditions. Treatment may include antipyretics and supportive symptomatic care. Health care workers are at risk of acquiring this infection from louse bites or louse feces. Also called **classic typhus, European typhus, jail fever, louse-borne typhus.** Compare **murine typhus.** See also **Brill-Zinsser disease, *Rickettsia*, typhus.**

epidemic vomiting, an episode of sudden vomiting by members of a group of people in close contact. The vomiting, caused by ribonucleic acid Norwalk virus infection, usually begins without previous signs or symptoms of illness and may continue for several hours, ending abruptly. The vomiting may be accompanied by headache, abdominal pain, and diarrhea. The patients are frequently children who are attending the same school.

epidemiological. See **epidemiology.**

epidemiologist /-dē′mē·ol′əjist/, a physician or medical scientist who studies the incidence, prevalence, spread, prevention, and control of disease in a community or a specific group of individuals. In a hospital a physician may be assigned as a staff epidemiologist with responsibility for directing infection control programs within the facility.

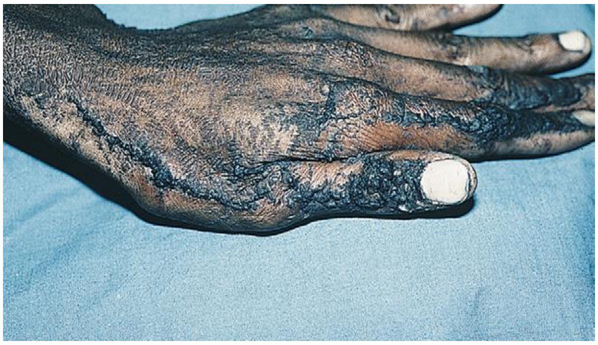
epidemiologist nurse, a registered nurse with special education and experience in the control of infections in the health care facility and community.

epidemiology /-dē′mē·ol′əjē/ [Gk, *epi* + *demos,* people, *logos,* science], the study of the determinants of disease events in populations. **—epidemiological,** *adj.*

epiderm-, epidermo-, prefix meaning "epidermis": *epidermoid, epidermolysis, epidermolytic.*

epidermal growth factor (EGF) /ep′idur′məl/, a mitogenic polypeptide produced by many cell types and made in large amounts by some tumors. It promotes growth and differentiation, is essential in embryogenesis, and is also important in wound healing. It has been found to be part of a family of compounds that includes also **transforming growth factor.**

epidermal nevus /-dur′məl/ [Gk, *epi* + *derma,* skin; L, *naevus,* birthmark], a discrete discolored congenital lesion caused by an overgrowth of epidermis. It may be seen in newborns. Also called **epithelial nevus, hard nevus.**



Epidermal nevus *(Callen et al, 2000)*

epidermis /ep′idur′mis/ [Gk, *epi* + *derma,* skin], the superficial avascular layers of the skin, made up of an outer dead, cornified part and a deeper living, cellular part. Each layer is named for its unique function, texture, or position. The deepest layer is the stratum basale. It anchors the more superficial layers to the underlying tissues, and it provides new cells to replace those lost by abrasion from the outermost layer. The cells of each layer migrate upward as they mature. Above the stratum basale lies the stratum spinosum. As the cells migrate to the next layer, the stratum granulosum, they become flat, lying parallel with the surface of the skin. Over this layer lies a clear, thin band of homogenous tissue called the stratum lucidum. The outermost layer, the stratum corneum, is composed of scaly, squamous plaques of dead cells that contain keratin, a waterproofing protein that hardens over several days. This horny layer is thick over areas of the body subject to abrasion, such as the palms of the hands, and thin over other more protected areas. Altogether these layers are between 0.5 and 1.1 mm in thickness. Also called **cuticle.** See also **skin. —epidermal, epidermoid,** *adj.*

epidermitis /ep′idurmī′tis/, an inflammation of the epidermis, the outer layer of the skin.

epidermoid carcinoma /-dur′moid/ [Gk, *epi* + *derma* + *eidos,* form], a malignant neoplasm in which the tumor cells tend to differentiate in the manner of epidermal cells, then form horny cells called prickle cells.

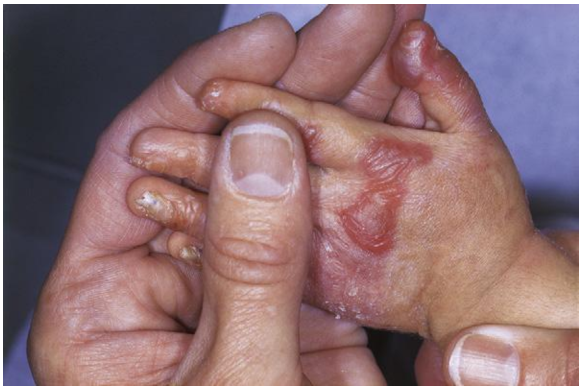
epidermoid cyst, a common benign cavity lined by keratinizing epithelium and filled with a cheesy material composed of sebum and epithelial debris. The cyst is in the skin, connected to the surface by a pore. Treatment is surgical excision. Also called *epidermal inclusion cyst,* **sebaceous cyst.** Compare **pilar cyst.**

epidermolysis bullosa /ep′idərmol′isis/ [Gk, *epi* + *derma* + *lysis,* loosening], a group of rare hereditary skin diseases in which vesicles and bullae develop, usually at sites of trauma. Severe forms may also involve mucous membranes and may leave scars and contractures on healing. Basal cell and squamous cell carcinomas sometimes develop in the scar tissue.

epidermolytic hyperkeratosis [Gk, *epi* + *derma,* skin + *lysis,* loosening; Gk, *hyper,* excess + *keras,* horn + *osis,* condition], a rare autosomal-dominant form of ichthyosis with a high frequency of spontaneous mutations. Present at birth, it is characterized by generalized erythroderma and severe hyperkeratosis with small wartlike scales over the entire body, especially in body folds, and sometimes on the palms and soles. There are also recurrent bullae on the lower limbs. If sepsis and electrolyte imbalances are not treated correctly in neonates, morbidity can occur. Also called **bullous congenital ichthyosiform erythroderma.** See also **ichthyosis.**

epidermomycosis. See **dermatophytosis.**

epidermophytosis /ep′idur′mōfītō′sis/, a superficial fungus infection of the skin.



Junctional epidermolysis bullosa
(Weson, Lane, and Morelli, 2007)

epididym-, prefix meaning "epididymis": *epididymectomy, epididymitis.*

epididymal appendix, a cystic structure sometimes found on the head of the epididymis. It represents a remnant of the mesonephros. Also called **appendix epididymidis.**

epididymis /ep′idid′imis/ *pl.* **epididymides** [Gk, *epi* + *didymos,* pair], one of a pair of long, tightly coiled ducts that carry sperm from the seminiferous tubules of the testes to the vas deferens.

epididymitis /ep′idid′imī′tis/ [Gk, *epi* + *didymos* + *itis,* inflammation], acute or chronic inflammation of the epididymis. It may result from venereal disease, urinary tract infection, prostatitis, prostatectomy, or prolonged use of indwelling catheters. Symptoms include fever and chills; pain in the groin; and tender, swollen epididymides. Treatment includes bed rest, scrotal support, antiinflammatory medications, and antibiotics, as appropriate.

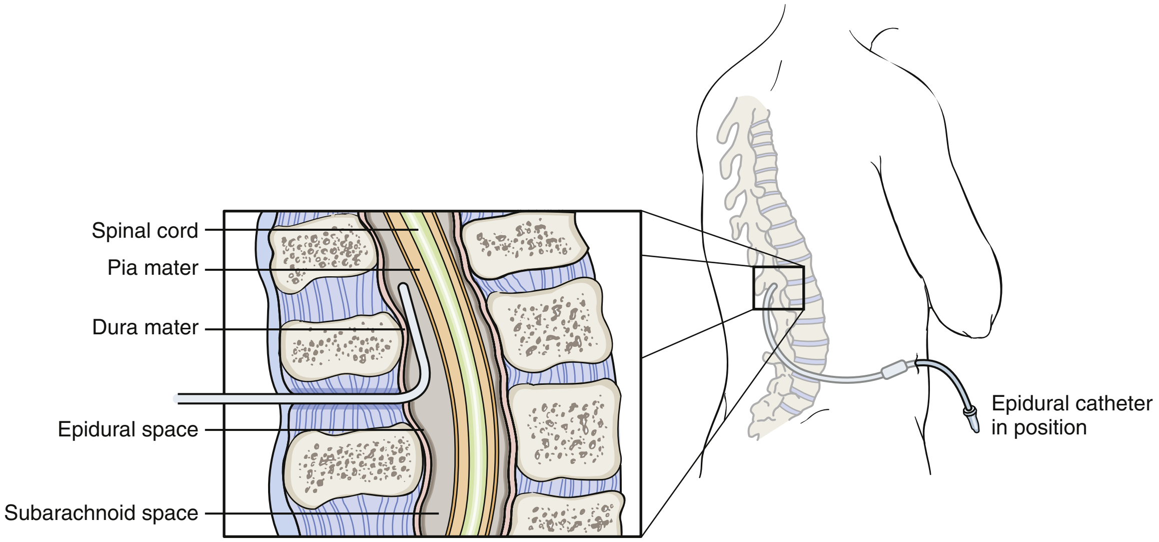
epididymoorchitis /ep′idid′imō′ôrkī′tis/ [Gk, *epi* +, *didymos* + *orchis,* testis, *itis*], inflammation of the epididymis and of the testis. See also **epididymitis, orchitis.**

epididymovesiculography /ep′idid′imōves′ikyəlog′rəfē/, the radiographic examination of the seminal ducts. It is usually performed in cases of sterility, cysts, tumors, abscesses, or inflammation. The contrast medium may be injected through a catheter in the urethra or placed directly in the ducts through a surgical incision in the upper part of the scrotum.

epidural /ep′idŏŏr′əl/ [Gk, *epi* + *dura,* hard], outside or above the dura mater.

epidural abscess, a disorder characterized by inflammation and a collection of pus between the dura mater of the brain and skull, or between the dura mater of the spinal cord and the vertebral canal. It is called an intracranial epidural abscess if the infection is inside the skull. The infection is usually caused by a bacterium such as ***Staphylococcus,*** but it can also be secondary to a fungal or viral infection, which can occur secondary to a chronic ear or sinus infection, a penetrating head injury, or mastoiditis. Fever, headache, and neurological symptoms are common.

epidural anesthesia/analgesia, a type of anesthesia block in which a local anesthetic is injected into the epidural space surrounding the dural sack which contains CSF and the spinal cord. Epidurals are most commonly performed in the lumbar area by an injection of medication through a catheter placed in the epidural space. Analgesia is maintained by either intermittent dosing or a continuous infusion into the catheter. Close monitoring of vital signs, respirations, pain, and sensation is important. Epidurals have a wide application in anesthesia and pain management because of their safety and versatility. Epidural anesthesia



Epidural anesthesia *(Monahan et al, 2007)*

or analgesia can be tailored to affect an area of the body from the lower extremities to the upper abdomen. Epidurals are often used for labor and birth and in postoperative pain management. The most common adverse effects include unintentional dural membrane puncture, postdural puncture headache, and hypotension from sympathetic nerve block and vascular dilation. Severe complications may include intravascular injection of local anesthetic and seizures, hematoma of the epidural space. See also **epidural hematoma, regional anesthesia.**

epidural blood patch (EBP), a treatment for postdural puncture headache in which 15 to 20 mL of a patient's autologous blood is injected into the epidural space at or near the location of a dural puncture. The volume injected displaces cerebrospinal fluid (CSF) from the lumbar CSF space into the area surrounding the brain, often yielding immediate relief. When the blood clots, it seals the dural puncture, prohibiting further leakage of CSF from the subarachnoid space.

epidural hematoma, accumulation of blood in the epidural space, caused by damage to and leakage of blood from the middle meningeal artery, producing compression of the dura mater and thus of the brain. Unless evacuated, it may result in herniation through the tentorium and death.

epidural hemorrhage, a hemorrhage that produces a collection of blood outside the dura mater of the brain or spinal cord. It usually results from tearing of the middle meningeal artery and may be rapidly life threatening. Also called **extradural hemorrhage.**

epidural space, the space immediately above and surrounding the dura mater of the brain or spinal cord, beneath the endosteum of the cranium and the spinal column.

epifascial /ep′ifash′ē·əl/ [Gk, *epi* + L, *fascia,* band], on a fascia.

epifolliculitis /ep′ifolik′yəlī′tis/, an inflammation of the hair follicles of the head. See also **folliculitis.**

epigastric /-gas′trik/ [Gk, *epi,* above, *gaster,* stomach], pertaining to the epigastrium, the area above the stomach.

epigastric arteries, the arteries (superficial, superior, and inferior) that supply the medial abdominal wall.

epigastric hernia, the protrusion of an internal organ through the linea alba.

epigastric node [Gk, *epi* + *gaster,* stomach; L, *nodus,* knot], a node in one of the seven groups of parietal lymph nodes serving the abdomen and the pelvis, comprising about four nodes along the caudal portion of the inferior epigastric vessels. See also **lymph, lymphatic system, lymph node.**

epigastric pain [Gk, *epi,* above, *gaster,* stomach; L, *poena,* penalty], pain in the upper middle part of the abdomen.

epigastric reflex [Gk, *epi,* above, *gaster,* stomach; L, *reflectere,* to bend back], a contraction of the rectus abdominis muscle that occurs when the skin surface in the upper and middle abdominal region is stimulated. The reflex also may be induced by stimulation of the axillary region of the fifth and sixth dorsal nerves.

epigastric region, the part of the abdomen in the upper zone between the right and left hypochondriac regions. Also called **antecardium, epigastrium.** See also **abdominal regions.**

epigastric sensation, a weak, sinking feeling of undefined nature that is usually localized in the pit of the stomach but may occur throughout the abdominal region. See also **sensation,** def. 1.

epigastrium. See **epigastric region.**

epigenesis /ep′ijen′əsis/ [Gk, *epi* + *genein,* to produce], (in embryology) a theory of development in which the organism grows from a simple to more complex form through the progressive differentiation of an undifferentiated cellular unit. Compare **preformation. —epigenesist,** *n.,* **epigenetic,** *adj.*

epiglott-, prefix meaning "epiglottis": *epiglottitis.*

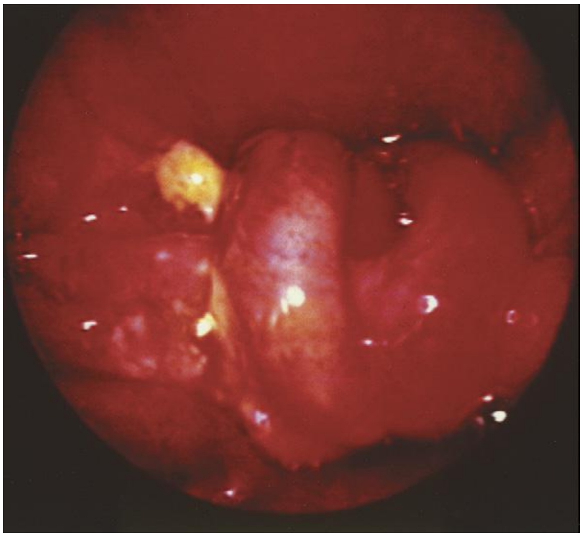
epiglottic vallecula, a depression between the lateral and median glossoepiglottic folds on each side.

epiglottiditis. See **epiglottitis.**

epiglottis /ep′iglot′is/ [Gk, *epi* + *glossa,* tongue], the thin, leaf-shaped cartilaginous structure that overhangs the larynx like a lid and prevents food from entering the larynx and the trachea while swallowing.

epiglottitis /ep′iglotī′tis/ [Gk, *epi* + *glossa,* tongue, *itis,* inflammation], an inflammation of the epiglottis. Acute epiglottitis is a severe form of the condition, which primarily affected children 2 to 7 years of age before a significant decrease in the occurrence of the disease resulting from the introduction of the ***Haemophilus influenzae*** B vaccine in 1985. It is characterized by fever; sore throat; drooling; stridor; croupy cough; and an erythematous, swollen epiglottis. The patient may become cyanotic and require an emergency tracheostomy to maintain respiration. The causative organism is usually ***Haemophilus influenzae,*** type B, but it can also be caused by *Streptococcus,* groups A, B, and C;

S. pneumoniae; Klebsiella pneumoniae; Candida albicans; Staphylococcus aureus; Neisseria meningitides; Varicella zoster; and other viruses. Antibiotics, rest, oxygen, and supportive care are usually included in treatment. Also called **epiglottiditis.** See also **acute epiglottitis.**



Acute epiglottitis *(Marx, 2010)*

epilating forceps /ep′ilā′ting/ [L, *e* + *pilus,* without hair], a kind of small spring forceps, used for removing unwanted hair.

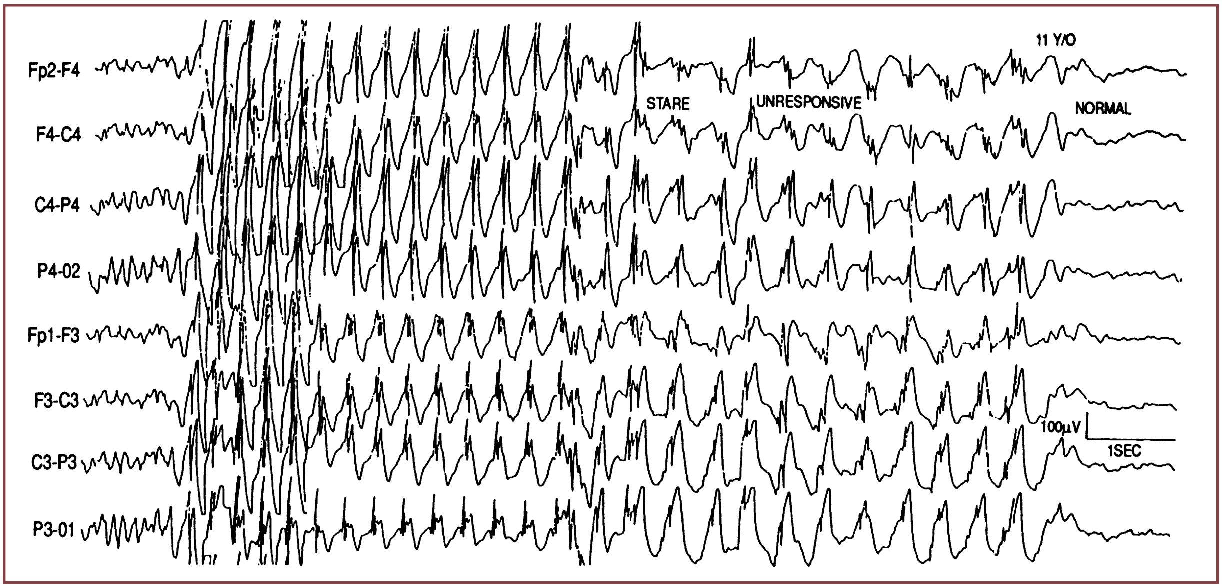
epilation. See **depilation.**

epilepsy /ep′ilep′sē/ [Gk, *epilepsia,* seizure], a group of neurological disorders characterized by recurrent episodes of convulsive seizures, sensory disturbances, abnormal behavior, loss of consciousness, or all of these. Common to all types of epilepsy is an uncontrolled electrical discharge from the nerve cells of the cerebral cortex. Although most epilepsy is of unknown cause, it is sometimes associated with cerebral trauma, intracranial infection, brain tumor, vascular disturbances, intoxication, or chemical imbalance. See also **absence seizure, focal seizure, psychomotor seizure, tonic-clonic seizure.**

■ OBSERVATIONS: The frequency of attacks may range from many times a day to intervals of several years. In predisposed individuals, seizures may occur during sleep or after physical stimulation, such as by a flickering light or sudden loud sound. Emotional disturbances also may be significant triggers. Some seizures are preceded by an aura, but others have no warning symptoms. Most epileptic attacks are brief. They may be localized or general, with or without clonic movements, and are often followed by drowsiness or confusion. Diagnosis is made by observation of the pattern of seizures and abnormalities on an electroencephalogram. Diagnosis is also aided by a system of classification of the criteria that characterize the different types of epileptic seizures. One major category in the classification scheme encompasses the partial seizures, which often begin focally, then spread to other brain areas. A second major category includes the generalized seizures, which usually begin deep in the brain and impair consciousness.

■ INTERVENTIONS: The kind of epilepsy determines the selection of preventive medication. Correctable lesions and metabolic causes are eliminated when possible. During a seizure the patient should be protected from injury without being severely restrained.

■ NURSING CONSIDERATIONS: In addition to protecting the patient from injury, a nurse observing an epileptic seizure should carefully note and accurately describe the sequence of seizure activity. The patient and family must be fully informed and counseled about the disorder; the importance of regularly taking prescribed medication, never discontinuing treatment without professional advice, and using a medical identification tag; the toxic effects of medication; and the maintenance of the most normal life-style possible. Nurses also have a responsibility to help improve the public's attitude toward epilepsy and to correct misunderstanding that limits educational and occupational opportunities for individuals affected by this condition. See also **anticonvulsant, aura, central nervous system stimulant, clonus, ictus, tonic. —epileptic,** *adj., n.*



Childhood absence epilepsy: typical EEG pattern *(Goldman et al, 2004)*

epileptic cry /ep′ilep′tik/, a loud vocalization by a person with epilepsy, often immediately before onset of a seizure.

epileptic dementia [Gk, *epilepsia,* seizure; L, *de* + *mens,* mind], a loss of cognitive and intellectual functions that develops in some cases of incompletely controlled epilepsy. Symptoms include slowness and circumstantiality of speech and narrowed attention span.

epileptic march. See **cortical march.**

epileptic stupor, the state of unawareness and unresponsiveness that follows an epileptic seizure or postepileptic state.

epileptic vertigo [Gk, *epilepsia,* seizure; L, *vertigo,* dizziness], an aura of dizziness that may precede, accompany, or follow an epileptic seizure.

epileptogenic /ep′ilep′tōjen′ik/, causing epileptic seizures.

epiloia. See **tuberous sclerosis.**

epimysium /ep′imiz′ē·əm/ [Gk, *epi* + *mys,* muscle], the outermost fibrous sheath that covers a muscle, continuous with the perimysium. It is sturdy in some areas but more delicate in others, such as those areas where the muscle moves freely under a strong sheet of fascia. The epimysium may also fuse with fascia that attaches a muscle to a bone.

epINEPHrine /ep′ənef′rin/ [Gk, *epi* + *nephros,* kidney], an endogenous adrenal hormone and synthetic adrenergic agent. It acts as an agonist at alpha-1, alpha-2, beta-1, and beta-2 receptors. Also called **adrenaline.**

■ INDICATIONS: It is prescribed to treat anaphylaxis, acute bronchial spasm, and nasal congestion and to increase the effectiveness of a local anesthetic.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are arrhythmias, increases in blood pressure, rebound congestion (when it is used as a decongestant), tachycardia, and nervousness.

epiotic /ep′ē·ot′ik/, **1.** pertaining to the portion of the temporal bone that is the ossification center for the mastoid. **2.** above the ear.

epipastic /ep′ipas′tik/ [Gk, *epipassein,* to sprinkle about], dusting powder.

epiphora. See **tearing.**

epiphyseal /ep′ifiz′ē·əl, ipif′əsē′əl/ [Gk, *epi,* above, *phyein,* to grow], pertaining to or resembling the epiphysis. Also spelled **epiphysial.**

epiphyseal fracture [Gk, *epi* + *phyein,* to grow, *fractura,* break], a fracture involving the epiphyseal plate of a long bone, which causes separation or fragmentation of the plate. Also called **Salter fracture.**

epiphyseal plate [Gk, *epi,* above, *phyein,* to grow, *platys,* flat], a thin layer of cartilage between the epiphysis, a secondary bone-forming center, and the bone shaft. The new bone forms along the plate. Epiphyseal plates remain open until late adolescence. Also called *growth plate*.

epiphysial. See **epiphyseal.**

epiphysis /epif′isis/ *pl.* **epiphyses** [Gk, *epi* + *phyein,* to grow], the enlarged proximal and distal ends of a long bone. See also **epiphyseal plate. —epiphysial** /ipif′əsē′əl/, *adj.*

epiphysis cerebri. See **pineal body.**

epiphysitis /ipif′isī′tis/, an inflammation of the epiphysis, usually of a long bone, such as the femur or humerus. The disorder mainly affects children.

epipial /ep′i·pi′əl/ [Gk, *epi* + L, *pia,* soft or tender], situated on the pia mater.

epiploic /ep′iplō′ik/, pertaining to the omentum.

epiploic appendix, one of the fat pads, 2 to 10 cm long, scattered through the peritoneum along the colon and the upper part of the rectum, especially along the transverse and sigmoid colon.

epiploic foramen [Gk, *epiploon,* caul; L, *foramen,* a hole]. See **omental foramen.**

epipygus. See **pygomelus.**

epiretinal /ep′iret′inal/, overlying the retina.

epiretinal membrane, a pathological membrane partially covering the surface of the retina, probably originating from the retinal pigment epithelial and glial cells. Membranes peripheral to the macula are generally asymptomatic, but those involving the macula or adjacent to it may cause reduction in vision, visual distortion, and diplopia.

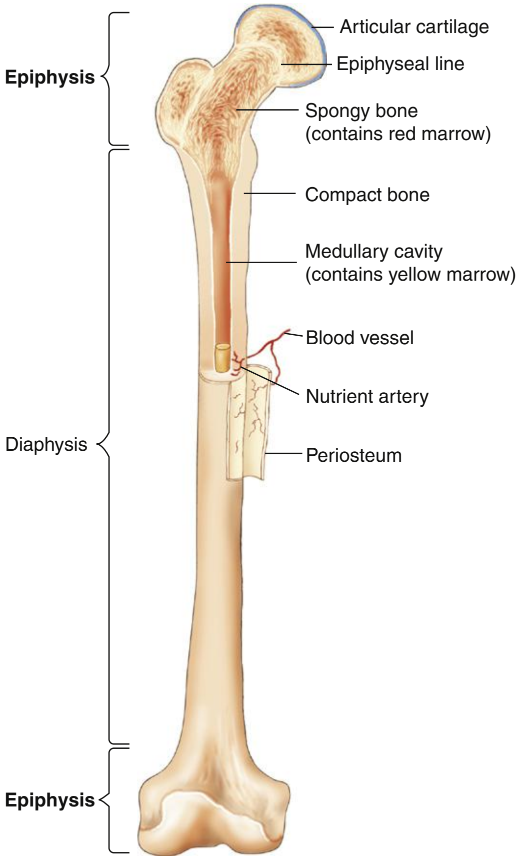
epirubicin, an antibiotic antineoplastic.

■ INDICATIONS: It is used as an adjuvant therapy to treat breast cancer with axillary node involvement following resection.

Classification of seizures

Type of seizure	*Effect on consciousness*	*Signs and symptoms*	*Postictal state*
Partial seizures			
Simple partial (focal)	Not impaired	Focal twitching of extremity Speech arrest Special visual sensations (e.g., seeing lights) Feeling of fear or doom	No
Complex partial (formerly psychomotor or temporal lobe seizures)	Impaired	May begin as simple partial and progress to complex Automatic behavior (e.g., lip smacking, chewing, or picking at clothes)	Yes
Complex partial progressing to generalized tonic-clonic	Impaired	Begins as complex partial as above, then progresses to tonic-clonic as described below	Yes
Generalized seizures			
Absence (formerly petit mal)	Impaired	Brief loss of consciousness, staring, unresponsiveness	No
Tonic-clonic (formerly grand mal)	Impaired	Tonic phase involving rigidity of all muscles, followed by clonic phase involving rhythmic jerking of muscles, and possibly tongue biting and urinary and fecal incontinence May be any combination of tonic and clonic movements	Yes
Atonic	Impaired for only a few seconds	Brief loss of muscle tone, which may cause patient to fall or drop something; referred to as drop attacks	No
Myoclonic	Impaired for only a few seconds or not at all	Brief jerking of a muscle group, which may cause patient to fall	No

From Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives*, ed 8, St Louis, 2007, Mosby.



Epiphysis *(Leonard, 2009)*

■ CONTRAINDICATIONS: Factors that prohibit its use include severe hepatic disease, baseline neutrophil count less than 1500 cells/mm^3, severe myocardial insufficiency, recent myocardial infarction, pregnancy, lactation, systemic infections, and known hypersensitivity to this drug, anthracyclines, or anthracenediones.

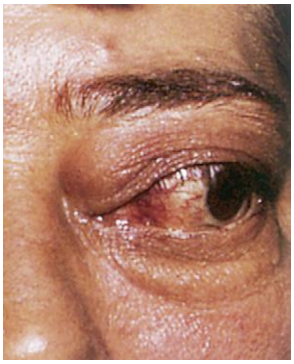
■ ADVERSE EFFECTS: Life-threatening effects are thrombocytopenia, leukopenia, anemia, neutropenia, secondary acute myelocytic leukemia, sinus tachycardia, premature ventricular contractions, bradycardia, and extrasystoles. Other serious adverse effects include increased blood pressure and chest pain. Common side effects include nausea, vomiting, anorexia, mucositis, diarrhea, amenorrhea, hot flashes, hyperuricemia, rash, necrosis at the injection site, reversible alopecia, infection, febrile neutropenia, lethargy, fever, and conjunctivitis.

episcleritis /ep′isklərī′tis/, inflammation of the outermost layers of the sclera and the tissues overlying its posterior parts.

episcope, a skin surface microscope that uses the technology of epiluminescence microscopy (the application of oil to produce translucence of the epidermis on a skin lesion). The episcope is placed gently over the lesion to observe its general appearance, surface, pigment pattern, border, and depigmentation.

episi-, prefix meaning "vulva": *episioplast, episiotomy.*

episiotomy /epē′zē·ot′əmē/ [Gk, *episeion,* pubic region, *temnein,* to cut], a surgical procedure in which an incision is made in a woman's perineum to enlarge her vaginal opening for delivery. It is performed most often electively to prevent tearing of the perineum, to hasten or facilitate birth of the baby, or to prevent stretching of perineal muscles and connective tissue thought to predispose to subsequent abnormalities of pelvic outlet relaxation, as cystocele, rectocele, and uterine prolapse. Its prophylactic efficacy is debated. It is usually required for a forceps delivery. The incision into the vaginal and perineal tissue is closed with absorbable sutures that need not be removed. Deep incisions require closure in two or more layers. Immediate complications include hemorrhage and extension of the incision along the vaginal sulcus or into the anal sphincter or rectum. Delayed complications include hematoma and abscess. Application of cold packs to the perineum for several hours immediately after delivery minimizes swelling. Later alternating applications of heat and cold and warm sitz baths reduce discomfort, but sitz baths longer than 10 minutes soften tissue and prolong healing time. A mediolateral episiotomy is an episiotomy cut at an angle of approximately 45 degrees with the midline. Although it affords wide exposure for delivery, it is painful after delivery and is prone to hematoma and infection. A median or **midline episiotomy** is an incision in the perineum in the midline; although less painful after delivery, it affords less exposure for delivery and may extend into or through the anal sphincter and into the rectum.



Episcleritis *(Moll, 1997)*

episode /ep′isōd/ [Gk, *episodion,* coming in besides], an incident or event that stands out from the continuity of everyday life, such as an episode of illness or a traumatic event in the course of a child's development. **—episodic,** *adj.*

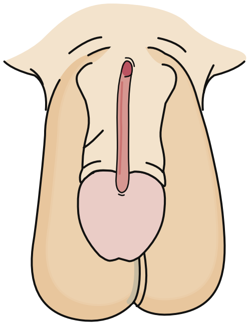
episode of hospital care, the services provided by a hospital in the continuous course of care of a patient with a health condition. It may cover a sequence from emergency through inpatient to outpatient services.

episodic. See **episode.**

episodic care /-sod′ik/, a pattern of medical and nursing care in which services are provided to a person for a particular problem, without an ongoing relationship being established between the person and health care professionals. Emergency departments provide episodic care.

episome /ep′isōm/ [Gk, *epi* + *soma,* body], an extrachromosomal replicating unit that exists autonomously or functions with a chromosome. See also **colicinogen, conjugon, F factor, plasmid, R factor.**

epispadias /ep′ispā′dē·əs/ [Gk, *epi* + *spadon,* a rent], a congenital defect in which the urethra opens on the dorsum of the penis at any point below the internal sphincter. Other pelvic abnormalities may be present. Treatment focuses on correcting or managing urinary incontinence, which occurs because the urinary sphincters are defective, and on permitting sexual function. The corresponding defect in women, in which the urethra opens by the separation of the labia minora and a fissure of the clitoris, is quite rare.



Epispadias *(Monahan et al, 2007)*

epistasis /epis′təsis/ [Gk, a standing], **1.** suppression of a secretion or excretion, as of blood, menses, or lochia. **2.** an interaction between genes at different loci in which one gene masks or suppresses the expression of the other. Epistasis, which is nonallelic and therefore different from dominance, may be caused by the presence of homozygous recessive alleles at one gene pair, as occurs in the Bombay phenotype, or by the presence of a dominant allele at one locus that counteracts the expression of a dominant allele at the other locus. Compare **dominance. —epistatic,** *adj.*

epistaxis /ep′istak′sis/ [Gk, a dropping], bleeding from the nose caused by local irritation of mucous membranes, violent sneezing, fragility or manipulation of the mucous membrane, chronic infection, trauma, hypertension, coagulopathy, vitamin K deficiency, or, thrombocytopenia. Also called **nosebleed.**

■ OBSERVATIONS: Epistaxis may result from the rupture of tiny vessels in the anterior nasal septum. This occurs most frequently in early childhood and adolescence. In adults it occurs more commonly in men than in women; may be severe in elderly persons; may be accompanied by respiratory distress, apprehension, restlessness, vertigo, and nausea; and may lead to syncope.

■ INTERVENTIONS: The patient suffering epistaxis is instructed to breathe through the mouth, to sit quietly with the head tilted slightly backward. The bleeding may be controlled by inserting a cotton ball soaked in a topical vasoconstrictor and applying pressure to the skin on both sides of the nose, occluding the blood supply to the nostrils; or by placing an ice compress over the nose. The nasal mucosa may be anesthetized with topical lidocaine, cauterized with a silver nitrate stick or an electrical cautery, and then sprayed with epinephrine. Severe bleeding, especially from the posterior nasal septum, may be treated by packing, which is left in place for 1 to 3 days. Persistent or recurrent profuse epistaxis may be treated by ligating an artery supplying the nose, such as the external carotid, ethmoid, or internal maxillary artery.

episternal /ep′istur′nəl/, situated on or over the sternum.

epistropheus. See **axis.**

epithalamus /ep′ithal′əməs/ [Gk, *epi* + *thalamos,* chamber], the uppermost portion of the diencephalon. It includes the trigonum habenulae, the pineal body, the posterior commissure, and the medullary layers of thalamus. Compare **hypothalamus, metathalamus, subthalamus, thalamus. —epithalamic,** *adj.*

epithelial /-thē′lē·əl/ [Gk, *epi,* above, *thele,* nipple], pertaining to or involving the outer layer of the skin.

epithelial cancer [Gk, *epi,* above, *thele,* nipple; L, *cancer,* crab], a carcinoma that develops from epithelium or related tissues in the skin, hollow viscera, and other organs. Also called **epithelioma.**

epithelial cell, any one of several cells arranged in one or more layers that form part of a covering or lining of a body surface. The cells usually adhere to one other along their edges and surfaces. One surface is free, and the other rests on a noncellular basement membrane. See also **epithelial tissue.**

epithelial cuff. See **junctional epithelium.**

epithelial cyst, **1.** any cyst lined by keratinizing stratified squamous epithelium, found most often in the skin. **2.** epidermal cyst.

epithelial débridement [Gk, *epi,* above, *thele,* nipple; Fr, *débridement,* incision], the removal of the entire inner lining and the attachment from the gingival or periodontal pocket with a gingival curettage. Also called **canal débridement, deepithelialization.**

epithelialization /-thē′lē·al′izā′shən/ [Gk, *epi,* above, *thele,* nipple; L, *ization,* process], the regrowth of skin over a wound.

epithelial nevus. See **epidermal nevus.**

epithelial peg [Gk, *epi* + *thele,* nipple], any of the papillary projections of the epithelium that penetrate the underlying stroma of connecting tissue and normally develop in mucous membranes and dermal tissues. Also called **rete peg.**

epithelial rest. See **embryonic rest.**

epithelial tissue [Gk, *epi,* above, *thele,* nipple; OFr, *tissu*], a closely packed single or stratified layer of cells covering the body and lining its cavities, with the exception of the blood and lymph vessels.

epithelioblastoma /ep′ithē′lē·ō′blastō′mə/, a tumor composed of epithelial cells.

epitheliofibril. See **tonofibril.**

epithelioid leiomyoma /ep′ithē′lē·oid/ [Gk, *epi* + *thele* + *eidos,* form], an uncommon neoplasm of smooth muscle in which the cells are polygonal in shape. It usually develops in the stomach. Also called **bizarre leiomyoma,** *leiomyoblastoma.*

epithelioma /-thē′lē·ō′mə/ [Gk, *epi* + *thele* + *oma,* tumor], a neoplasm derived from the epithelium.

-epithelioma, suffix meaning a "tumor of epithelial tissue": *inoepithelioma, periepithelioma, trichoepithelioma.*

epithelioma adamantinum. See **ameloblastoma.**

epithelioma adenoides cysticum. See **trichoepithelioma.**

epithelium /-thē′lē·əm/ [Gk, *epi* + *thele,* nipple], the covering of the internal and external organs of the body and the lining of vessels, body cavities, glands, and organs. It consists of cells bound together by connective material and varies in the number of layers and the kinds of cells. The stratified squamous epithelium of the epidermis comprises five different cellular layers. **—epithelial,** *adj.*

epitope /ep′itōp/ [Gk *epi* + *topos,* place]. See **antigenic determinant.**

epitympanic recess /-timpan′ik/ [Gk, *epi* + *tympanon,* drum], the area of the tympanic cavity cranial to the tympanic membrane. It contains the upper half of the malleus and greater part of the incus. Also called **attic.**

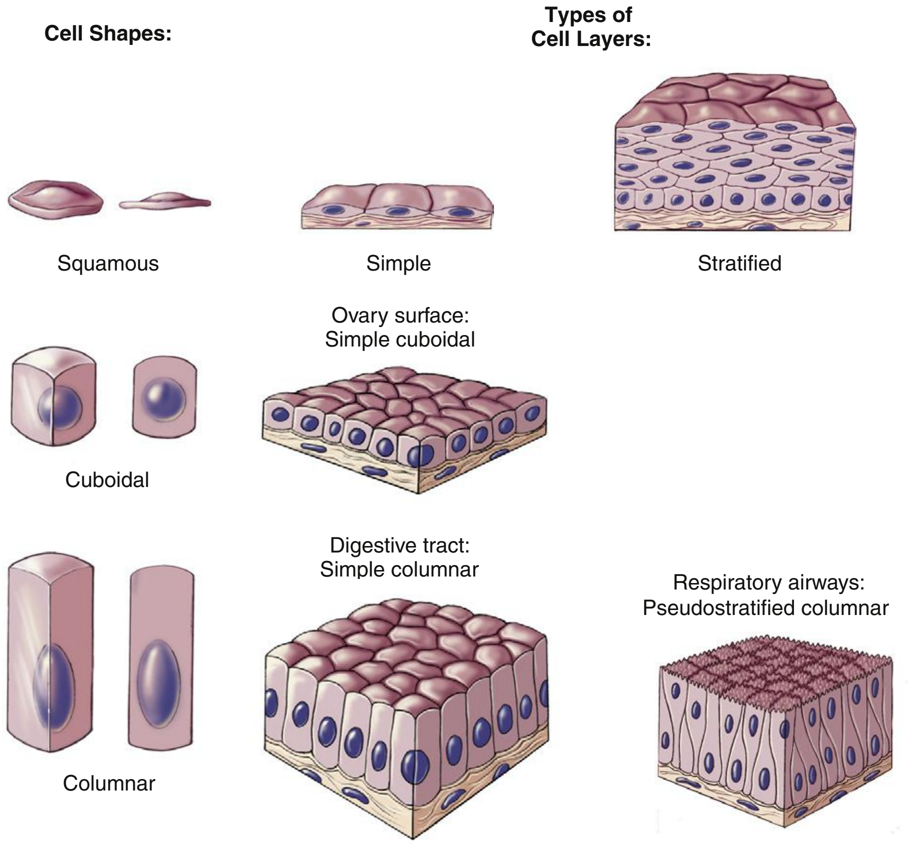
epizootic /ep′izō·ot′ik/, a disease or condition that occurs at about the same time in many individuals of the same species in a geographic area.

eplerenone, an antihypertensive agent.

EPO, **1.** abbreviation for **erythropoietin. 2.** abbreviation for **Exclusive Provider Organization.**

eponychium. See **cuticle,** def 3.

eponym /ep′ənim/ [Gk, *epi,* above, *onyma,* name], a name for a disease, organ, procedure, or body function that is derived from the name of a person, usually a physician or scientist who first identified the condition or devised the object bearing the name. Examples include fallopian tube, Parkinson's disease, and Billing's method.



Cell Shapes:
Types of Cell Layers:
Squamous
Simple
Stratified
Ovary surface: Simple cuboidal
Cuboidal
Digestive tract: Simple columnar
Respiratory airways: Pseudostratified columnar
Columnar

Classification of epithelium *(Herlihy, 2011)*

epoophoron /ep′ō·of′əron/ [Gk, *epi* + *oophoron,* ovary], a rudimentary structure that is situated in the mesosalpinx between the ovary and the uterine tube. The epoophoron is a persistent portion of the embryonic mesonephric duct. Also called **parovarium.**

epoprostenol /e′popros′tĕnol/, name for prostacyclin when used pharmaceutically. It is used in the form of the sodium salt as an inhibitor of platelet aggregation for blood contacting nonbiological systems, as in renal dialysis; as a pulmonary antihypertensive; and as a vasodilator.

epoxy, an organic chemical substructure consisting of a three-membered ring derived from the union of an oxygen atom and two carbon atoms. Epoxy resins are used as bonding agents.

eprosartan /ep′rosar′tan/, an angiotensin II antagonist that causes vasodilatation and decreases the effects of aldosterone, used as an antihypertensive, administered orally.

EPS, abbreviation for **electrophysiological study.**

EPSDT, abbreviation for **Early and Periodic Screening Diagnosis and Treatment.**

epsilon /ep′silon/, Ε, ε, the fifth letter of the Greek alphabet.

Epsom salt. See **magnesium sulfate.**

EPSP, abbreviation for *excitatory postsynaptic potential*.

Epstein-Barr virus (EBV) /ep′stīnbär′/ [Michael A. Epstein, b. 1921, English pathologist; Yvonne M. Barr, twentieth-century English virologist; L, *virus,* poison], the herpesvirus that causes infectious mononucleosis and is associated with nasopharyngeal sarcoma, Hodgkin's disease, B cell lymphoma, leukoplakia, central nervous system lymphoma in AIDS, and Burkitt's lymphoma, especially in immunodeficient patients such as posttransplantation patients on immunosuppressive therapy. It is also thought to cause oral hairy leukoplakia. One of the most common human viruses, it resides in the salivary glands, is transmitted with saliva, and continues to be shed. EBV is ubiquitous. By 40 years of age 99% of the U.S. population has serological evidence of EBV infection. Infection is often asymptomatic. There is no specific treatment. No antiviral drugs are available.

Epstein-Barr virus (EBV) titer, a blood test to indicate chronic EBV and associated illnesses.

Epstein's pearls [Alois Epstein, Czechoslovakian physician, 1849–1918; L, *perla,* a mussel], small, white pearl-like epithelial cysts that occur on both sides of the midline of the hard palate of the newborn. They are normal and usually disappear within a few weeks. Compare **Bednar's aphthae, thrush.**

e.p.t., a trademark for a human pregnancy test kit that uses monoclonal antibody technology to detect the presence of human chorionic gonadotropin in urine.

EP test, abbreviation for *erythrocyte protoporphyrin* test.

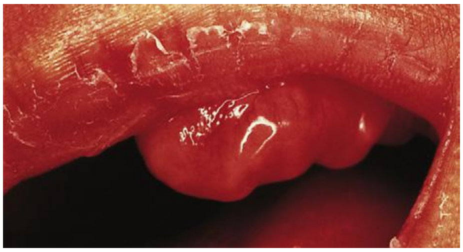
eptifibatide, an antiplatelet agent.

■ INDICATIONS: It is used to treat acute coronary syndrome, including patients with percutaneous coronary intervention.

■ CONTRAINDICATIONS: The following factors prohibit its use: known hypersensitivity to this drug, active internal bleeding, history of bleeding, stroke within 1 month, major surgery with severe trauma, severe hypotension, history of intracranial bleeding, intracranial neoplasm, arteriovenous malformation/aneurysm, aortic dissection, and dependence on renal dialysis.

■ ADVERSE EFFECTS: Life-threatening effects of this drug are stroke and bleeding. Hypotension is another serious adverse reaction.

epulis /epyo͞o′lis/ *pl.* **epulides** [Gk, *epi* + *oulon,* gum], any tumor or growth on the gingiva.



Epulis *(Zitelli and Davis, 2007)*

epulosis /ep′yəlō′sis/, a healing process by scar formation, resulting in the production of a cicatrix.

Equagesic, a trademark for a fixed-combination central nervous system drug that contains an analgesic **(aspirin)** and a sedative **(meprobamate).**

equal cleavage /ē′kwəl/ [L, *aequare,* to make alike; AS, *cleofan*], mitotic division of the fertilized ovum into blastomeres of identical size, as occurs in humans and most other mammals. Compare **unequal cleavage.**

equal distribution, a capitation method in which income is distributed equally among providers. It is used when the patient population is geographically and clinically homogeneous. Not applicable in Canada. See also **capitation.**

Equal Employment Opportunity Commission (EEOC), a body appointed by the president of the United States to administer the Civil Rights Act of 1964, particularly to investigate complaints of discrimination in employment in businesses engaged in interstate commerce. Discrimination based on race, color, creed, or national origin is forbidden, but certain kinds of employers and certain conditions of employment allow exceptions to the act.

Equanil, a trademark for a sedative **(meprobamate).**

equation [L, *aequare,* to make equal], an expression in symbols of equality or equivalence.

equator /ē·kwā′tər/ [L, *aequator,* equalizer], an imaginary line encircling a globe, equidistant from the poles, used in anatomical nomenclature to designate such a line on a spherical organ, dividing the surface into two approximately equal parts. Also spelled **aequator.**

equatorial plane /ēk′wətôr′ē·əl/ [L, *aequare,* to make alike; Fr, *flat* + *vessel*], the plane at the center of the spindle in which the chromosomes are arranged during metaphase of mitosis and meiosis.

equi-, prefix meaning "equal" or "equality": *equilibrate, equilibrium.*

equianalgesic dose /ē′kwē·an′əljē′sik/, a dose of one analgesic that is equivalent in pain-relieving effects to that of another analgesic. This equivalence permits substitution of medications to prevent possible adverse effects of one of the drugs. The term is also applied to equivalent alternative dose sizes and routes of administration.

equilbrium responses, complex postural reactions that involve righting reactions with rotation and diagnol patterns and are essential for volitional movement and mobility. Also called equilibrium reaction.

equilibration /ē′kwilibrā′shən/ [L, *aequus,* equal, *libra,* balance], the balancing and integrating of new experiences with those of the past in the psychological development of an individual.

equilibrium /ē′kwilib′rē·əm/ [L, *aequilibrium*], **1.** a state of balance or rest resulting from the equal action of opposing forces such as calcium and phosphorus in the body. **2.** (in psychiatry) a state of mental or emotional balance. **3.** (in radiotherapy) a point at which the rate of production of a daughter element is equal to the rate of decay of the parent element and the activities of parent and daughter are identical.

equilibrium reaction, automatic, reflexive, compensatory movements of body parts that restore and maintain the center of gravity over the base of support when the center of gravity of the supporting surface is displaced. Equilibrium reactions begin to develop around 6 months of age. See also **general adaptation syndrome, local adaptation syndrome.** Also called equilibrium responses.

equilin /ek′wəlin/, an estrogen isolated from the urine of pregnant horses. See also **conjugated estrogen.**

equin-, equino-, prefix meaning "characteristic of a horse": *equinovarus.*

equine antitoxin, an antitoxin derived from the blood of healthy horses immunized against a specific bacterial toxin.

equine encephalitis /ē′kwīn, ek′win/ [L, *equus,* horse; Gk, *enkephalon,* brain, *itis,* inflammation], an arbovirus infection with a member of the Togaviridae family, Alphavirus, characterized by inflammation of the nerve tissues of the brain and spinal cord. Other characteristics include high fever, headache, nausea, vomiting, myalgia, and neurological symptoms, such as visual disturbances, tremor, lethargy, and disorientation. The virus is transmitted by the bite of an infected mosquito. Horses are the primary host of the viruses that cause the infection; humans are secondary hosts. Because horses are deadend hosts, they are not a significant risk factor for human infection. **Eastern equine encephalitis (EEE)** is a severe form of the infection, with a mortality rate of 33%. The main EEE transmission cycle is between mosquitoes and birds, specifically the mosquito *Culiseta melanura.* EEE occurs primarily along the eastern seaboard of the United States and lasts longer and causes more deaths and residual morbidity than **western equine encephalitis (WEE),** which occurs throughout the United States and produces a mild, brief illness, as does **Venezuelan equine encephalitis (VEE),** which is common in Central and South America, Florida, and Texas. There is no specific treatment for EEE; care of patients is supportive. See also **encephalitis, encephalomyelitis.**

equine gait [L, *equus,* horse; ONorse, *gate,* a way], a manner of walking characterized by footdrop. The condition is the result of damage to the peroneal nerve, which causes the foot to hang in a toes-downward position.

equinovarus. See **clubfoot.**

equinus /ēkwī′nəs/ [L, horse], a condition characterized by tiptoe walking on one or both feet. It is usually associated with clubfoot.

equipotential, **1.** (in physics) indicating bodies that have the same electrical potential. **2.** pertaining to lines of force that have the same electrical potential.

equity model /ek′witē/, an organizational model for medical providers that offers the provider equity in the company instead of cash payments. Not applicable in Canada.

equivalence /ikwiv′ələns/, a state of being equal in value.

equivalent weight [L, *a* + *aequus* + *valere,* equal value; AS, *gewiht*], **1.** the weight of an element in any given unit (such as grams) that will displace a unit weight of hydrogen from a compound or combine with or replace a unit weight of hydrogen. **2.** the weight of an acid or base that will produce or react with 1.008 grams of hydrogen ion. **3.** the weight of an oxidizing or reducing agent that will produce or accept one electron in a chemical reaction.

equivocal symptom [L, *aequus,* equal, *vocare,* to call; Gk, *symptoma,* that which happens], a symptom that may be attributed to more than one cause or that may occur in several diseases.

Er, symbol for the element **erbium.**

ER, E.R., abbreviation no longer in common usage for **emergency room,** now referred to as the emergency department.

eradication /irad′ikā′shən/, the process of completely removing or destroying something.

Eraxis, a trademark for **anidulafungin.**

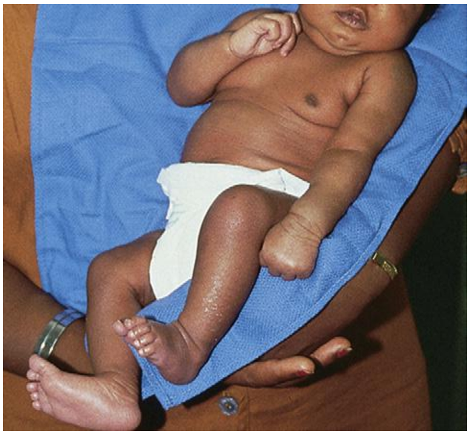
Erb-Duchenne paralysis. See **Erb's palsy.**

Erbitux, a trademark for **cetuximab.**

erbium (Er) /ur′bē·əm/ [Ytterby, Sweden], a metallic rare earth element. Its atomic number is 68; its atomic mass is 167.26.

Erb's muscular dystrophy [Wilhelm H. Erb], a form of muscular dystrophy that first affects the shoulder girdle and later often involves the pelvic girdle. It is a progressively crippling disease with onset in childhood or adolescence and is usually inherited as an autosomal-recessive trait. It affects both sexes. In males, differential diagnosis of Erb's muscular dystrophy and Duchenne's muscular dystrophy may be difficult. Also called **scapulohumeral muscular dystrophy.**

Erb's palsy [Wilhelm H. Erb, German neurologist, 1840–1921], a kind of paralysis caused by traumatic injury to the upper brachial plexus. It occurs most commonly as a result of forcible traction during childbirth, with injury to one or more cervical nerve roots. The signs of Erb's palsy include loss of sensation in the arm and paralysis and atrophy of the deltoid, the biceps, and the brachialis muscles. The arm on the affected side hangs loosely with the elbow extended and the forearm pronated. Treatment initially requires that the arm and shoulder be immobilized to allow the swelling and inflammation of the associated neuritis to resolve. Physical therapy and splinting may be necessary to improve muscle function and to prevent flexion contracture of the elbow. Also called **Erb-Duchenne paralysis.**



Erb's palsy *(Hockenberry and Wilson, 2011)*

Erb's point [Wilhelm H. Erb], a landmark of the brachial plexus on the upper trunk, located about 1 inch (2.5 cm) above the clavicle at about the level of the sixth cervical vertebra. The point is the location of an angle between the posterolateral border of the sternocleidomastoid muscle and the clavicle. Electrical stimulation at Erb's point causes contractions of the biceps, deltoid, and other arm muscles.

ERCP, abbreviation for **endoscopic retrograde cholangiopancreatography.**

erectile /irek′til, -tīl/ [L, *erigere,* to erect], capable of being erected or raised to an erect position. The term is usually used to describe spongy tissue of the penis or clitoris that becomes turgid and erectile when filled with blood. It also may be used when referring to the epidermal tissue involved in the appearance of "goose bumps" (piloerection) in response to fear, anger, cold, or other stimuli.

erectile dysfunction, failure by a male to attain or maintain erection until completion of sexual relations on an ongoing basis. The cause may be physical or psychological in nature. See **impotence.**

erectile myxoma, an angioma that contains areas of myxomatous tissue.

erection /irek′shən/ [L, *erigere,* to erect], the condition of hardness, swelling, and elevation observed in the penis and to a lesser degree in the clitoris, usually caused by sexual arousal but also occurring during sleep or after physical stimulation. It results when additional blood enters the organ and blood pressure within the organ increases, and it is influenced by psychic and nerve stimulation. Erection enables the penis to enter the vagina and to emit semen. See also **ejaculation, nocturnal emission, priapism.**

erector spinae. See **sacrospinalis.**

erector spinae reflex [L, *erigere,* to erect, *spina,* spine, *reflectere,* to bend back], a reflex characterized by contraction of the sacrospinalis and other back muscles when the overlying skin is stimulated. Also called **dorsal reflex, lumbar reflex.**

ERF, abbreviation for **edge response function.**

erg /urg, erg/, a unit of energy in the centimeter-gram-second system equal to the work done by a force of 1 dyne through a distance of 1 cm. 1 erg lm= 10^{-7}J. See also **joule.**

-erg-, combining form denoting an ergot alkaloid derivative.

ergastoplasm /ərgas′təplaz′əm/ [Gk, *ergaster,* worker, *plassein,* to mold], a network of cytoplasmic structures that show basophilic staining properties; granular endoplasmic reticulum. See also **endoplasmic reticulum.**

-ergic, -ergetic, suffix meaning an "effect of activity": *allergic, pathergic, telergic.*

ergo-, prefix meaning "work": *ergodermatosis, ergomaniac, ergotropy.*

ergocalciferol. See **calciferol.**

ergogenic /ur′gōjen′ik/, a tendency to increase work output.

ergogenic aid, a substance, such as a steroid, used by athletes with the expectation that it will provide a competitive edge.

ergoloid mesylate /ur′gōloid/, an ergot alkaloid preparation with psychotropic actions but lacking significant vasoconstrictor or vasodilator effects.

■ INDICATIONS: It is occasionally prescribed in the treatment of symptomatic age-related decline in mental capacity with an unknown cause, as in senile dementia, but its efficacy is not well established.

■ CONTRAINDICATIONS: Psychosis or known sensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are sublingual irritation, transient nausea, and gastric disturbance.

Ergomar, a trademark for an ergot alkaloid **(ergotamine tartrate).**

ergometer. See **dynamometer.**

ergometrine maleate. See **ergonovine maleate.**

ergometry /ərgom′ətrē/, the study of physical work activity, including that performed by specific muscles or muscle groups. The studies may involve testing with equipment such as stationary bicycles, treadmills, or rowing machines.

ergonomics /ur′gōnom′iks/ [Gk, *ergon,* work, *nomos,* law], a scientific discipline devoted to the study and analysis of human work, especially as it is affected by individual anatomical, psychological, and other human characteristics. **—ergonomic,** *adj.*

ergonovine maleate /ur′gōnō′vēn/, an oxytocic ergot alkaloid. Also called **ergometrine maleate.**

■ INDICATIONS: It is prescribed to contract the uterus in the treatment or prevention of postpartum or postabortion hemorrhage caused by uterine atony.

■ CONTRAINDICATIONS: Pregnancy, peripheral vascular disease, elevated blood pressure, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypertension, nausea, headache, blurred vision, and hypersensitivity reactions. Fetal death may result from use of the drug in pregnancy.

ergosome. See **polysome.**

ergosterol /ərgos′tərôl/, an unsaturated hydrocarbon of the vitamin D group isolated from yeast, mushrooms, ergot, and other fungi. When treated with ultraviolet irradiation it is converted into vitamin D_2. See also **calciferol, viosterol, vitamin D.**

ergot /ur′gət/ [L, *ergota,* a grain fungus], a fungus structure that replaces the seed of rye and other cereal grasses infested with the parasitic fungus *Claviceps purpurea*. Ergot contains ergot alkaloids, the agents responsible for what was known as St. Anthony's fire in people who consumed the contaminated grain in the Middle Ages. Effects included hallucinations and such intense vasoconstriction in the extremities that portions of the limbs often developed gangrene and fell off before the person died.

ergot alkaloid, one of a large group of alkaloids derived from a common fungus, *Claviceps purpurea*. The alkaloids comprise three groups: the amino acid alkaloids typified by ergotamine, the dihydrogenated amino acid alkaloids such as dihydroergotamine, and the amine alkaloids such as ergonovine.

■ INDICATIONS: Ergotamine and dihydroergotamine are less effective oxytocics than ergonovine. Therefore ergonovine, given orally or intravenously, is currently used in obstetrics to treat or prevent postpartum uterine atony and to complete an incomplete or missed abortion. Ergotamine is prescribed to relieve migraine headache. It acts by reducing the amplitude of arterial pulsations in the external carotid branches of the cranial arteries resulting from stimulation of vasoconstrictive alpha receptors, and it may also act as a serotonin antagonist. See also **missed abortion.**

■ CONTRAINDICATIONS: Peripheral vascular disease, coronary artery disease, hypertension, renal or hepatic dysfunction, and sepsis are contraindications for ergot alkaloids. Pregnancy prohibits their use because they may cause contractions of the uterus, decreased blood flow to the fetus, and fetal death.

■ ADVERSE EFFECTS: Ergot poisoning may result from prolonged or excessive use of the drug or accidental ingestion of contaminated grain. Signs of toxicity are thirst, diarrhea, dizziness, chest pain, abnormal and variable rate of cardiac contraction, nausea and vomiting, digital paresthesia, severe cramping, and seizures. Tissue anoxia and gangrene of the extremities may occur as a result of prolonged vasoconstriction if poisoning is severe.

ergotamine tartrate /ərgot′əmēn/, a vasoconstrictor that binds to several receptor populations (e.g., alpha-adrenergic, dopamine, serotonin) and, depending upon the receptor, can be an agonist or antagonist.

■ INDICATIONS: It is prescribed to abort or prevent vascular headaches such as migraines.

■ CONTRAINDICATIONS: Pregnancy, peripheral vascular disease, infectious disease, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are vomiting, diarrhea, thirst, tingling of fingers and toes, and increased blood pressure. Fetal death may occur if it is used during pregnancy.

ergotherapy /ur′gōther′əpē/ [Gk, *ergon,* work, *therapeia,* treatment], the use of physical activity and exercise in the treatment of disease. By extension the therapy includes any procedure that increases the blood supply to a diseased or injured part, such as massage or various types of hot baths. **—ergotherapeutic,** *adj.*

ergotism /ur′gətiz′əm/ [L, *argota,* a grain fungus], **1.** an acute or chronic disease caused by excessive dosages of medications containing ergot. Symptoms may include cerebrospinal manifestations such as spasms, cramps, and dry gangrene. **2.** a chronic disease caused by ingestion of cereal products made with rye flour contaminated by ergot fungus.

ergot poisoning [L, *argota,* a grain fungus; L, *potio,* drink], the toxic effects of ingesting food or medications containing ergot alkaloids, particularly ergotamine. See also **ergotism.**

ergotropic /ur′gōtrop′ik/, **1.** pertaining to an activity or work state involving somatic muscle, sympathetic nervous system, and cortical alpha rhythm activity. **2.** pertaining to the administration of medications or other therapies to energize the power of the body's blood and other tissues to resist infections.

-ergy, **1.** suffix meaning an "action": *leukergy, synergy.* **2.** suffix meaning an "effect or result": *allergy, anabolergy, pathergy.*

-eridine, suffix denoting an analgesic of the meperidine group.

Erikson, Erik, a psychologist who described the development of identity of the self and the ego through successive stages that naturally unfold throughout the lifespan. The eight stages are trust vs. mistrust (infancy); autonomy vs. shame and doubt (toddlerhood); initiative vs. guilt (preschool); industry vs. inferiority (middle childhood); identity vs. role confusion (adolescence); intimacy vs. isolation (young adulthood); generativity vs. stagnation (middle adulthood); and ego integrity vs. despair (older adulthood).

Eriksson, Katie, a nursing theorist who developed the Theory of Caritative Care, which distinguishes between caring ethics, the practical relation between the patient and the nurse, and nursing ethics, the ethical principles and rules that guide decision-making. Caritative caring consists of love and charity, or caritas, and respect and reverence for human holiness and dignity. Suffering related to lack of caritative care violates human dignity.

ERISA, abbreviation for **Employment Retirement Income Security Act.**

erlotinib, a miscellaneous antineoplastic.

■ INDICATION: This drug is used in the treatment of non–small cell lung cancer.

■ CONTRAINDICATIONS: Pregnancy and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: A life-threatening side effect of this drug is interstitial lung disease. Common side effects include nausea, diarrhea, vomiting, anorexia, mouth ulceration, rash, conjunctivitis, eye pain, fatigue, infection, cough, and dyspnea.

erogenous /iroj′ənəs/ [Gk, *eros,* love, *genein,* to produce], pertaining to the production of erotic sensations or sexual excitement. Also **erotogenic** /irot′ōjen′ik/.

erogenous zones, areas of the body in which sexual tension tends to become concentrated and can be relieved by manipulation of the region. The areas include the mouth, anus, nipples, and genitals.

Eros /ir′os, er′os/ [Gk, mythic love-inciting son of Aphrodite], a Freudian term for the drive or instinct for survival, including self-preservation and continuation of the species through reproduction.

erosion /irō′zhən/ [L, *erodere,* to consume], the wearing away or gradual destruction of a surface. For example, a mucosal or epidermal surface may erode as a result of inflammation, injury, or other causes, usually marked by the appearance of an ulcer. See also **necrosis.** The action of acid (low pH) substances dissolving tooth structure. Can be due to habitual sucking on citrus fruits such as lemons, from acidic swimming pool water, or gastroesophageal reflux.

erosive gastritis /irō′siv/, an inflammatory condition characterized by multiple erosions of the mucous membrane lining the stomach. Nausea, anorexia, pain, and gastric hemorrhage may occur. **Acute erosive gastritis** involves erosions of the full thickness of the stomach mucosa, usually with some degree of hemorrhaging; it may be either localized or diffuse. **Chronic erosive gastritis** is a type of chronic gastritis with mild symptoms, characterized by multiple punctate or aphthous ulcers, found by endoscopy. Some patients have nausea and vomiting, but others are symptom free. Complications include perforation, penetration into a surrounding organ, and hemorrhage. The cause may be a reaction to nonsteroidal antiinflammatory drugs, a complication of Crohn's disease or a viral infection, or an unknown factor. Also called **varioliform gastritis.** See also **chemical gastritis, corrosive gastritis.**

erosive osteoarthritis. See **Kellgren's syndrome.**

-erotic, suffix meaning "sexual love or desire": *anterotic, homoerotic, hysteroerotic.*

eroticism /irot′isiz′əm/ [Gk, *erotikos,* sexual love], **1.** sexual impulse or desire. **2.** the arousal or attempt to arouse the sexual instinct through suggestive or symbolic means. **3.** the expression of sexual instinct or desire. **4.** an abnormally persistent sexual drive. Also called *erotism.* See also **anal eroticism, oral eroticism.**

eroto- /irot′ə-/, prefix meaning "sexual love or desire": *erotogenic, erotopath, erotophobia.*

erotogenic. See **erogenous.**

erratic /irat′ik/ [L, *erraticus,* wandering], deviating from the normal but with no apparent fixed course or purpose.

error [L, *errare,* to wander], (in research) a defect in the design of a study, in the development of measurements or instruments, or in the interpretation of findings.

error message, a brief statement delivered by a computer by means of a peripheral device, such as a monitor or printer, that a procedure has been done incorrectly.

error of the first kind. See **type I error.**

error of the second kind. See **type II error.**

error theory of aging, a stochastic theory of aging that ascribes aging to the accumulation of errors in the process of information flow from genes to proteins. The errors create faulty proteins that do not function normally, resulting in impaired cell function and death. See also **theories of aging.**

ERT, abbreviation for **external radiation therapy.**

ertapenem, an antiinfective agent to treat adults with moderate to severe infections, complicated skin and skin structure infections, and complicated urinary tract infections.

erucic acid /ero͞o′sik/, a fatty acid that has been associated with heart disease. It is present in rapeseed oil that is used in some countries as a vegetable oil for salad dressings, margarines, and mayonnaise. Canola oil is a rapeseed oil from which virtually all erucic acid has been removed through breeding.

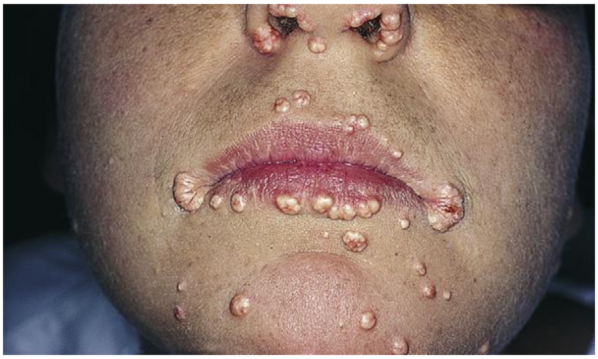
eructation /ē′ruktā′shən/ [L, *eructare,* to belch], the act of drawing up air from the stomach with a characteristic sound through the mouth. Also called **belching.**

eruption /irup′shən/ [L, *eruptio,* bursting forth], the appearance of rapidly forming skin lesions, especially of a viral exanthem, or of a rash that commonly accompanies a drug reaction.

eruptive fever /irup′tiv/ [L, *eruptio,* bursting forth; *febris*], a febrile disease of Mediterranean regions, Africa, the Crimea, and India, caused by infection with *Rickettsia conorii.*

eruptive gingivitis, inflammation of the gums that may occur when the secondary teeth (adult dentition) break through. Compare **desquamative gingivitis.**

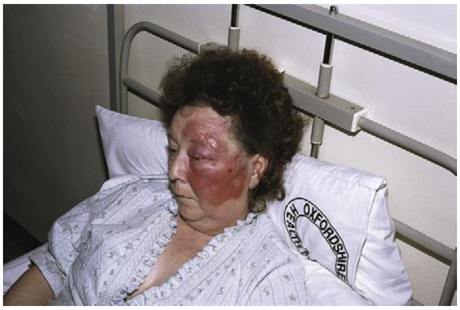
eruptive xanthoma, a skin disorder associated with elevated triglyceride levels in the blood. Numerous erythematous or pale, raised papules suddenly appear on the trunk, legs, arms, and buttocks.



Eruptive xanthoma *(Callen et al, 2000)*

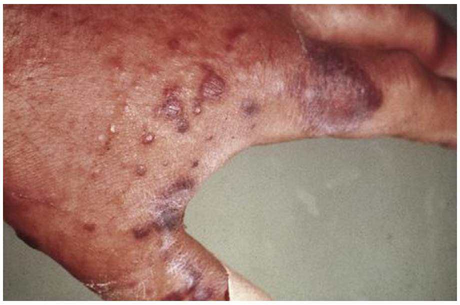
ERV, abbreviation for **expiratory reserve volume.**

erysipelas /er′isip′ələs/ [Gk, *erythros,* red, *pella,* skin], an infectious skin disease characterized by redness, swelling, vesicles, bullae, fever, pain, and lymphadenopathy. It is caused by a species of group A beta-hemolytic streptococci. Predisposing conditions include diabetes, HIV, and nephrotic syndrome, as well as immunocompromised conditions. It is also seen in those with vagrant life-styles. Treatment includes antibiotics, analgesics, and packs or dressings applied locally to the lesions.



Erysipelas *(Conlon and Snydman, 2000)*

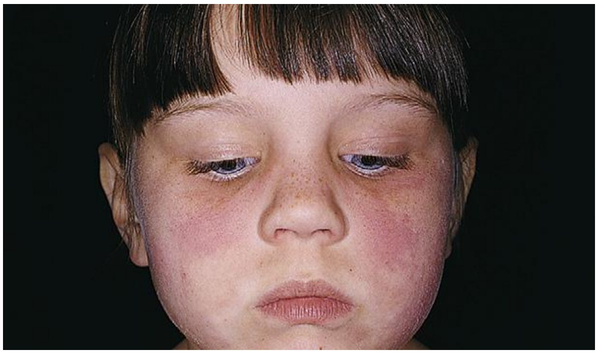
erysipeloid /er′isip′əloid/ [Gk, *erhthros* + *pella* + *eidos*, form], an infection of the hands characterized by blue-red patches and occasionally by erythema. It is acquired by handling meat or fish infected with *Erysipelothrix rhusiopathiae*. The disease is self-limited, lasting about 3 weeks, but responds to penicillin. Also called **fish-handler's disease.** Compare **erysipelas.**



Erysipeloid *(Conlon and Snydman, 2000)*

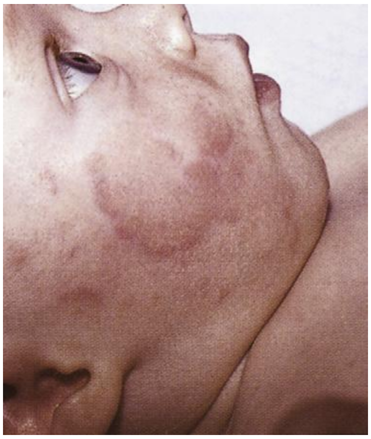
erythema /er′ithē′mə/ [Gk, *erythros*, red], redness or inflammation of the skin or mucous membranes that is the result of dilation and congestion of superficial capillaries. Examples of erythema are nervous blushes and mild sunburn. See also **erythroderma, rubor. —erythematous,** *adj*.

erythema infectiosum, **1.** an acute benign infectious disease, mainly of childhood, characterized by fever and an erythematous rash that begins on the cheeks and later appears on the arms, thighs, buttocks, and trunk. As the rash progresses, earlier lesions fade. Sunlight aggravates the eruption, which usually lasts about 10 days but may recur in 1 to 3 weeks or longer after exposure to sunlight or heat. For a period the rash may reappear whenever the skin is irritated. It is caused by parvovirus B_{19}. Morbidity is more significant in adults, immunocompromised patients, pregnant women, and those with uremia. **2.** a virus that lives only in humans. No treatment is necessary, and prognosis is excellent. Isolation of patients is not required. Also called **fifth disease.**



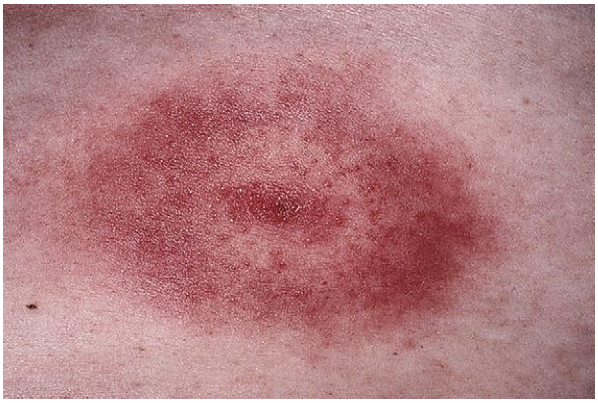
Erythema infectiosum *(Callen et al, 2000)*

erythema marginatum, a skin disorder seen in acute rheumatic fever characterized by temporary disk-shaped nonpruritic reddened macules that fade in the center, leaving raised margins.



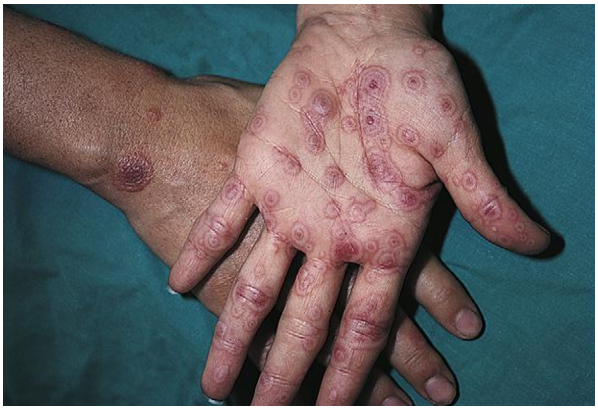
Erythema marginatum *(Weston, Lane, and Morrelli, 2007)*

erythema migrans (EM), a disease that begins as small papules that spread peripherally, characterized by a raised, red margin and clearing in the center. It may mark the site of a tick bite and is a diagnostic sign of **Lyme disease.** Also called **bullseye rash.**



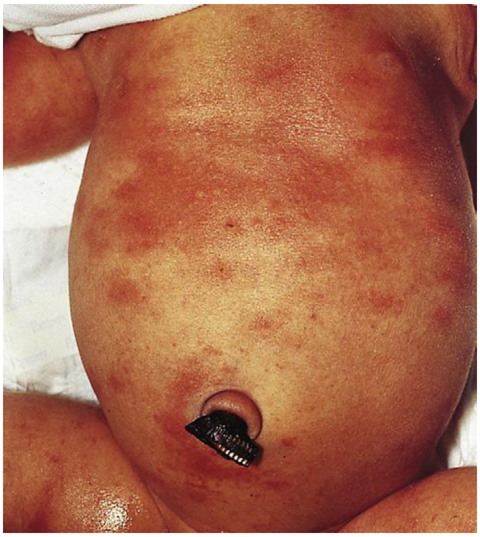
Erythema migrans in Lyme disease *(Callen et al, 2000)*

erythema multiforme (EM) /mul′tifôr′mē, mo͝ol′tēfôr′mā/, any of three major clinical syndromes characterized by lymphocytic infiltrates in the skin that cause keratinocyte necrosis. The patient may experience polymorphous eruption of skin and mucous membranes. Macules, papules, nodules, vesicles or bullae, and target (bullseye-shaped) lesions are seen. The three major classifications of erythema multiforme are EM minor, EM major, and pure plaque toxic epidermal necrosis. EM minor is an acute form of the disease, characterized by three-ring target lesions on the extremities. Symptoms often follow an infection of herpes simplex. The patient may have raised lesions but no fever and no blistering. EM major, also called **Stevens-Johnson syndrome**, is characterized by the presence of target lesions, blistering, and detachment of the skin and mucous membranes. EM major also tends to follow herpes simplex virus infections. Plaque toxic epidermal necrolysis may not be associated with target lesions. However, the condition is associated with detachment of large sheets of skin. It is generally drug induced. Definitive and preventive treatment depends on finding the specific cause. Use of topical or systemic corticosteroids is helpful in most cases.



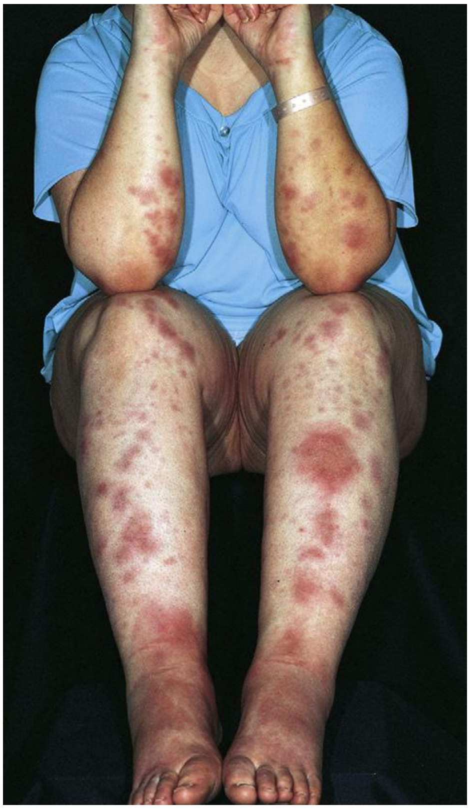
Erythema multiforme *(Callen et al, 2000)*

erythema neonatorum, a common skin condition of neonates characterized by a pink papular rash frequently superimposed with vesicles or pustules. The rash appears within 24 to 48 hours after birth and disappears spontaneously after several days. A smear of the papules that reveals the presence of eosinophils rather than neutrophils differentiates the condition from neonatal pustular melanosis. Also called **toxic erythema of the newborn.**



Erythema neonatorum *(Zitelli and Davis, 2007)*

erythema nodosum, a hypersensitivity reaction characterized by reddened, tender subcutaneous nodules on the extensor aspects of the extremities, such as the shins. The nodules last for several days or weeks, never ulcerate, and are often associated with mild fever, malaise, and pain in muscles and joints. This condition may accompany streptococcal infections, tuberculosis, sarcoidosis, drug sensitivity, ulcerative colitis, and pregnancy. The prognosis is good with appropriate treatment of the underlying condition. A course of corticosteroids is usually effective in diminishing the symptoms.



Erythema nodosum *(From Habif TP: Clinical Dermatology, 5th edition, St. Louis, 2010, Mosby/Elsevier. (Fig. 18-11, p. 720))*

erythema perstans, a persistent local redness of the skin, characteristically annular.

erythematous. See **erythema.**

erythematous pemphigus [Gk, *erythros,* red, *pemphix,* bubble], a skin disorder characterized by bullous eruptions on the trunk and a facial eruption that resembles that of lupus erythematosus. The condition may be accompanied by seborrheic dermatitis. Also called **pemphigus erythematosus.**

erythemo-, combining form meaning "red": *erythematous, erythemogenic.*

erythemogenic /er′ithe′mojen′ik/, producing or causing erythema.

erythralgia /er′ithral′jə/ [Gk, *erythros,* red, *algos,* pain], a skin disorder characterized by a painful burning sensation, raised skin temperature, and redness, generally of the lower limbs.

erythrasma /er′ithraz′mə/ [Gk, *erythros,* red], a bacterial skin infection common in the axillary or inguinal region, characterized by irregular reddish-brown areas. An asymptomatic disease, it is more common in diabetics and responds quickly to oral erythromycin. Compare **intertrigo, tinea cruris.**

erythremia /er′ithrē′mē·ə/ [Gk, *erythros* + *haima,* blood], an abnormal increase in the number of red blood cells. See **polycythemia.**

erythro-, prefix meaning "red": *erythroblast, erythroclast, erythrocyte.*

erythroblast /erith′rəblast′/, a nucleated immature form of a red blood cell found only in bone marrow.

erythroblastoma /-blastō′mə/ [Gk, *erythros,* red, *blastos,* germ, *oma,* tumor], a myeloma tumor (osteolytic neoplasm) in which the cells resemble erythroblasts.

erythroblastosis /-blastō′sis/, the presence of abnormally large numbers of erythroblasts in the peripheral blood.

erythroblastosis fetalis /-blastō′sis/ [Gk, *erythros* + *blastos,* germ, *osis,* condition; L, *fetus,* bringing forth], a type of hemolytic anemia in newborns that results from maternal-fetal blood group incompatibility, specifically involving the Rh factor and the ABO blood groups. The condition is caused by an antigen-antibody reaction in the bloodstream of the infant resulting from placental transmission of maternally formed antibodies against the incompatible antigens of the fetal blood. In Rh factor incompatibility, the hemolytic reaction occurs only when the mother is Rh negative and the infant is Rh positive. The isoimmunization process rarely occurs in the first pregnancy, but there is increased risk with each succeeding pregnancy. See also **hydrops fetalis, hyperbilirubinemia of the newborn, Rh factor, hemolytic disease of the fetus and newborn (HDFN)**

erythrochromia /-krō′mē·ə/, **1.** a red coloration or stain. **2.** red pigmentation in spinal fluid caused by the presence of blood.

Erythrocin, a trademark for an antibiotic **(erythromycin).**

erythrocyanosis /-sī′ənō′sis/, a condition characterized by bluish-red discoloration of skin, accompanied by swelling, burning, and itching.

erythrocyte /erith′rəsīt′/ [Gk, *erythros* + *kytos,* cell], mature red blood cell; a biconcave disk about 7 µm in diameter that contains hemoglobin confined within a lipoid membrane. It is the major cellular element of the circulating blood and transports oxygen as its principal function. The number of red blood cells per microliter of blood is 4.5 to 5.5 million in men and 4.2 to 4.8 million in women. The red blood cell count varies with age, activity, and environmental conditions. An erythrocyte normally survives for 110 to 120 days, when it is removed from the bloodstream and broken down by the reticuloendothelial system. New erythrocytes are produced at a rate of slightly more than 1% a day; thus a constant level is usually maintained. Acute blood loss, hemolytic anemia, or chronic oxygen deprivation may cause erythrocyte production to increase greatly. Erythrocytes originate in the marrow of the flat bones or at the end of long bones. Maturation proceeds from the pronormoblast to the basophilic polychromatophilic normoblast to the basophilic polychromatophilic normoblast, and orthochromic normoblast the final stage before the mature adult cell develops. Also called **red blood cell (RBC), red cell, red corpuscle.** Compare **normoblast, reticulocyte.** See also **erythropoiesis, hemoglobin, red cell indexes.**

erythrocyte reinfusion, the process of injecting into an individual's bloodstream red blood cells previously taken from that individual and preserved temporarily by freezing. The process is managed in the same manner as when an individual donates his or her own blood for later retransfusion (autologous transfusion).

erythrocyte sedimentation rate (ESR), the rate at which red blood cells settle out in a vertical column of anticoagulated whole blood, expressed in millimeters per hour. Blood is collected in an anticoagulant and allowed to form a sediment in a calibrated glass column. At the end of 1 hour the laboratory technician measures the distance the erythrocytes have fallen in the tube. Elevated sedimentation rates are not specific for any disorder but most commonly indicate the presence of inflammation. Inflammation causes an alteration of the blood proteins, which makes the red blood cells aggregate, becoming heavier than normal. The speed with which they fall to the bottom of the tube corresponds to the degree of inflammation. Serial evaluations of erythrocyte sedimentation rate are useful in monitoring the course of inflammatory activity in rheumatic diseases and, when performed with a white blood cell count, can indicate infection. Certain noninflammatory conditions, such as pregnancy, are also characterized by high sedimentation rates. The Westergren ESR is determined with a 200-mm Westergren tube. Values are higher for women in both methods and vary according to the method used. Normal findings by the Westergren method are up to 20 mm/hr for females and up to 15 mm/hr for males. Other diseases which alter blood proteins can also be called abnormal ESRs. Also called *(informal)* **sedimentation rate.** See also **inflammation.**

erythrocythemia /erith′rōsīthē′mē·ə/ [Gk, *erythros* + *kytos* + *haima,* blood], an increase in the number of erythrocytes circulating in the blood.

erythrocytopenia /-sī′təpē′nē·ə/ [Gk, *erythros,* red, *kytos,* cell, *penes,* poor], a condition characterized by a deficiency or decrease in number of erythrocytes.

erythrocytosis /erith′rōsītō′sis/ [Gk, *erythros* + *kytos* + *osis,* condition], an abnormal increase in the number of circulating red cells. See also **polycythemia.**

erythroderma /erith′rōdur′mə/ [Gk, *erythros* + *derma,* skin], an abnormal redness of the skin. Compare **erythema, rubor.**

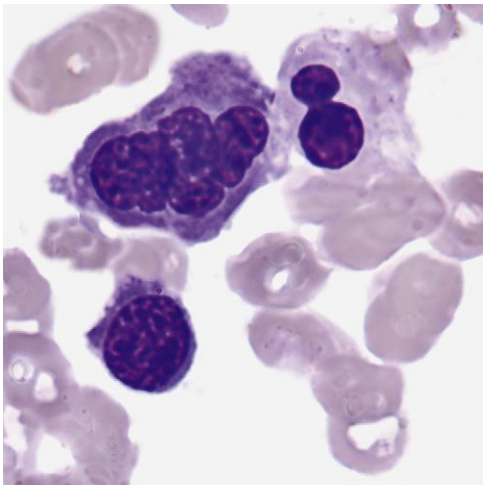
erythroderma desquamativum. See **Leiner's disease.**

erythroderma polyneuropathy. See **acrodynia.**

erythrogenesis, the creation of red blood cells. See also **erythropoiesis.**

erythroid /erith′roid/, **1.** reddish in color. **2.** pertaining to erythrocytes.

erythroleukemia /-lo͞okē′mē·ə/ [Gk, *erythros* + *leukos,* white, *haima,* blood], a malignant blood disorder characterized by a proliferation of erythropoietic elements in bone marrow, erythroblasts with bizarre lobulated nuclei, and abnormal myeloblasts in peripheral blood. The disease may have an acute or chronic course. Also called **Di Guglielmo's disease, Di Guglielmo's syndrome, erythromyeloblastic leukemia.**



Erythroleukemia *(Carr and Rodak, 2008)*

erythroleukosis, an abnormal increase in numbers of granulocytes and red blood cells.

erythromelalgia /erith′rōmilal′jə/ [Gk, *erythros* + *melos,* limb, *algos,* pain], a rare disorder characterized by a paroxysmal dilation of the peripheral blood vessels. It occurs bilaterally, usually in the extremities, and is associated with burning, redness of the skin, and pain. **—erythromelalgic,** *adj.*

erythromycin /erith′rōmī′sin/, an antibiotic (of the macrolide type).

■ INDICATIONS: It is prescribed in the treatment of many bacterial and mycoplasmic infections, particularly those that cannot be treated by penicillin.

■ CONTRAINDICATIONS: Liver disease or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: The more serious adverse effects result from its effects on the metabolism of other drugs, which have led to fatalities (e.g., with Seldane [terfenadine]). Cholestatic hepatitis, hypersensitivity reactions, and GI discomfort are other adverse effects associated with its use.

erythromyeloblastic leukemia. See **erythroleukemia.**

erythron /erith′ron/, the total mass of circulating red blood cells (RBCs) and the RBC-forming tissues from which they are derived.

erythropathy /er′ithrop′əthē/, any disease involving the red blood cells (erythrocytes).

erythropenia. See **hypocythemia.**

erythrophage /erith′rəfāj/, a phagocyte that ingests red blood cells or blood pigment.

erythrophobia /-fō′bē·ə/ [Gk, *erythros* + *phobos,* fear], **1.** an anxiety disorder characterized by an irrational fear of blushing or of displaying embarrassment. **2.** a symptom manifested by blushing at the slightest provocation. **3.** a morbid fear of or aversion to the color red. **—erythrophobic,** *adj.*

erythrophthisis /erith′rōtī′sis/, grave damage to the restorative power of red corpuscles. See also **anemia.**

erythroplasia of Queyrat /erith′rōplā′zhə/ [Gk, *erythros* + *plasis,* forming; Louis A. Queyrat, French dematologist, 1856–1933], a premalignant lesion on the glans or corona of the penis. It is a shiny, velvety, well-circumscribed reddish patch on the skin. It is usually excised surgically. See also **Bowen's disease.**

erythropoiesis /erith′rōpō·ē′sis/ [Gk, *erythros* + *poiein,* to make], the process of erythrocyte production in the bone marrow involving the maturation of a nucleated precursor into a hemoglobin-filled, nucleus-free erythrocyte that is regulated by erythropoietin, a hormone produced by the kidney. Compare **erythrogenesis.** See also **erythrocyte, erythropoietin, hemoglobin, leukopoiesis. —erythropoietic,** *adj.*

erythropoietic porphyria. See **porphyria.**

erythropoietic protoporphyria (EPP), an autosomal-dominant disorder, a form of erythropoietic porphyria, characterized by increased levels of protoporphyrin in the erythrocytes, plasma, liver, and feces and a wide variety of photosensitive skin changes, ranging from a burning or pruritic sensation to erythema, plaquelike edema, and wheals.

erythropoietin (EPO) /erith′rōpō·ē′tin/ [Gk, *erythros* + *poiein,* to make], a glycoprotein hormone synthesized mainly in the kidneys and released into the bloodstream in response to anoxia. The hormone acts to stimulate and to regulate the production of erythrocytes and thus increases the oxygen-carrying capacity of the blood. See also **erythropoiesis.**

erythropoietin (EPO) test, a blood test measuring the hormone erythropoietin, used in the diagnosis of anemia and polycythemia.

Erythrovirus /e-rith′rōvi′rus/, a genus of parvoviruses containing viruses that infect erythrocyte progenitor cells. It includes the species B19 virus.

Es, symbol for the element **einsteinium.**

ESADDI, abbreviation for **Estimated Safe and Adequate Daily Dietary Intake.**

escape beat [ME, *escapen,* to flee; *beten,* to beat], an automatic beat of the heart that occurs after an interval equal to or longer than the duration of its normal cycle. Escape beats function as safety mechanisms, and anything that produces a long pause in the prevailing heart cycle may allow an escape to occur. Pauses in which escape beats occur may be caused by sinoatrial block, atrioventricular (AV) block, or sinus bradycardia. Escape beats may arise from the atria, the AV junction, or the ventricles.

escape rhythm [OFr, *escaper* + Gk, *rhythmos,* beat], a sustained heartbeat that occurs when the sinus or atrioventricular (AV) node is depressed or blocked. Under such conditions, the heart rate is controlled by the AV junction or the His-Purkinje system.

escarronodulaire. See **Marseilles fever.**

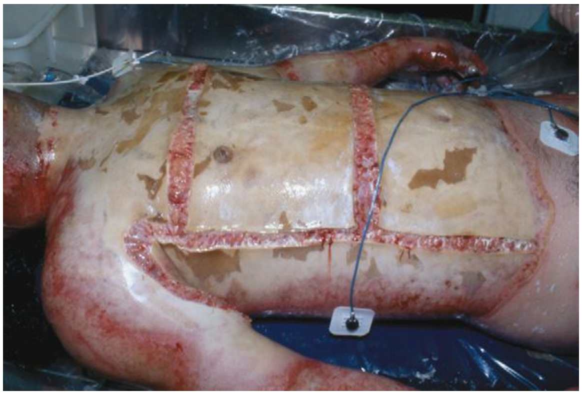
-escent, suffix meaning "beginning to be": *alkalescent, convalescent, turgescent.*

eschar /es′kär/ [Gk, *eschara,* scab], a **scab** or dry crust that results from trauma, such as a thermal or chemical burn, infection, or excoriating skin disease. **—escharotic,** *adj.*

escharonodulaire. See **Marseilles fever.**

escharotic. See **eschar.**

escharotomy /es′kärot′əmē/, a surgical incision into necrotic tissue resulting from a severe burn. The procedure is sometimes necessary to prevent edema from generating sufficient interstitial pressure to impair capillary filling, causing ischemia.



Escharotomy *(Monahan et al, 2007)*

Escherichia coli (E. coli) /eshirī′kē·ə kō′lī/ [Theodor Escherich, German physician, 1857–1911; Gk, *kolon,* colon], a species of coliform bacteria of the family Enterobacteriaceae, normally present in the intestines and common in water, milk, and soil. *E. coli* is the most frequent cause of urinary tract infection and is a serious gram-negative pathogen in wounds. *E. coli* septicemia may rapidly result in shock and death through the action of an endotoxin released from the bacteria. See also **enterohemorrhagic *Escherichia coli.***

escitalopram, an antidepressant, selective serotonin reuptake inhibitor used to treat major depressive disorders.

Escobar's syndrome. See **multiple pterygium syndrome.**

escutcheon /eskuch′ən/ [L, *scutum,* shield], the pattern of distribution of coarse, adult pubic hair, rhomboid in the male and triangular in the female.

-esis, suffix meaning an "action, process, or result of": *enuresis, oxydesis, synthesis.*

Eskalith, a trademark for a medication used to treat bipolar affective disorders **(lithium carbonate).**

Esmarch's bandage /es′märks/ [Johann F. A. von Esmarch, German surgeon, 1823–1908], a broad, flat elastic bandage wrapped around an elevated limb to force blood out of the limb. It is used before certain surgical procedures to create a blood-free field.

ESO, abbreviation for **electric spinal orthosis.**

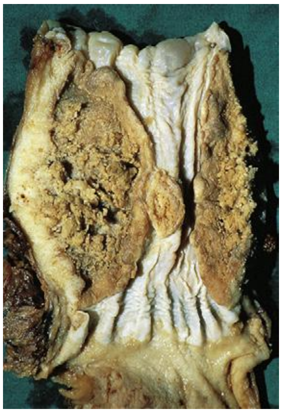
eso-, prefix meaning “within”: *esogastritis, esotropia, esophagus*.

esomeprazole /esʹomep′räzōl/, a proton pump inhibitor administered orally as the magnesium salt in treatment of gastroesophageal reflux disease and in the treatment of duodenal ulcer associated with ***Helicobacter pylori*** infection.

esophageal. See **esophagus.**

esophageal atresia /əsof′əjēʹəl, es′ofāʹjē·əl/ [Gk, *oisophagos,* gullet], an abnormal esophagus that ends in a blind pouch or narrows to a thin cord and thus does not provide a continuous passage to the stomach. It usually occurs as a congenital anomaly. Thoracotomy can affect repair.

esophageal cancer, a rare malignant neoplastic disease of the esophagus that peaks at about 60 years of age, occurs three times more frequently in men than in women, and is found more often in Asia and Africa than in North America. Risk factors associated with the disease are heavy consumption of alcohol, tobacco smoking, betel-nut chewing, Plummer-Vinson syndrome, Barrett’s esophagus, and achalasia. Aflatoxin in moldy grain and peanuts or a dietary deficiency, especially of molybdenum, may be involved. Esophageal cancer does not often cause any symptoms in the early stages but in later stages produces painful dysphagia, chest pain, anorexia, weight loss, regurgitation, cervical adenopathy, and, in some cases, persistent cough. Left vocal cord paralysis and hemoptysis indicate an advanced state of the disease. Esophageal cancer metastasizes rapidly and thus has a poor prognosis. The tumor may spread locally to invade the trachea, bronchi, pericardium, great blood vessels, and thoracic vertebrae or may metastasize to lymph nodes, the lungs, and the liver. Diagnostic measures include barium swallow, fiberoptic esophagoscopy, and biopsy and cytological examination of the primary lesion and regional nodes. Most esophageal tumors are poorly differentiated squamous cell carcinomas; adenocarcinomas occur less frequently and are usually found in the lower third of the esophagus. Surgical treatment may require total or partial esophagectomy. Radiotherapy may eradicate early local tumors and may effectively palliate the symptoms of an advanced lesion. Chemotherapy may be used in palliation of advanced disease or as an adjuvant to surgery or radiation therapy. See also **esophagectomy.**



Esophageal cancer *(Fletcher, 2007)*

esophageal dilator, a bougie or similar instrument for dilation of an esophageal stricture or the lower esophageal sphincter.

esophageal dysfunction, any disturbance, impairment, or abnormality that interferes with the normal functioning of the esophagus, such as dysphagia, esophagitis, or sphincter incompetence. The condition is one of the primary symptoms of scleroderma.

esophageal feeding. See **tube feeding.**

esophageal function studies, manometric tests used to assess esophageal function. These include tests for acid reflux, acid clearing, and acid perfusion.

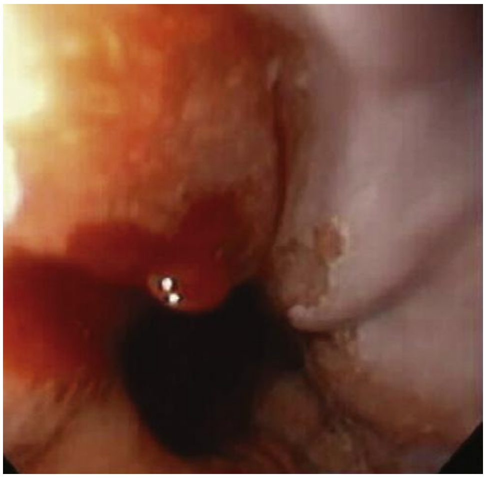
esophageal lead /lēd/, **1.** an electrocardiographic conductor in which the exploring electrode is placed within the lumen of the esophagus. It is used to detect sizable atrial deflections as an aid in identifying cardiac arrhythmias. **2.** *(informal)* a tracing produced by such a lead on an electrocardiograph.

esophageal obturator airway (EOA), an emergency device that consists of a large tube that is inserted into the mouth through an airtight face mask. Holes in the tube open into the oropharynx when properly placed. The esophagus is blocked by inflating a balloon at the end of the tube. Because of the design, air passes only into the trachea.

esophageal peristalsis, strong, uncoordinated nonpropulsive contractions of the esophagus evoked by swallowing, especially in the elderly. On barium radiography, the lumen of the esophagus appears as a series of concentric narrowings or as a spiral coil. Also called *esophageal spasm*.

esophageal speech. See **alaryngeal speech.**

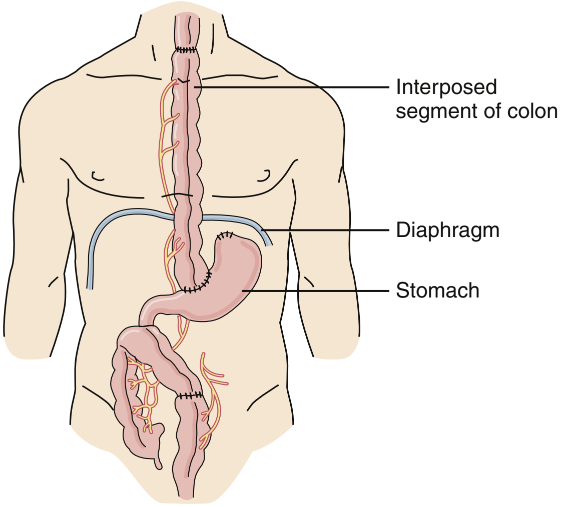
esophageal varices, a complex of longitudinal tortuous veins at the lower end of the esophagus, enlarged and swollen as the result of portal hypertension. These vessels are especially susceptible to hemorrhage. Conditions that can cause portal hypertension include cirrhosis and chronic hepatitis.



Esophageal varices: endoscopic view
(Goldman et al, 2008/Courtesy Dr. Pankaj Jay Pasricha)

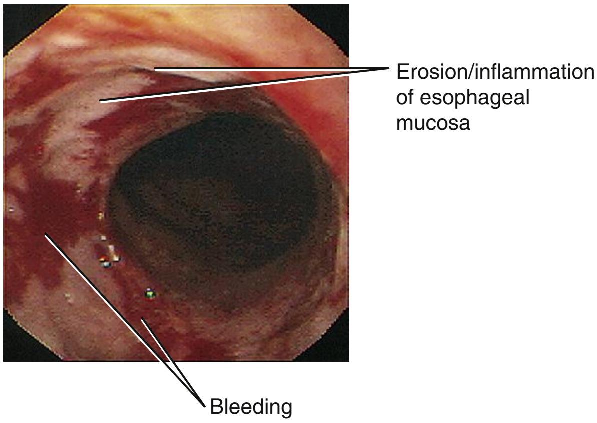
esophageal web, a thin membrane that may develop across the lumen of the esophagus, usually near the level of the cricoid cartilage. The abnormal condition is generally associated with iron deficiency anemia and usually disappears when the underlying problem is resolved. See also **Plummer-Vinson syndrome.**

esophagectomy /esof′əjekʹtəmē/ [Gk, *oisophagos* + *ektomē*, excision], a surgical procedure in which all or part of the esophagus is removed, as may be required to treat severe recurrent bleeding, esophageal varices, or esophageal cancer. Also spelled **oesophagectomy.**



Esophagectomy with colon interposition
(Monahan et al, 2007)

esophagitis /esof′əjīʹtis/ [Gk, *oisophagos* + *itis*], inflammation of the mucosal lining of the esophagus, caused by infection, irritation from a nasogastric tube, or, most commonly, backflow of gastric juice from the stomach. Also spelled **oesophagitis.** See also **gastroesophageal reflux.**



Severe esophagitis: endoscopic view
(Black and Hawks, 2009)

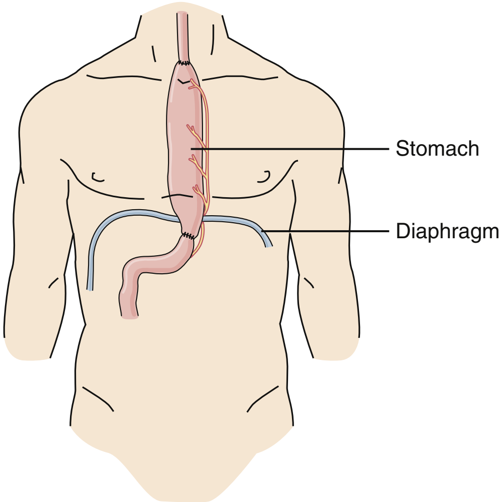
esophagocele /esofʹəgōsēl′/, a hernia of the mucous membrane through a weakened area in the wall of the esophagus.

esophagogastroduodenoscopy (EGD) /ə·sof′əgōgas′trōdo͞o′odənos′kəpe/, an endoscopic test that permits direct visualization of the upper GI tract. Insertion of a long, flexible, fiberoptic-lighted scope allows examination of tumors, varices, mucosal inflammations, hiatal hernias, polyps, ulcers, and obstructions. This test evaluates patients with dysphagia, weight loss, early satiety, upper abdominal pain, ulcer symptoms, or dyspepsia and is also used therapeutically for electrocoagulation, laser coagulation, or injection of sclerosing agents.

esophagogastronomy /esof′əgō′gastronʹəmē/ [Gk, *oisophagos*, gullet, *gaster*, stomach, *stoma*, mouth], the surgical creation of a passage between the esophagus and the stomach.

esophagogastroscopy /-gastrosʹkəpē/ [Gk, *oisophagos*, gullet, *gaster*, stomach, *skopein*, to watch], the examination with an endoscope of the esophagus and stomach.

esophagogastrostomy /-gastrosʹtəmē/, an artificial anastomosis of the esophagus to the stomach.



Esophagogastrostomy for esophageal cancer
(Monahan et al, 2007)

esophagojejunostomy /-jij′o͞onosʹtəmē/ [Gk, *oisophagos*, gullet; L, *jejunum*, empty, *stoma*, mouth], the surgical creation of a direct passage from the esophagus to the jejunum, bypassing the stomach. The procedure is used after total gastrectomy.

esophagomyotomy /-mī′otʹəmē/, a longitudinal incision in the lower part of the esophageal muscle made to treat esophageal achalasia, an obstruction to the passage of food.

esophagoscopy /esof′əgosʹkəpē/ [Gk, *oisophagos* + *skopein*, to look], examination of the esophagus with an endoscope. Also spelled **oesophagoscopy.**

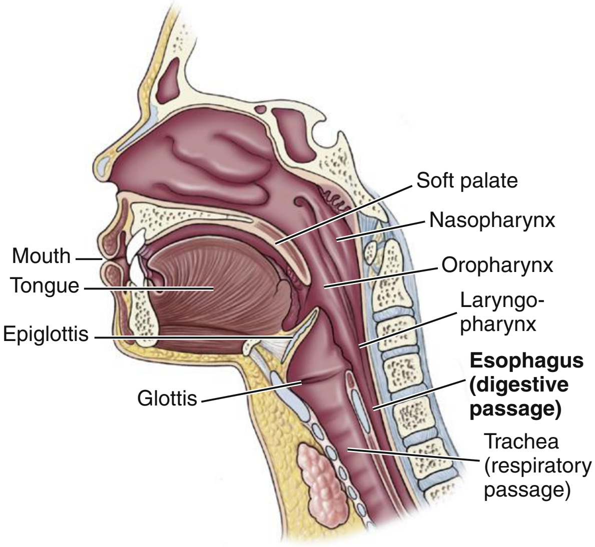
esophagospasm /esofʹəgōspaz′əm/ [Gk, *oisophagos*, gullet, *spasmos*], spasmodic contractions of the walls of the esophagus. The symptoms are substernal chest pain similar to angina pectoris and dysphagia for both liquids and solid food.

esophagostomy /esof′əgosʹtəmē/, a surgical opening into the esophagus for enteral tube feeding.

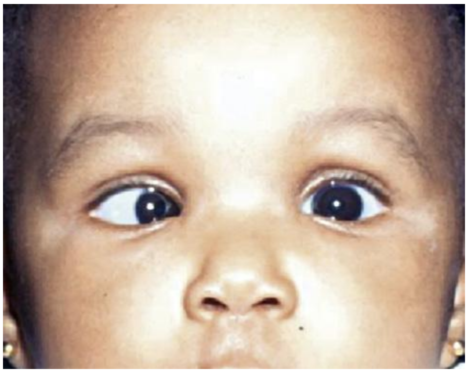
esophagus /esofʹəgəs/ [Gk, *oisophagos*], the musculomembranous canal, about 24 cm long, extending from the pharynx to the stomach. It begins in the neck at the inferior border of the cricoid cartilage, opposite the sixth cervical vertebra, and descends to the cardiac sphincter of the stomach in a vertical path with two slight curves. The esophagus is composed of a fibrous coat, a muscular coat, and a submucous coat and is lined with mucous membrane. Also spelled **oesophagus.** Also called **gullet. —esophageal,** *adj*.

esophoria /es′əfôrʹē·ə/ [Gk, *eso*, inward, *pherein*, to bear], the latent medial deviation of the visual axis of one eye in the absence of visual stimuli for fusion. Also called **cross-eye.** Compare **esotropia, exophoria. —esophoric,** *adj*.

esotropia /es′ətrōʹpē·ə/ [Gk, *eso* + *tropos*, turning], a medial deviation of one eye relative to the other fixating eye such that fusion is not maintained. Also called **convergent squint, convergent strabismus, internal strabismus.** Compare **esophoria, exotropia.** See also **strabismus. —esotropic,** *adj*.



Esophagus *(Herlihy, 2011)*



Esotropia *(Kliegman et al, 2011)*

ESP, abbreviation for **extrasensory perception.**

espundia /espun′dē·ə/ [Sp, cancerous ulcer], a cutaneous form of American leishmaniasis most common in Brazil, caused by *Leishmania brasiliensis*. The primary lesion often disappears spontaneously, followed by mucocutaneous lesions that destroy the mucosal surface of the nose, pharynx, and larynx. If the condition is untreated, potentially fatal secondary bacterial infections and disfigurement may occur. Also called **Breda's disease.**

ESR, abbreviation for **erythrocyte sedimentation rate.**

essential /esen′shəl/, a necessary part of a thing without which it could not exist.

essential amino acid [L, *essentia,* quality], an organic compound not synthesized in the body that is essential for protein synthesis in adults and optimal growth in infants and children. Adults require isoleucine, leucine, lysine, methionine, phenylalanine, threonine, tryptophan, and valine. Infants need these amino acids plus arginine and histidine. Cysteine and tyrosine are derived from methionine and phenylalanine, respectively, and are considered semiessential. See also **amino acid, nonessential amino acid.**

essential convulsion, central convulsion.
